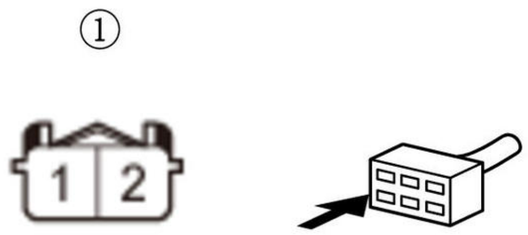
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Knock sensor 2P connector: disconnected
B	PCM connector E (80P) : disconnected
Test point 1	Knock sensor 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 34**



Is there 1.0 Ω or less?

YES

The KSGND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the KSGND wire between the PCM (E34) and the knock sensor.

5. Open wire check (KS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

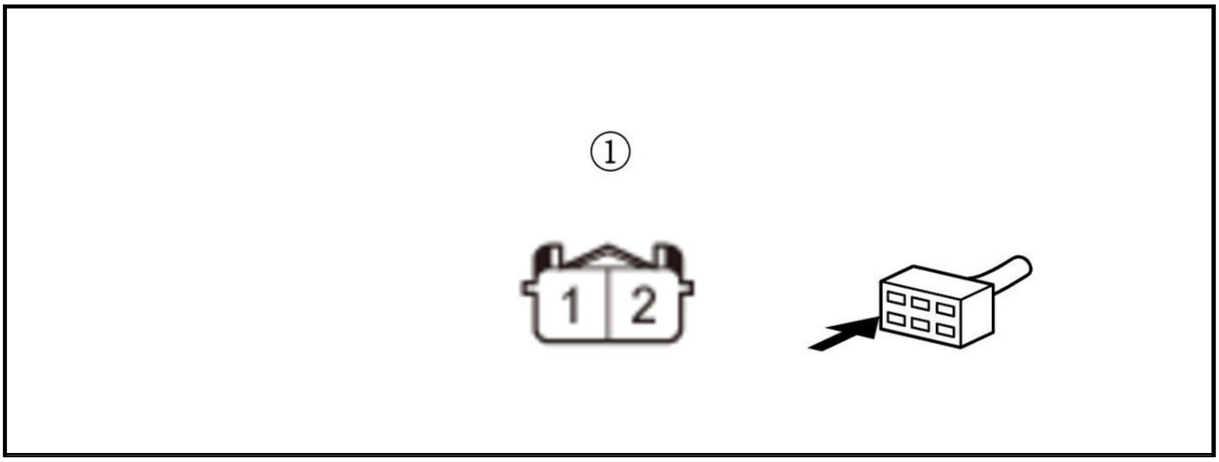
PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Knock sensor 2P connector: disconnected
B	PCM connector E (80P) : disconnected

Test point 1	Knock sensor 2P connector (female terminals) No. 2: ①

Test point 2	**PCM connector E (80P) No. 35**



Is there 1.0 Ω or less?

YES

The KS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the KS wire between the PCM (E35) and the knock sensor.

DTC TROUBLESHOOTING

DTC P032F, P06AF

DTC P032F : Engine Stall

DTC P06AF : Engine Stall

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Do this troubleshooting when the POWER SYSTEM indicator comes on and the battery condition monitor module DTC P1DFD is stored.
- If the 12 VOLT CHARGING SYSTEM indicator comes on, **do the electric powertrain system troubleshooting** first.
- Before beginning this troubleshooting, **do a customer diagnostic interview** .
-
    - -

      If the symptom cannot be duplicated, **you can do the troubleshooting using the on-board snapshot information in this procedure** . Refer to any available customer questionnaires and estimate the mileage when the failure occurred. Make sure the date when the failure occurred corresponds with the estimated mileage. If it does not, the on-board snapshot cannot be used for troubleshooting.
- If the engine stall occurred after refueling, the likely cause is poor fuel quality. Also if the fuel is old, the engine stall will occur.
- Before beginning this troubleshooting:
-
    - -

      Make sure the 12 volt battery is fully charged.
    - -

      Make sure the fuel tank is at least 1/4 full.
    - -

      Make sure the engine oil level is correct.
- After the troubleshooting, **reset the PCM with the HDS** to erase the on-board snapshot information recorded on the PCM.

DTC Description	Confirmed DTC	Pending DTC
P032F Engine Stall	B	B
P06AF Engine Stall	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any Pending or Confirmed DTCs other than DTC P032F or P06AF indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Body electrical system DTC check

   -1. Check for body electrical system DTCs with the HDS.

DTC Description	Confirmed DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the troubleshooting for the body electrical system DTC(s) .

   NO

   Go to step 3.

3. Problem verification (snapshot sampling):

   Set the HDS to record a SNAPSHOT of following parameters for 30 seconds.

   - Engine Speed
   - Battery
   - ECT Sensor 1
   - MAP Sensor
   - MAF Sensor
   - CMP B No Pulse
   - CMP B Noise
   - CKP No Pulse
   - CKP Noise
   - EGR valve position sensor (EGR Vls)
   - EGR L Command
   - Misfire
   - Fuel Level

Data List

-2. Begin the snapshot, then **enter the maintenance mode and start the engine** , and let it idle without load in P or N.

NOTE: Do not press the accelerator pedal while the motor cranking.

Did the engine stall?

YES

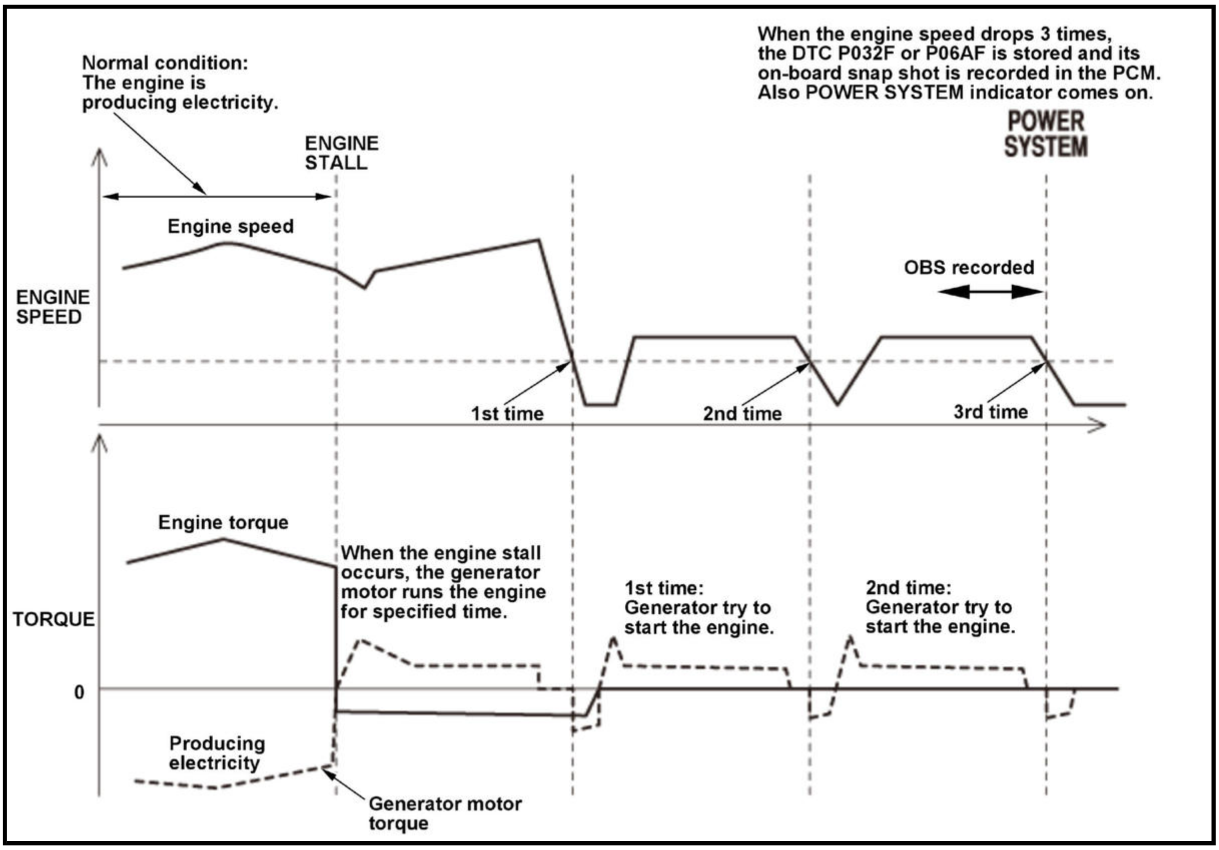
Go to step 5 (diagnosis by parameter (FUEL LEVEL)).

NO

Go to step 4.

4. On-board snapshot check

-1. Check the recorded on-board snapshot with the HDS.



Is the on-board snapshot recorded?

YES

Go to step 6 (diagnosis by parameter (Battery)).

NO

Go to step 18 (fuel system troubleshooting).

NOTE: **If the 12 volt battery is weak, dead, or replaced, the on-board snapshot is cleared.**

5. On-board snapshot or snapshot check (FUEL LEVEL):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-board Snapshot

-2. Select the FUEL LEVEL and ENGINE SPEED in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare those snapshots to the FUEL LEVEL pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	Engine stalls when FUEL LEVEL is lower than 30 %  	If the FUEL LEVEL is lower than 30 %, the engine may have run out of fuel, causing the engine to stall.
Pattern 2	FUEL LEVEL is high  	If the FUEL LEVEL is higher than 30 % when the engine stalled, the engine stall was not caused by the fuel level.

Which pattern is indicated?

Pattern 1

Refuel and recheck.

NOTE: If the fuel is old or of poor fuel quality, the engine stall will occur.

Pattern 2

Go to step 6 (diagnosis by parameter (BATTERY)).

6. On-board snapshot or snapshot check (Battery):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

Select the Battery and Engine Speed in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the Battery pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	Battery voltage low  12 volt battery voltage under 12 V, engine stalls when the voltage is as low as 7.0 V	- When the battery voltage is excessively low, the PCM or control unit stops functioning, causing a engine stall. - For the PCM or each control unit to start (functioning), more than 7.0 V is needed.
Pattern 2	Battery voltage normal  12 volt battery voltage above 12 V	If the battery voltage is above 12 V when the engine stalls, the 12 volt battery is normal.

Which pattern is indicated?

Pattern 1

Test the 12 volt battery , and check its battery cables and terminals.

Pattern 2

The 12 volt battery is OK. Go to step 7 (diagnosis by parameter (ECT Sensor 1)).

7. On-board snapshot or snapshot check (ECT SENSOR 1):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

-2. Select the ECT Sensor 1 and Engine Speed in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare ECT Sensor 1 pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	ECT Sensor 1 high 	When ECT Sensor 1 indicates about 176 deg.F (80 deg.C) or more when the engine is actually cold, ECT sensor 1 signal may be stuck high. If this occurs, the PCM may not properly compensate for a cold engine operation, causing the engine to stall.
Pattern 2	ECT Sensor 1 normal 	If the actual engine temp is similar to ECT Sensor 1, ECT sensor 1 is normal.

Which pattern is indicated?

Pattern 1

Check for a short in ECT sensor 1 circuit and a failure in ECT sensor 1.

Pattern 2

Go to step 8.

8. ECT sensor 1 check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Let the engine cool for 24 hours.

-3. Measure the ambient temperature of the engine with the thermometer.

-4. Turn the vehicle to the ON mode, but do not start the engine.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
ECT Sensor 2	B	B

Are the values of ECT SENSOR 1, ECT SENSOR 2, and the ambient temperature almost the same?

YES

ECT sensor 1 is OK. Go to step 9 (diagnosis by parameter (MAP Sensor)).

NO

If the value of ECT Sensor 1 is much higher (or lower) than that of ECT Sensor 2 and the ambient temperature, check for the ECT sensor 1 circuit and a failure in ECT sensor 1.

9. On-board snapshot or snapshot check (MAP Sensor):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

-2. Select the MAP Sensor and Engine Speed in the configuration list.

Check the recorded snapshot parameters while motor cranking, then compare the MAP Sensor pattern to the pattern from the chart below, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	MAP Sensor detects no change of pressure when motor cranking 	When the MAP Sensor detects no change of pressure when the engine stall or motor cranking, the pressure measurement port may be clogged. The PCM decides the basic duration time of fuel injection from engine speed, ECT sensor signal, and the MAP sensor signal when the motor cranking.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 2	Normal when MAP Sensor detects vacuum when motor cranking 	When the MAP Sensor detects vacuum while the motor is cranking, the condition is normal and the MAP sensor pressure port is clear.

Which pattern is indicated?

Pattern 1

Check the pressure measurement port of the MAP sensor for clogging, foreign objects, etc.

Pattern 2

The MAP sensor is OK. Go to step 10 (diagnosis by parameter (MAF Sensor)).

10. On-board snapshot or snapshot check (MAF Sensor):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

    On-Board Snapshot

    -2. Select the MAF Sensor and Engine Speed in the configuration list.

    Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the MAF Sensor pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	Poor connection of MAF Sensor 	If the engine stalls 1-2 seconds after MAF Sensor shows the "0" g/s the engine stall may be caused by a faulty MAF sensor, poor connection, or electrical noise in the MAF sensor signal.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 2	MAF Sensor normal 	When the MAF Sensor pattern matches the Engine Speed, the MAF sensor is normal.

Which pattern is indicated?

Pattern 1

Check MAF sensor/IAT sensor 1 for loose terminals or poor connections. If the terminals and connections are OK, **substitute a known-good MAF sensor/IAT sensor 1** .

Pattern 2

MAF sensor/IAT sensor 1 is OK. Go to step 11 (diagnosis by parameter (CMP B No Pulse)).

11. On-board snapshot or snapshot check (CMP B No Pulse):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

-2. Select the CMP B No Pulse and Engine Speed in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the CMP B No Pulse pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	There are many CMP B No Pulse counts or CMP B No Pulse count  increases	When there are many CMP B No Pulse counts or if the CMP B No Pulse count increases, no CMP pulse is received. If the CMP pulse is not received, the PCM cannot detect the cylinder to be ignited.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 2	The CMP B No Pulse indicates the pulse is normal  	The CMP B No Pulse signal is OK when the CMP B No Pulse count does not increase, or goes up and down but does not increase continuously.

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for DTC P0365. If the CMP B No Pulse count reaches the malfunction threshold, DTC P0365 will set. Check for poor connections and loose terminals at CMP sensor B.

Pattern 2

Go to step 12 (diagnosis by parameter (CMP B Noise)).

12. On-board snapshot or snapshot check (CMP B Noise):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

-2. Select the CMP B Noise and Engine Speed in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the CMP B Noise pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	There are many CMP B Noise counts or CMP B Noise count  increases	When there are many CMP B Noise counts or if the CMP B Noise count increases, there is noise in the CMP signal. When CMP signal has noise, the PCM cannot detect the cylinder to be ignited.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 2	The CMP B Noise indicates the pulse is normal 	It is normal when CMP B Noise count does not increase, or increases but intermittently while the motor cranking.

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for **DTC P0369**. If the CMP B Noise count reaches the malfunction threshold, DTC P0369 will set. Check for poor connections and loose terminals at CMP sensor B.

Pattern 2

CMP sensor B is OK. Go to step 13 (diagnosis by parameter (CKP No Pulse)).

13. On-board snapshot or snapshot check (CKP No Pulse):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

-2. Select the CKP No Pulse and Engine Speed in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the CKP No Pulse pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	There are many CKP No Pulse counts or CKP No Pulse count  increases	When there are many CKP No Pulse counts or if the CKP No Pulse count increases, the PCM is not receiving the CKP sensor signal.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 2	The CKP No Pulse indicates the pulse is normal 	The CKP sensor signal is OK when the CKP No Pulse count does not increase, or goes up and down but does not increase continuously.

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for **DTC P0335**.

Pattern 2

Go to step 14 (diagnosis by parameter (CKP Noise)).

14. On-board snapshot or snapshot check (CKP Noise):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

-2. Select the CKP Noise and Engine Speed in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare the CKP Noise pattern from these charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	There are many CKP Noise counts or CKP Noise count increases 	When there are many CKP Noise counts or if the CKP Noise count increases, the PCM is receiving electrical noise along with the CKP sensor signal.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 2	Normal when CKP Noise count does not go up  	The CKP sensor signal is OK when the CKP Noise count does not increase, or increases but intermittently.

Which pattern is indicated?

Pattern 1

Go to the troubleshooting for **DTC P0339**.

Pattern 2

The CKP sensor is OK. Go to step 15 (diagnosis by parameter (EGR valve position sensor (EGR Vls)).

15. On-board snapshot or snapshot check (EGR valve position sensor (EGR Vls)):

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

-2. Select the EGR valve position sensor (EGR Vls), EGR L Command, and Engine Speed in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of engine stall, then compare the EGR valve position sensor (EGR Vls) pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	EGR valve position sensor (EGR Vls) is 1.3 V or more  	If the EGR L COMMAND is 0 and the EGR valve position sensor (EGR Vls) voltage is about 1.3 V or more when the engine stalls, the EGR valve may be stuck open.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 2	EGR is normal if EGR valve position sensor (EGR Vls) is 1.3 V or  less	If the EGR L COMMAND is 0 and the EGR valve position sensor (EGR Vls) voltage should be less than 1.3 V.

Which pattern is indicated?

Pattern 1

Loosen the EGR valve mounting bolts , then install a metal plate between the EGR valve and the engine to shut out the EGR port, and recheck. If it is OK, **replace the EGR valve** .

Pattern 2

The EGR valve is OK. Go to step 16 (diagnosis by parameter (Misfire)).

16. On-board snapshot or snapshot check (Misfire): failure.

NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

-1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

On-Board Snapshot

-2. Select the Misfire and Engine Speed in the configuration list.

Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare those snapshots to the Misfire pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	Engine stalls if there are many Misfire counts or after Misfire count  increases	When engine stalls after Misfire counts increase, the engine stall may be caused by misfire.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 2	Normal when engine stalls with Misfire count remaining constant 	If the Misfire count remains constant when the engine stalls, the engine stall was not caused by a misfire.

Which pattern is indicated?

Pattern 1

Diagnostic procedure:

- If misfire counts go up without storing misfire DTC P0300-P0304, go to the troubleshooting for **DTC P0300-P0304** .
- If the misfire count reaches the malfunction threshold, DTC P0300-P0304 is stored. Go to the troubleshooting for **DTC P0300-P0304** .

Pattern 2

Go to step 17 (diagnosis by parameter (FUEL LEVEL)).

17. On-board snapshot or snapshot check (Fuel Level):

    NOTE: Use the on-board snapshot in the case of an intermittent failure, or use the snapshot in the case of a reproducible failure.

    -1. Check for a record of the on-board snapshot or the recorded snapshot with the HDS.

    On-Board Snapshot

    -2. Select the Fuel Level and Engine Speed in the configuration list.

    Check the recorded snapshot or on-board snapshot parameters at the time of the engine stall, then compare those snapshots to the Fuel Level pattern from the charts, and determine the problem.

Pattern	Symptom (Diagnosis by parameter)	Additional remarks
Pattern 1	Engine stalls when Fuel Level is lower than 30 % 	If the Fuel Level is lower than 30 %, there is a possibility that the vehicle is running of fuel, causing the engine to stall.
Pattern 2	 Fuel Level is high	If the Fuel Level is higher than 30 % when the engine stalls, the engine stall was not caused by the fuel level.

Which pattern is indicated?

Pattern 1

Refuel and recheck.

NOTE: If the fuel is old or of poor fuel quality, the engine stall will occur.

Pattern 2

Go to step 18 (fuel system troubleshooting).

18. Fuel pressure check

-1. **Do the fuel pressure test** .

Is the fuel pressure OK?

YES

Go to step 19.

NO

Check for following parts:

- **Fuel pump circuit**
- **Fuel pressure regulator**
- **Fuel filter**

19. Spark plug visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the spark plugs** .

-3. **Check the condition of the spark plug electrodes** .

NOTE: Make sure the spark plugs are the correct part number for the vehicle. If the plugs are aftermarket or they are not the correct part number, replace all of the plugs and retest.

Is the electrode damaged or wet?

1. YES (wet)

   Check the following conditions. If those conditions do not apply, go to step 20.

   - In very cold conditions, multiple very short trips can cause the spark plug to foul. If this is the case, drive the vehicle a longer distance and recheck.
   - Incorrect, poor quality, or old fuel can cause a wet spark plug. Replace the fuel and recheck.

   YES (damaged)

   Replace the damaged spark plugs , determine the cause of the spark plug damage.

   NO

   Go to step 20.

20. Determine possible failure area (ignition system, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Fit a spark plug to the ignition coil and ground it to the engine.

-3. Turn the vehicle to the ON mode.

-4. Select ALL INJECTORS STOP in the Function Test Menu with the HDS, and stop fuel injection from the injector.

ALL INJECTORS STOP

Enter the maintenance mode, then start the engine . During the motor cranking, watch for spark at the spark plugs.

Do the spark plugs sparkΩ

YES

The ignition system is OK. Select PCM reset in the PGM-FI Function Test Menu to cancel ALL INJECTORS STOP with the HDS, then go to step 22 (engine compression troubleshooting).

NO

Select PCM reset in the PGM-FI Function Test Menu to cancel ALL INJECTORS STOP with the HDS, then go to step 21.

21. Ignition coil power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

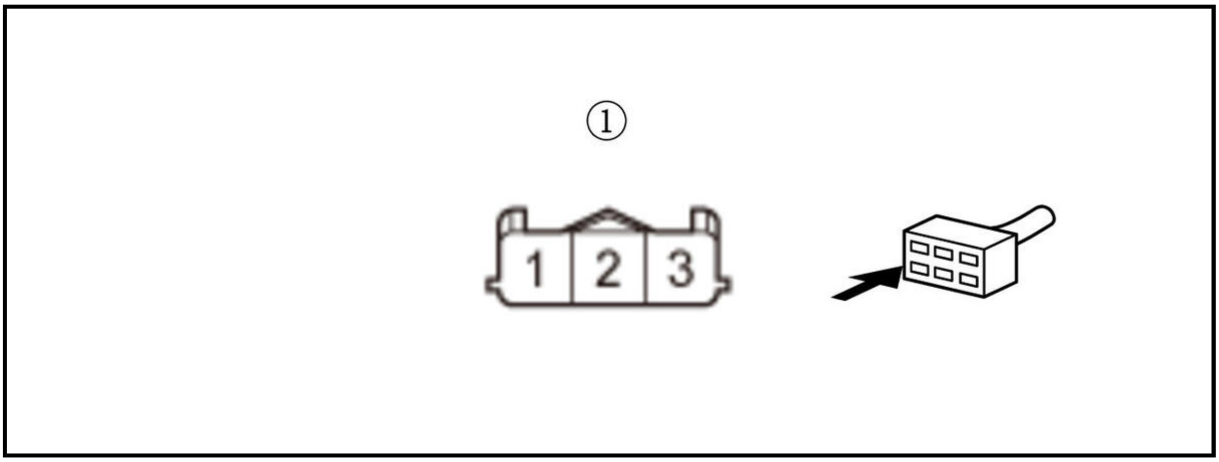
-2. Disconnect the following connector(s).

Ignition coil(s) 3P connector from the problem cylinder

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Ignition coil 3P connector (problem cylinder): disconnected
Test point 1	Ignition coil 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The ignition coil power circuit is OK. **Replace the ignition coil(s)** .

NO

Repair an open in the IG_COIL_RLY_OUT/IG1(COIL)/IG1(IGN COIL) wire between the relay circuit board and the ignition coil.

22. Engine compression check

-1. **Do an engine compression inspection** .

NOTE: When removing the spark plugs, make sure the spark plugs are the correct part number for the vehicle. If the plugs are aftermarket or they are not the correct part number, replace all of the plugs and retest.

Is the engine compression OK?

YES

Go to step 23 (EVAP canister purge valve check).

NO

Check for wear or damage to these parts:

- Incorrect valve clearance
- Confirmation of cam timing

- Oil pressure relief valve
- Damage or worn cam lobes
- Damage or worn valve and seats
- Damage cylinder head gasket
- Damage or worn piston rings
- Damage or worn piston and cylinder bore
- Hydraulic tappet stuck

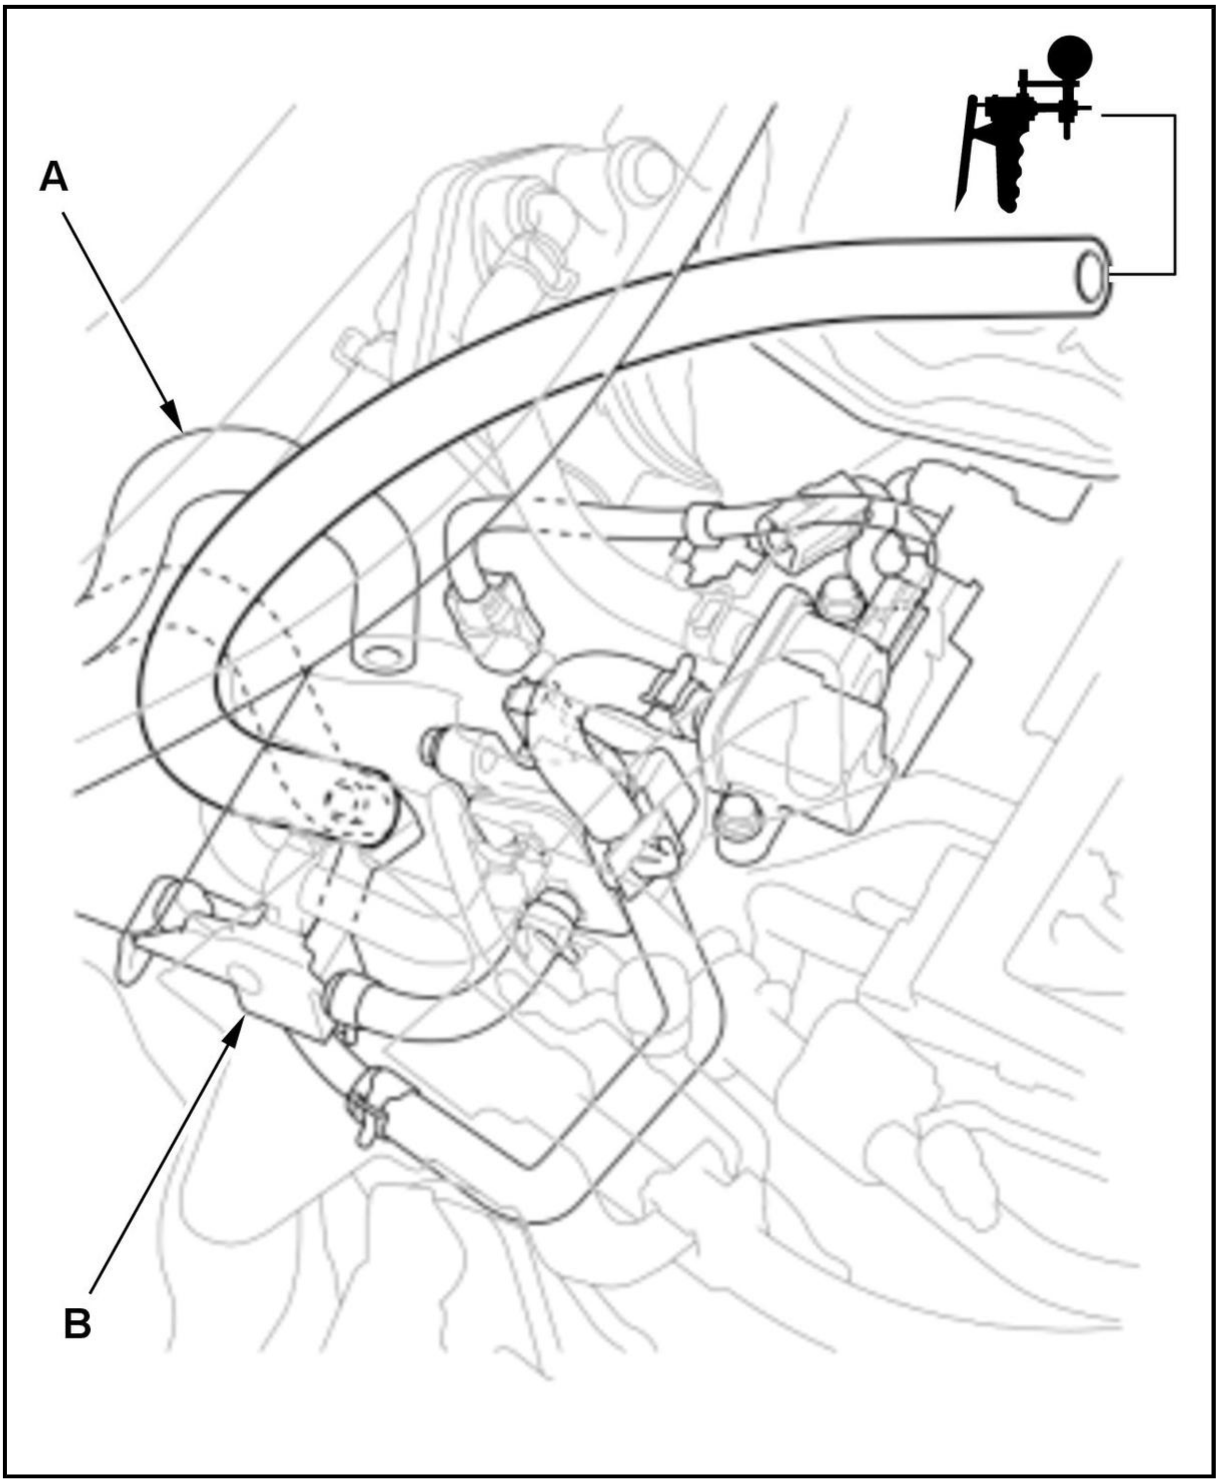
23. EVAP canister purge valve check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

EVAP canister purge valve 1 2P connector
EVAP canister purge valve 2 2P connector

-3. Disconnect the vacuum hose (purge line) (A) from the 3-way joint (B) in the engine compartment, and connect a vacuum pump/gauge, 0-30 inHg to the 3-way joint as shown.



-4. **Enter the maintenance mode, then start the engine** , and let it idle.

Is there vacuum?

YES

When the climate is warm, fuel vapor from the canister line to the fuel tank enters the intake manifold, enriching the mixture (excessively rich), causing the engine to stall in some cases. If needed, **replace the EVAP canister purge valve** .

NO (Reproducible failure)

Go to step 24 (fuse check).

NO (Intermittent failure)

Go to step 25 (relay check).

24. Fuse check

-1. Check the following fuses.

Fuse	**No. A7** to the relay circuit board (PGM-FI main relay 1 circuit)
	No. A8 to the relay circuit board (PGM-FI subrelay circuit)
	No. A15 to the relay circuit board (ignition coil relay circuit)
	No. C1-4 to the relay circuit board (electric VTC relay circuit)
B	**No. D8** to PGM-FI main relay 2

Are the fuses OK?

YES

Go to step 25.

NO

Replace the blown fuse(s).

25. Relay check:

Test the following relays.

NOTE: In situations where the failure is difficult to reproduce, the following relays may have an intermittent failure.

- **Relay circuit board** (includes PGM-FI main relay 1 circuit, PGM-FI subrelay circuit, ignition coil relay circuit, and electric VTC relay circuit)
- **PGM-FI main relay 2**

Are the relays OK?

YES

Go to step 26.

NO

Replace any damaged relay.

26. Power and ground terminal check:

Check the corrosion and looseness at the following terminals:

- 12 volt battery terminals
- Ground cable terminals between the engine and the body ground, and the transmission and the body ground
- Engine wire harness ground (G101, G102)

Are the terminals OK?

YES

Go to step 27.

NO

Repair any terminal(s) as needed.

27. Connector terminal check:

    Check the foreign objects clogged and corrosion at the following connector terminals:

    - **PCM connectors**
    -
        - -

          FI_MAIN_RLY_OUT, FI_MAIN_RLY_CL-
        - -

          FUEL_PUMP_RLY_CL-
        - -

          FI_SUB_RLY_OUT, FI_SUB_RLY_CL-
        - -

          GND_2, GND_3, GND_4, FI_ECU_GND
        - -

          INJ_1, INJ_2, INJ_3, INJ_4
        - -

          IGN01A, IGN02A, IGN03A, IGN04A
        - -

          TDC
        - -

          CRKP
        - -

          MAP(PB)
        - -

          VGP, VGM
        - -

          TW
        - -

          EEGR, EGRL
        - -

          PCS1, PCS2
        - -

MTR1, MTR2, THL1, THL2

- CMP sensor B
- CKP sensor
- Ignition coils
- Injectors
- EGR valve
- ECT sensor
- MAF sensor/IAT sensor 1
- MAP sensor
- Throttle body
- EVAP canister purge valve 1, EVAP canister purge valve 2
- Fuel tank unit

Are the terminals OK?

YES

Go to the diagnostic interview for engine stalls .

NO

Repair any terminal(s) as needed.

DTC P0335

DTC P0335 : CKP Sensor No Signal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0335 CKP Sensor No Signal	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine, and let it idle** .

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0335 CKP Sensor No Signal	B	B

Is DTC P0335 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC1 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

CKP sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground

   Is there about 5.0 V?

   YES

   Go to step 4.

   NO

   Go to step 3.

3. Open wire check (VCC1 line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

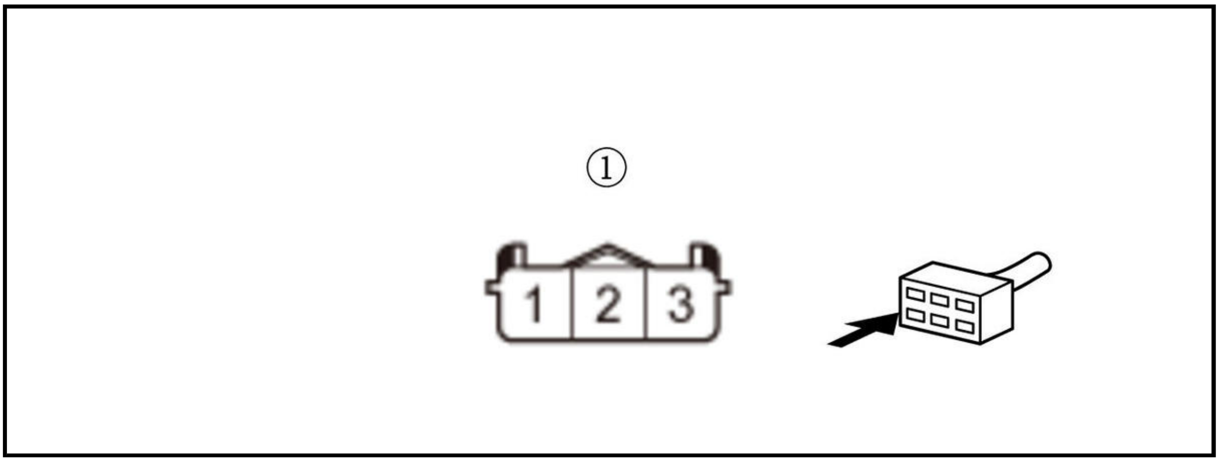
   -3. Disconnect the following connector.

PCM connector E (80P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	CKP sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 70**



Is there 1.0 Ω or less?

YES

The VCC1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

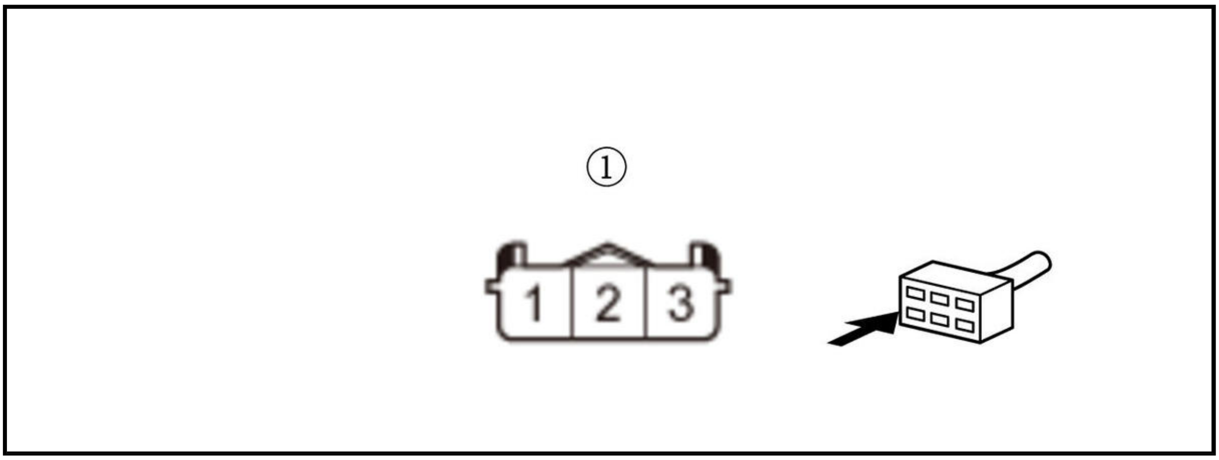
NO

Repair an open in the VCC1 wire between the PCM (E70) and the CKP sensor.

4. Determine possible failure area (CRKP line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

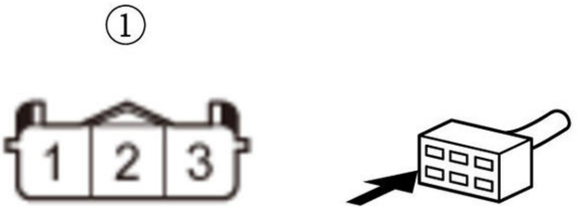
NO

Go to step 7.

5. Determine possible failure area (CKP sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CKP sensor 3P connector: disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 2: ①
Test point 2	CKP sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

The SG1 wire is OK. **Replace the CKP sensor** .

NO

Go to step 6.

6. Open wire check (SG1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

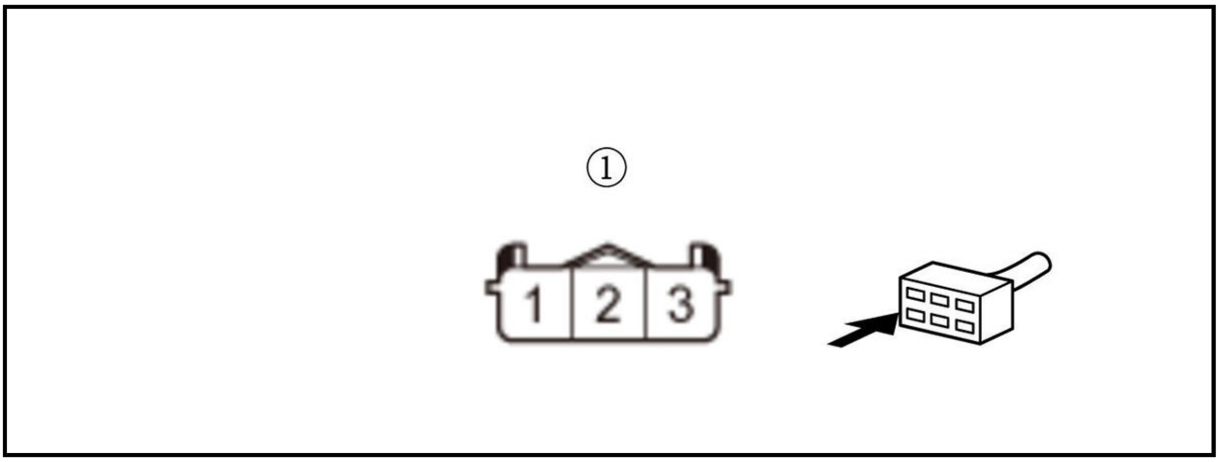
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CKP sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 71**



Is there 1.0 Ω or less?

YES

The SG1 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG1 wire between the PCM (E71) and the CKP sensor.

7. Shorted wire check (CRKP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 44**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The CRKP wire is not shorted. Go to step 8.

NO

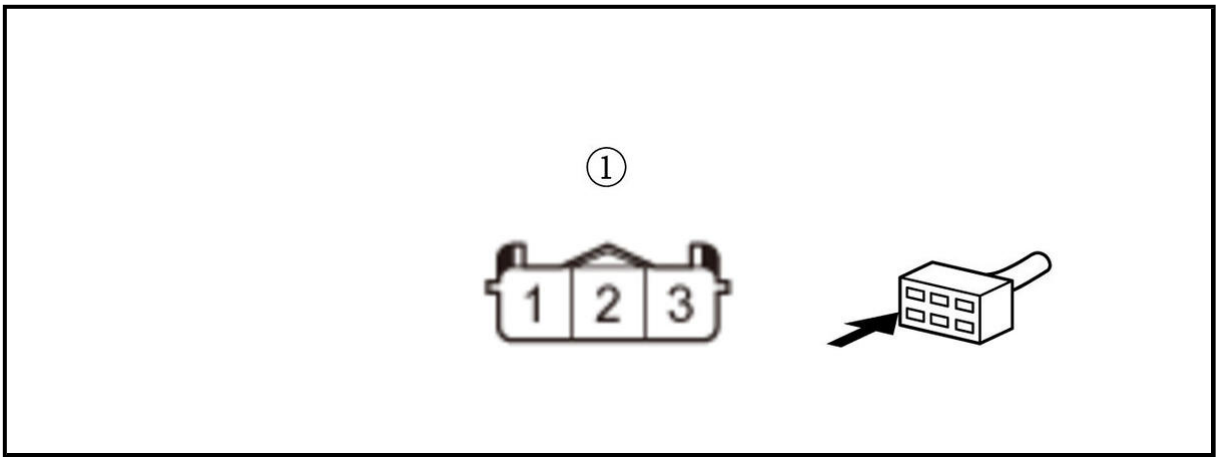
Repair a short in the CRKP wire between the PCM (E44) and the CKP sensor.

8. Open wire check (CRKP line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	CKP sensor 3P connector (female terminals) No. 1: ①

Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CKP sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
B	CKP sensor 3P connector No. 1: jumped to body ground
Test point 1	**PCM connector E (80P) No. 44**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The CRKP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the CRKP wire between the PCM (E44) and the CKP sensor.

DTC P0339

DTC P0339 : CKP Sensor Circuit Intermittent Interruption

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0339 CKP Sensor Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds.

-4. Monitor the OBD STATUS for DTC P0339 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0339 CKP Sensor Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

   Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

   - ENGINE SPEED
   - VEHICLE SPEED

   On-board Snapshot

   -2. Monitor the OBD STATUS for DTC P0339 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0339 CKP Sensor Circuit Intermittent Interruption	B

Does the HDS indicate FAILED?

YES

Go to step 3.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CKP sensor circuit connectors and terminals condition check:

   Check for poor connections or loose terminals at these locations:

   - CKP sensor
   - PCM
   - Engine ground
   - Body ground

   Are the connections and terminals OK?

YES

Go to step 4.

NO

Repair the connections or terminals.

4. CKP pulse plate visual check

   -1. **Remove the CKP sensor** , and check for damage to the CKP pulse plate.

   Is the pulse plate damaged or loose?

   YES

   Replace the CKP pulse plate .

   NO

   Replace the CKP sensor .

DTC P0340

DTC P0340 : CMP Sensor A No Signal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0340 CMP Sensor A No Signal	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** , and let it idle.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0340 CMP Sensor A No Signal	B	B

   Is DTC P0340 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC2 line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

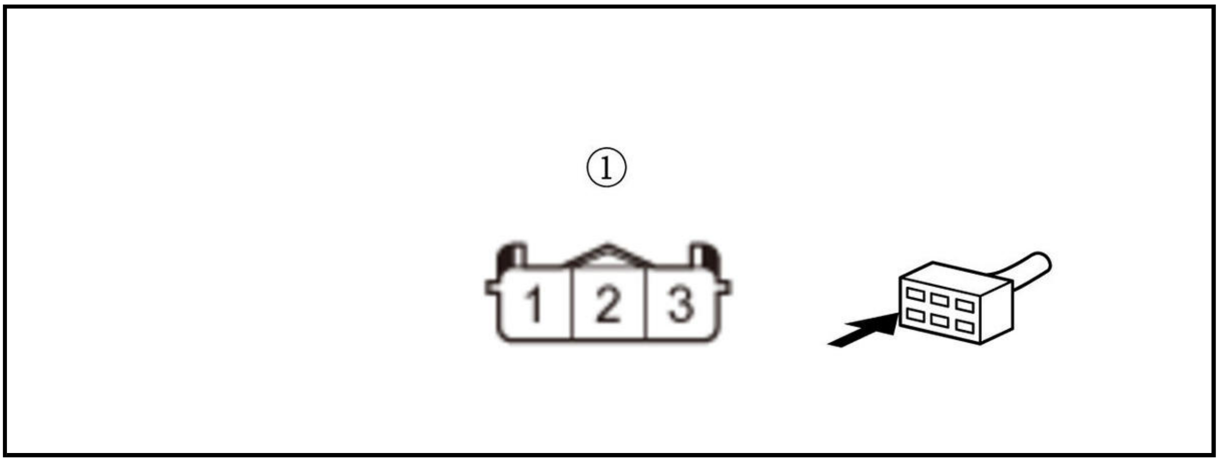
   -2. Disconnect the following connector.

CMP sensor A 3P connector

   -3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

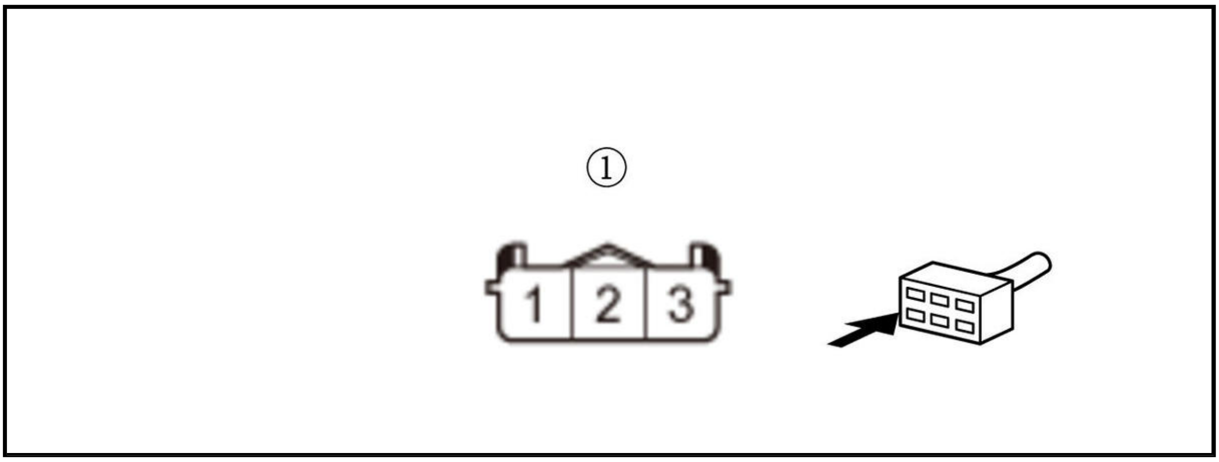
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	CMP sensor A 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there 1.0 Ω or less?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

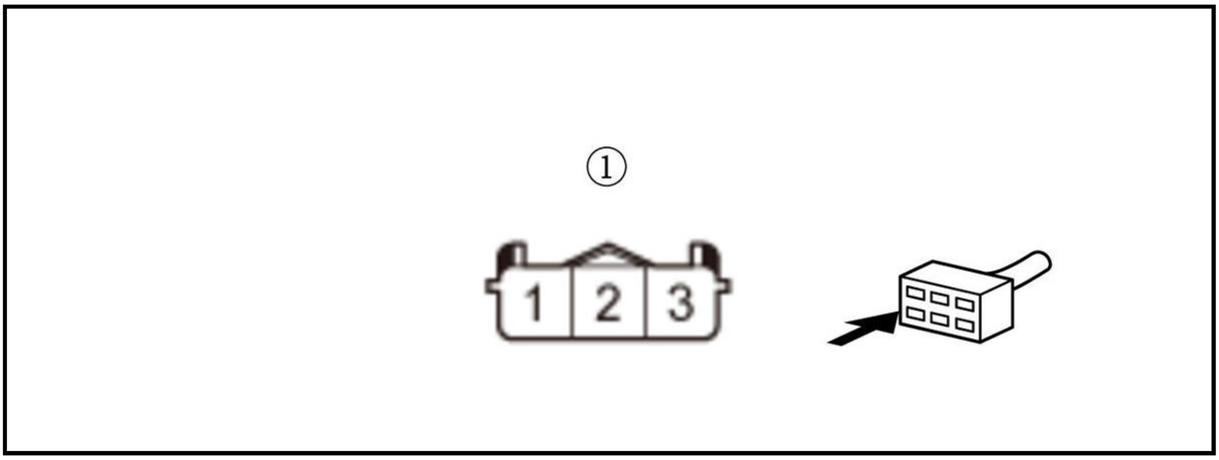
NO

Repair an open in the VCC2 wire between the PCM (E77) and CMP sensor A.

4. Determine possible failure area (CAM line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

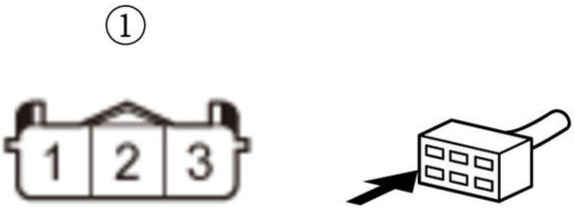
NO

Go to step 7.

5. Determine possible failure area (CMP sensor A, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor A 3P connector: disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 1: ①
Test point 2	CMP sensor A 3P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

The SG2 wire is OK. **Replace CMP sensor A** .

NO

Go to step 6.

6. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

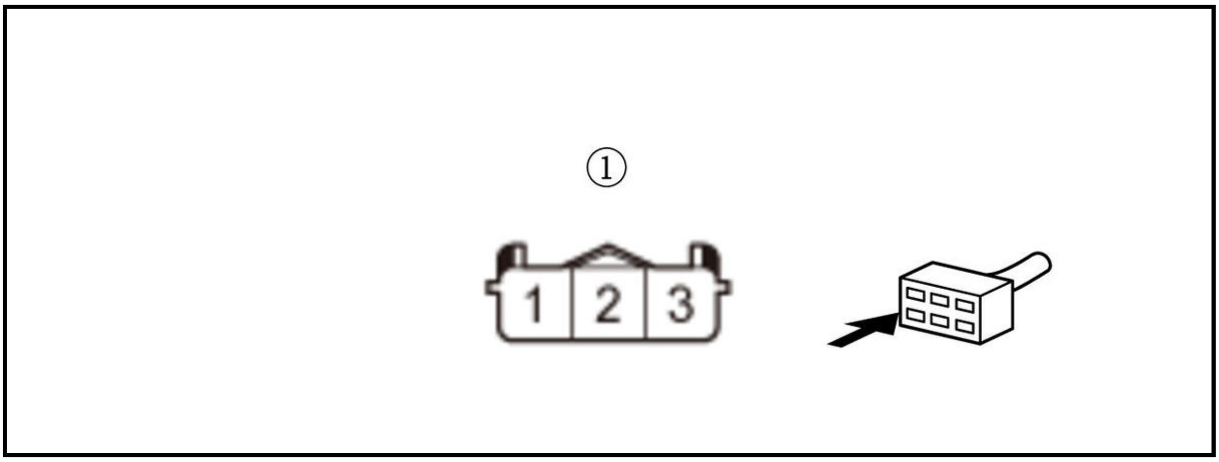
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and CMP sensor A.

7. Shorted wire check (CAM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 41**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The CAM wire is not shorted. Go to step 8.

NO

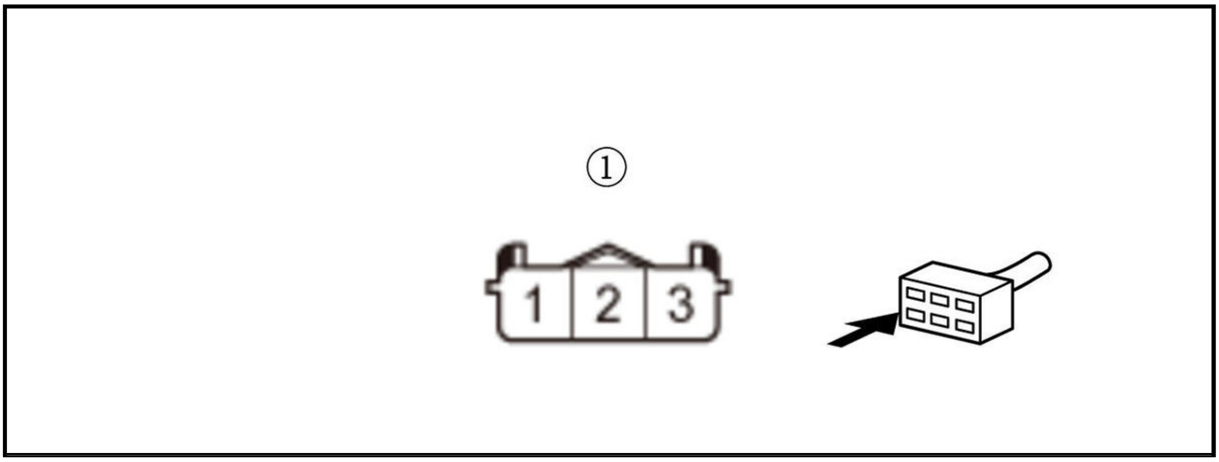
Repair a short in the CAM wire between the PCM (E41) and CMP sensor A.

8. Open wire check (CAM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected

B	PCM connector E (80P): disconnected
Test point 1	CMP sensor A 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 41**



Is there 1.0 Ω or less?

YES

The CAM wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the CAM wire between the PCM (E41) and CMP sensor A.

DTC P0341

DTC P0341 : CMP Sensor A and CKP Sensor Incorrect Phase Detected

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the 12 volt battery voltage is higher than the nominal voltage (DC-DC converter failure), this DTC will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

DTC (PGM-FI)

1. Electric powertrain system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   Enter the maintenance mode, then start the engine , and let it idle under these conditions:

   - Headlights on high beam
   - Blower fan at maximum speed
   - Rear window defogger on
   - A/C switch ON, heater on, max hot

-4. Monitor the OBD STATUS for DTC P0A94 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0A94 DC-DC Converter Performance	B

Does the HDS indicate FAILED?

YES

Go to the troubleshooting for **DTC P0A94** .

NO

If the HDS indicates PASSED, go to step 2. If the HDS indicates EXECUTING, keep idling until a result comes on.

2. Problem verification (idling)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Allow the engine to cool to 104 deg.F (40 deg.C) or less.

-5. **Enter the maintenance mode, then start the engine** , and let it idle.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

Is DTC P0341 indicated?

YES

The failure is duplicated. Go to step 4.

NO

Go to step 3.

3. Problem verification (DTC check)

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode.

-4. Select the VTC TEST in the Function Test Menu with the HDS.

VTC TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

Is DTC P0341 indicated?

YES

Go to step 4.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A, the CKP sensor, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

4. Camshaft timing check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the camshaft timing** .

Is the camshaft timing OK?

YES

Go to step 5.

NO

Reset the camshaft timing .

5. Cam chain check

-1. **Check for damage or stretch at the cam chain** .

Is the cam chain damaged or stretched?

YES

Replace the cam chain .

NO

Go to step 6.

6. CMP pulse plate A visual check

-1. **Check for damage to CMP pulse plate A** .

Is the pulse plate damaged?

YES

Replace CMP pulse plate A .

NO

Go to step 7.

7. VTC actuator installation check

-1. **Check the installation of the VTC actuator** .

Is the VTC actuator installed correctly?

YES

Go to step 8.

NO

Reinstall the VTC actuator .

8. CKP pulse plate visual check

-1. **Remove the CKP sensor** , and check for damage to the CKP pulse plate.

Is the pulse plate damaged?

YES

Replace the CKP pulse plate .

NO

Go to step 9.

9. PGM-FI system check (DTC check)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Allow the engine to cool to 104 deg.F (40 deg.C) or less.

-5. **Enter the maintenance mode, then start the engine** , and let it idle.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0341 CMP Sensor A and CKP Sensor Incorrect Phase Detected	B	B

Is DTC P0341 indicated?

YES

Replace the electric VTC motor .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A, the CKP sensor, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0344

DTC P0344 : CMP Sensor A Circuit Intermittent Interruption

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0344 CMP Sensor A Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine, and let it idle** for 10 seconds.

   -4. Monitor the OBD STATUS for DTC P0344 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0344 CMP Sensor A Circuit Intermittent Interruption	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 3.

   NO

   If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

   Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

   - ENGINE SPEED
   - VEHICLE SPEED

   On-board Snapshot

   -2. Monitor the OBD STATUS for DTC P0344 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0344 CMP Sensor A Circuit Intermittent Interruption	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 3.

   NO

   If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at CMP sensor A and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CMP sensor A circuit connectors and terminals condition check:

   Check for poor connections or loose terminals at these locations:

- CMP sensor A
- PCM
- Engine ground
- Body ground

Are the connections and terminals OK?

YES

Go to step 4.

NO

Repair the connections or terminals.

4. CMP pulse plate A visual check

-1. **Check for damage to CMP pulse plate A** .

Is the pulse plate damaged or loose?

YES

Replace CMP pulse plate A .

NO

Replace CMP sensor A , then recheck. If DTC P0344 is indicated again, **replace the PCM** .

DTC P0351, P0352, P0353, P0354

DTC P0351 : No. 1 Cylinder Ignition Coil Circuit Malfunction

DTC P0352 : No. 2 Cylinder Ignition Coil Circuit Malfunction

DTC P0353 : No. 3 Cylinder Ignition Coil Circuit Malfunction

DTC P0354 : No. 4 Cylinder Ignition Coil Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

Is DTC P0351, P0352, P0353, and/or P0354 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the ignition coil and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Ignition coil check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Exchange the ignition coil from the problem cylinder with one from another cylinder** .

-3. **Enter the maintenance mode, then start the engine** .

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0351 No. 1 Cylinder Ignition Coil Circuit Malfunction	B	B
P0352 No. 2 Cylinder Ignition Coil Circuit Malfunction	B	B

DTC Description	Confirmed DTC	Pending DTC
P0353 No. 3 Cylinder Ignition Coil Circuit Malfunction	B	B
P0354 No. 4 Cylinder Ignition Coil Circuit Malfunction	B	B

Is DTC indicated at the exchanged position?

YES

Replace the faulty ignition coil .

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A15**

Is the fuse OK?

YES

Go to step 4.

NO

Check for a short in the IG_COIL_RLY_OUT/IG1(COIL)/IG1(IGN_COIL) wire between the relay circuit board and the ignition coil, and the +B_IG_COIL wire between the No. A15 fuse and the relay circuit board, and repair it if needed. Also replace the No. A15 fuse.

4. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 5.

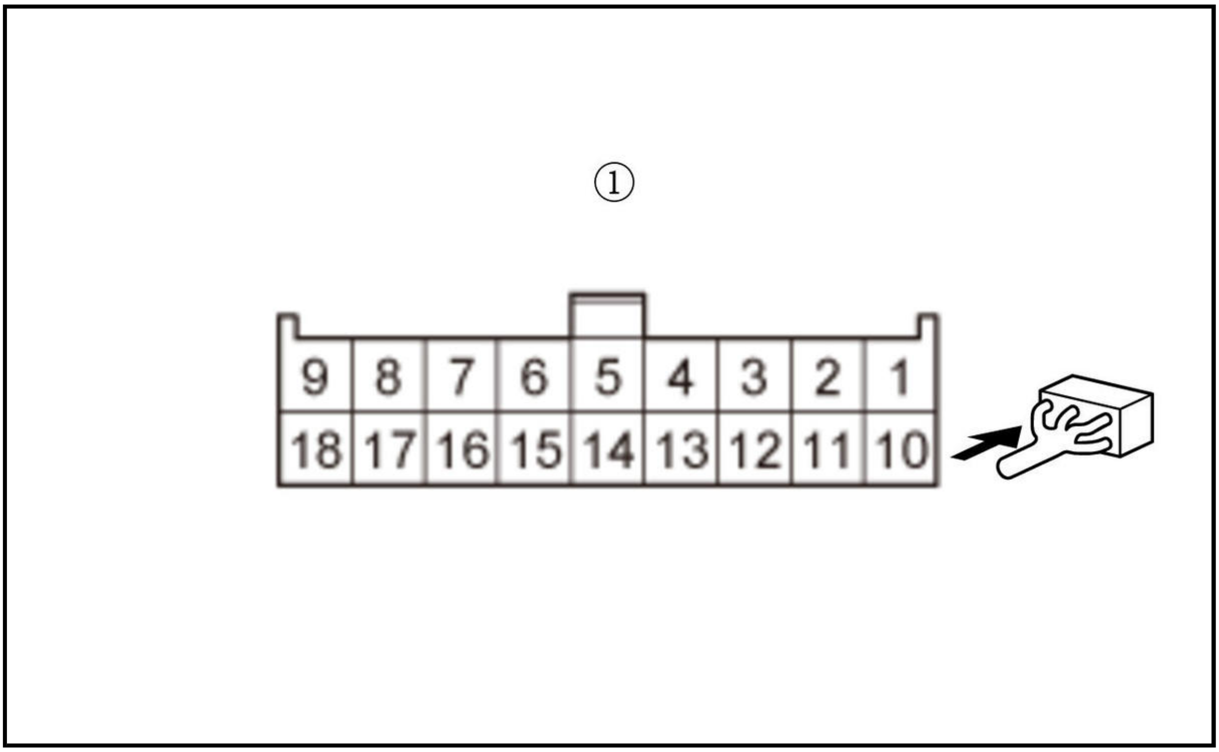
NO

Replace the relay circuit board .

5. Open wire check (+B_IG_COIL line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 9: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 6.

NO

Check for an open in the +B_IG_COIL wire between the **No. A15 fuse** and the relay circuit board.

6. Open wire check (IG_COIL_RLY_OUT/IG1(COIL)/IG1(IGN_COIL) line)

-1. **Reinstall the relay circuit board** .

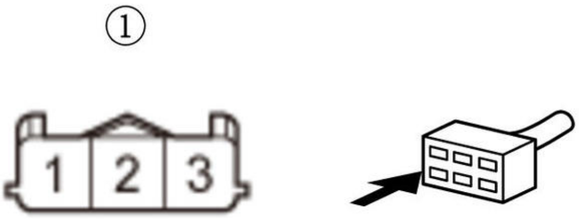
-2. Disconnect the following connector(s).

Ignition coil 3P connector (problem cylinder)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Ignition coil 3P connector (problem cylinder): disconnected
Test point 1	Ignition coil 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 7.

NO

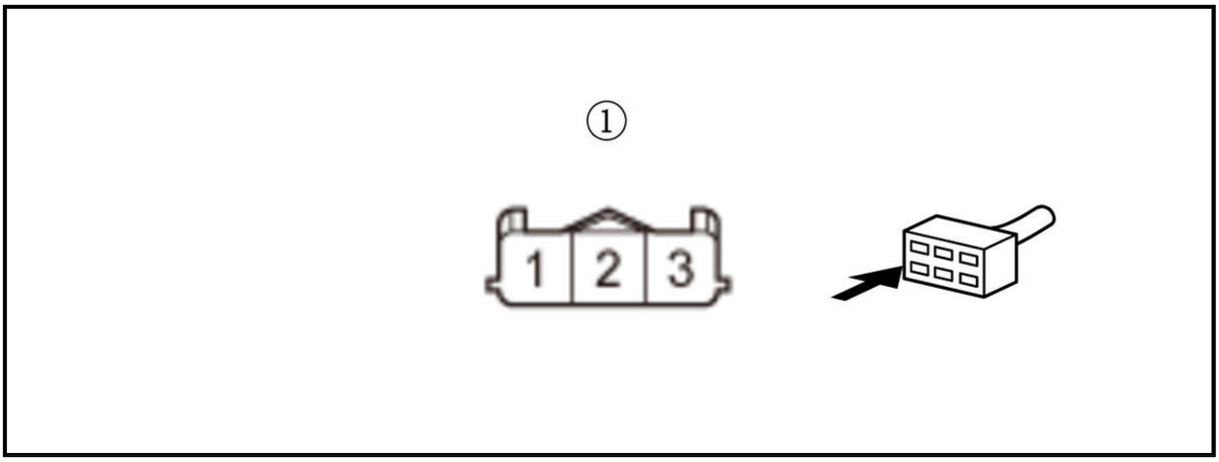
Repair an open in the IG_COIL_RLY_OUT/IG1(COIL)/IG1(IGN_COIL) wire between the relay circuit board and the ignition coil.

7. Open wire check (PG(COIL) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
Test point 1	Ignition coil 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 8.

NO

Repair an open in the PG(COIL) wire between the ignition coil and G101.

8. Shorted wire check (IGN lines)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between body ground and the appropriate PCM connector terminal of the problem ignition coil (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
B	PCM connector E (80P): disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0351	PCM connector E (80P)	No. 37
No. 2	P0352		No. 38
No. 3	P0353		No. 39
No. 4	P0354		No. 40

Is there 1 MΩ or more?

YES

The IGN wires are not shorted. Go to step 9.

NO

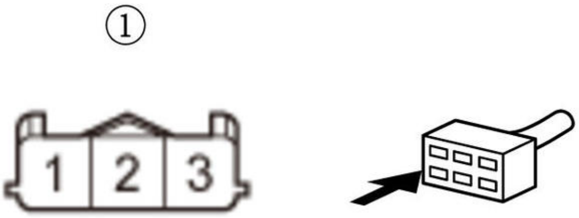
Repair a short in the IGN wire(s) between the PCM and the ignition coil.

9. Open wire check (IGN lines)

-1. Measure the resistance between appropriate ignition coil 3P connector (female terminals) terminal No. 3: ① and the appropriate PCM connector terminal of the problem ignition coil (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Ignition coil 3P connector (problem cylinder): disconnected
B	PCM connector E (80P): disconnected

Problem cylinder	DTC	Connector	Terminal
No. 1	P0351	**PCM connector E (80P)**	No. 37
No. 2	P0352		No. 38
No. 3	P0353		No. 39
No. 4	P0354		No. 40



Is there 1.0 Ω or less?

YES

The IGN wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the IGN wire(s) between the PCM and the ignition coil.

DTC P0365

DTC P0365 : CMP Sensor B Circuit No Signal

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0365 CMP Sensor B Circuit No Signal	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine, then let it idle** .

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0365 CMP Sensor B Circuit No Signal	B	B

Is DTC P0365 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at CMP sensor B and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC2 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

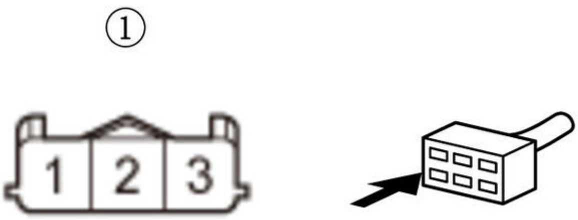
-2. Disconnect the following connector.

CMP sensor B 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

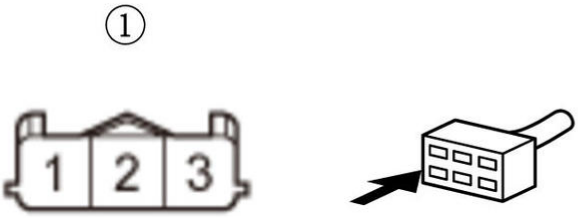
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	CMP sensor B 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there 1.0 Ω or less?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

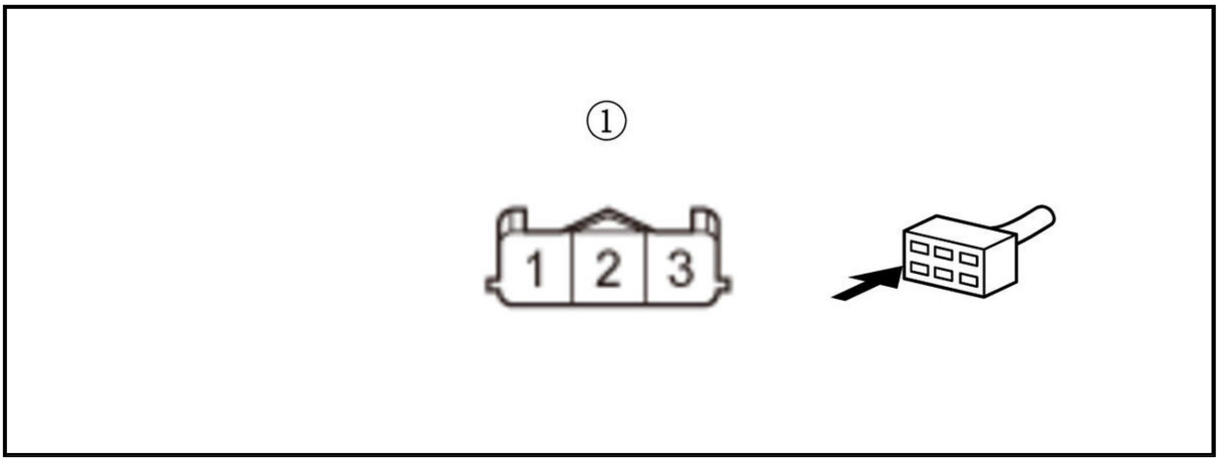
NO

Repair an open in the VCC2 wire between the PCM (E77) and CMP sensor B.

4. Determine possible failure area (TDC line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

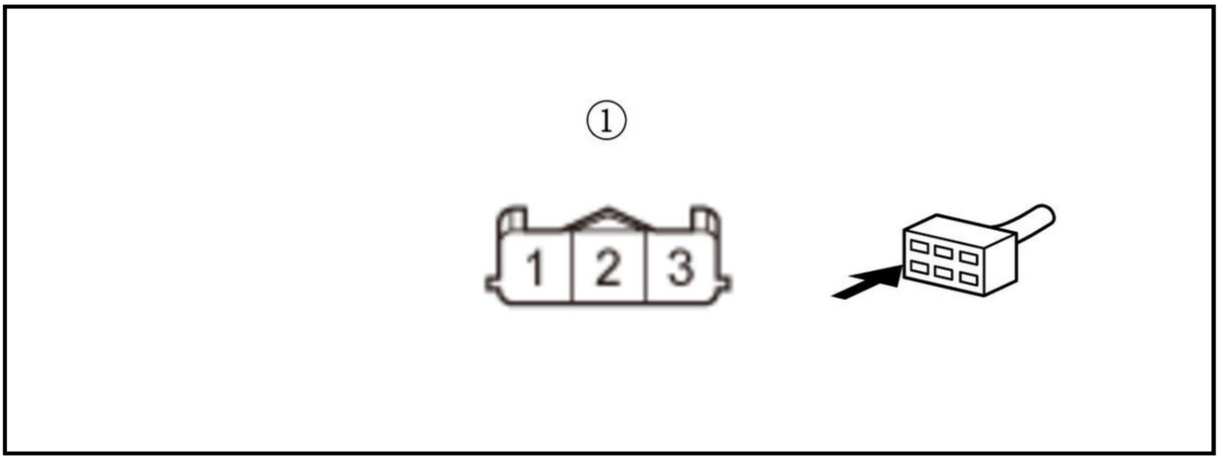
NO

Go to step 7.

5. Determine possible failure area (CMP sensor B, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CMP sensor B 3P connector: disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 1: ①
Test point 2	CMP sensor B 3P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

The SG2 wire is OK. **Replace CMP sensor B** .

NO

Go to step 6.

6. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

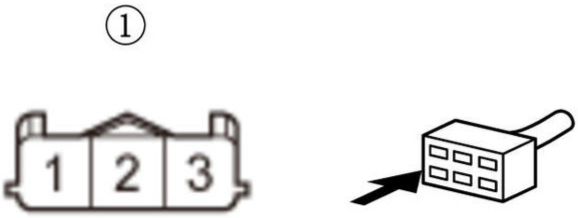
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and CMP sensor B.

7. Shorted wire check (TDC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 43**

Test point 2	Body ground

Is there 1 MΩ or more?

YES

The TDC wire is not shorted. Go to step 8.

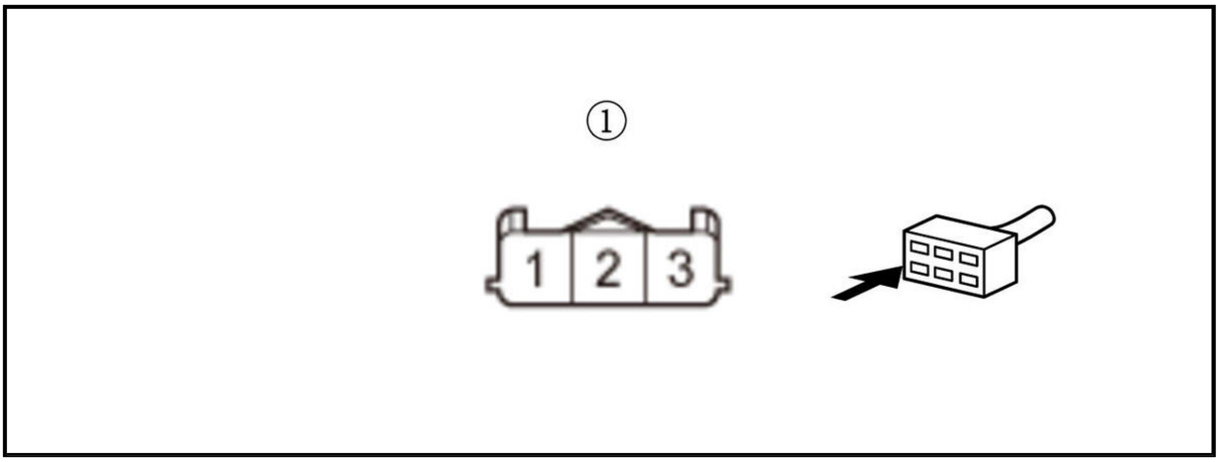
NO

Repair a short in the TDC wire between the PCM (E43) and CMP sensor B.

8. Open wire check (TDC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor B 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	CMP sensor B 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 43**



Is there 1.0 Ω or less?

YES

The TDC wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TDC wire between the PCM (E43) and CMP sensor B.

DTC P0369

DTC P0369 : CMP Sensor B Circuit Intermittent Interruption

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0369 CMP Sensor B Circuit Intermittent Interruption	B	B

DTC (PGM-FI)

1. Problem verification (idling)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** , then let it idle for 10 seconds.

   -4. Monitor the OBD STATUS for DTC P0369 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0369 CMP Sensor B Circuit Intermittent Interruption	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 3.

   NO

   If the HDS indicates PASSED, go to step 2. If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

2. Problem verification (test-drive):

   Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

   - ENGINE SPEED
   - VEHICLE SPEED

   On-board Snapshot

   -2. Monitor the OBD STATUS for DTC P0369 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0369 CMP Sensor B Circuit Intermittent Interruption	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 3.

   NO

   If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at CMP sensor B and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, retest and check the OBD STATUS again.

3. CMP sensor B circuit connectors and terminals condition check:

   Check for poor connections or loose terminals at these locations:

   - CMP sensor B
   - PCM
   - Engine ground

- Body ground

Are the connections and terminals OK?

YES

Go to step 4.

NO

Repair the connections or terminals.

4. CMP pulse plate B visual check

-1. **Check for damage to CMP pulse plate B** .

Is the pulse plate damaged or loose?

YES

Replace CMP pulse plate B .

NO

Replace CMP sensor B , then recheck. If DTC P0369 is indicated again, **replace the PCM** .

DTC P0400

DTC P0400 : EGR System Leak Detected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0400 EGR System Leak Detected	B	B

DTC (PGM-FI)

1. EGR pipe visual check

-1. Check for a loose or damaged EGR pipe.

Is the EGR pipe OK?

YES

Go to step 2.

NO

Reconnect or replace the EGR pipe .

2. Problem verification

-1. **Enter the maintenance mode, then start the engine** .

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg.F (70 deg.C)

- Transmission in D
- Drive the vehicle at 25 mph (40 km/h) or less for 5 minutes
- Maintain the vehicle speed at 50 mph (80 km/h) or more and the engine speed between 1, 750-3, 000 rpm for at least 10 seconds

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
Vehicle Speed	B	B
Engine Speed	B	B

-4. Monitor the OBD STATUS for DTC P0400 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0400 EGR System Leak Detected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the EGR valve** .

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for leakage between the EGR pipe and the EGR valve. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, go to step 2-3 and recheck.

DTC P0401

DTC P0401 : EGR Insufficient Flow

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0401 EGR Insufficient Flow	B	B

DTC (PGM-FI)

1. EGR valve check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Select the EGR TEST in the Function Test Menu with the HDS

EGR Test

Is the result OK?

YES

Go to step 2.

NO

Replace the EGR valve .

2. Problem verification:

   Test-drive the vehicle under these conditions:

   - Engine coolant temperature (ECT SENSOR 1) above 158 deg.F (70 deg.C)
   - Transmission in D
   - Drive the vehicle at a steady speed between 15-75 mph (24-120 km/h) for at least 5 seconds
   - Drive the vehicle at a steady speed between 55-75 mph (90-120 km/h) for at least 10 seconds
   - During the drive, decelerate (with the throttle fully closed) for at least 4 seconds

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
Vehicle Speed	B	B

-2. Monitor the OBD STATUS for DTC P0401 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0401 EGR Insufficient Flow	B

Does the HDS indicate FAILED?

YES

Clean the intake manifold EGR port with throttle plate cleaner. Also, clean the passage inside the EGR valve with throttle plate cleaner.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep driving until a result comes on. If the HDS indicates OUT OF CONDITION, meet the test condition and recheck.

DTC P0404

DTC P0404 : EGR Valve Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0404 EGR Valve Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Select the EGR TEST in the Function Test Menu with the HDS.

EGR Test

Is the result OK?

YES

Intermittent failure, the system is OK at this time. Clean any carbon build-up on the EGR valve with throttle plate cleaner. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. Go to step 2.

2. EGR valve position sensor internal circuit check 1

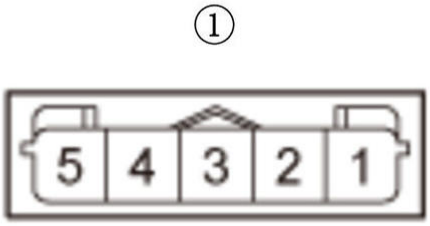
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EGR valve 5P connector

-3. At the EGR valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR 5P connector: disconnected
Test point 1	EGR valve 5P connector (male terminals) No. 3 (valve side): ①
Test point 2	EGR valve 5P connector (male terminals) No. 4 (valve side): ①



Is there 100 kΩ or more?

YES

Replace the EGR valve .

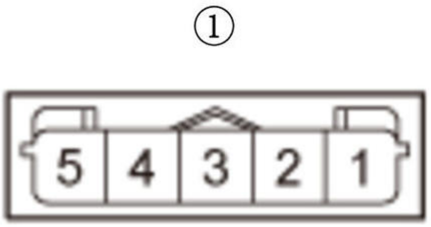
NO

Go to step 3.

3. EGR valve position sensor internal circuit check 2

-1. At the EGR valve side, measure the resistance between test point 1 and 2.

Test condition	Vehicle OFF (LOCK) mode EGR 5P connector: disconnected
Test point 1	EGR valve 5P connector (male terminals) No. 2 (valve side): ①
Test point 2	EGR valve 5P connector (male terminals) No. 4 (valve side): ①



Is there 100 kΩ or more?

YES

Replace the EGR valve .

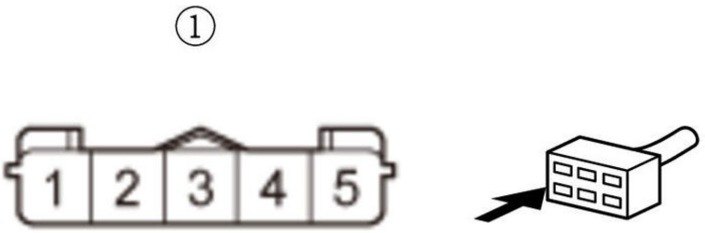
NO

Go to step 4.

4. Open wire check (PG line)

-1. Measure the resistance between test point 1 and 2.

Test condition	Vehicle OFF (LOCK) mode EGR 5P connector: disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 5.

NO

Repair an open in the PG wire between the EGR valve and G101.

5. Shorted wire check (EEGR line)

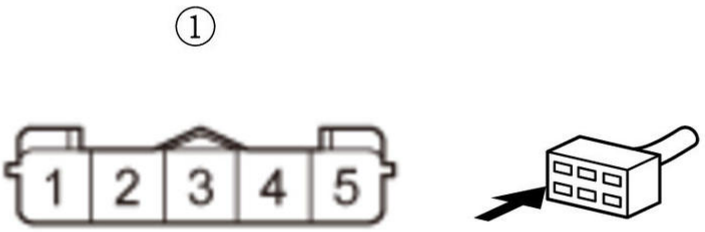
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test point 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EGR 5P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 6.

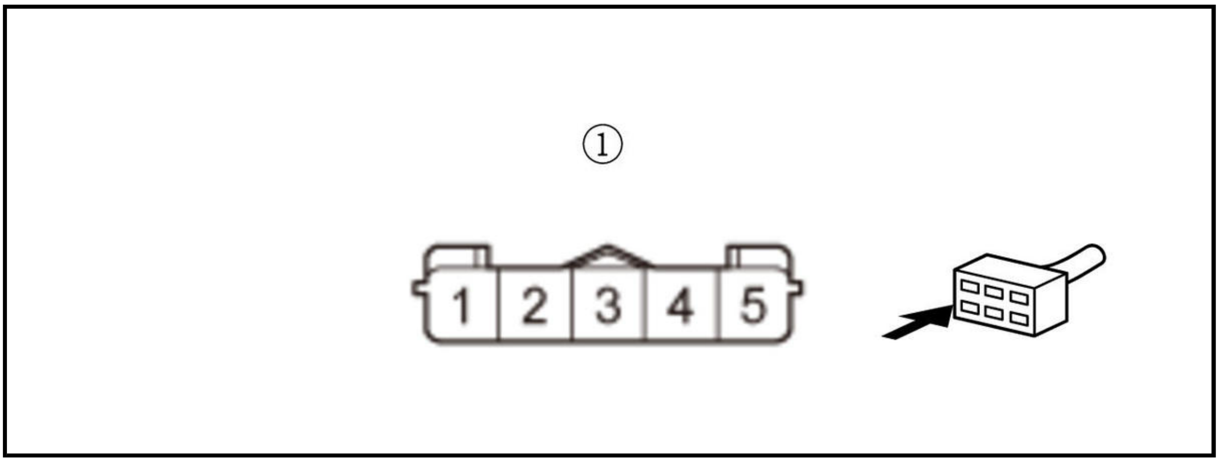
NO

Repair a short in the EEGR wire between the PCM (E10) and the EGR valve.

6. Open wire check (EEGR line)

-1. Measure the resistance between test point 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EGR 5P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 10**



Is there 1.0 Ω or less?

YES

Go to step 7.

NO

Repair an open in the EEGR wire between the PCM (E10) and the EGR valve.

7. EGR port and passage cleaning

-1. **Remove the EGR valve** .

-2. Clean the intake manifold EGR port with throttle plate cleaner. Also, clean the passage inside the EGR valve with throttle plate cleaner.

-3. **Install the EGR valve** .

-4. Reconnect all connectors.

-5. Exit the SCS mode with the HDS.

-6. Turn the vehicle to the ON mode.

-7. **Reset the PCM with the HDS** .

Reset PCM

-8. Select the EGR TEST in the Function Test Menu with the HDS.

EGR Test

Is the result OK?

YES

The failure is not duplicated. The troubleshooting is complete.

NO

Go to step 8.

8. EGR valve check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good EGR valve** .

-3. Turn the vehicle to the ON mode.

-4. **Reset the PCM with the HDS** .

Reset PCM

-5. Select the EGR TEST in the Function Test Menu with the HDS.

EGR Test

Is the result OK?

YES

Replace the original EGR valve .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P0405

DTC P0405 : EGR Valve Position Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0405 EGR Valve Position Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EGR Valve Position Sensor (EGR Vls)	Less than 0.31	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

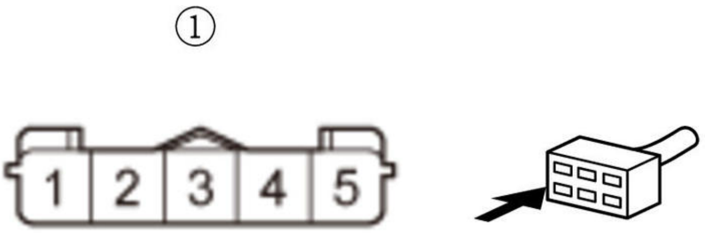
-2. Disconnect the following connector.

EGR valve 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EGR valve 5P connector: disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 2: ①
Test point 2	EGR valve 5P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

The VCC2 wire is OK. Go to step 3.

NO

Repair an open in the VCC2 wire between the PCM (E77) and the EGR valve.

3. Shorted wire check (EGRL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

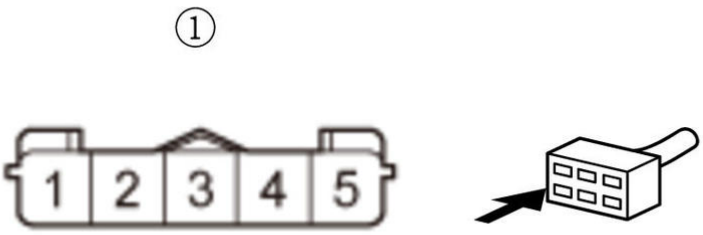
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 4.

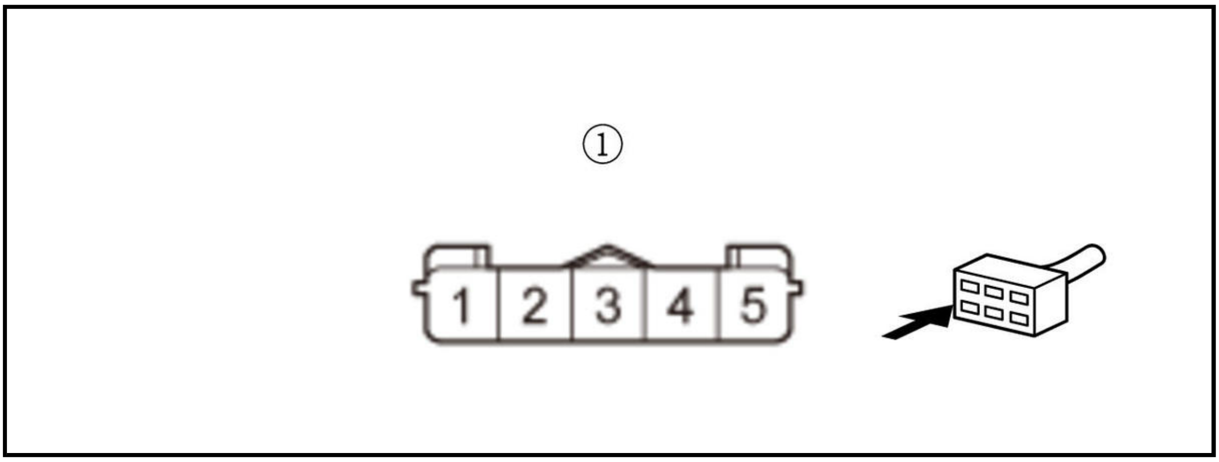
NO

Repair a short in the EGRL wire between the PCM (E69) and the EGR valve.

4. Open wire check (EGRL line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 69**



Is there 1.0 Ω or less?

YES

The EGRL wire is OK. Go to step 5.

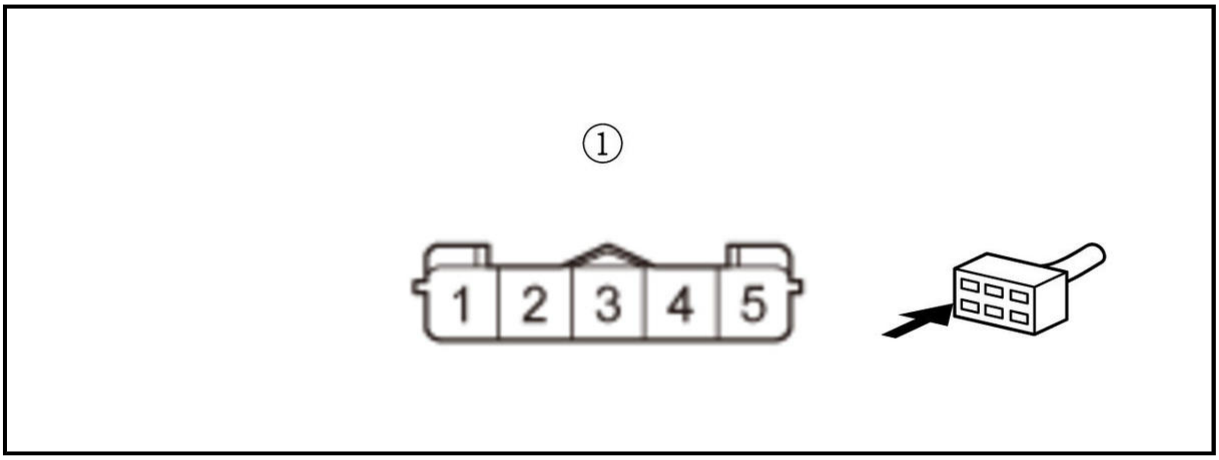
NO

Repair an open in the EGRL wire between the PCM (E69) and the EGR valve.

5. PCM internal circuit check

-1. Connect terminals A and B with a jumper wire.

Terminal A	EGR valve 5P connector (female terminals) No. 2: ①
Terminal B	EGR valve 5P connector (female terminals) No. 4: ①



-2. Reconnect the following connector.

PCM connector E (80P)

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EGR Valve Position Sensor (EGR Vls)	Less than 0.31	V	B	B

Do the current condition(s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the EGR valve** .

DTC P0406

DTC P0406 : EGR Valve Position Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0406 EGR Valve Position Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EGR Valve Position Sensor (EGR Vls)	More than 4.89	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (EGR valve, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

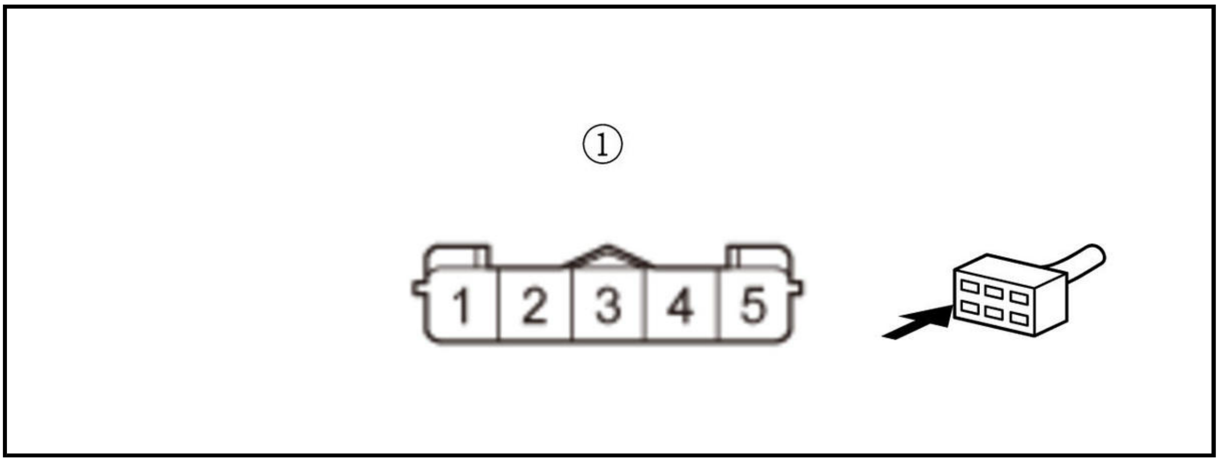
-2. Disconnect the following connector.

EGR valve 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EGR valve 5P connector: disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 2: ①
Test point 2	EGR valve 5P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the EGR valve .

NO

Go to step 3.

3. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

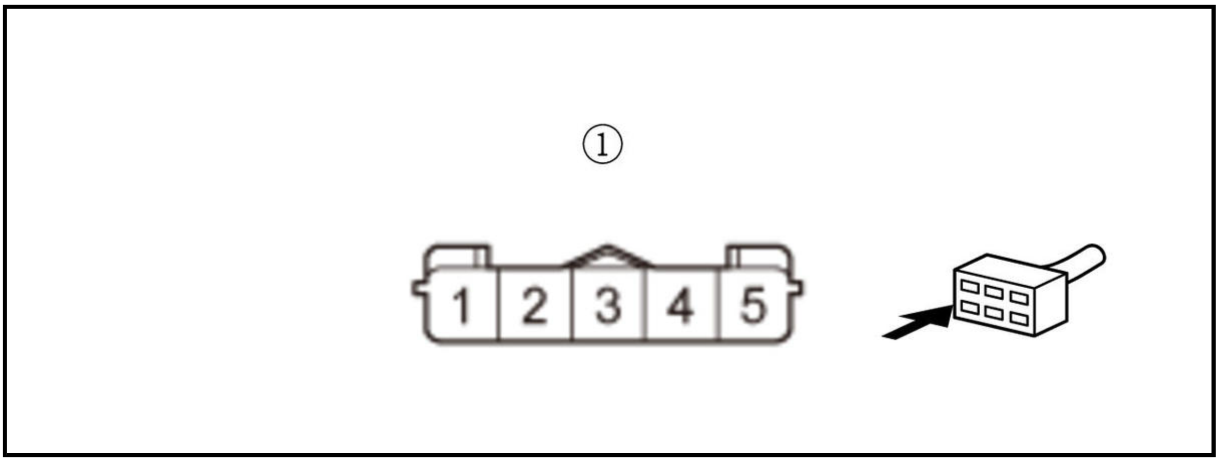
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and the EGR valve.

DTC P0420

DTC P0420 : Catalyst System Efficiency Below Threshold

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If some of the DTCs listed below are stored at the same time as DTC P0420, troubleshoot them first, then recheck for DTC P0420.
-
    - -

      P0137, P0138, P0139, P2270, P2A01: Secondary HO2S (Sensor 2)
    - -

      P0141: Secondary HO2S (Sensor 2) heater
    - -

      P0300: Random misfire
    - -

      P0301, P0302, P0303, P0304: No. 1, No. 2, No. 3, No. 4 cylinder misfire detected
- Poor quality fuel may cause this DTC.

DTC Description	Confirmed DTC	Pending DTC
P0420 Catalyst System Efficiency Below Threshold	B	B

DTC (PGM-FI)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0420 Catalyst System Efficiency Below Threshold	B	B

Is Confirmed DTC P0420 indicated?

YES (Confirmed DTC is indicated)

Replace the catalytic converter .

NO (Pending DTC is indicated)

Check the installation of the catalytic converter, then recheck.

DTC P043E, P043F

DTC P043E : EVAP Leak Check Module Standard Pressure Low

DTC P043F : EVAP Leak Check Module Standard Pressure High

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P043E EVAP Leak Check Module Standard Pressure Low	B	B
P043F EVAP Leak Check Module Standard Pressure High	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST

Is the result OK?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. Go to step 2.

2. EVAP leak check module drain hose check

-1. **Remove the EVAP leak check module** and the **EVAP canister filter** , then check the blockage in the drain hoses and the EVAP canister filter.

Are the parts OK?

YES

Replace the EVAP leak check module .

NO

Remove the blockage from them, or replace the part(s) if needed.

DTC P0441

DTC P0441 : EVAP System Purge Flow Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0441 is indicated alone, do the troubleshooting for DTC P04DF and P04F1 using the on-board snapshot for P0441.
- If DTC P04DF, P04F1, and P0441 are stored at the same time, check for a poor connection, a blockage, or damage at the EVAP canister purge line between the EVAP canister purge valve 1 and the EVAP canister. Also check for a stuck closed EVAP canister purge valve 1.
- If any of the DTCs listed below are indicated at the same time as DTC P0441, troubleshoot those DTCs first, then recheck for P0441.

  P04DF, P04F1: EVAP system purge flow

DTC Description	Confirmed DTC	Pending DTC
P0441 EVAP System Purge Flow Malfunction	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Select the EVAP TEST in the Function Test Menu, then select the FUNCTION TEST with the HDS.

   EVAP TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0441 EVAP System Purge Flow Malfunction	B	B
P04DF EVAP System High Purge Flow Detected	B	B
P04F1 EVAP System Low Purge Flow Detected	B	B

Are DTC P0441 and P04DF or P04F1 indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC P04DF** and **DTC P04F1** using the on-board snapshot for DTC P0441.

DTC P0443

DTC P0443 : EVAP Canister Purge Valve Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0443 EVAP Canister Purge Valve Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0443 EVAP Canister Purge Valve Circuit Malfunction	B	B

   Is DTC P0443 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at EVAP canister purge valve 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A11**

   Is the fuse OK?

   YES

   Go to step 3.

   NO

Repair a short in the IGPS(PCS1)/IGPS(LAF) wire between the No. A11 fuse and EVAP canister purge valve 1. Also replace the No. A11 fuse.

3. Open wire check (IGPS(PCS1)/IGPS(LAF) line)

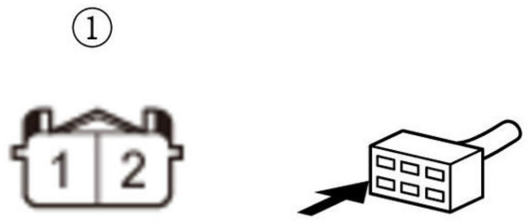
-1. Disconnect the following connector.

EVAP canister purge valve 1 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP canister purge valve 1 2P connector: disconnected
Test point 1	EVAP canister purge valve 1 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGPS(PCS1)/IGPS(LAF) wire is OK. Go to step 4.

NO

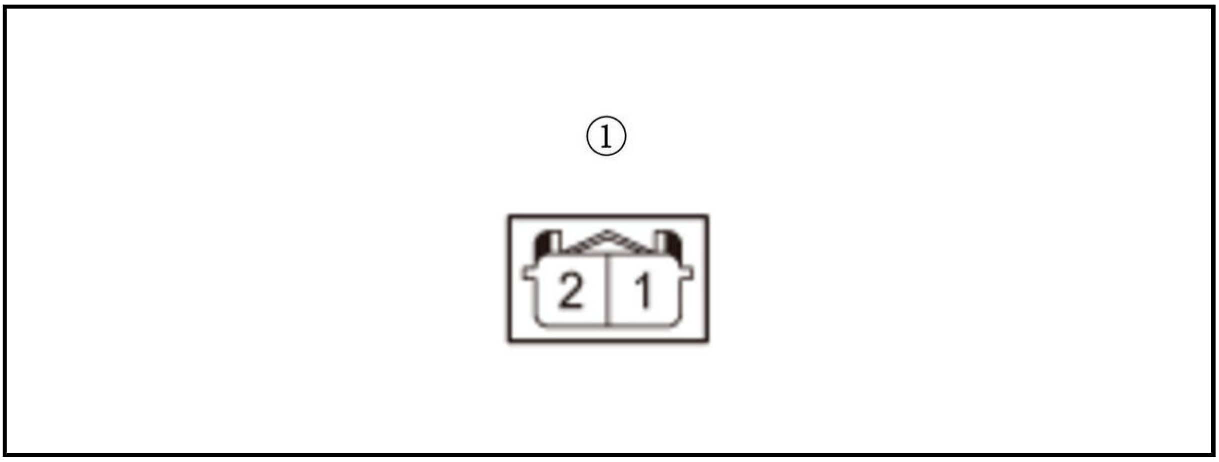
Repair an open in the IGPS(PCS1)/IGPS(LAF) wire between the **No. A11 fuse** and EVAP canister purge valve 1.

4. EVAP canister purge valve 1 internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. At EVAP canister purge valve 1 side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 1 2P connector: disconnected
Test point 1	EVAP canister purge valve 1 2P connector (male terminals) No. 1 (valve side): ①
Test point 2	EVAP canister purge valve 1 2P connector (male terminals) No. 2 (valve side): ①



Is there about 23-26 Ω at room temperature?

YES

The EVAP canister purge valve 1 internal circuit is OK. Go to step 5.

NO

Replace EVAP canister purge valve 1 .

5. Shorted wire check (PCS1 line)

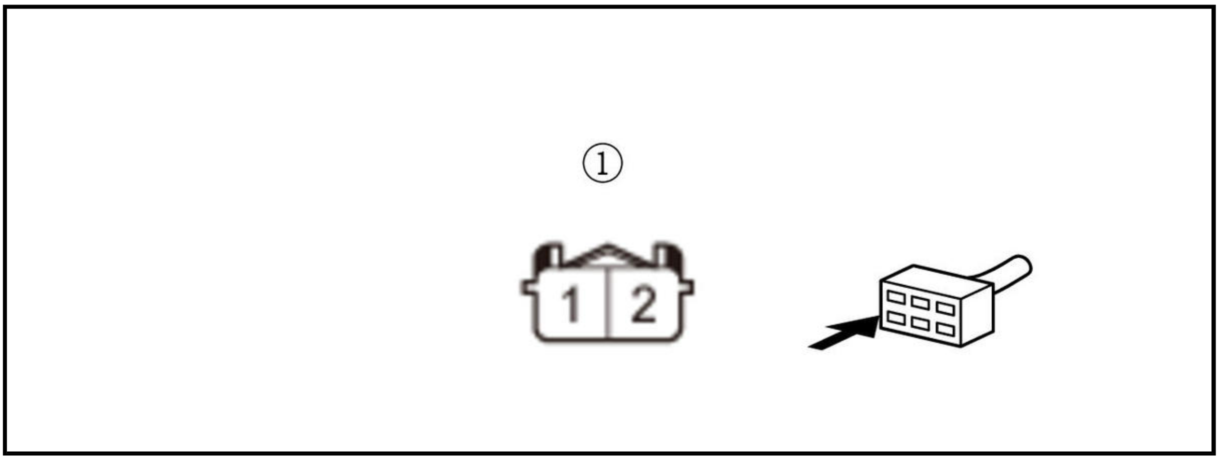
-1. Jump the SCS line with the HDS.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 1 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EVAP canister purge valve 1 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The PCS1 wire is not shorted. Go to step 6.

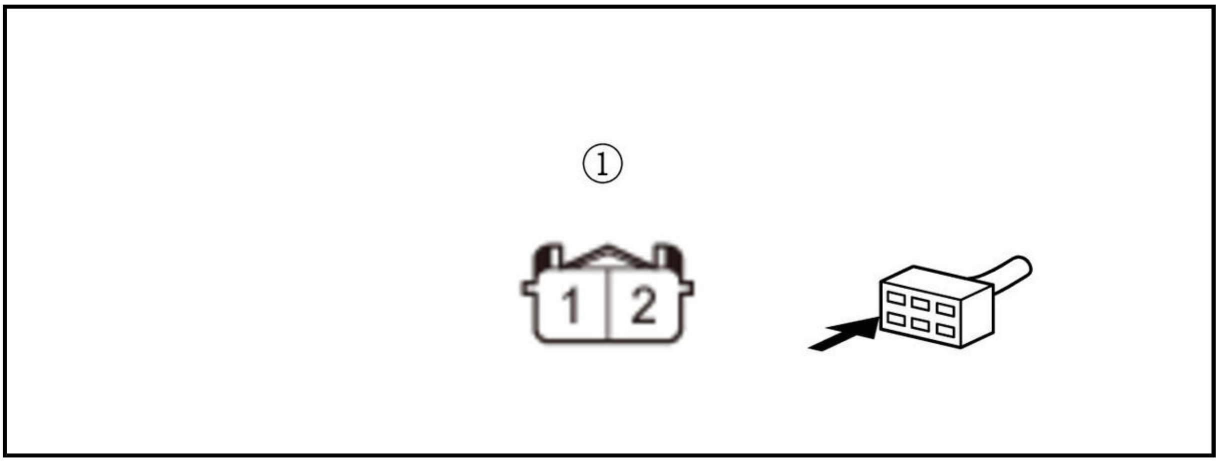
NO

Repair a short in the PCS1 wire between the PCM (E80) and EVAP canister purge valve 1.

6. Open wire check (PCS1 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 1 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EVAP canister purge valve 1 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 80**



Is there 1.0 Ω or less?

YES

The PCS1 wire is OK. Go to step 7.

NO

Repair an open in the PCS1 wire between the PCM (E80) and EVAP canister purge valve 1.

7. EVAP canister purge valve 1 check

-1. **Substitute known-good EVAP canister purge valve 1** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. **Enter the maintenance mode, then start the engine** .

-7. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0443 EVAP Canister Purge Valve Circuit Malfunction	B	B

Is DTC P0443 indicated?

YES

EVAP canister purge valve 1 is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace original EVAP canister purge valve 1 .

DTC P0451

DTC P0451 : EVAP Leak Check Module Pressure Sensor Range/Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P24BA or P24BB is stored at the same time as DTC P0451, troubleshoot DTC P24BA or P24BB first, then recheck for DTC P0451.

DTC Description	Confirmed DTC	Pending DTC
P0451 EVAP Leak Check Module Pressure Sensor Range/Performance	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** , and let it idle for 1 minute.

-4. Monitor the OBD STATUS for DTC P0451 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P0451 EVAP Leak Check Module Pressure Sensor Range/Performance	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the EVAP leak check module** .

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates NOT COMPLETED, keep idling until a result comes on.

DTC P0456

DTC P0456 : EVAP System Very Small Leak Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

WARNING: **The fuel system is designed to allow specified maximum vacuum and pressure conditions. Do not deviate from the vacuum and pressure tests as indicated in these procedures. Excessive pressure/vacuum would damage the EVAP components or cause eventual fuel tank failure.**

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Fresh fuel has a higher volatility that will create greater pressure/vacuum. The best condition for testing is less than a full tank of fresh fuel. If possible, to assist in leak detection, add 1 gallon of fresh fuel to the tank (as long as it will not fill the tank), just before starting these procedures.

DTC Description	Confirmed DTC	Pending DTC
P0456 EVAP System Very Small Leak Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module, the EVAP canister purge valve(s), and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the vehicle returns with the same DTC, continue with step 2.

   NO

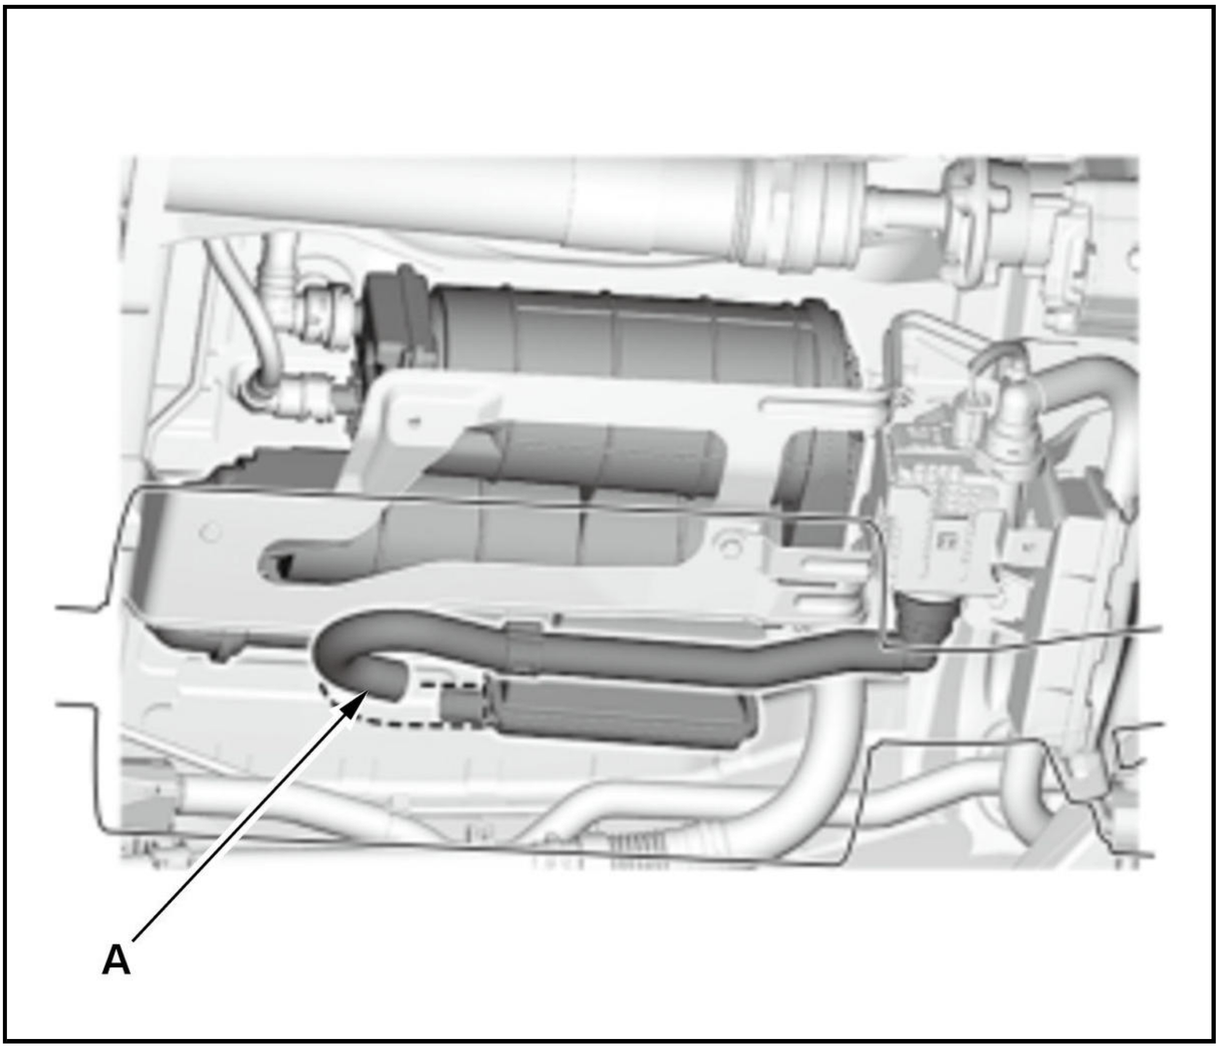
   The failure is duplicated. Go to step 2.

2. EVAP canister drain hose check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the heat shield** .

   -3. Check the EVAP canister drain hose A for a blockage or a restriction.



Is there a blockage or a restriction in the hose?

YES

Remove a blockage or a restriction, if needed, replace the EVAP canister drain hose A.

NO

Reconnect the hose, then go to step 3.

3. EVAP leak check module drain hose check

-1. **Check the blockage in the hoses and the EVAP canister filter** .

Are the parts OK?

YES

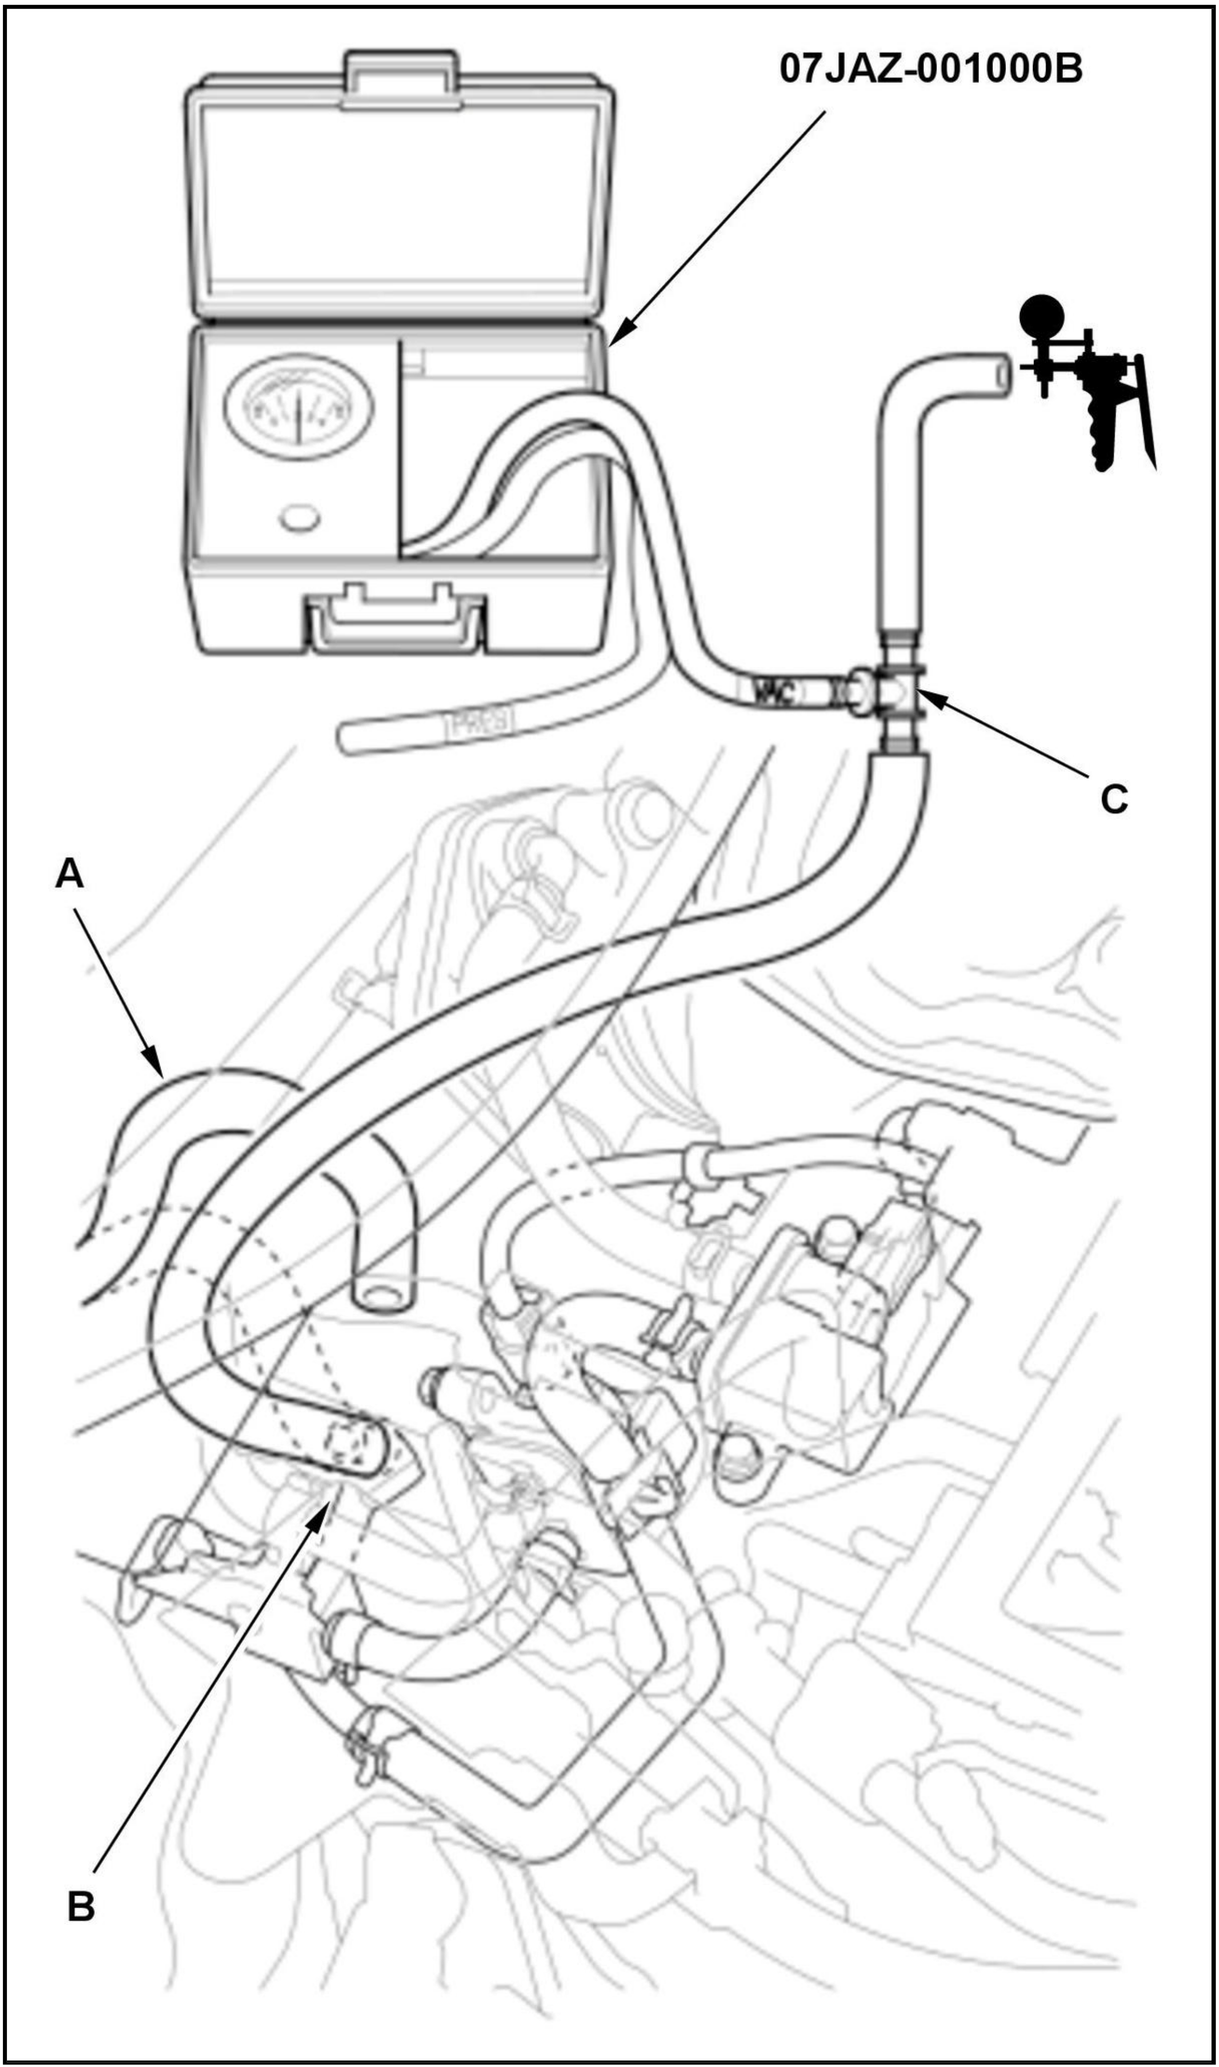
Go to step 4.

NO

Remove the blockage from them, or replace the part(s) if needed.

4. EVAP canister purge valve leak check

-1. Disconnect the vacuum hose (purge line) (A) from the 3-way joint (B) in the engine compartment, then connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg as shown.



07JAZ-001000B
VAC
PRES
A
B
C

-2. Slowly apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose.

Does it hold vacuum for 1 minute?

YES

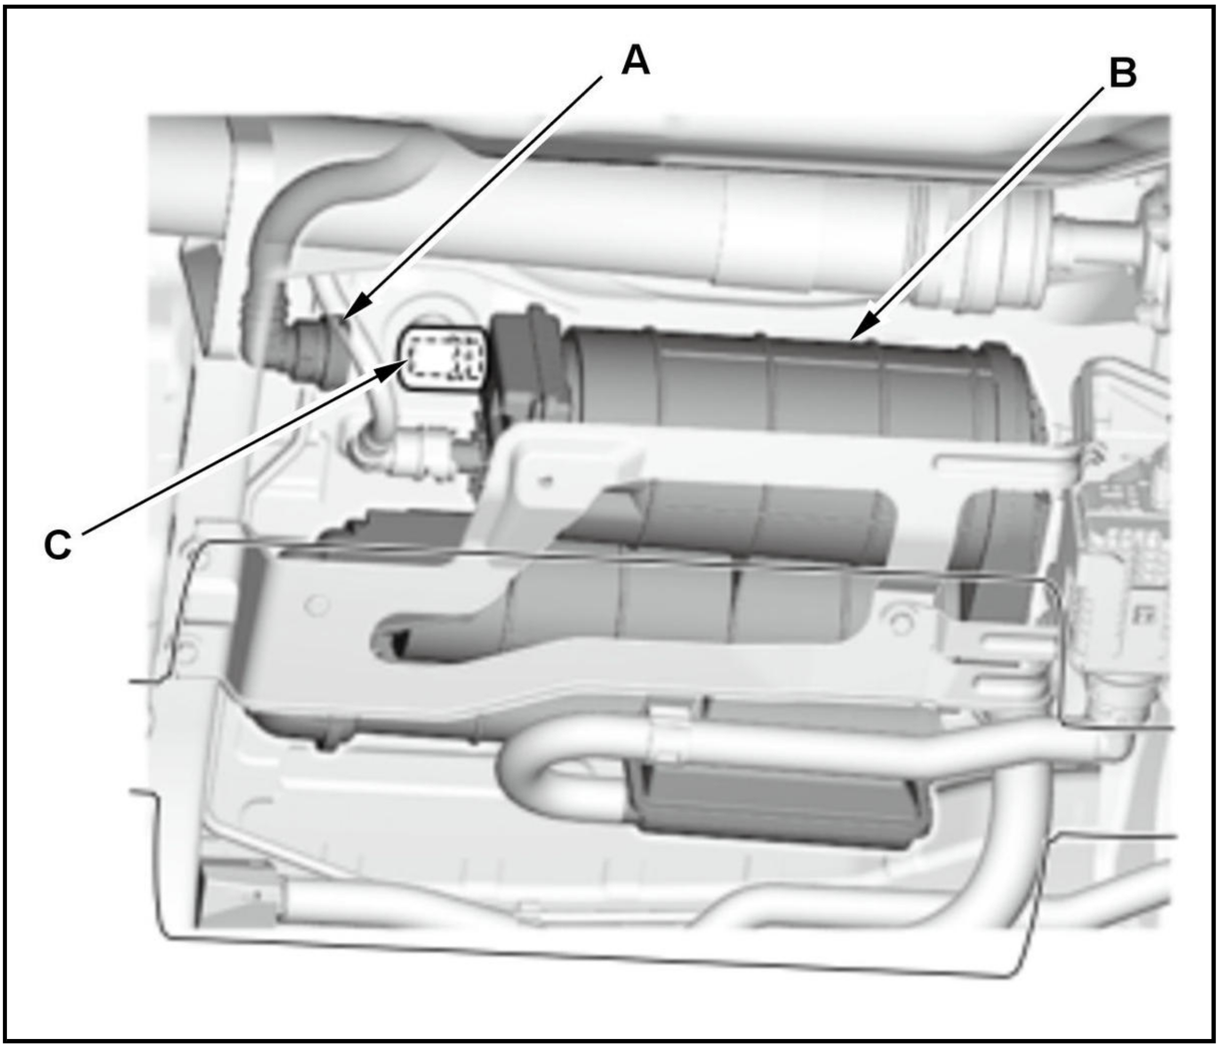
Leak is not detected between the 3-way joint and EVAP canister purge valves. Go to step 5.

NO

Go to step 10.

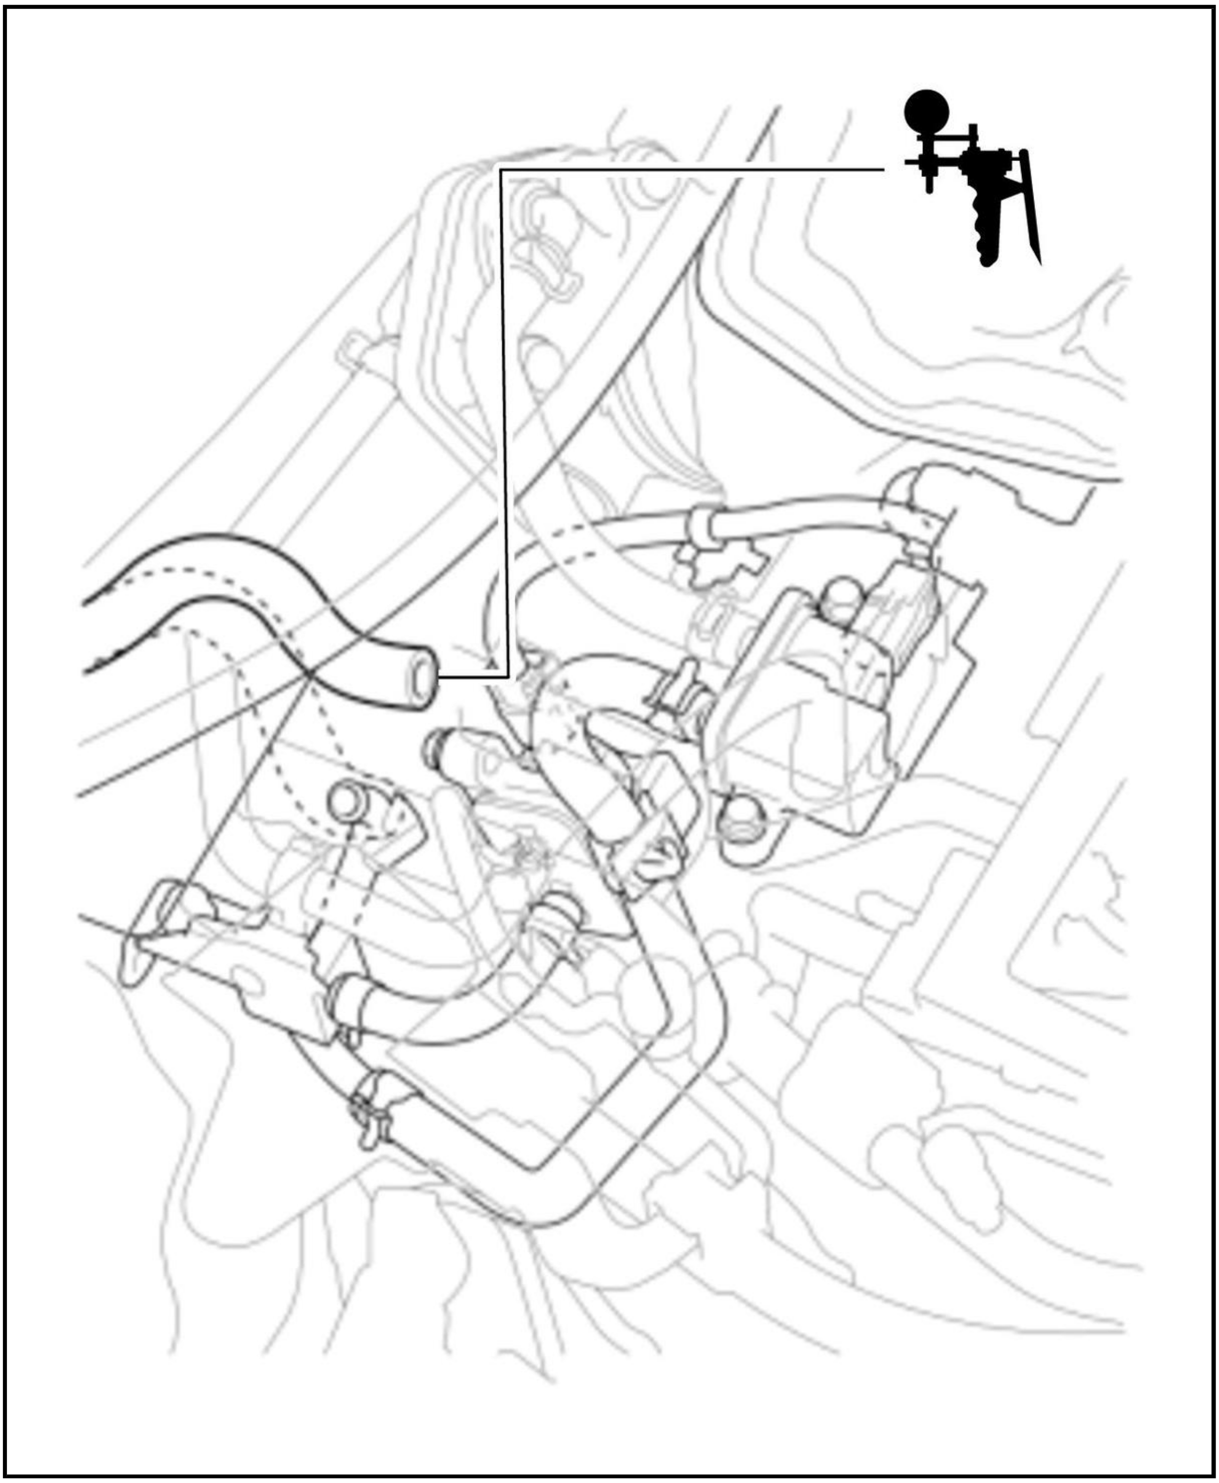
5. Determine possible failure area (EVAP canister, others)

-1. Disconnect the fuel vent tube (A) from the EVAP canister (B), and plug the EVAP canister port (C).



-2. Disconnect the vacuum gauge, the tube joint adapter, and the vacuum pump/gauge from the hose.

-3. Connect the vacuum pump/gauge, 0-30 inHg to the hose as shown.



-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST in the Function Test Menu, then select CCV ON in the Single Solenoid Test with the HDS.

EVAP TEST

Apply vacuum to the hose until the Absolute Pressure of ELCM Pressure Sensor is 2 kPa (15 mmHg, 0.6 inHg).

NOTE: Be careful not to exceed the vacuum. If you do, the EVAP leak check module can be damaged.

Signal	Current conditions	
	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	B	B

-7. Check the parameter(s) below with the HDS for 1 minute.

Signal	Current conditions	
	Values	**Unit**
Absolute Pressure of ELCM Pressure Sensor	B	B

Does it hold a vacuum?

YES

Go to step 7.

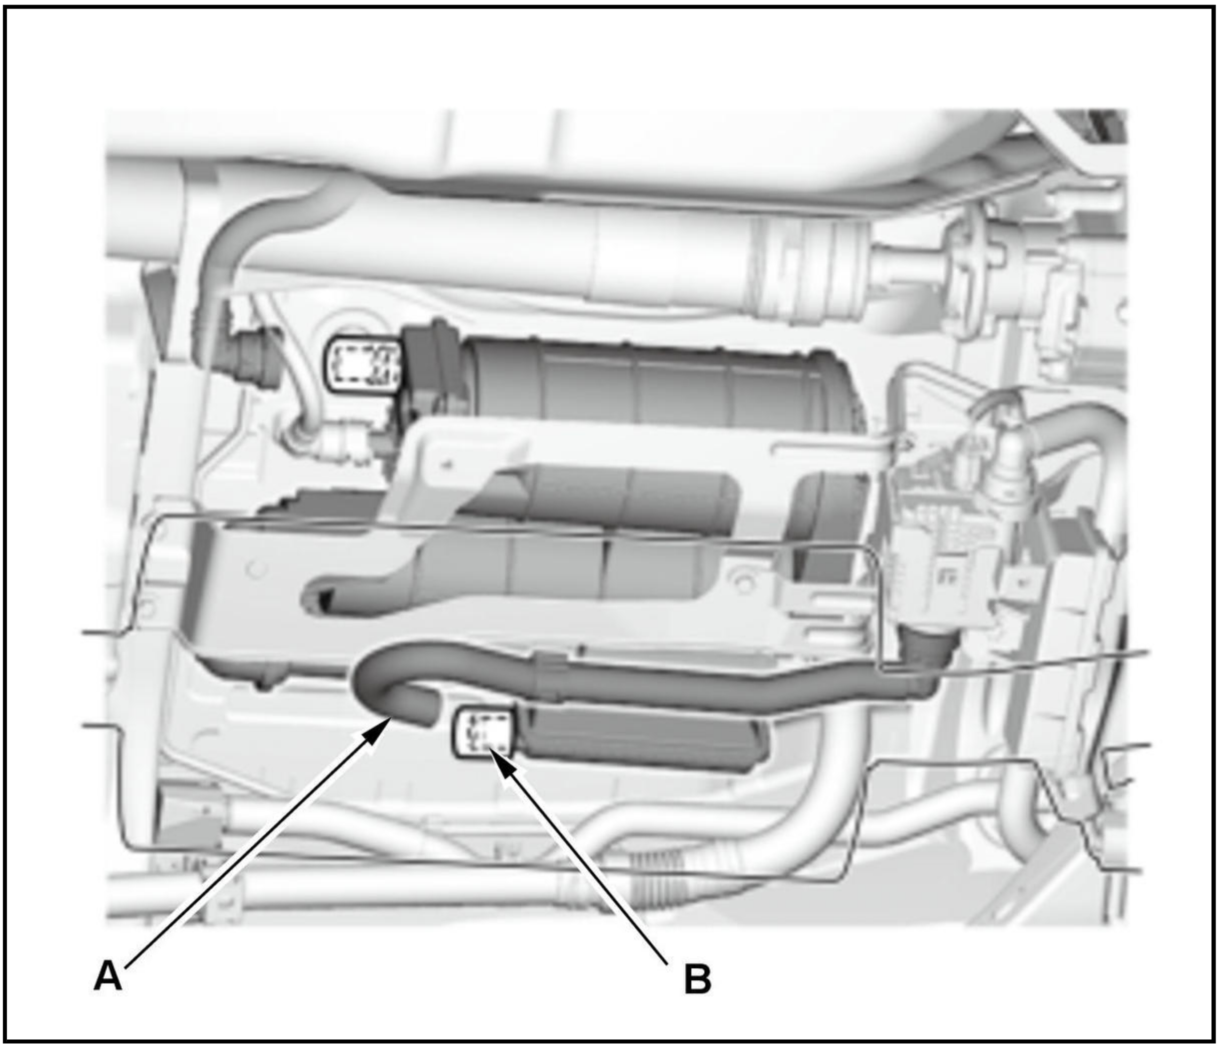
NO

Go to step 6.

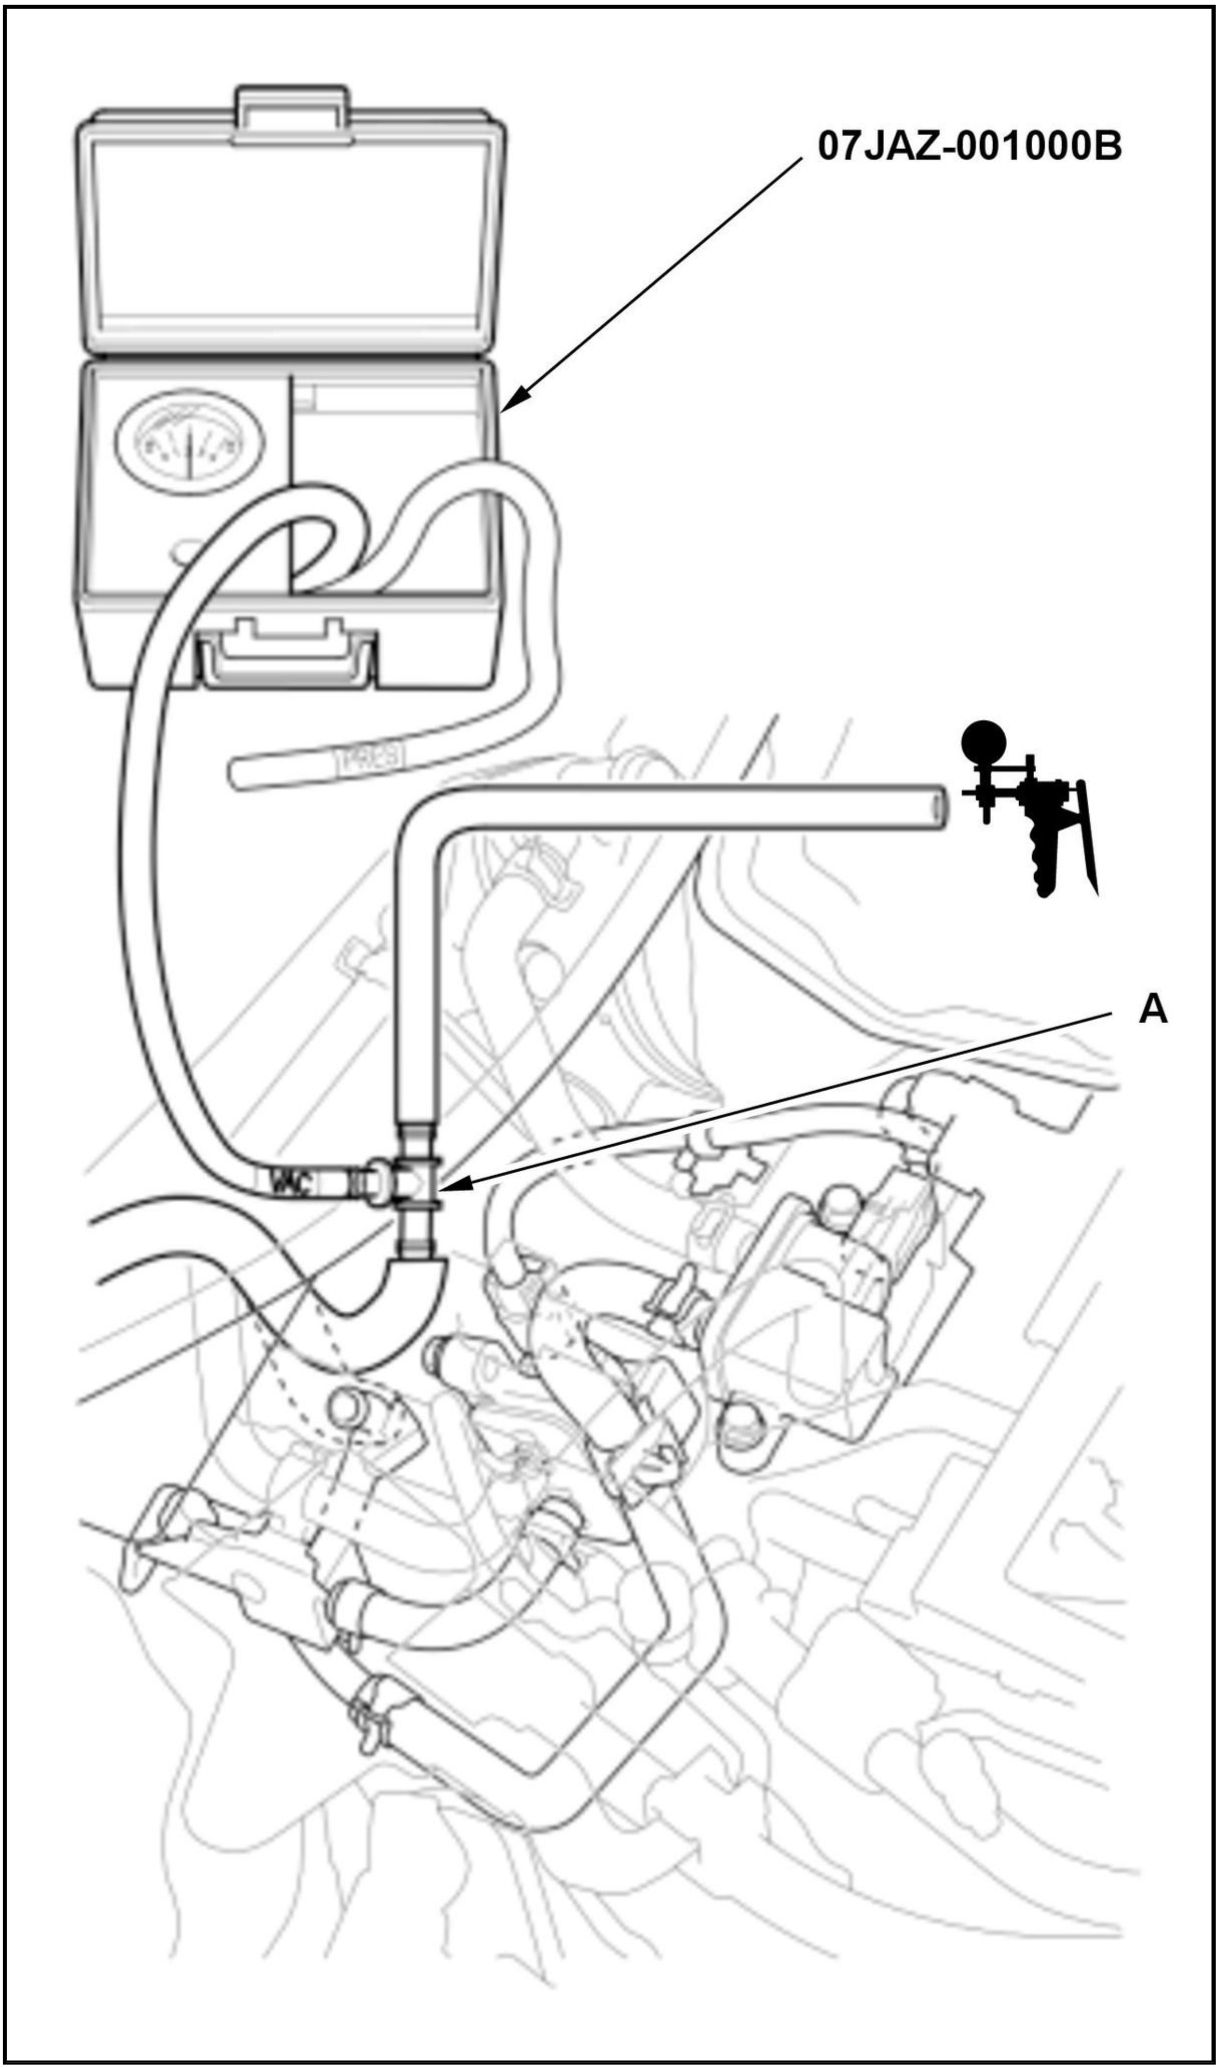
6. EVAP canister check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the EVAP canister drain hose A from the EVAP canister port (B), and plug it.



-3. Connect the T-fitting (A), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg as shown, then slow apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose.



07JAZ-001000B
A
PRES
VAC

Does it hold vacuum?

YES

The EVAP canister is OK. **Replace the EVAP leak check module** .

NO

Check for a poor connection or damage to the EVAP purge line between the 3-way joint and the EVAP canister, then **replace the EVAP canister** .

7. Fuel fill pipe and fuel tank vapor recirculation tube visual check

   -1. Check for a poor connection or damage to the fuel fill pipe and the fuel tank vapor recirculation tube.

   Are the parts and connections OK?

   YES

   The fuel fill pipe and fuel tank vapor recirculation tube are OK. Go to step 8.

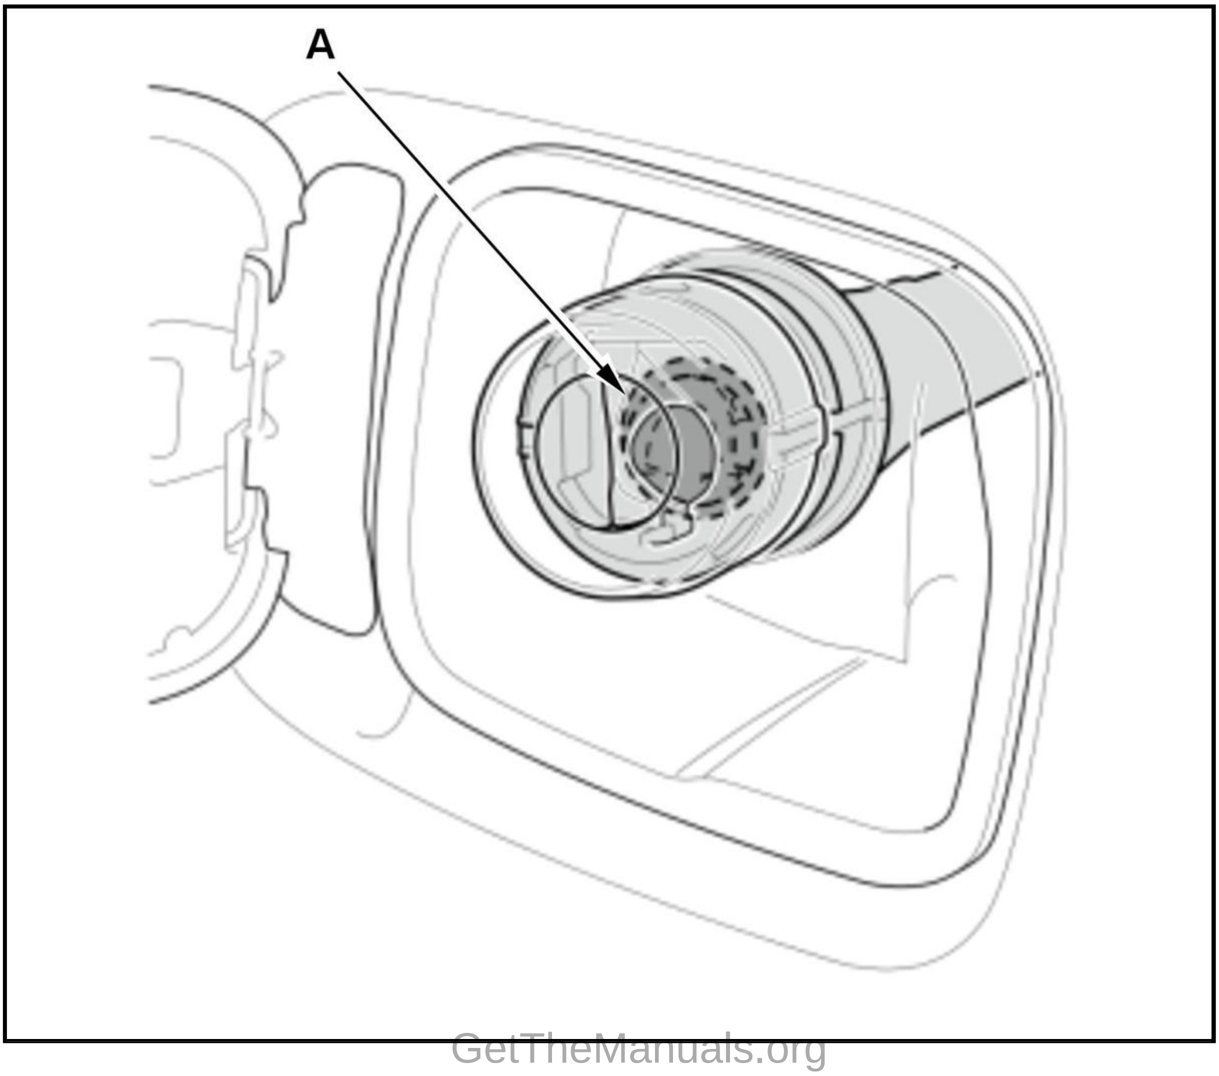
   NO

   Replace the fuel tank .

8. Shut-off valve check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the flap of the shut-off valve (A).



Is the flap closed?

YES

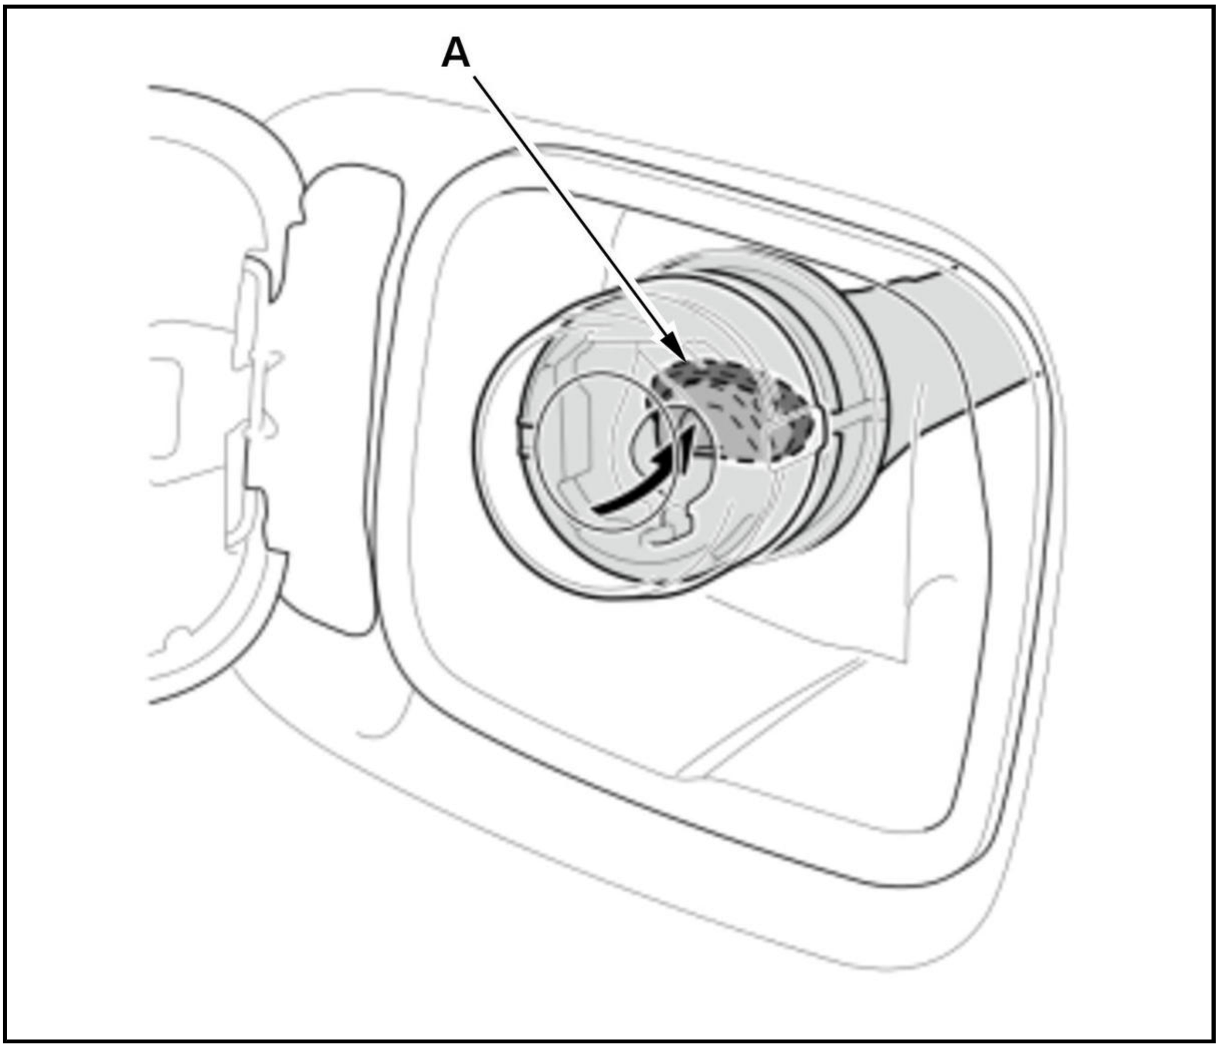
Go to step 9.

NO

Replace the main flap unit .

9. Shut-off valve seal check

-1. Check the flap seal of the shut-off valve (A) and the mating surface.



Is the flap seal missing or damaged, is the shut-off valve mating surface damaged?

YES

Replace the main flap unit .

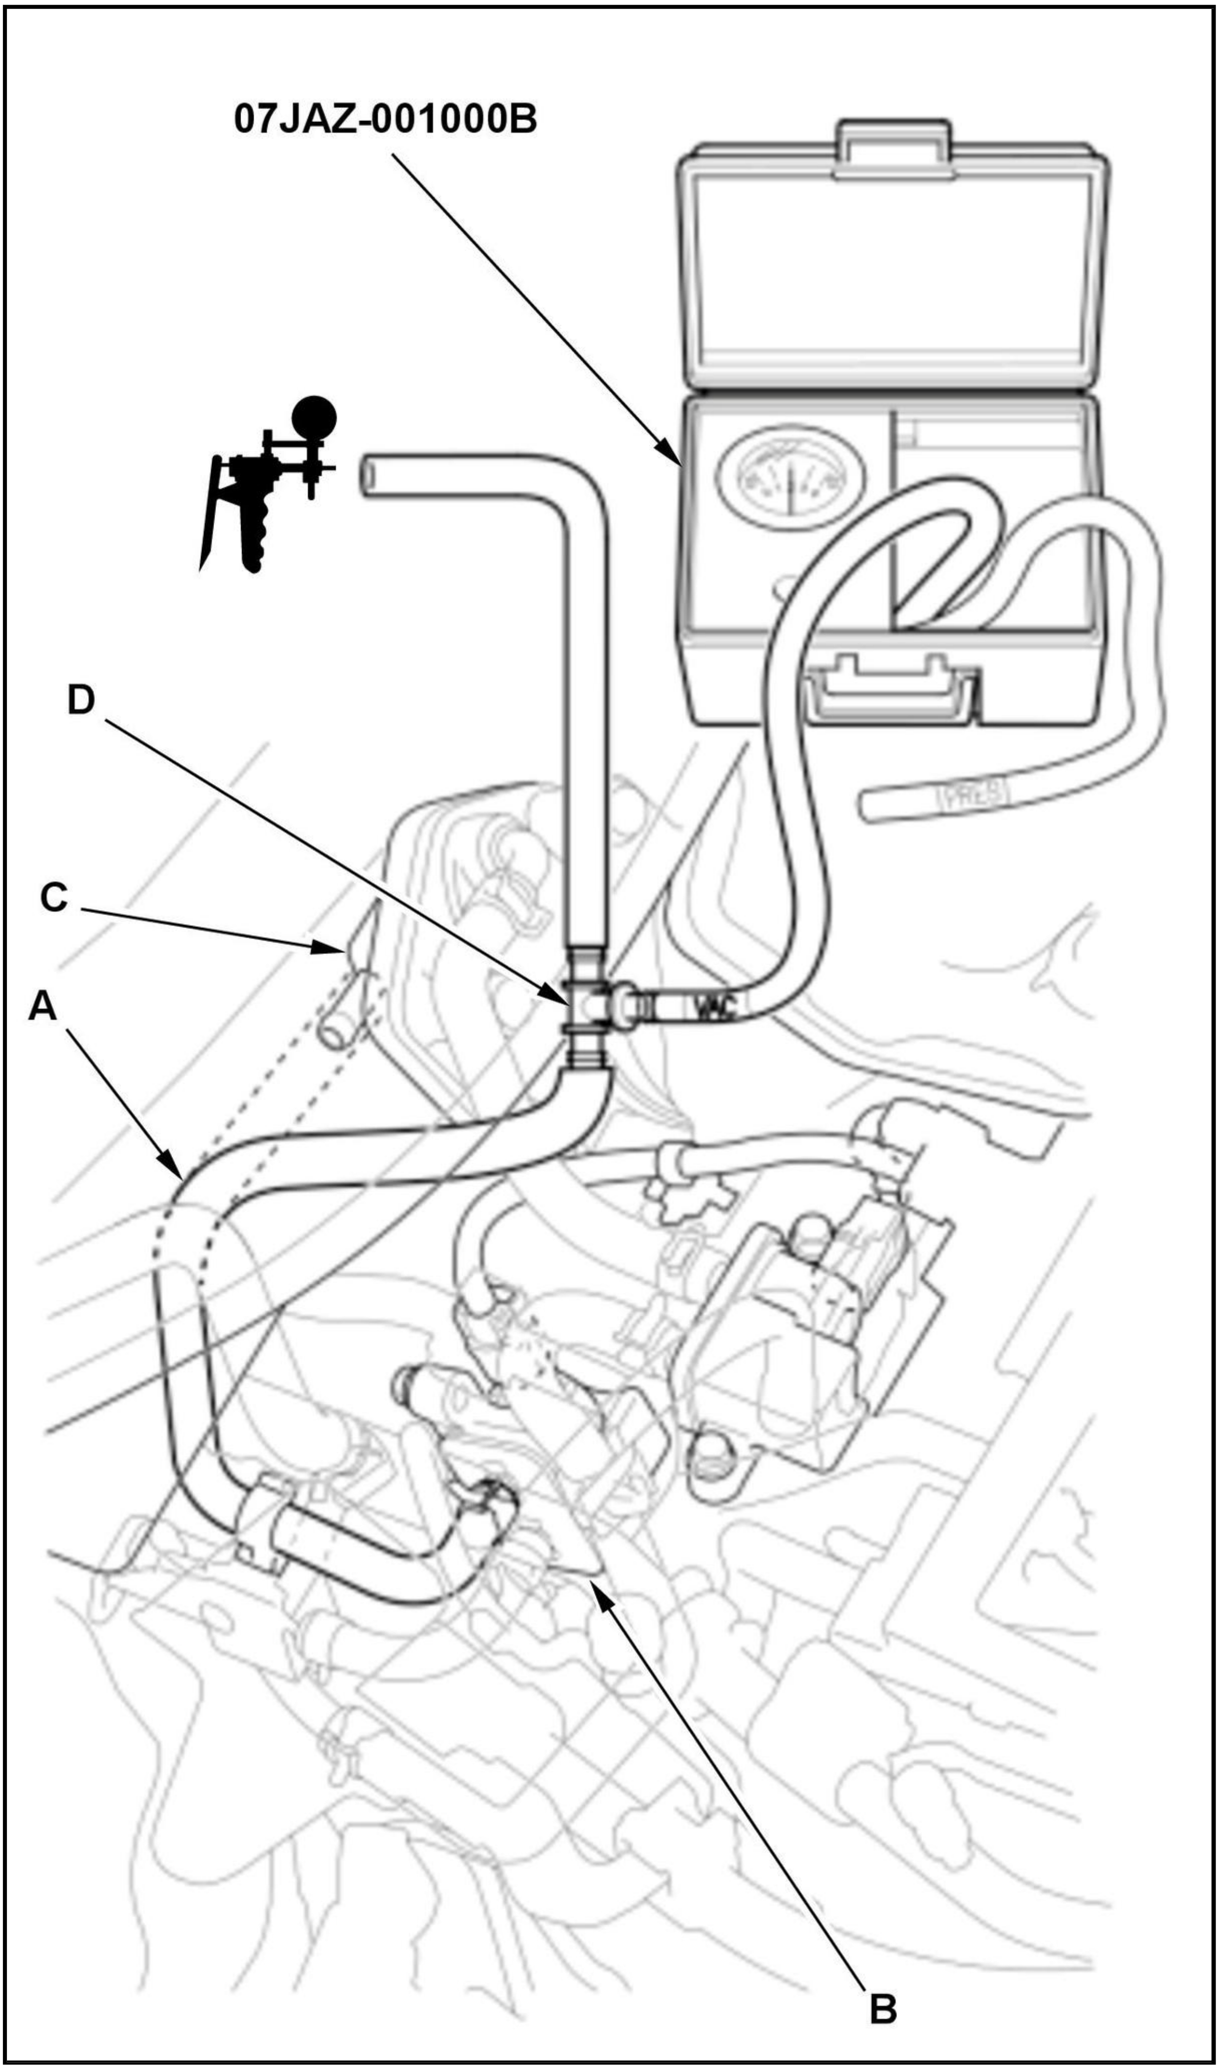
NO

The shut-off valve is OK. Check the fuel tank unit base gasket and fuel tank.

10. EVAP canister purge valve 1 leak check

-1. Remove the vacuum gauge, the tube joint adapter, and the vacuum pump/gauge from the 3-way joint, then reconnect the hose.

-2. Disconnect the hose (A) of EVAP canister purge valve 1 (B) from the intake manifold (C), then connect the T-fitting (D), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg as shown.



07JAZ-001000B
D
C
A
VAC
PRES
B

-3. Slowly apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose.

Does it hold vacuum for 1 minute?

YES

Leak is not detected at EVAP canister purge valve 1. Go to step 11.

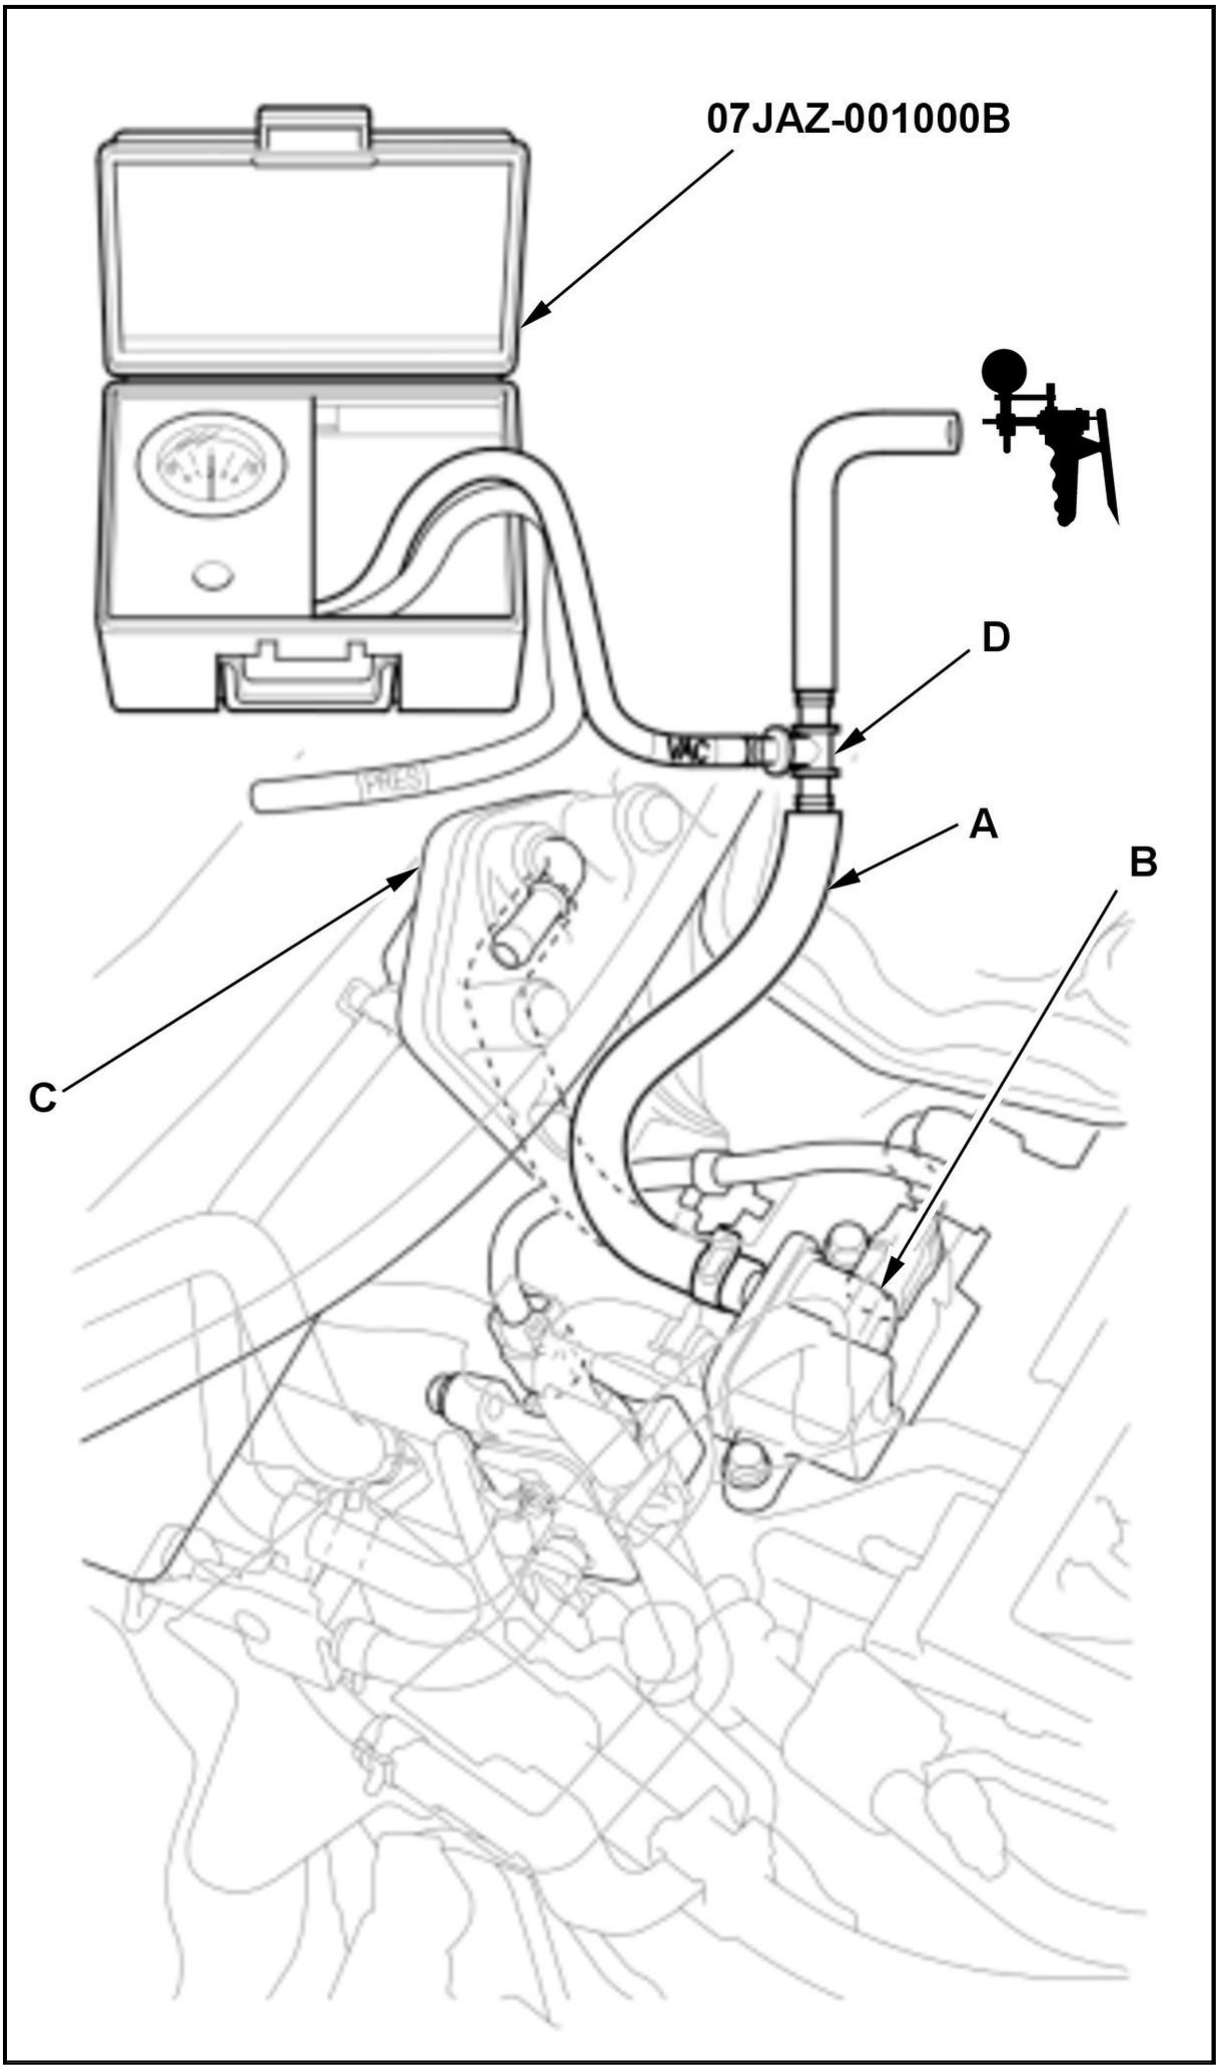
NO

Replace EVAP canister purge valve 1 .

11. EVAP canister purge valve 2 leak check

    -1. Remove the vacuum gauge, the tube joint adapter, and the vacuum pump/gauge from EVAP canister purge valve 1, then reconnect the hose.

    -2. Disconnect the hose (A) of EVAP canister purge valve 2 (B) from the throttle body (C), then connect the T-fitting (D), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg as shown.



07JAZ-001000B
D
A
B
C
VAC
PRES

-3. Slowly apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose.

Does it hold vacuum for 1 minute?

YES

Leak is not detected at EVAP canister purge valve 2. Check for a leakage at the 3-way joint and the hoses between the 3-way joint and each EVAP canister purge valve.

NO

Replace EVAP canister purge valve 2 .

DTC P0460

DTC P0460 : Fuel Level Sensor (Fuel Gauge Sending Unit) Out of Range

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0462 and/or P0463 are stored at the same time as DTC P0460, troubleshoot those DTCs first, then recheck for DTC P0460.

DTC Description	Confirmed DTC	Pending DTC
P0460 Fuel Level Sensor (Fuel Gauge Sending Unit) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Wait 30 seconds.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0460 Fuel Level Sensor (Fuel Gauge Sending Unit) Out of Range	B	B

Is DTC P0460 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel tank unit. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (FUEL_GAUGE+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

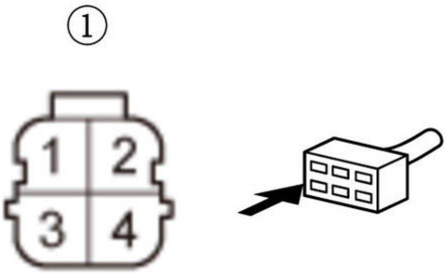
-2. **Remove the gauge control module** .

-3. Disconnect the following connectors.

Fuel tank unit 4P connector
Gauge control module connector A (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Fuel tank unit 4P connector: disconnected
	Gauge control module connector A (32P): disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 3.

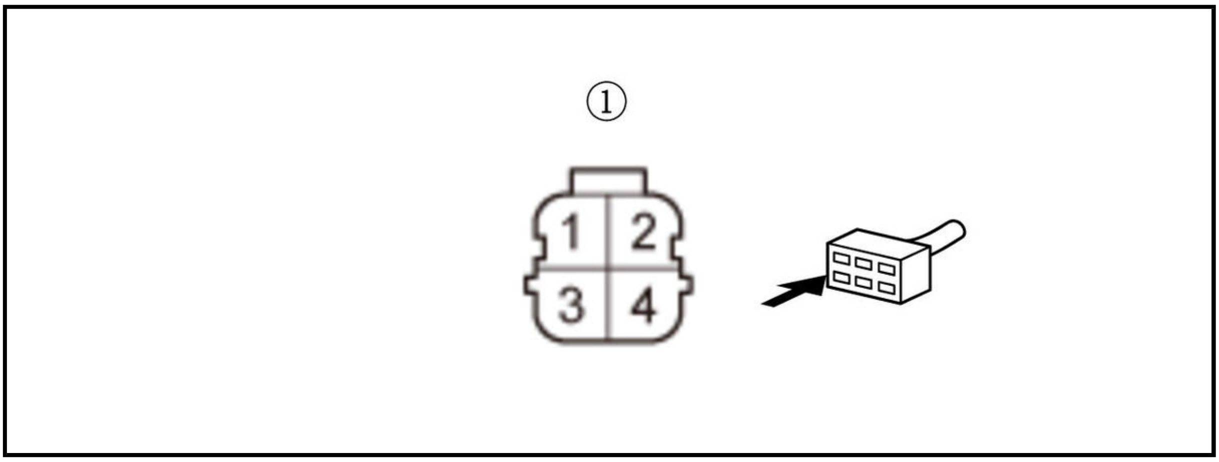
NO

Repair a short in the FUEL_GAUGE+ wire between the gauge control module and the fuel tank unit.

3. Open wire check (FUEL_GAUGE+ line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 2: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel tank unit 4P connector: disconnected
B	Gauge control module connector A (32P): disconnected
B	Fuel tank unit 4P connector No. 2: jumped to body ground
Test point 1	**Gauge control module connector A (32P) No. 22**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 4.

NO

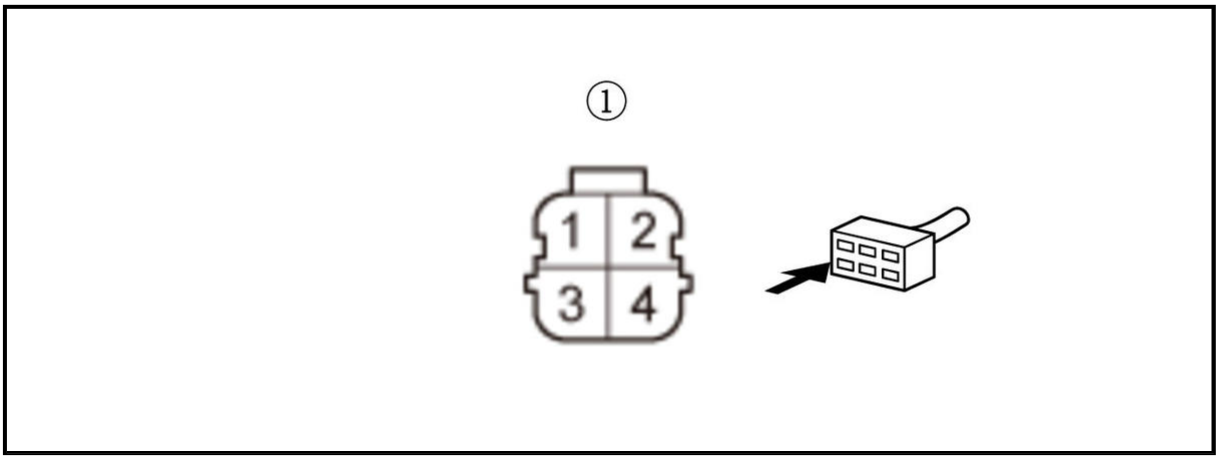
Repair an open in the FUEL_GAUGE+ wire between the gauge control module and the fuel tank unit.

4. Open wire check (FUEL_GAUGE- line)

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 4: ①
Terminal B	Body ground



-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Fuel tank unit 4P connector: disconnected
B	Gauge control module connector A (32P): disconnected
B	Fuel tank unit 4P connector No. 4: jumped to body ground
Test point 1	**Gauge control module connector A (32P) No. 21**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 5.

NO

Repair an open in the FUEL_GAUGE- wire between the gauge control module and the fuel tank unit.

5. Fuel gauge sending unit check

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC P0461 (2020)

DTC P0461 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Because it requires 143 miles (230 km) of driving without refueling to complete this diagnosis, DTC P0461 cannot be duplicated during this troubleshooting.

DTC Description	Confirmed DTC	Pending DTC
P0461 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Fuel gauge sending unit performance check

-1. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Check for poor connections or loose terminals at the fuel gauge sending unit and the gauge control module. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the** same conditions with the on-board snapshot .

NO

Replace the fuel gauge sending unit .

DTC P0461 (2021)

DTC P0461 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- Because it requires 4.7 US gal (17.7L) of fuel consumption without refueling to complete this diagnosis, DTC P0461 cannot be duplicated during this troubleshooting.
- DTC P0461 may be stored due to the following:
-
    - -

      Repeated small amounts of refueling
    - -

      Fuel draining during repairs
    - -

      Constant cornering or driving on a sloping road for a certain period of time

DTC Description	Confirmed DTC	Pending DTC
P0461 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Customer usage check

   -1. Ask the customer about their refueling method.

   Has the vehicle been repeatedly refilled with less than 1.3 US gal (5.0 L) at each refuel?

   YES

   Direct the customer on the proper refilling conditions in the How to Refuel section of the owner's manual.

   NO

   Go to step 2.

2. Fuel gauge sending unit performance check

   -1. Test the fuel gauge sending unit .

   Is the fuel gauge sending unit OK?

   YES

Check for poor connections or loose terminals at the fuel gauge sending unit and the gauge control module. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Replace the fuel gauge sending unit .

DTC P0462

DTC P0462 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0462 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Wait 30 seconds.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0462 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit Low Voltage	B	B

   Is DTC P0462 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel tank unit. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (FUEL_GAUGE+ line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the gauge control module** .

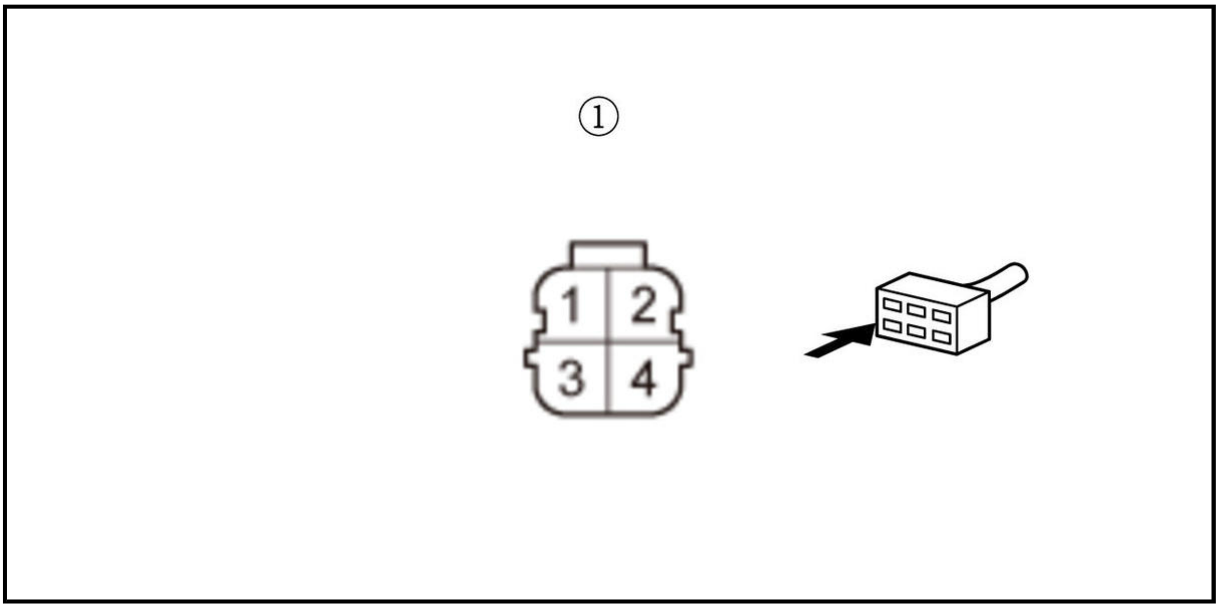
   -3. Disconnect the following connector.

Fuel tank unit 4P connector

Gauge control module connector A (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Fuel tank unit 4P connector: disconnected Gauge control module connector A (32P): disconnected
Test point 1	Fuel tank unit 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 3.

NO

Repair a short in the FUEL_GAUGE+ wire between the gauge control module and the fuel tank unit.

3. Fuel gauge sending unit check

-1. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC P0463

DTC P0463 : Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0463 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Wait 30 seconds.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0463 Fuel Level Sensor (Fuel Gauge Sending Unit) Circuit High Voltage	B	B

   Is DTC P0463 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the gauge control module and the fuel tank unit. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (FUEL_GAUGE- line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

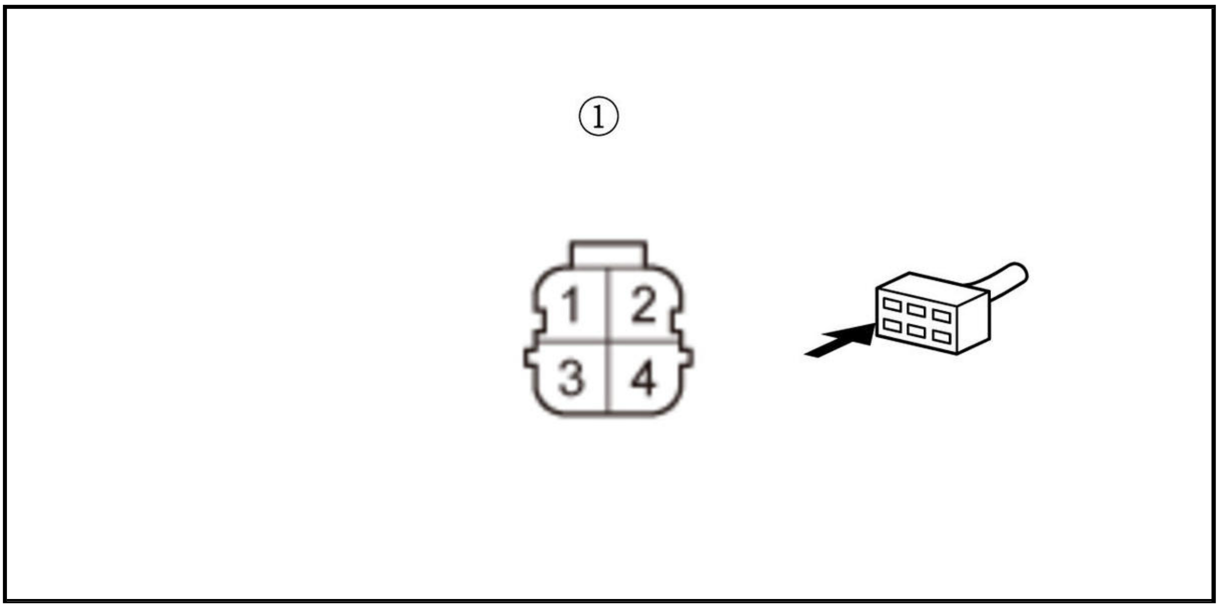
   -2. **Remove the gauge control module** .

   -3. Disconnect the following connector.

Fuel tank unit 4P connector
Gauge control module connector A (32P)

   -4. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Fuel tank unit 4P connector: disconnected
	Fuel tank unit 4P connector No. 4: jumped to body ground
	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 21**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 3.

NO

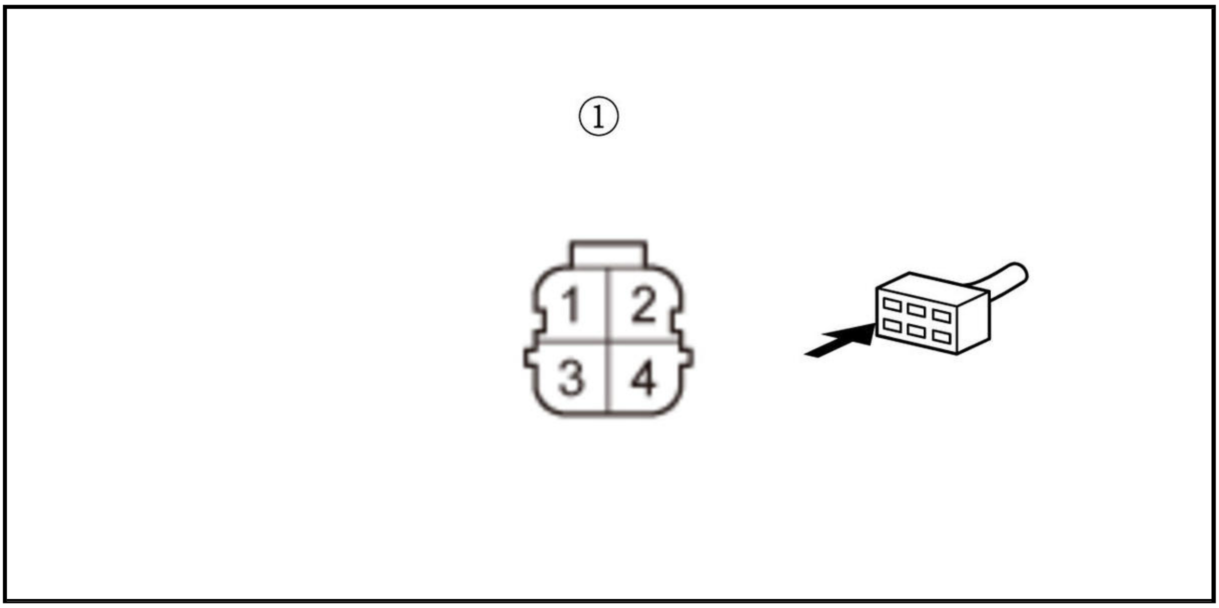
Repair an open in the FUEL_GAUGE- wire between the gauge control module and the fuel tank unit.

3. Open wire check (FUEL_GAUGE+ line)

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Fuel tank unit 4P connector (female terminals) No. 2: ①
Terminal B	Body ground



-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Fuel tank unit 4P connector: disconnected
	Fuel tank unit 4P connector No. 2: jumped to body ground
	Gauge control module connector A (32P): disconnected
Test point 1	**Gauge control module connector A (32P) No. 22**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 4.

NO

Repair an open in the FUEL_GAUGE+ wire between the gauge control module and the fuel tank unit.

4. Fuel gauge sending unit check

-1. Remove the jumper wire from the fuel tank unit 4P connector.

-2. **Test the fuel gauge sending unit** .

Is the fuel gauge sending unit OK?

YES

Replace the gauge control module .

NO

Replace the fuel gauge sending unit .

DTC P046C

DTC P046C : EGR Valve Position Sensor Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P046C EGR Valve Position Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
EGR Valve Position Sensor (EGR Vls)	More than 4.40	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (EGR valve, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

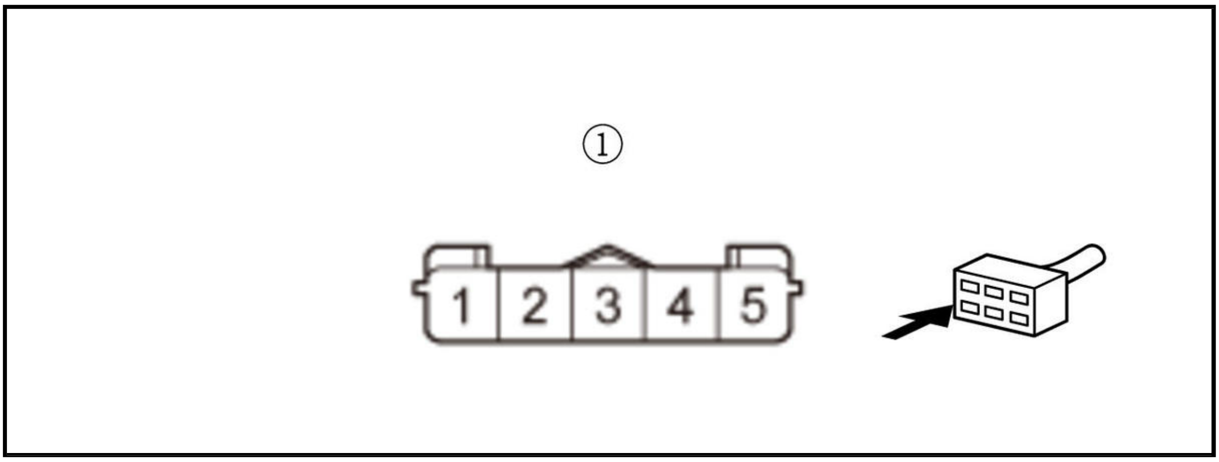
   -2. Disconnect the following connector.

EGR valve 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EGR valve 5P connector: disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 2: ①
Test point 2	EGR valve 5P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the EGR valve .

NO

Go to step 3.

3. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

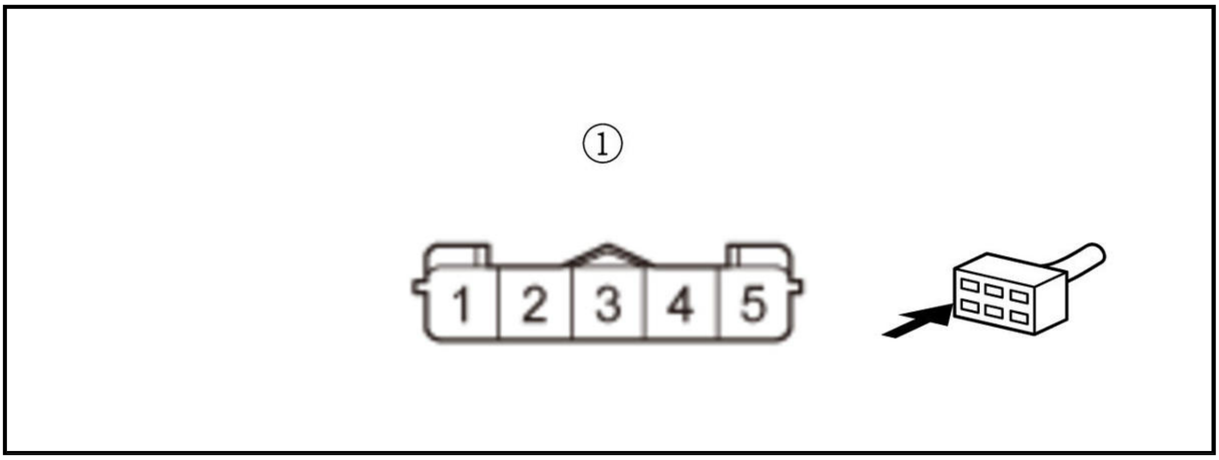
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and the EGR valve.

DTC P0480

DTC P0480 : RFC System Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0480 RFC System Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the RADIATOR FAN in the Function Test Menu with the HDS.

   RADIATOR FAN

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0480 RFC System Malfunction	B	B

   Is DTC P0480 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the RFC unit, the RFC relay, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Fan shroud assembly visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   Check for these conditions at the fan shroud assembly:

   - Interference with fan shroud
   - Debris in the fan
   - Ice on the fan blades
   - Broken or deformed radiator fan
   - Broken or deformed fan shroud

   Are the conditions OK?

YES

Go to step 3.

NO

Repair or replace the damaged parts .

3. Fuse check 1

-1. Check the following fuse.

Fuse	**No. C1-5**

Is the fuse OK?

YES

Go to step 7.

NO

Go to step 4.

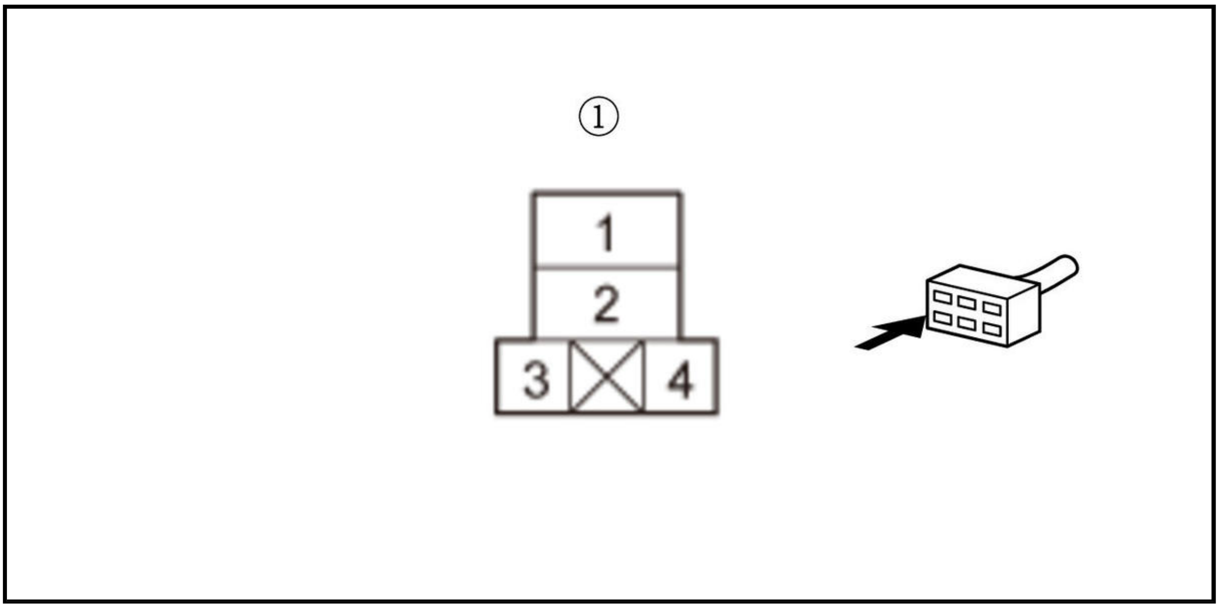
4. Shorted wire check (+B_MAIN_FAN line)

-1. Remove the blown **No. C1-5 fuse** .

-2. **Remove the RFC relay** .

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode RFC relay: disconnected
Test point 1	RFC relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The +B_MAIN_FAN wire is OK. Go to step 5.

NO

Repair a short in the +B_MAIN_FAN wire between the No. C1-5 fuse and the RFC relay. Also replace the No. C1-5 fuse.

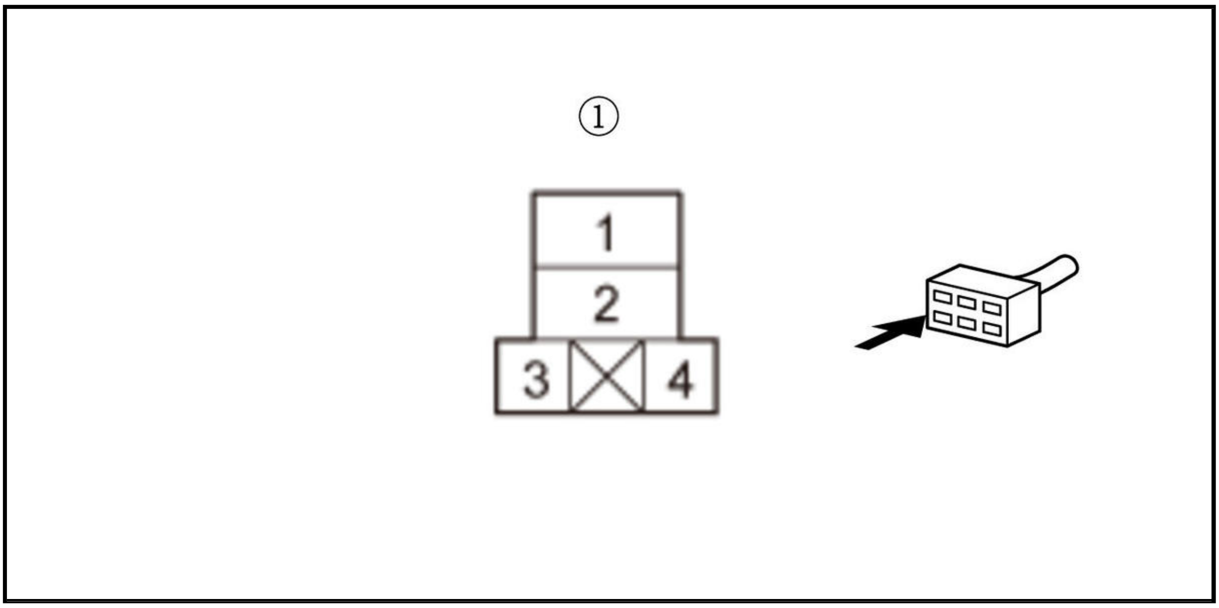
5. Shorted wire check (MAIN_FAN_MOTOR line)

-1. Disconnect the following connector.

RFC unit connector A (2P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	RFC relay: disconnected
B	RFC unit connector A (2P): disconnected
Test point 1	RFC relay 4P socket (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The MAIN_FAN_MOTOR wire is OK. Go to step 6.

NO

Repair a short in the MAIN_FAN_MOTOR wire between the RFC relay and the RFC unit. Also replace the **No. C1-5 fuse** .

6. Relay check

-1. **Test the RFC relay** .

Is the relay OK?

YES

Replace the **No. C1-5 fuse** , then recheck. If the fuse is blown again, **replace the RFC unit** .

NO

Replace the RFC relay.

7. Determine possible failure area (RFC relay control circuit, others)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   -2. Disconnect the following connector.

PCM connector A (50P)

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 18**
Test point 2	Body ground

   Is there battery voltage?

   YES

   Go to step 12.

   NO

   Go to step 8.

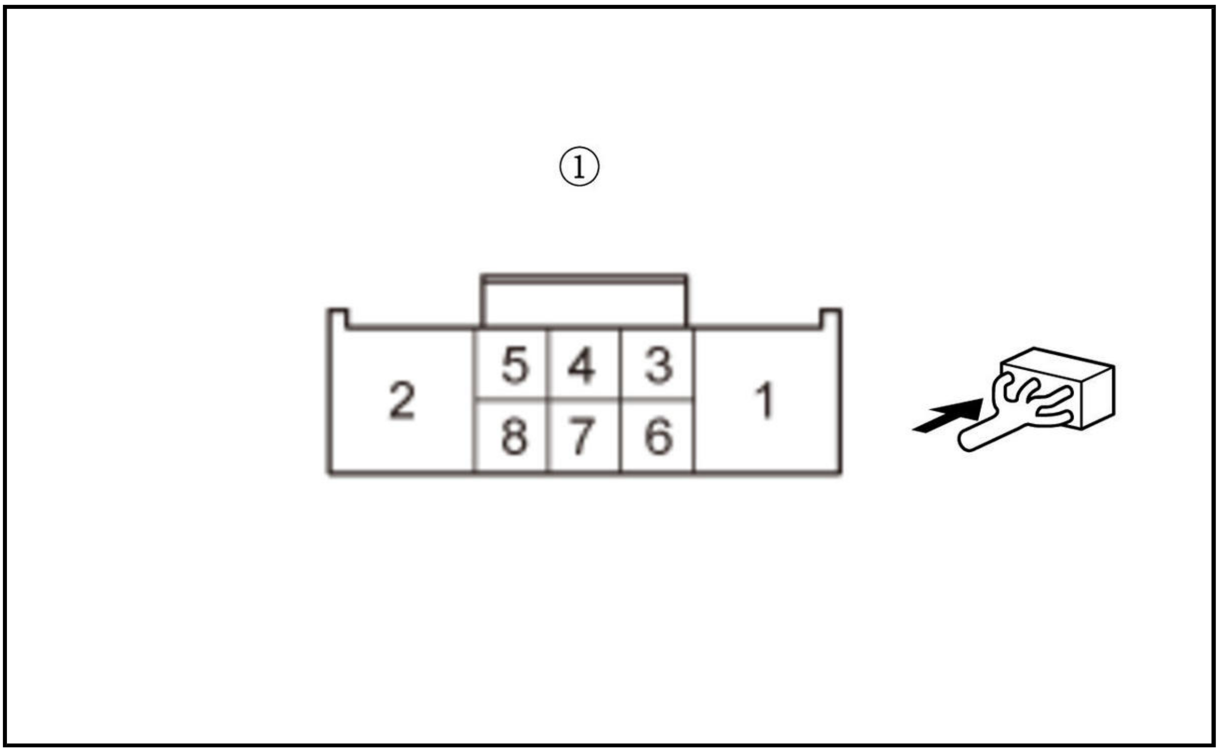
8. Open wire check (FAN_LO_SIGNAL line)

   -1. Disconnect the following connector.

Relay circuit board connector A (8P)

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Relay circuit board connector A (8P): disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 18**



Is there 1.0 Ω or less?

YES

The FAN_LO_SIGNAL wire is OK. Go to step 9.

NO

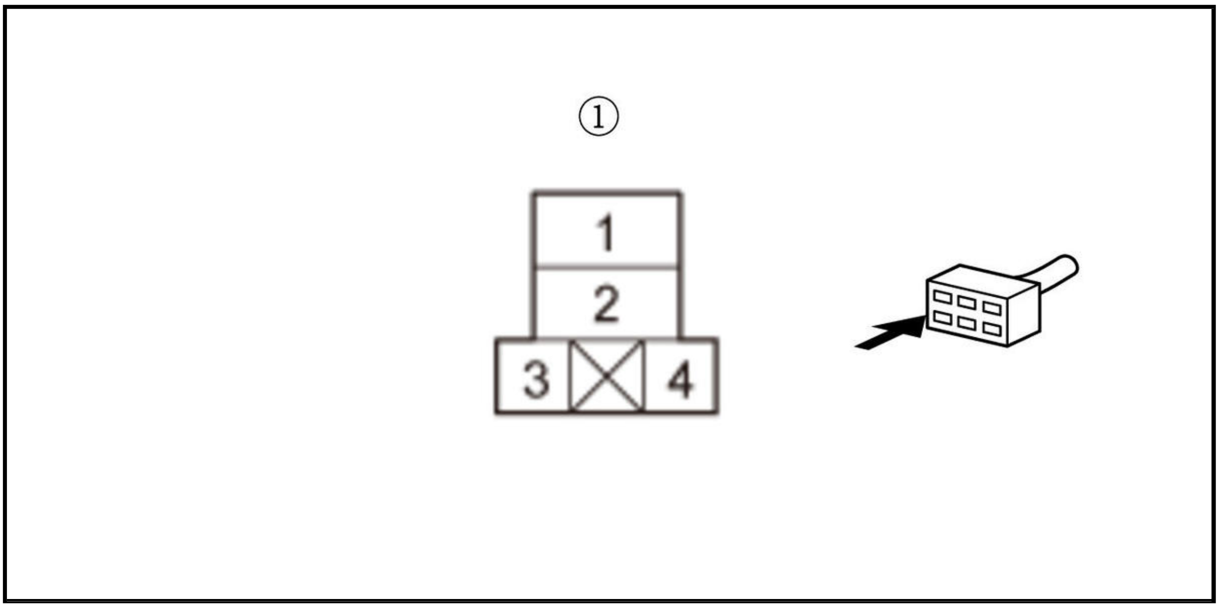
Repair an open in the FAN_LO_SIGNAL wire between the PCM (A18) and the relay circuit board.

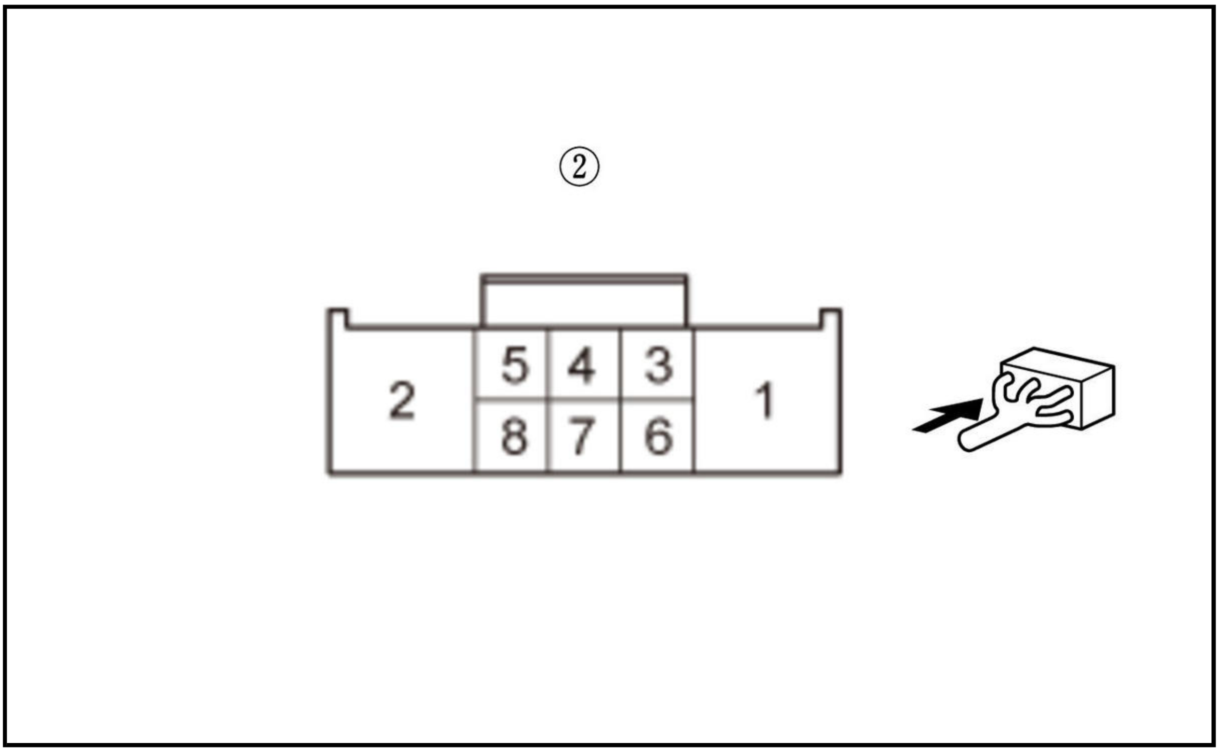
9. Open wire check (FAN_LO_SIGNAL_CL- line)

-1. **Remove the RFC relay** .

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Relay circuit board connector A (8P): disconnected
B	RFC relay: disconnected
Test point 1	RFC relay 4P socket (female terminals) No. 4: ①
Test point 2	Relay circuit board connector A (8P) (female terminals) No. 1: ②





Is there 1.0 Ω or less?

YES

The FAN_LO_SIGNAL_CL- wire is OK. Go to step 10.

NO

Repair an open in the FAN_LO_SIGNAL_CL- wire between the relay circuit board and the RFC relay.

10. Relay check

-1. Test the RFC relay .

Is the relay OK?

YES

Go to step 11.

NO

Replace the RFC relay.

11. Fuse check 2

-1. Check the following fuse.

Fuse	**No. A16**

Is the fuse OK?

YES

Repair an open in the +B_RFC_RLY_COIL+ wire between the No. A16 fuse and the RFC relay. If the wire is OK, **replace the relay circuit board** .

NO

Repair a short in the +B_RFC_RLY_COIL+ wire between the No. A16 fuse and the RFC relay. Also replace the No. A16 fuse.

12. Shorted wire check (FAN_CONTROL line)

-1. Disconnect the following connector.

RFC unit connector B (3P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
B	RFC unit connector B (3P): disconnected
Test point 1	**PCM connector A (50P) No. 17**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The FAN_CONTROL wire is not shorted. Go to step 13.

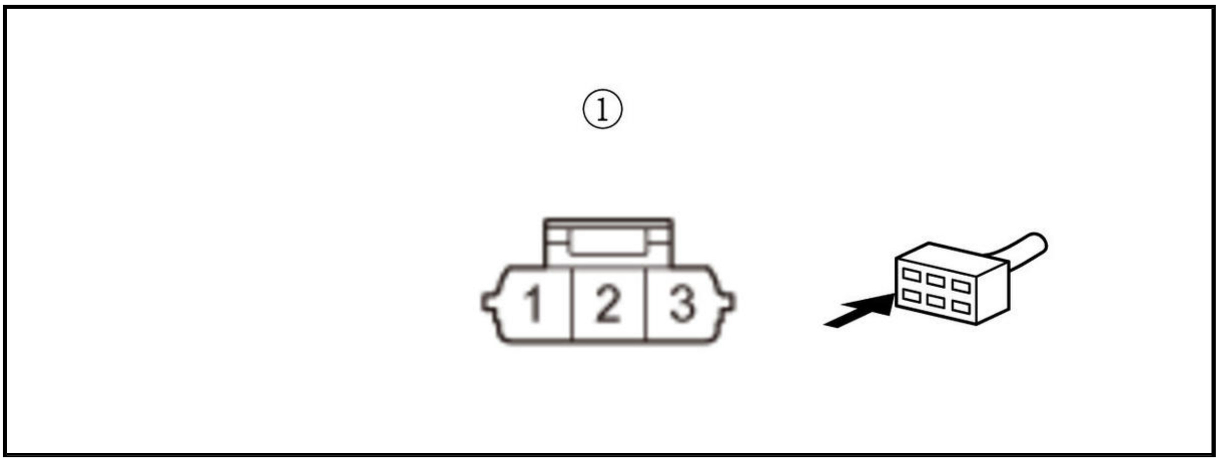
NO

Repair a short in the FAN_CONTROL wire between the PCM (A17) and the RFC unit.

13. Open wire check (FAN_CONTROL line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	RFC unit connector B (3P): disconnected
Test point 1	RFC unit connector B (3P) (female terminals) No. 1: ①
Test point 2	**PCM connector A (50P) No. 17**



Is there 1.0 Ω or less?

YES

The FAN_CONTROL wire is OK. Go to step 14.

NO

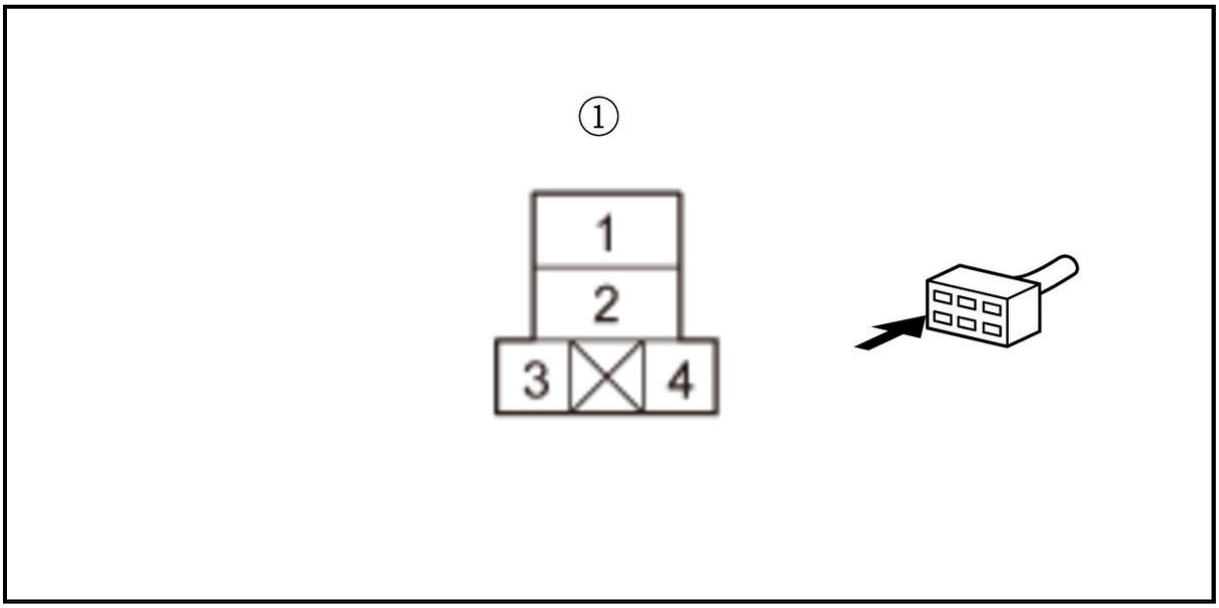
Repair an open in the FAN_CONTROL wire between the PCM (A17) and the RFC unit.

14. Open wire check (+B_MAIN_FAN line)

-1. **Remove the RFC relay** .

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
B	RFC unit connector B (3P): disconnected
B	RFC relay: disconnected
Test point 1	RFC relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_MAIN_FAN wire is OK. Go to step 15.

NO

Repair an open in the +B_MAIN_FAN wire between the **No. C1-5 fuse** and the RFC relay.

15. Relay check

-1. **Test the RFC relay** .

Is the relay OK?

YES

Go to step 16.

NO

Replace the RFC relay.

16. Open wire check (MAIN_FAN_MOTOR line)

-1. **Reinstall the RFC relay** .

-2. Reconnect PCM connector A (50P).

-3. Exit the SCS mode with the HDS.

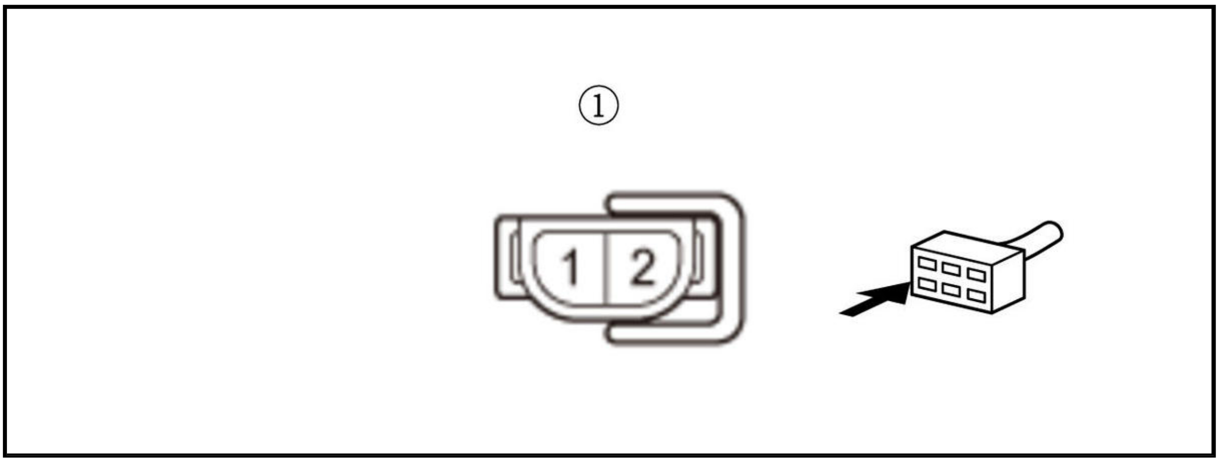
-4. Disconnect the following connector.

RFC unit connector A (2P)

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	RFC unit connector B (3P): disconnected
B	RFC unit connector A (2P): disconnected
Test point 1	RFC unit connector A (2P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The MAIN_FAN_MOTOR wire is OK. Go to step 17.

NO

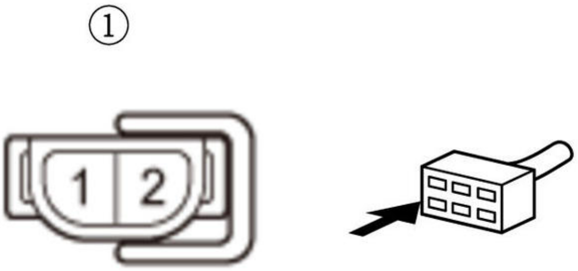
Repair an open in the MAIN_FAN_MOTOR wire between the RFC relay and the RFC unit.

17. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	RFC unit connector B (3P): disconnected
B	RFC unit connector A (2P): disconnected
Test point 1	RFC unit connector A (2P) (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 18.

NO

Repair an open in the GND wire between the RFC unit and G351.

18. RFC unit check

-1. **Substitute a known-good RFC unit** .

-2. Reconnect all connectors.

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Select the RADIATOR FAN in the Function Test Menu with the HDS.

RADIATOR FAN

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0480 RFC System Malfunction	B	B

Is DTC P0480 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Replace the original RFC unit .

DTC P049D

DTC P049D : EGR Control Position Exceeded Learning Limit

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P049D EGR Control Position Exceeded Learning Limit	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P049D EGR Control Position Exceeded Learning Limit	B	B

   Is DTC P049D indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. EGR valve operation check

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Remove the EGR valve .

-4. Reconnect the EGR valve 5P connector.

-5. Turn the vehicle to the ON mode.

-6. Visually check the EGR valve operation.

Does the EGR valve move to its fully closed position?

YES

Go to step 3.

NO

Go to step 4.

3. EGR valve condition check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EGR valve 5P connector

-3. Check for sludge or carbon on the EGR valve.

Is there sludge or carbon on the EGR valve?

YES

Clean the EGR valve and recheck. If DTC P049D is indicated again, **replace the EGR valve** .

NO

Replace the EGR valve .

4. Open wire check (PG line)

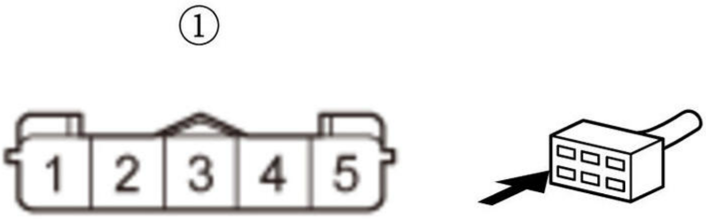
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EGR valve 5P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 5.

NO

Repair an open in the PG wire between the EGR valve and G101.

5. Open wire check (EEGR line)

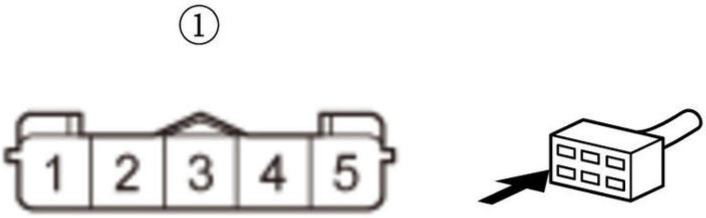
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 10**



Is there 1.0 Ω or less?

YES

The EEGR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the EEGR wire between the PCM (E10) and the EGR valve.

DTC P04AB

DTC P04AB : EVAP Canister Purge Valve Circuit Malfunction 2

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P04AB EVAP Canister Purge Valve Circuit Malfunction 2	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P04AB EVAP Canister Purge Valve Circuit Malfunction 2	B	B

   Is DTC P04AB indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at EVAP canister purge valve 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A11**

   Is the fuse OK?

   YES

   Go to step 3.

NO

Repair a short in the IGPS(PCS2)/IGPS(LAF) wire between the No. A11 fuse and EVAP canister purge valve 2. Also replace the No. A11 fuse.

3. Open wire check (IGPS(PCS2)/IGPS(LAF) line)

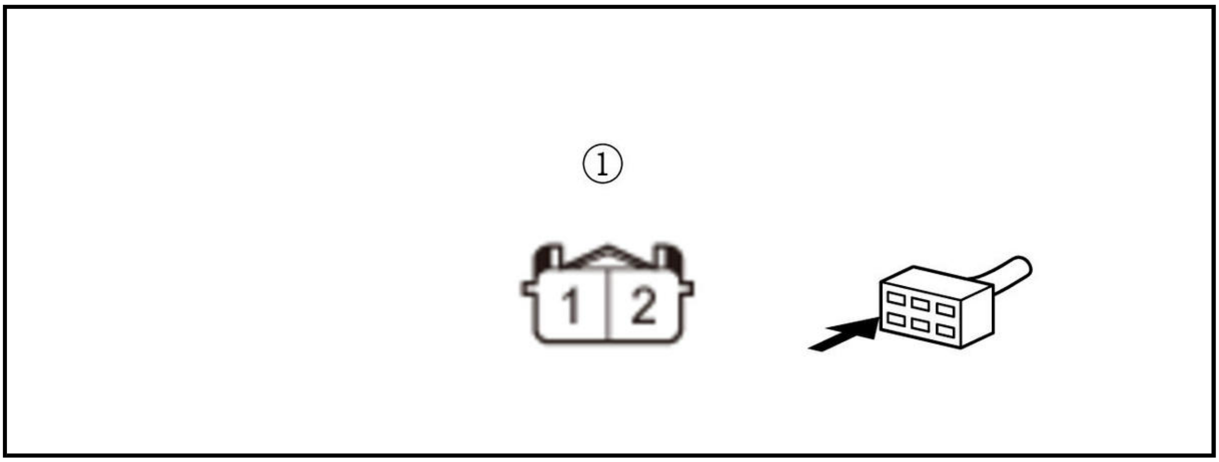
-1. Disconnect the following connector.

EVAP canister purge valve 2 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP canister purge valve 2 2P connector: disconnected
Test point 1	EVAP canister purge valve 2 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGPS(PCS2)/IGPS(LAF) wire is OK. Go to step 4.

NO

Repair an open in the IGPS(PCS2)/IGPS(LAF) wire between the **No. A11 fuse** and EVAP canister purge valve 2.

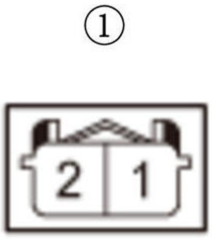
4. EVAP canister purge valve 2 internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. At EVAP canister purge valve 2 side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2 2P connector: disconnected
Test point 1	EVAP canister purge valve 2 2P connector (male terminals) No. 1 (valve side): ①

Test point 2	EVAP canister purge valve 2 2P connector (male terminals) No. 2 (valve side): ①



Is there about 23-26 Ω at room temperature?

YES

The EVAP canister purge valve 2 internal circuit is OK. Go to step 5.

NO

Replace EVAP canister purge valve 2 .

5. Shorted wire check (PCS2 line)

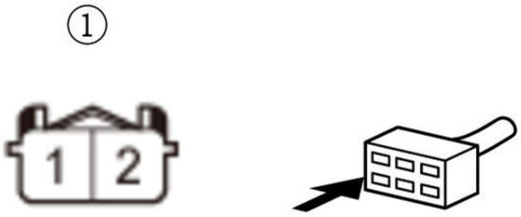
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EVAP canister purge valve 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The PCS2 wire is not shorted. Go to step 6.

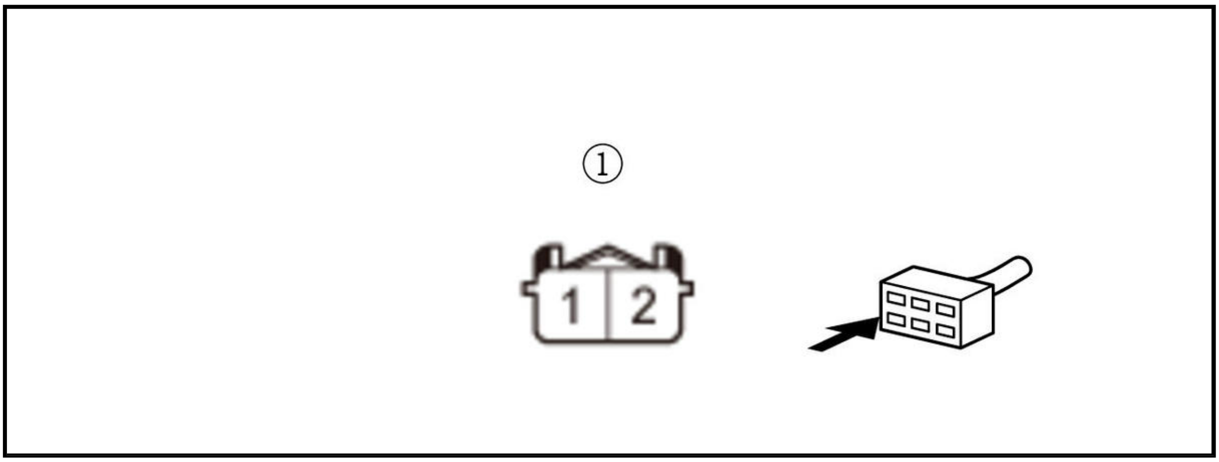
NO

Repair a short in the PCS2 wire between the PCM (E79) and EVAP canister purge valve 2.

6. Open wire check (PCS2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP canister purge valve 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EVAP canister purge valve 2 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 79**



Is there 1.0 Ω or less?

YES

The PCS2 wire is OK. Go to step 7.

NO

Repair an open in the PCS2 wire between the PCM (E79) and EVAP canister purge valve 2.

7. EVAP canister purge valve 2 check

-1. **Substitute known-good EVAP canister purge valve 2** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. **Enter the maintenance mode, then start the engine** .

-7. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P04AB EVAP Canister Purge Valve Circuit Malfunction 2	B	B

Is DTC P04AB indicated?

YES

EVAP canister purge valve 2 is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace original EVAP canister purge valve 2 .

DTC P04AE

DTC P04AE : EVAP System High Purge Flow Detected 2

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P04AE EVAP System High Purge Flow Detected 2	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

NOTE: If the test could not be completed because of another DTC, do the troubleshooting for that DTC.

EVAP TEST

Is the result OK?

YES

Intermittent failure, the system is OK at this time. Check EVAP canister purge valve 2 for debris that may cause it to stick open intermittently. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

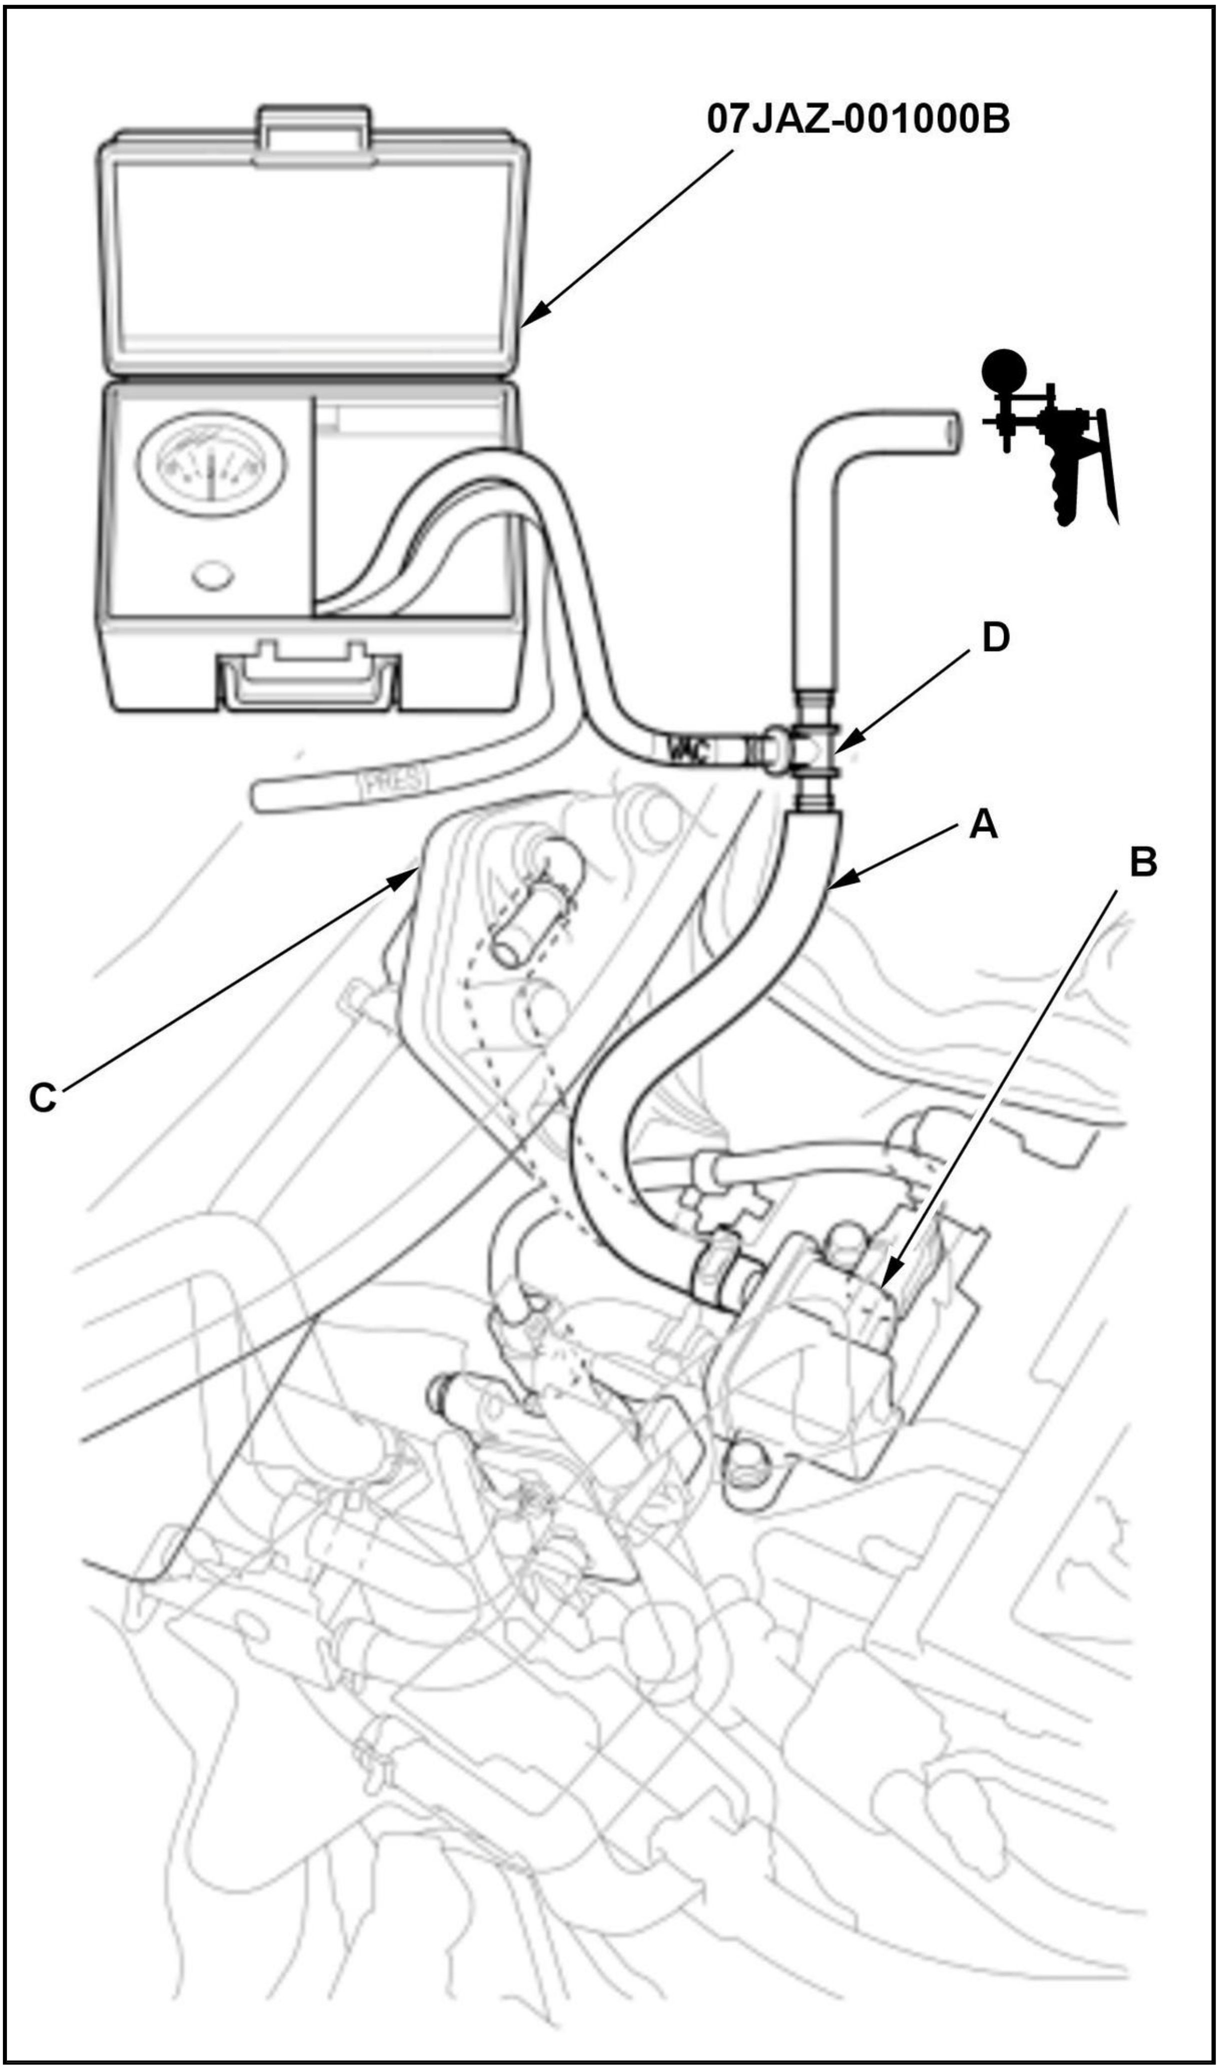
NO

The failure is duplicated. Go to step 2.

2. EVAP canister purge valve 2 open stuck check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the hose (A) of EVAP canister purge valve 2 (B) from the throttle body (C), then connect the T-fitting (D), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg as shown.



07JAZ-001000B
D
A
B
C
VAC
PRES

-3. Apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose.

Does it hold vacuum?

YES

Replace the EVAP leak check module .

NO

Check the hose leakage. If the hose is OK, **replace EVAP canister purge valve 2** .

DTC P04DF

DTC P04DF : EVAP System High Purge Flow Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P04DF EVAP System High Purge Flow Detected	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

NOTE: If the test could not be completed because of another DTC, do the troubleshooting for that DTC.

EVAP TEST

Is the result OK?

YES

Intermittent failure, the system is OK at this time. Check EVAP canister purge valve 1 for debris that may cause it to stick open intermittently. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

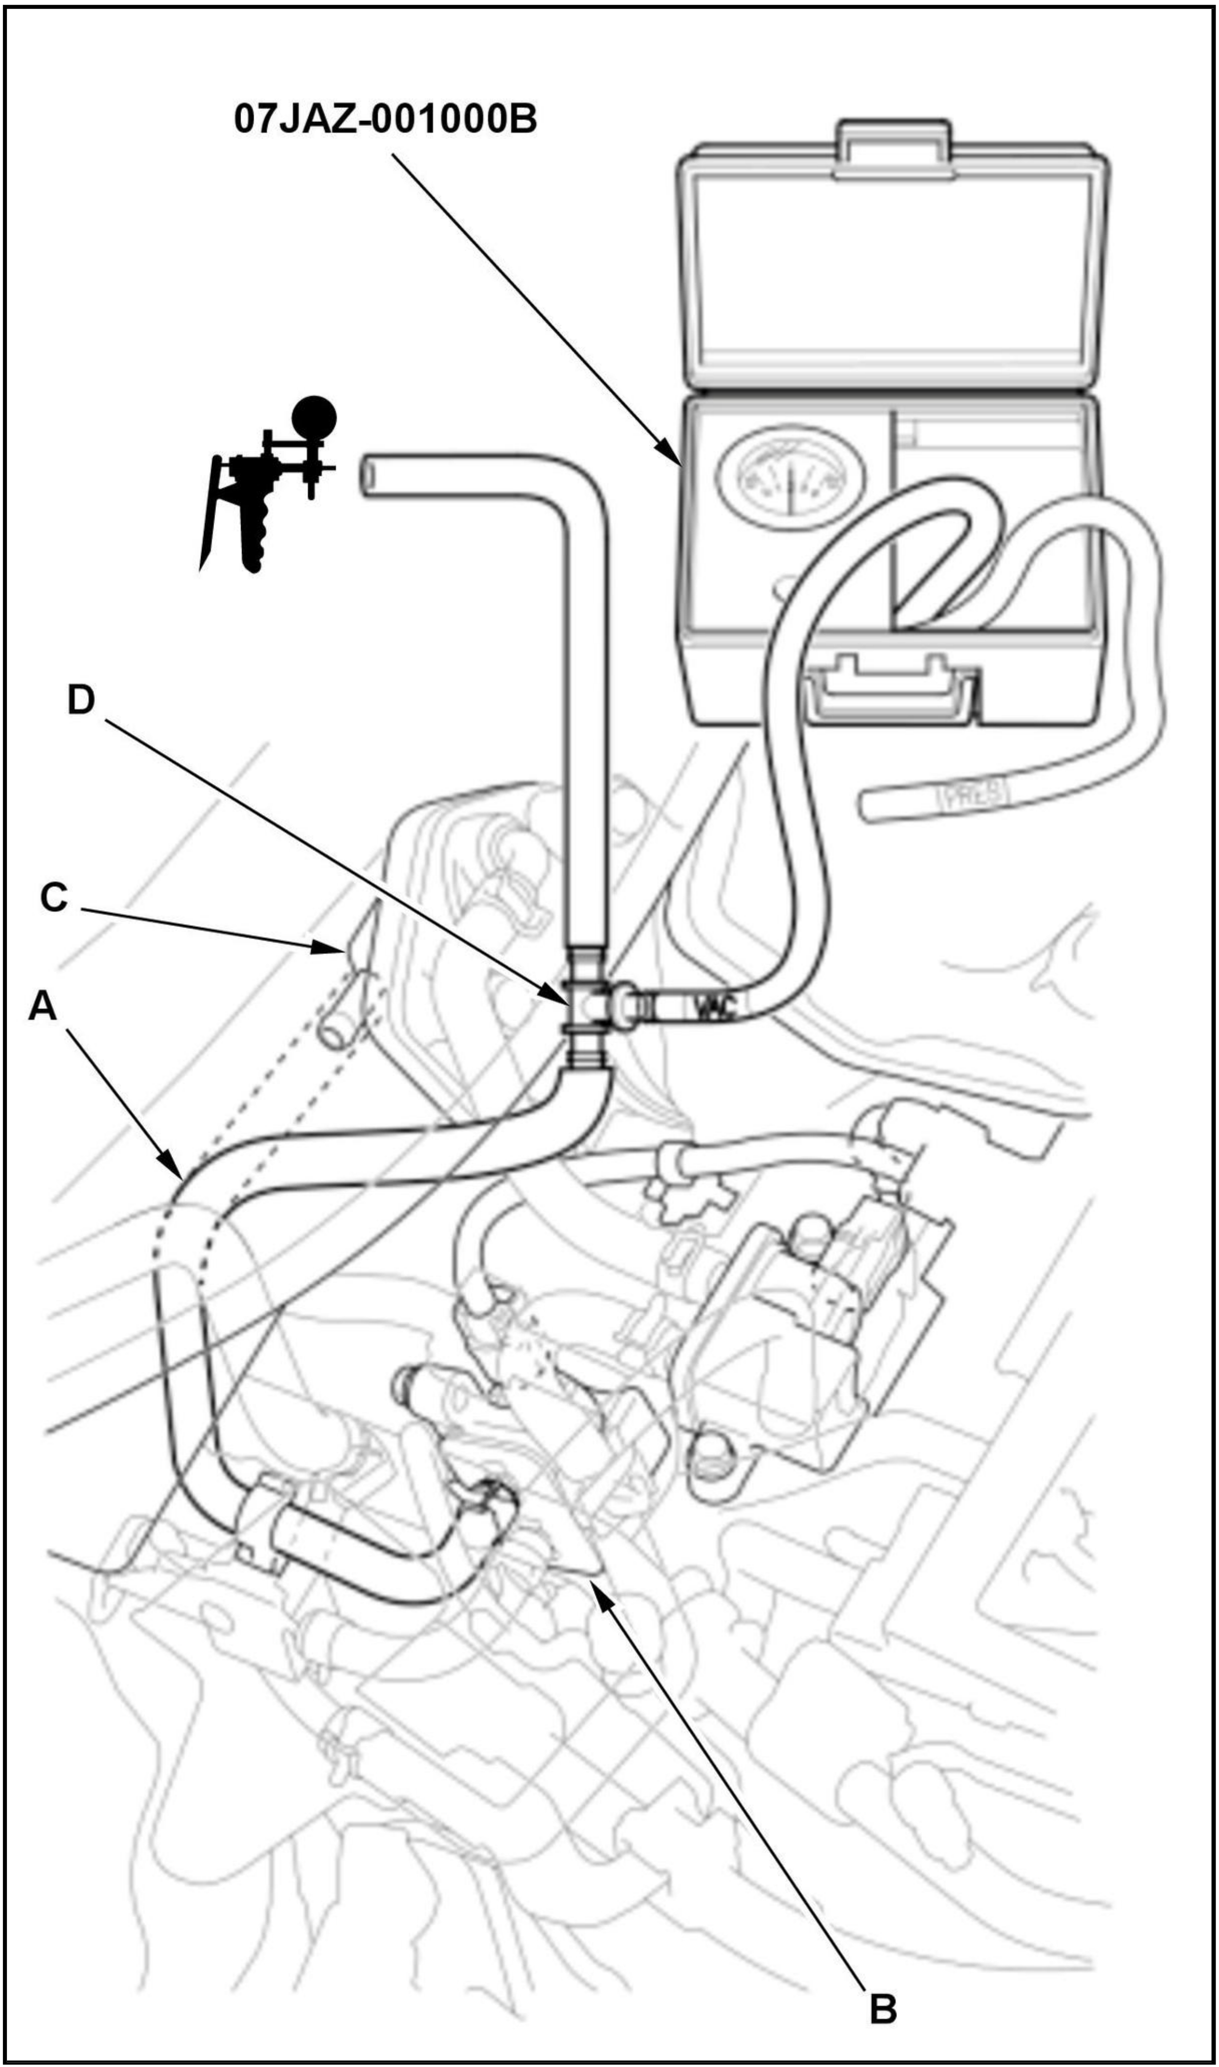
NO

The failure is duplicated. Go to step 2.

2. EVAP canister purge valve 1 open stuck check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the hose (A) of EVAP canister purge valve 1 (B) from the intake manifold (C), then connect the T-fitting (D), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg as shown.



07JAZ-001000B
D
C
A
VAC
PRES
B

-3. Apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose.

Does it hold vacuum?

YES

Replace the EVAP leak check module .

NO

Check the hose leakage. If the hose is OK, **replace EVAP canister purge valve 1** .

DTC P04E0

DTC P04E0 : EVAP Canister Purge Valve Stuck Closed

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P04E0 EVAP Canister Purge Valve Stuck Closed	B	B

DTC(PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST in the Function Test Menu, then select the EVAP Purge Flow Check Test with the HDS.

EVAP TEST

Is the result OK?

YES

If the test result is PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the fuel vapor containment valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

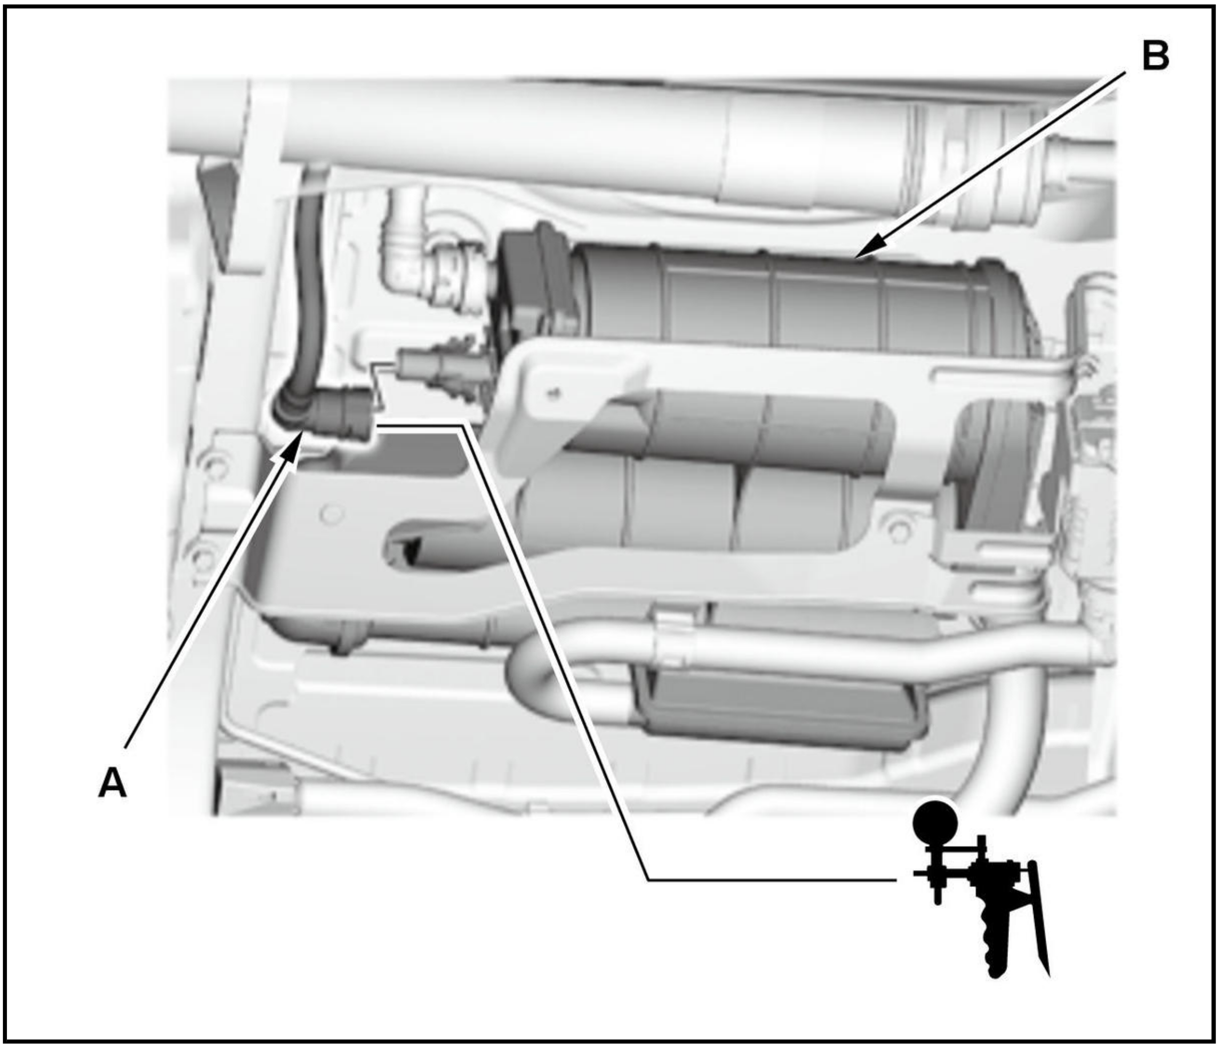
NO

Go to step 2.

2. EVAP canister purge valve check (closed stuck)

-1. **Remove the heat shield** .

-2. Disconnect the EVAP canister purge hose (A) from the EVAP canister (B), and connect a vacuum pump/gauge, 0-30 inHg, to the hose.



-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then continue to hold the engine speed at 3, 000 rpm.

Is there vacuum?

YES

Replace the EVAP canister .

NO

Inspect the purge hose routing. If OK, **replace the EVAP canister purge valve 1** .

DTC P04F1

DTC P04F1 : EVAP System Low Purge Flow Detected

Special Tools Required

Vacuum Pump/Gauge, 0-30 inHg Snap-on YA4000A or equivalent, commercially available

Vacuum/Pressure Gauge, 0-4 inHg 07JAZ-001000B

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P04F1 EVAP System Low Purge Flow Detected	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at EVAP canister purge valve 1, EVAP canister purge valve 2, the EVAP leak check module, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the result of the EVAP Leak Check Module Test is OK, but the DTC P04F1 is stored again, go to step 2.

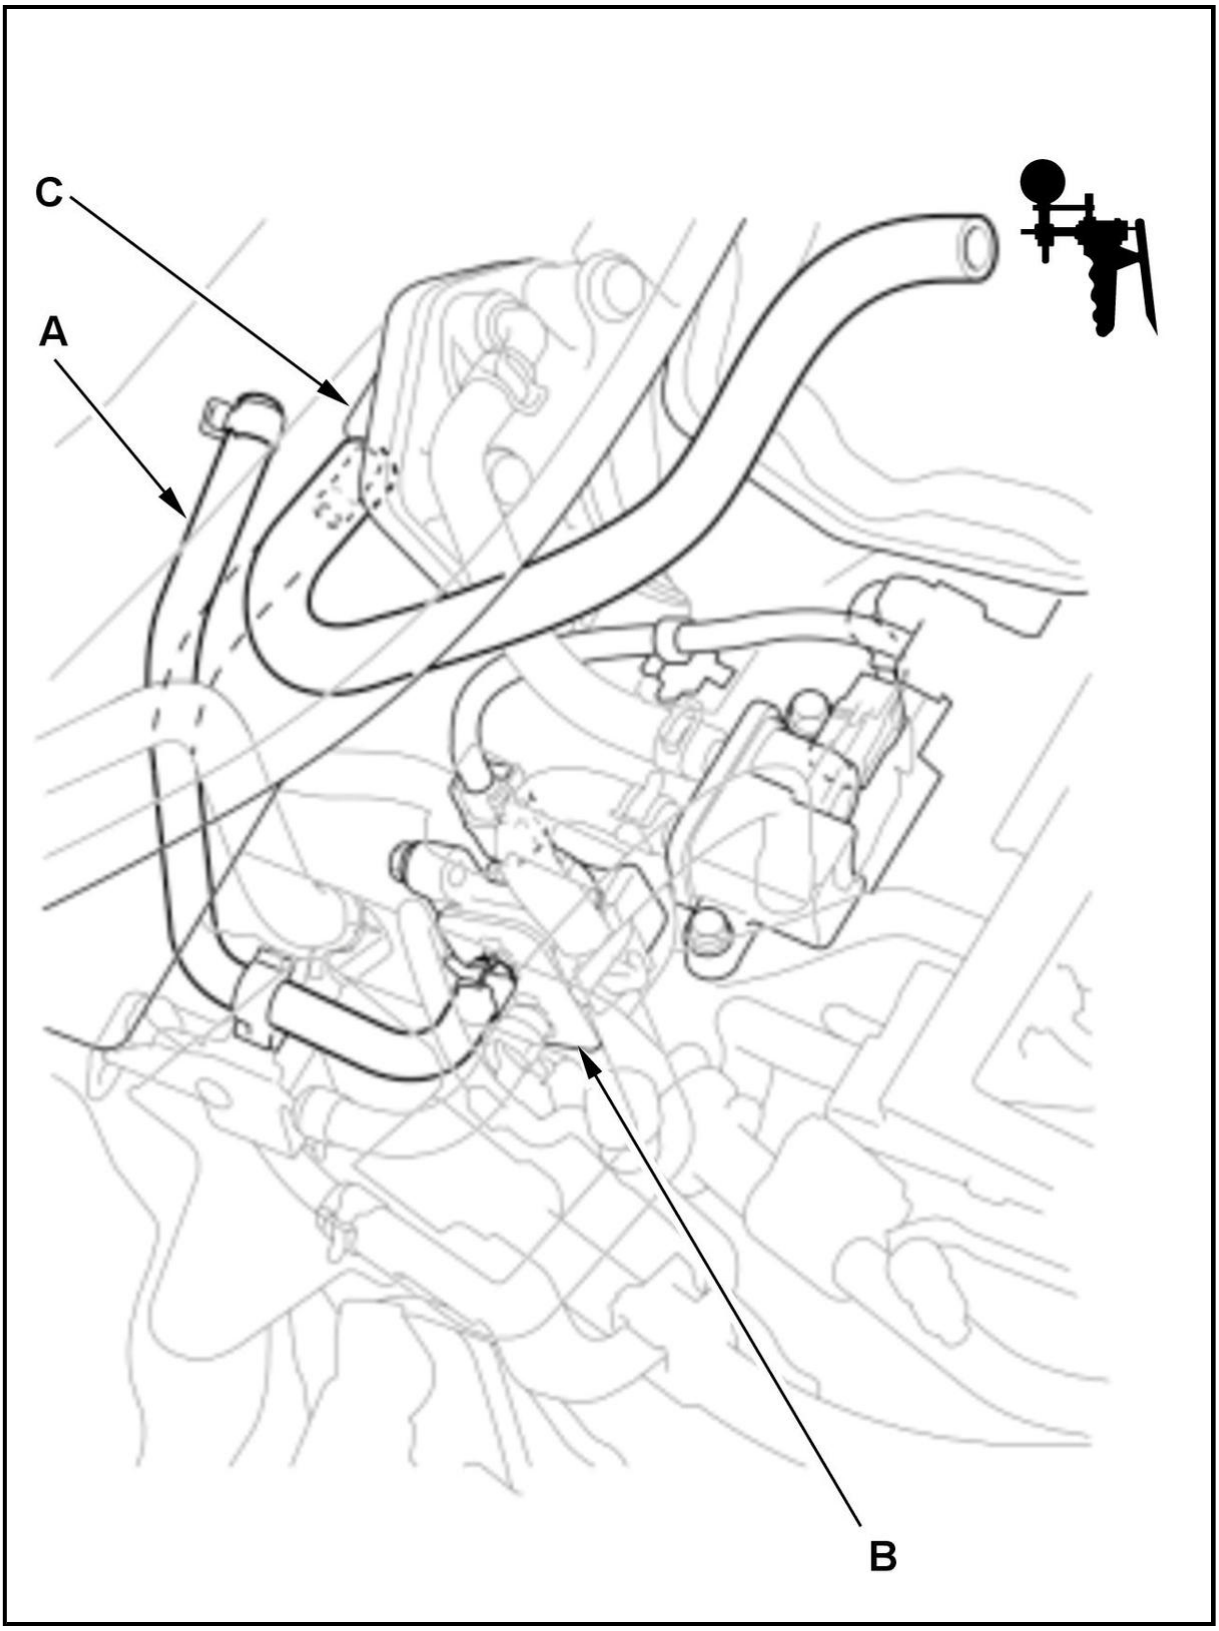
   NO

   The failure is duplicated. Go to step 2.

2. EVAP canister purge port check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the hose (A) of EVAP canister purge valve 1 (B) from the intake manifold (C), then connect the vacuum pump/gauge, 0-30 inHg to the intake manifold as shown.



-3. Apply vacuum to the hose.

Does it hold vacuum?

YES

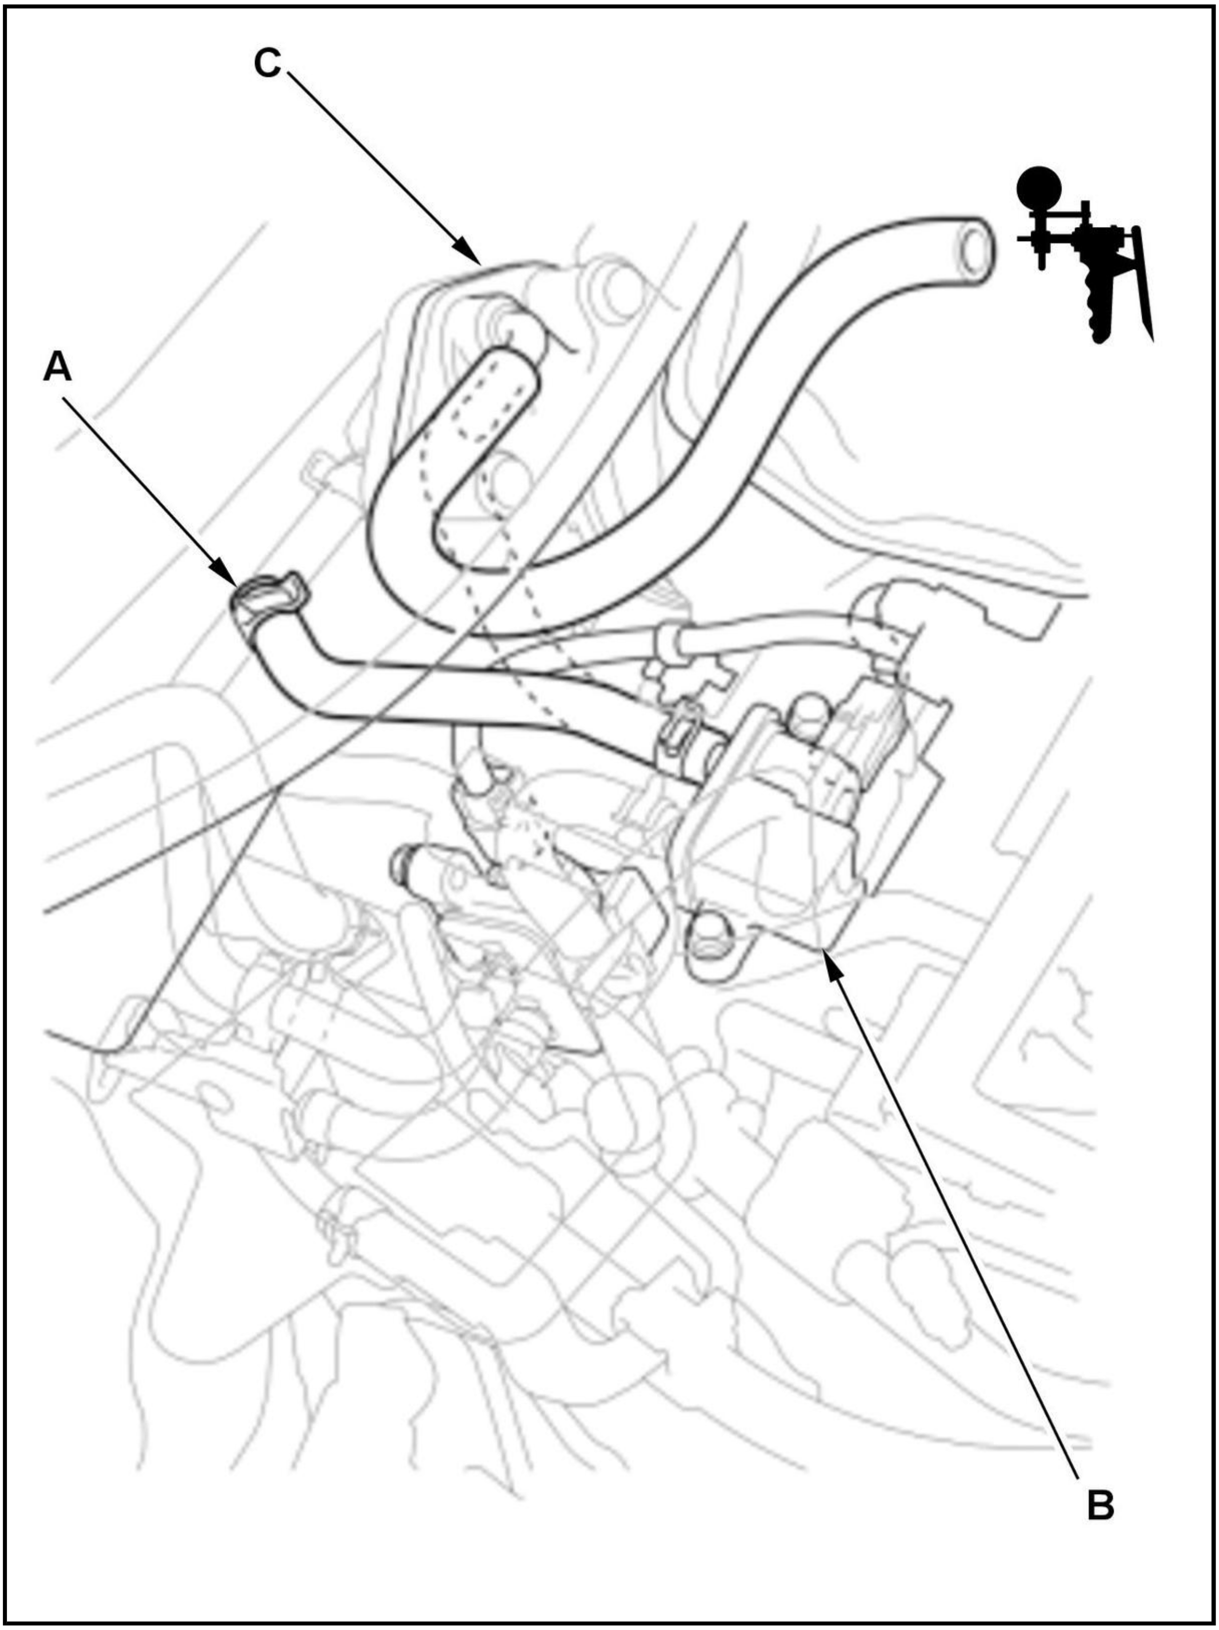
Remove the blockage from the EVAP canister purge port on the intake manifold.

NO

Go to step 3.

3. EVAP canister purge port check 2

-1. Disconnect the hose (A) of EVAP canister purge valve 2 (B) from the throttle body (C), then connect the vacuum pump/gauge, 0-30 inHg to the throttle body as shown.



-2. Apply vacuum to the hose.

Does it hold vacuum?

YES

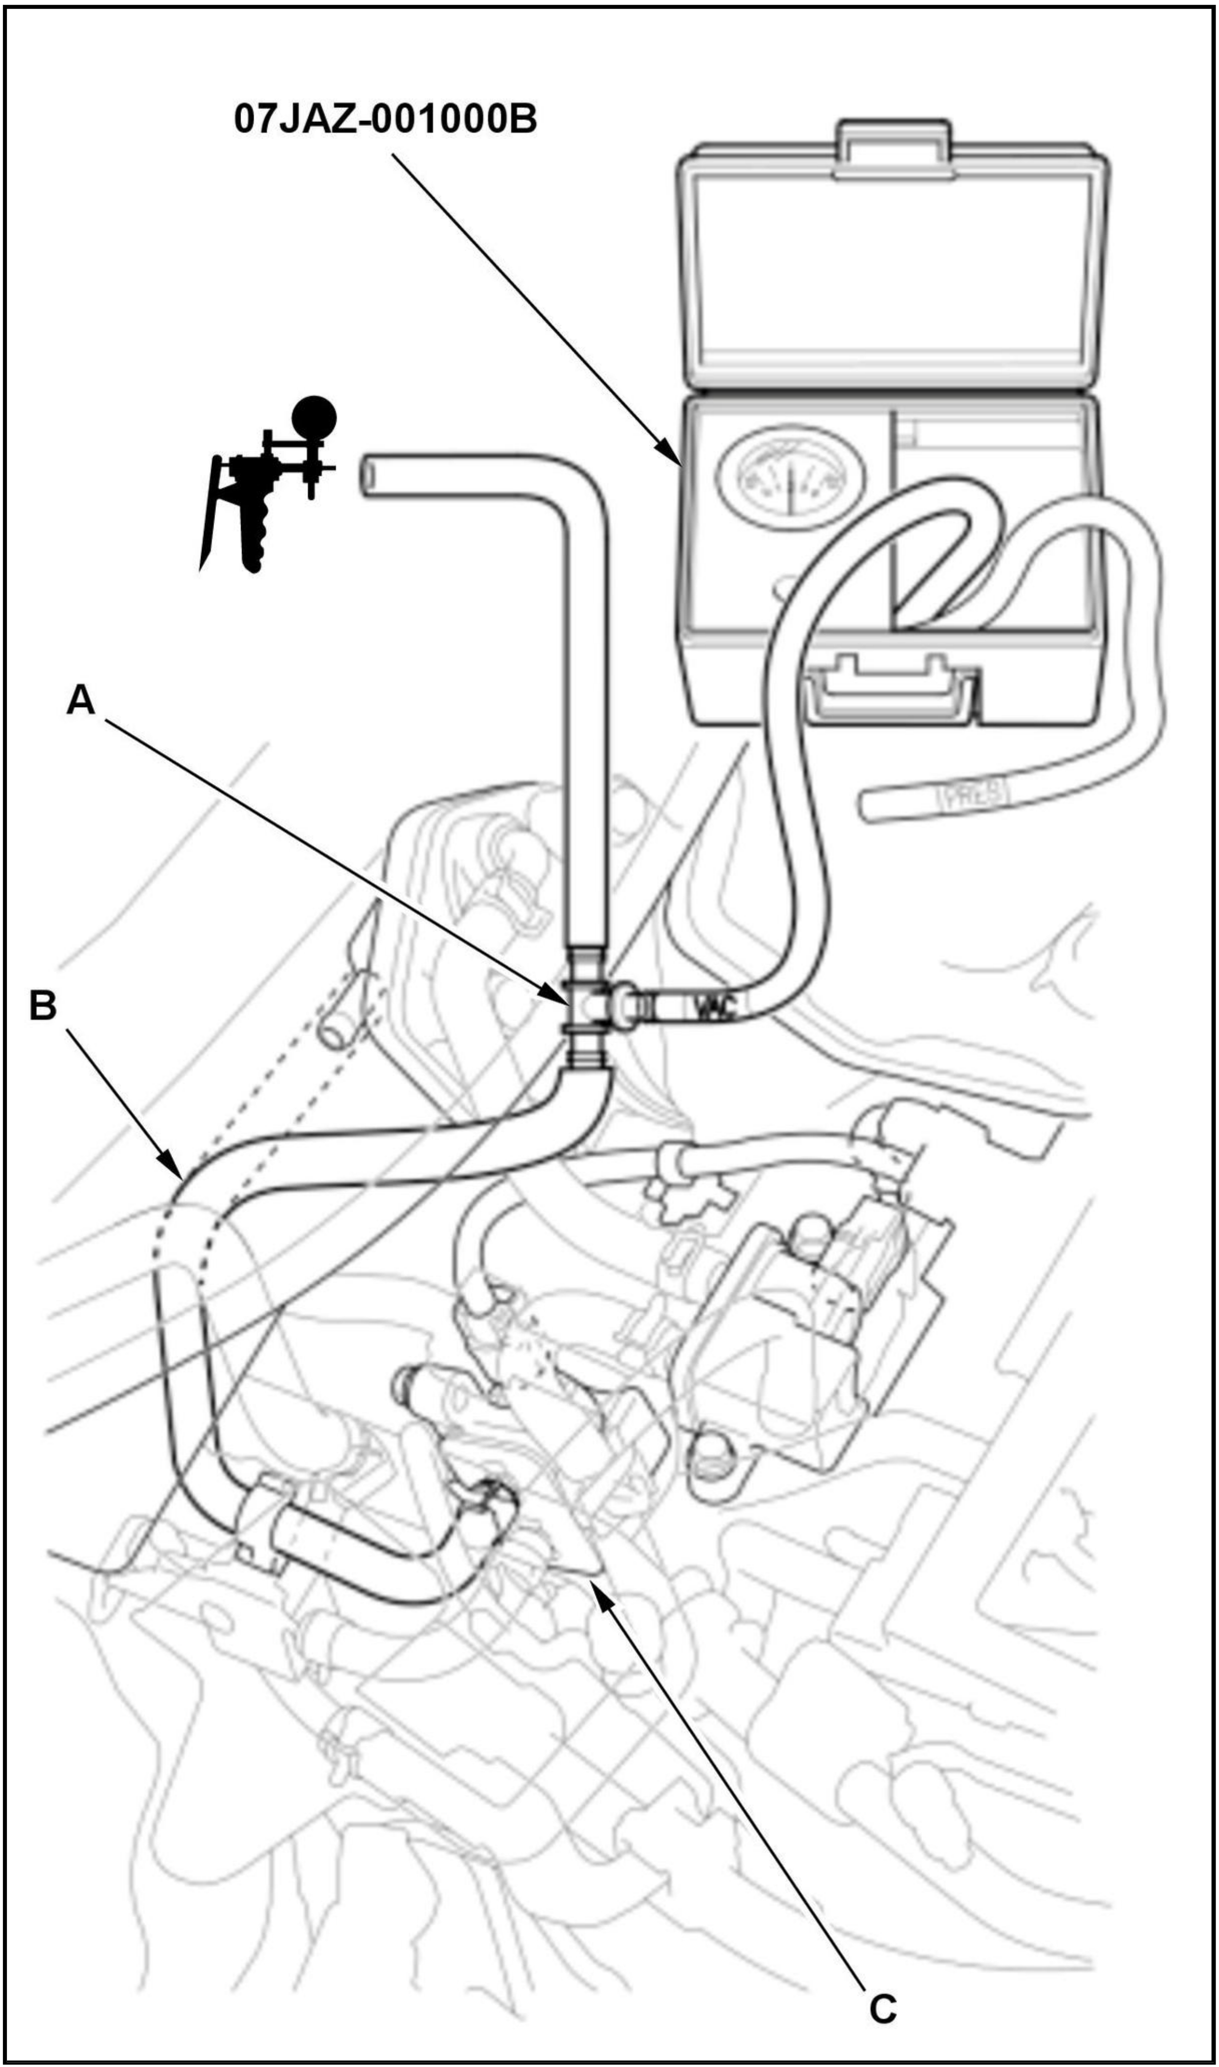
Remove the blockage from the EVAP canister purge port on the throttle body.

NO

Go to step 4.

4. EVAP canister purge valve 1 check

   -1. Connect the T-fitting (A), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg to the hose (B) of EVAP canister purge valve 1 (C) as shown.



07JAZ-001000B
A
B
C
VAC
PRES

-2. Turn the vehicle to the ON mode.

-3. Apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose, and wait for a minute.

-4. Select the EVAP TEST in the Function Test Menu, and do the PCS 1 ON in the SOLENOID TEST with the HDS.

EVAP TEST

Does it hold vacuum, then release?

YES

EVAP canister purge valve 1 is OK, go to step 5.

NO (Does not hold vacuum)

Check for leakage of the hose between EVAP canister purge valve 1 and the intake manifold. If the hose is OK, **replace EVAP canister purge valve 1** .

NO (Does not release vacuum)

Check for a blockage in the hose between EVAP canister purge valve 1 and the intake manifold. If the hose is OK, **replace EVAP canister purge valve 1** .

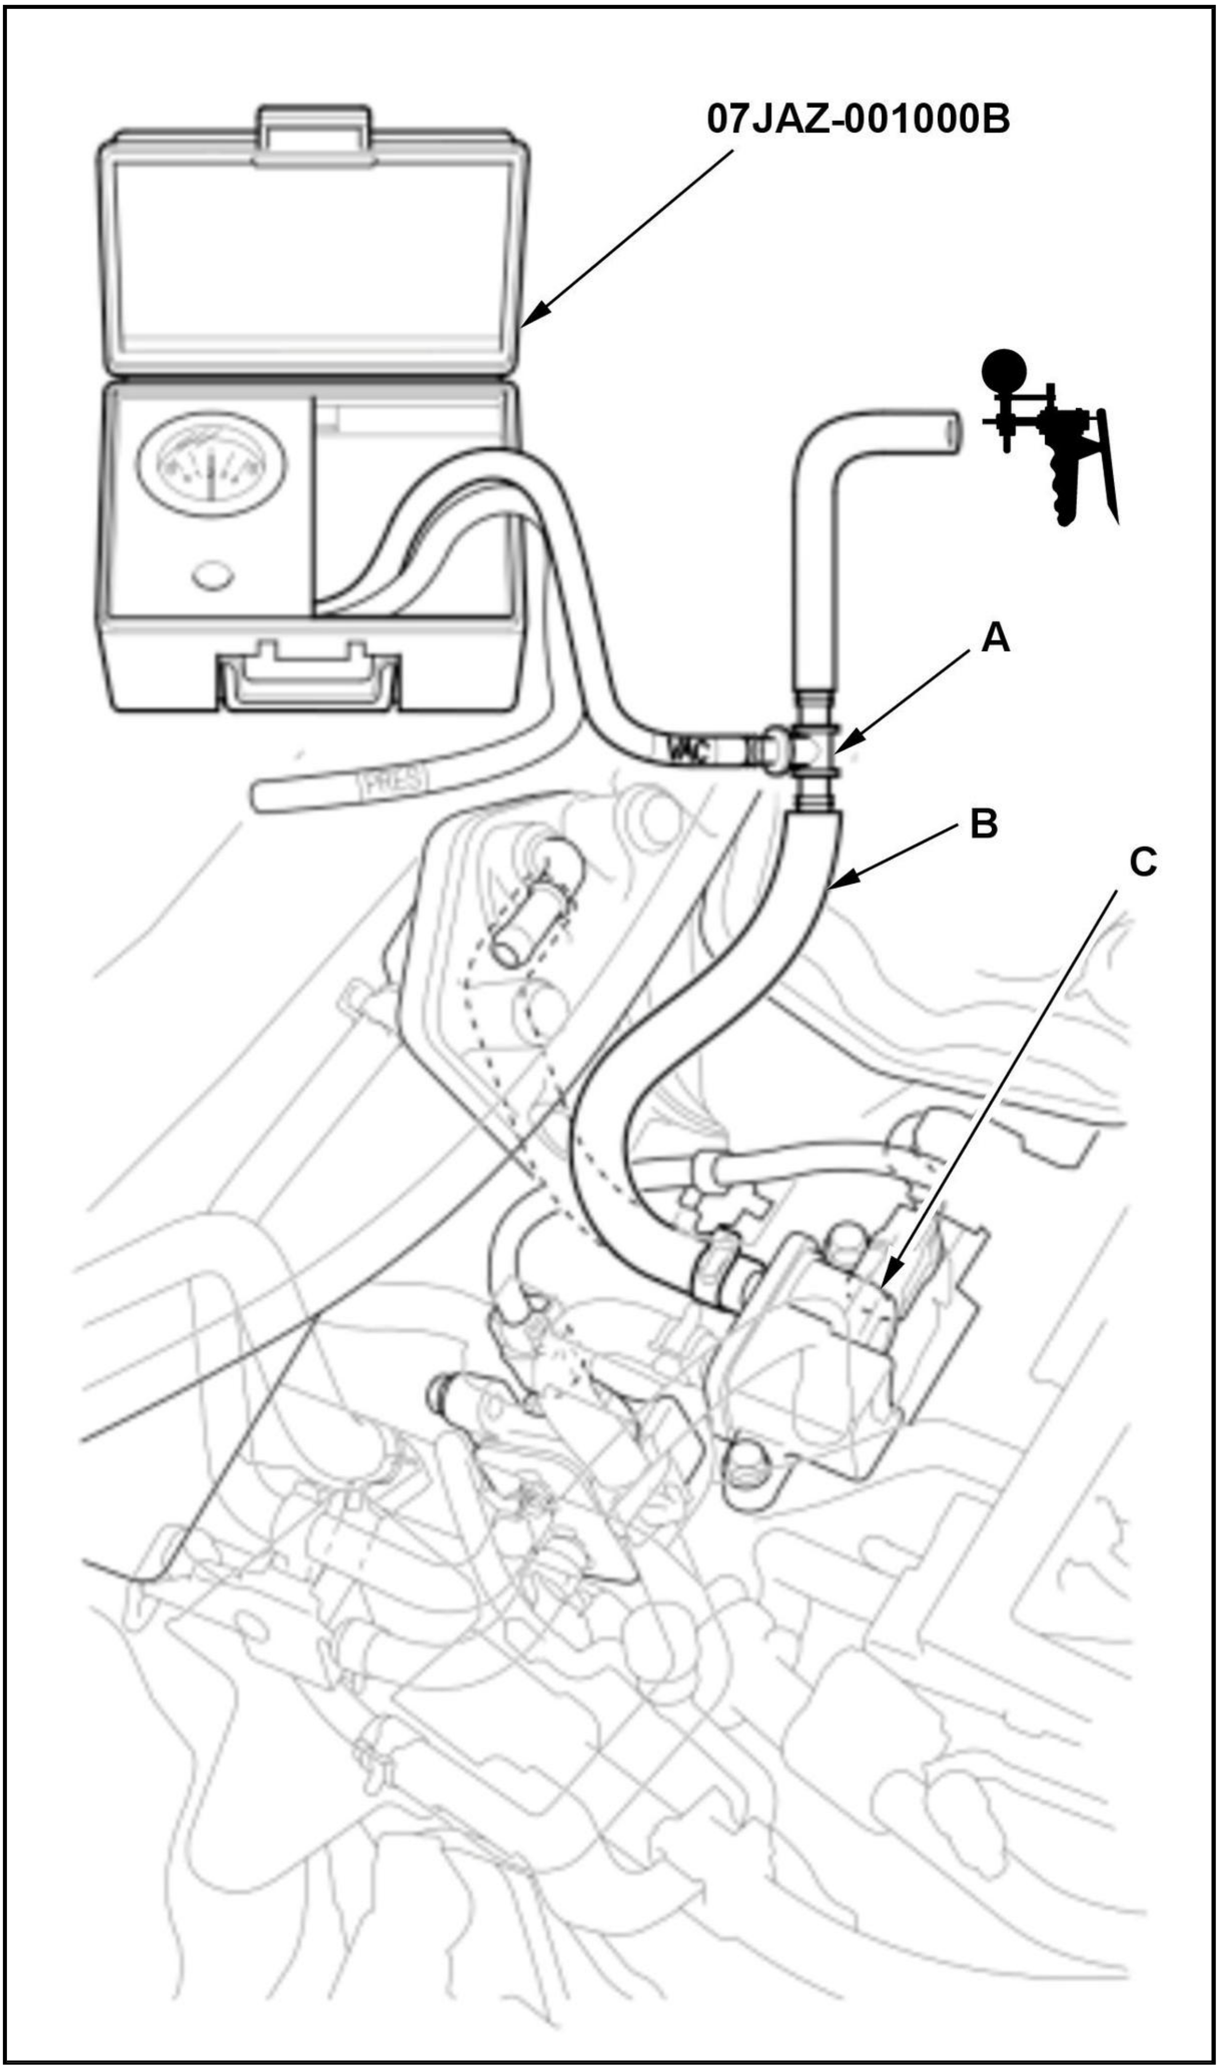
5. EVAP canister purge valve 2 check

-1. Select the EVAP TEST in the Function Test Menu, and do the PCS 1 OFF in the SOLENOID TEST with the HDS.

EVAP TEST

Remove the vacuum gauge, the tube joint adapter, and the vacuum pump/gauge, and reconnect the hose to EVAP canister purge valve 1.

-3. Connect the T-fitting (A), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg to the hose (B) of EVAP canister purge valve 2 (C) as shown.



07JAZ-001000B
A
B
C
VAC
PRES

-4. Apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose, and wait for a minute.

-5. Select the EVAP TEST in the Function Test Menu, and do the PCS 2 ON in the SOLENOID TEST with the HDS.

EVAP TEST

Does it hold vacuum, then release?

YES

EVAP canister purge valve 2 is OK, go to step 6.

NO (Does not hold vacuum)

Check for leakage of the hose between EVAP canister purge valve 2 and the throttle body. If the hose is OK, **replace EVAP canister purge valve 2** .

NO (Does not release vacuum)

Check for a blockage in the hose between EVAP canister purge valve 2 and the throttle body. If the hose is OK, **replace EVAP canister purge valve 2** .

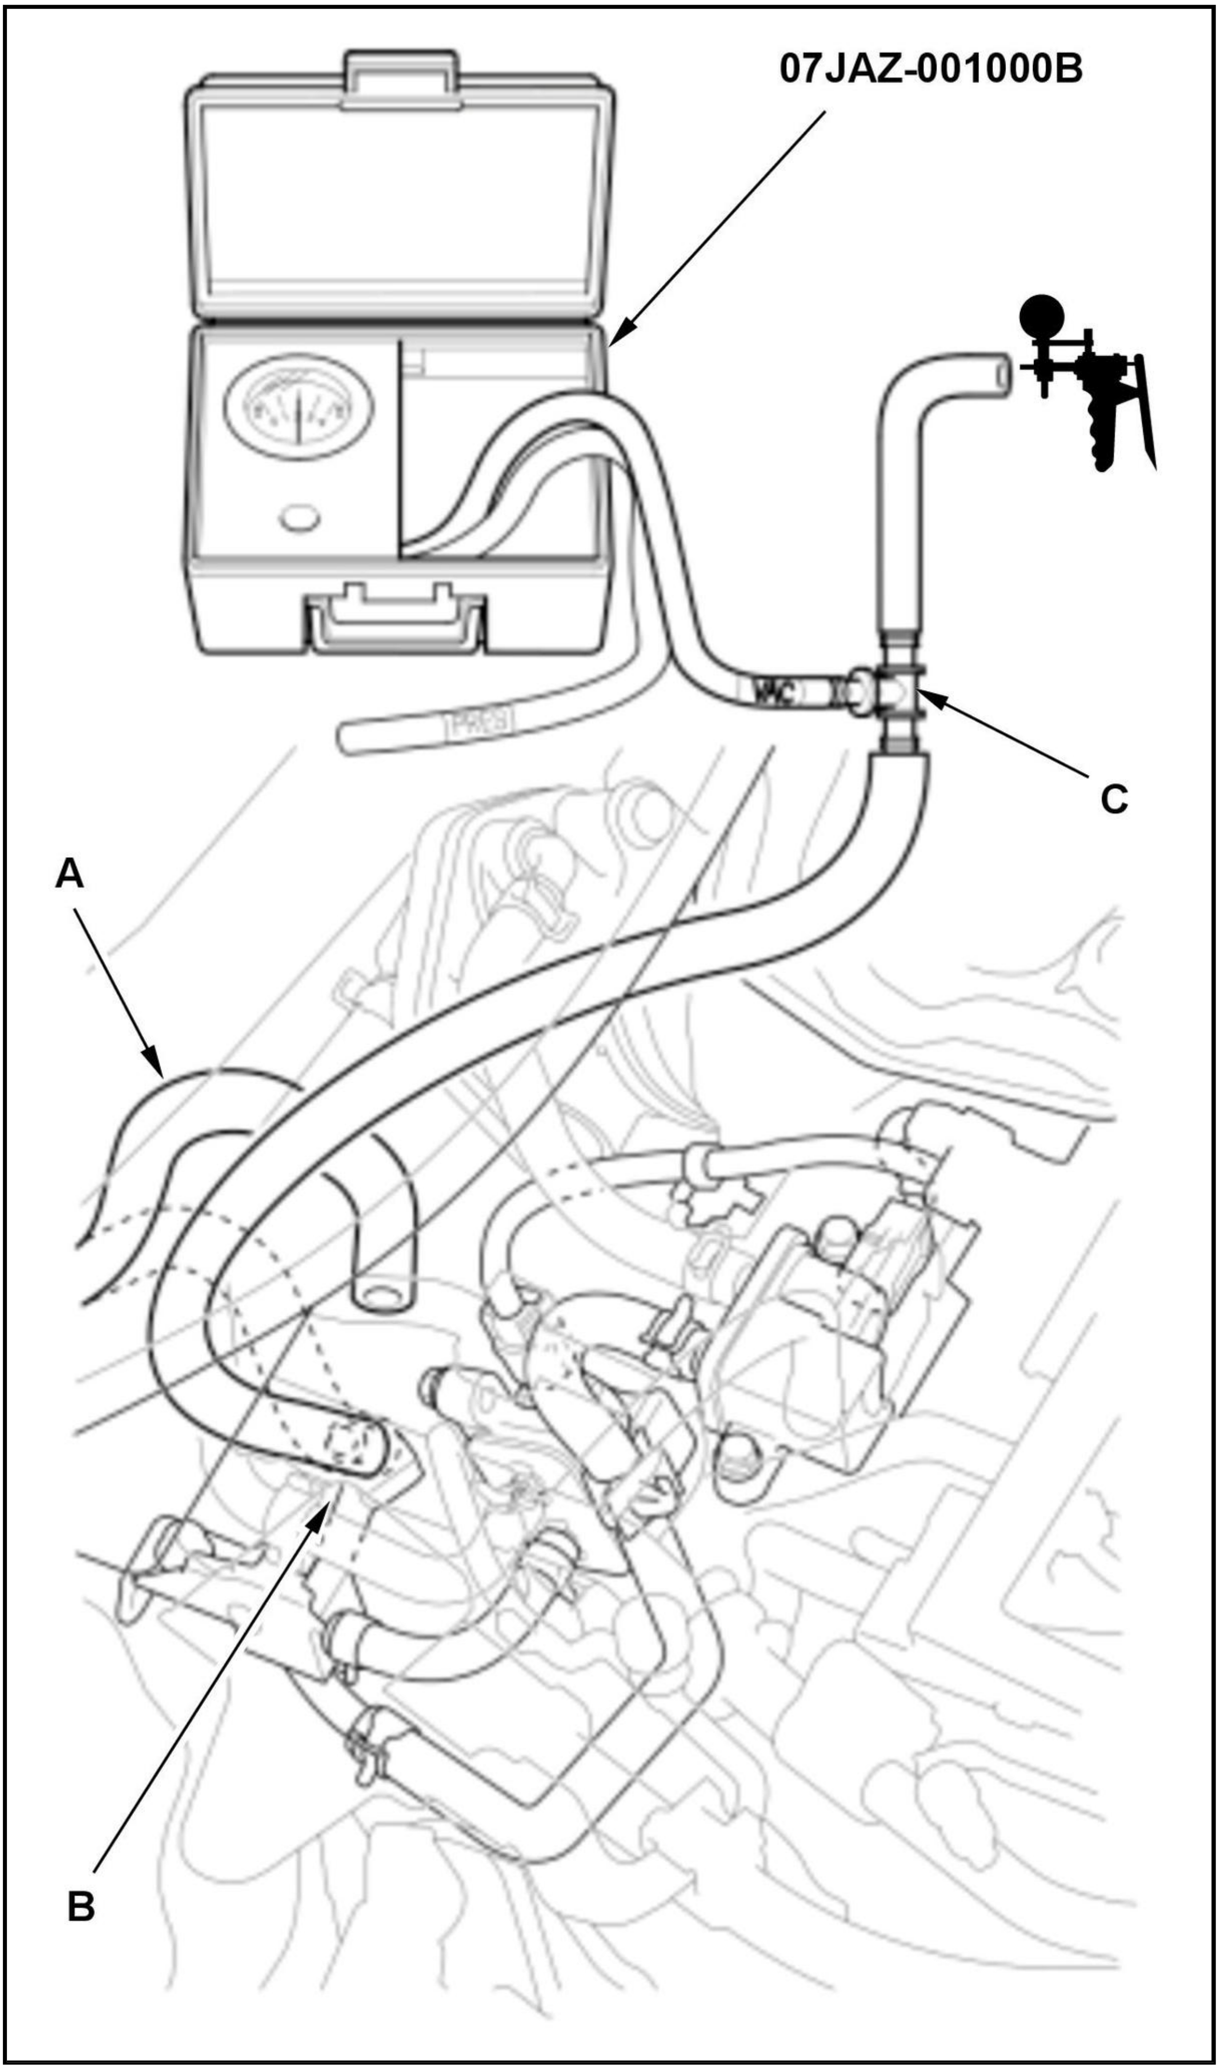
6. EVAP canister purge line check 1

-1. Select the EVAP TEST in the Function Test Menu, and do the PCS 2 OFF in the SOLENOID TEST with the HDS.

EVAP TEST

Remove the vacuum gauge, the tube joint adapter, and the vacuum pump/gauge, and reconnect the hose to EVAP canister purge valve 2.

-3. Disconnect the hose (A) from the 3-way joint (B), then connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg to the 3-way joint as shown.



07JAZ-001000B
VAC
PRES
C
A
B

-4. Apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose, and wait for a minute.

-5. Select the EVAP TEST in the Function Test Menu, and do the PCS 1 ON in the SOLENOID TEST with the HDS.

EVAP TEST

Does it hold vacuum, then release?

YES

Go to step 7.

NO (Does not hold vacuum)

Check for leakage between the 3-way joint and EVAP canister purge valve 1.

NO (Does not release vacuum)

Check for a blockage between the 3-way joint and EVAP canister purge valve 1.

7. EVAP canister purge line check 2

-1. Select the EVAP TEST in the Function Test Menu, and do the PCS 1 OFF in the SOLENOID TEST with the HDS.

EVAP TEST

Apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose, and wait for a minute.

-3. Select the EVAP TEST in the Function Test Menu, and do the PCS 2 ON in the SOLENOID TEST with the HDS.

EVAP TEST

Does it hold vacuum, then release?

YES

Go to step 8.

NO (Does not hold vacuum)

Check for leakage between the 3-way joint and EVAP canister purge valve 2.

NO (Does not release vacuum)

Check for a blockage between the 3-way joint and EVAP canister purge valve 2.

8. EVAP canister purge line check 3

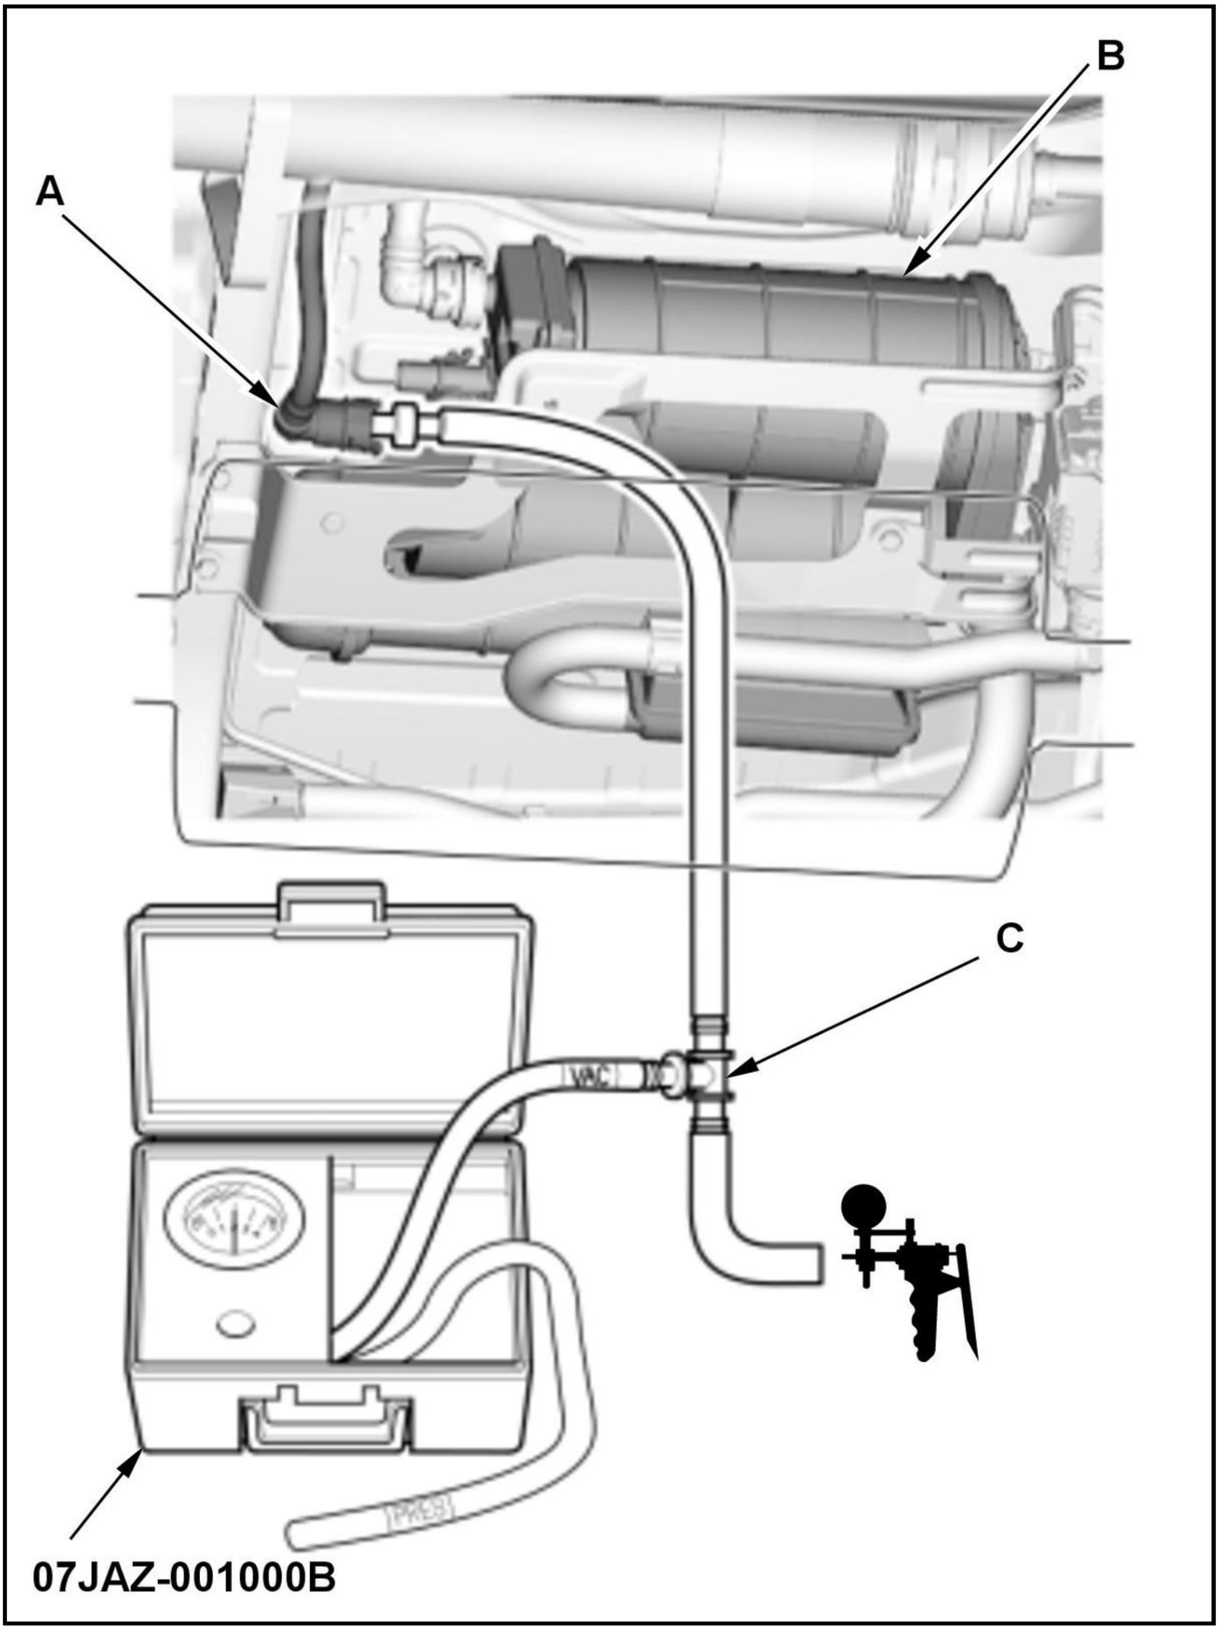
-1. Select the EVAP TEST in the Function Test Menu, and do the PCS 2 OFF in the SOLENOID TEST with the HDS.

EVAP TEST

Remove the vacuum gauge, the tube joint adapter, and the vacuum pump/gauge, and reconnect the hose to the 3-way joint.

-3. Remove the heat shield .

-4. Disconnect the EVAP canister purge line (A) from the EVAP canister (B), then connect the T-fitting (C), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg to the EVAP canister purge line as shown.



-5. Apply about 2 kPa (15 mmHg, 0.6 inHg) of vacuum to the hose, and wait for a minute.

-6. Select the EVAP TEST in the Function Test Menu, then do the PCS 1 and PCS 2 ON in the SOLENOID TEST with the HDS.

EVAP TEST

Does it hold vacuum, then release?

YES

Go to step 9.

NO (Does not hold vacuum)

Check for leakage between the EVAP canister and the 3-way joint.

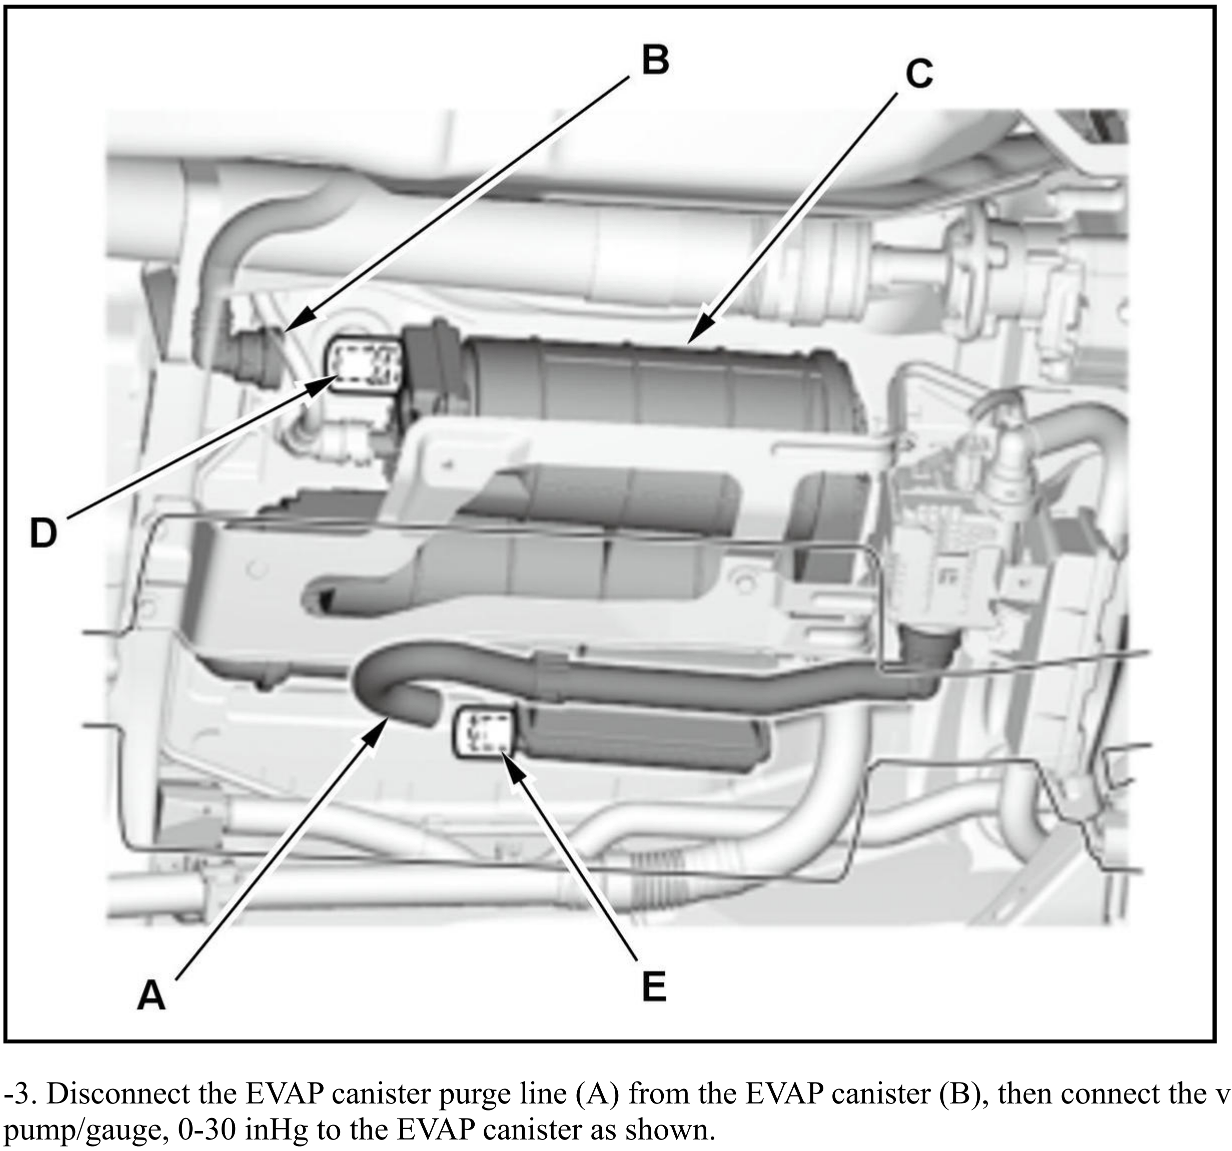
NO (Does not release vacuum)

Check for a blockage between the EVAP canister and the 3-way joint.

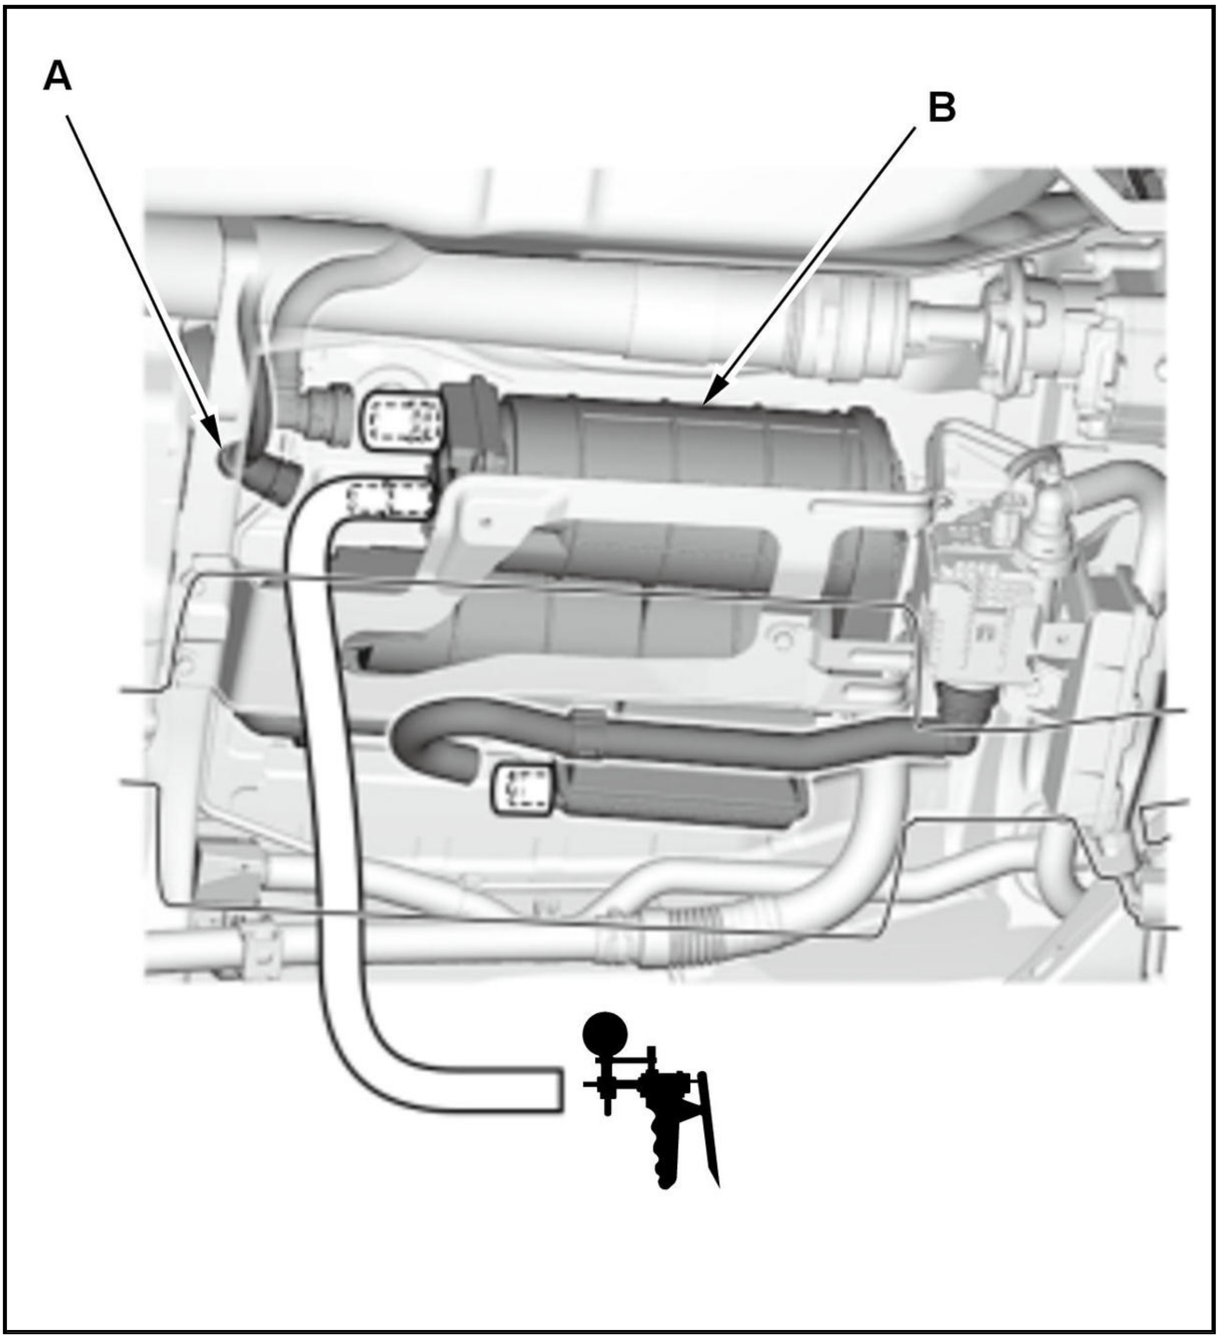
9. EVAP canister vent line check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the fuel vent hose (B) and the EVAP canister drain hose A from the EVAP canister (C), and plug the EVAP canister port (D) and (E).



-3. Disconnect the EVAP canister purge line (A) from the EVAP canister (B), then connect the vacuum pump/gauge, 0-30 inHg to the EVAP canister as shown.



-4. Slowly apply the vacuum to the EVAP canister.

Does it hold vacuum?

YES

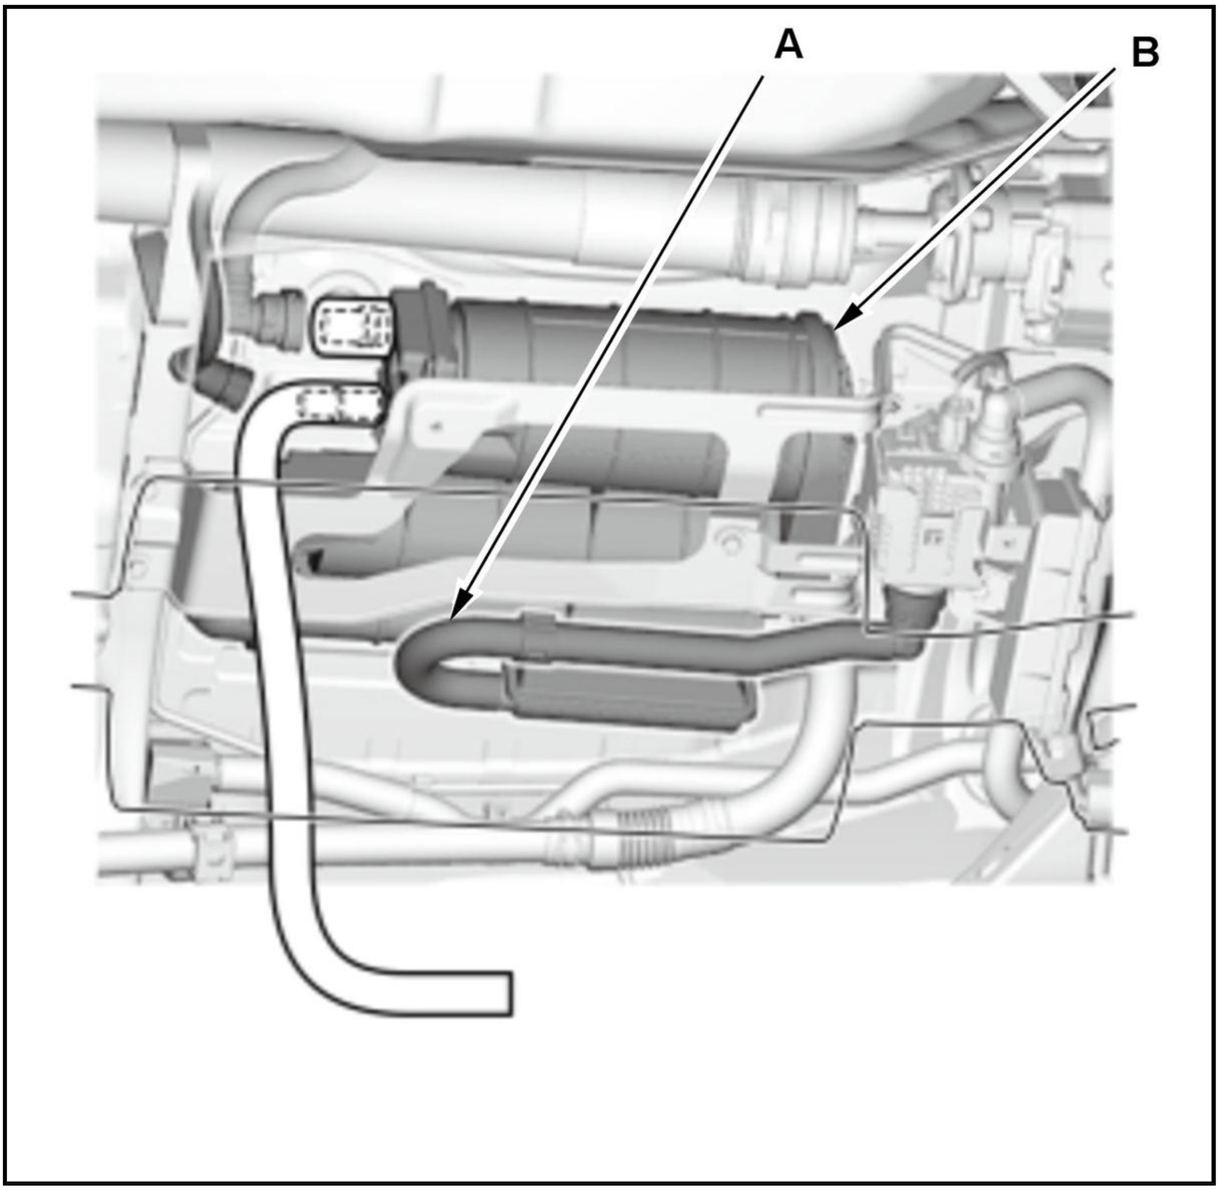
Go to step 10.

NO

Replace the EVAP canister .

10. EVAP leak check module performance check

    -1. Connect the EVAP canister drain hose A to the EVAP canister (B).



-2. Turn the vehicle to the ON mode.

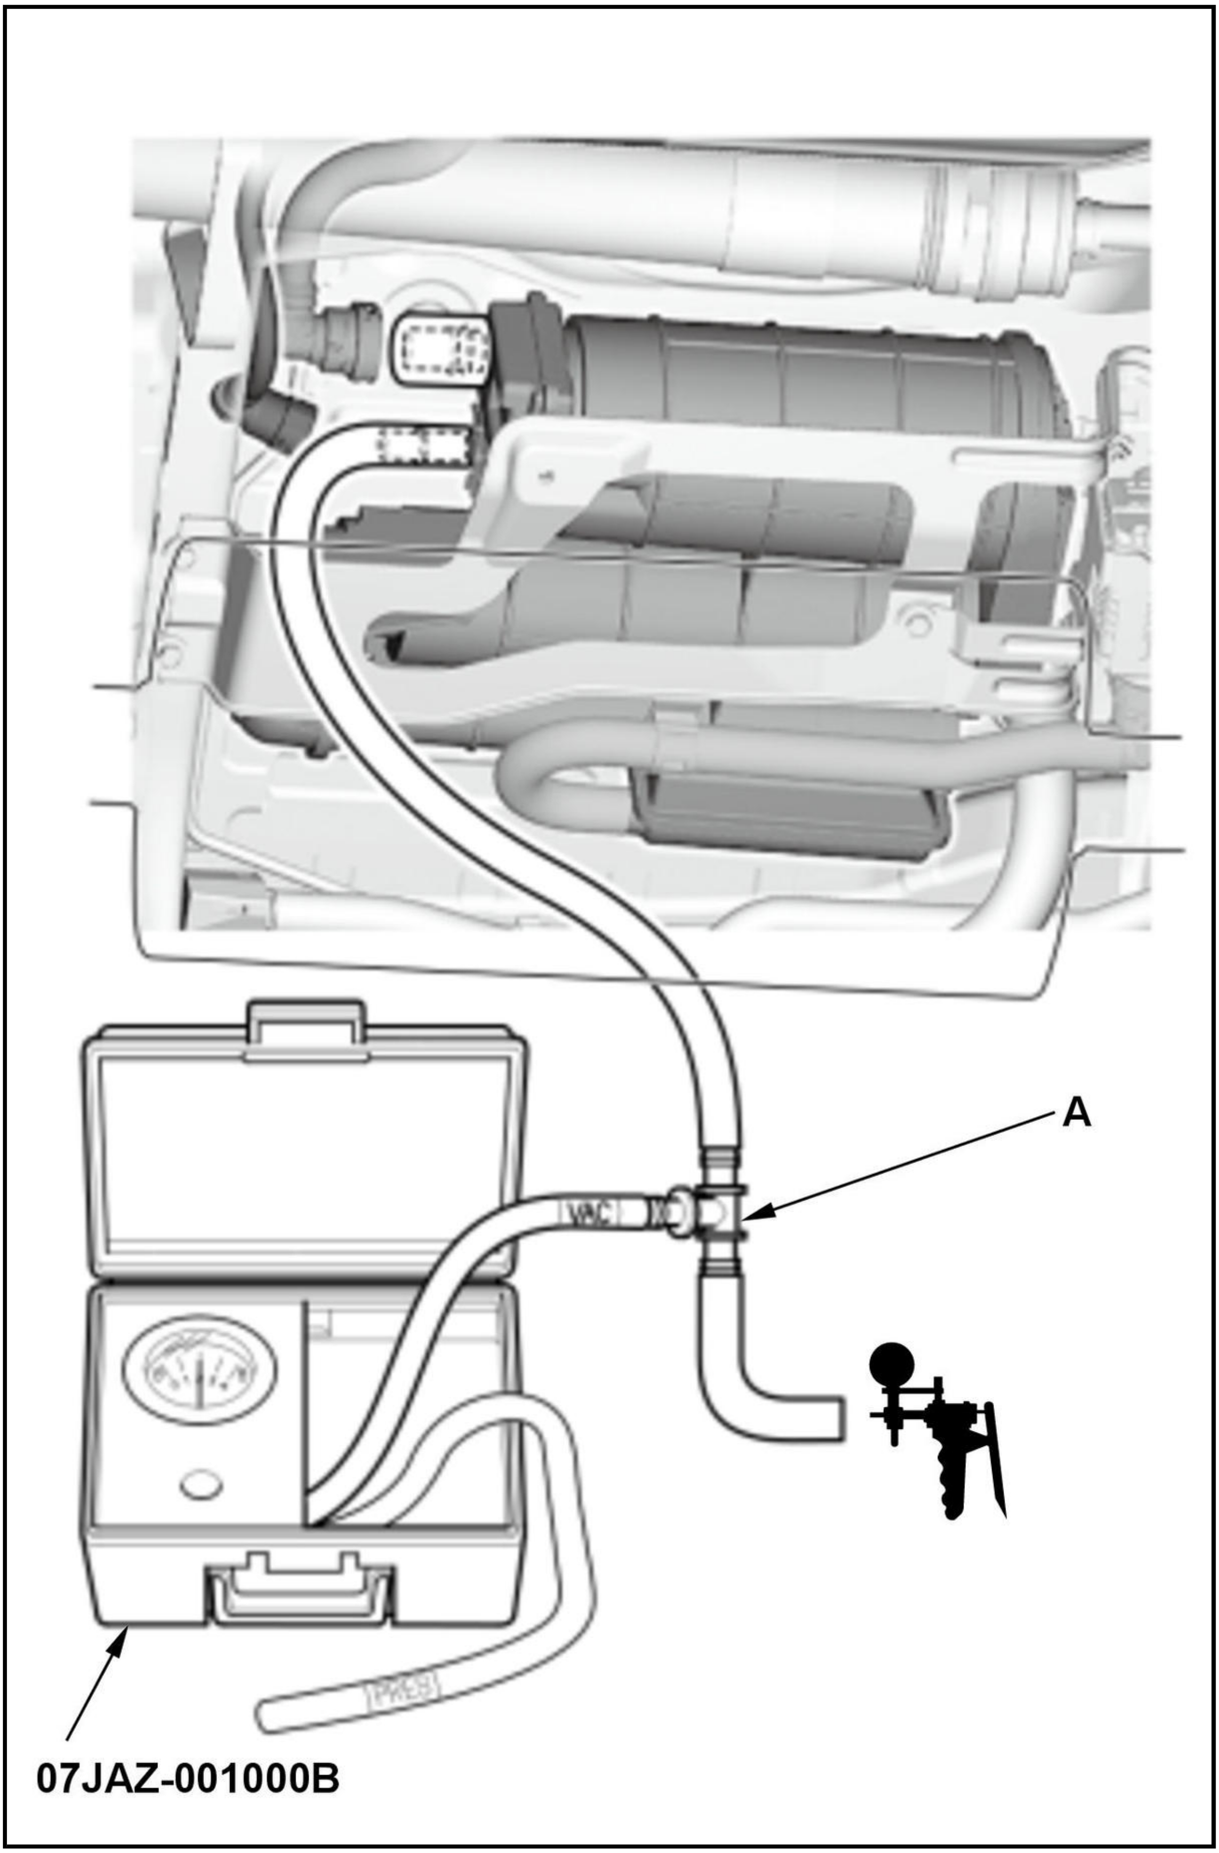
-3. Select the EVAP TEST in the Function Test Menu, then select the CCV ON in the Single Solenoid Test with the HDS.

EVAP TEST

Check and record the Absolute Pressure of ELCM Pressure Sensor reading in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	B	B

-5. Connect the T-fitting (A), the vacuum gauge, and the vacuum pump/gauge, 0-30 inHg to the EVAP canister as shown.



A
VAC
PRES
07JAZ-001000B

-6. Slowly apply about 1.3 kPa (10 mmHg, 0.4 inHg) of vacuum to the hose.

NOTE: Be careful not to exceed the vacuum. If you do, the EVAP leak check module can be damaged.

-7. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	B	B

Does the value change?

YES

Check for blockage in the EVAP canister purge line port.

NO

Replace the EVAP leak check module .

DTC P050A

DTC P050A : Cold Start Idle Air Control System Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P050A Cold Start Idle Air Control System Performance Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any Pending or Confirmed DTCs other than P050A indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Intake air tube visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check for a poor connection or blockage at the intake air tube** .

   Is it OK?

   YES

   Go to step 3.

   NO

Reconnect or repair the intake air tube.

3. Air cleaner housing visual check

-1. Check for a poor connection or blockage at the air cleaner housing .

Is it OK?

YES

Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. Check for dirt or debris on the air cleaner element .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Let the engine cool until the value of ECT Sensor 1 is 122 deg.F (50 deg.C) or less.

Signal	**Current conditions**	
	Values	**Unit**
ECT Sensor 1	B	B

-2. Clear the DTC with the HDS.

-3. Enter the maintenance mode, then start the engine , and let it idle for 10 seconds or more.

-4. Monitor the OBD STATUS for DTC P050A in the DTCs MENU with the HDS.

DTC Description	**OBD STATUS**
P050A Cold Start Idle Air Control System Performance Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the throttle body, MAF sensor/IAT sensor 1, and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-1 and recheck.

6. Throttle body check

-1. Select the ETCS(TAC) TEST in the Function Test Menu with the HDS.

ETCS(TAC) TEST

Is the THROTTLE ACTUATOR CONTROL VALVE normal?

YES

Go to step 7.

NO

Replace the throttle body .

7. MAF sensor performance check

-1. **Enter the maintenance mode, then start the engine** .

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-3. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor	7.5 - 10.5	g/s	B	B

Do the current condition(s) match the malfunction threshold?

YES

Go to step 8.

NO

Replace MAF sensor/IAT sensor 1 .

8. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of the IAT Sensor (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1)	B	B

-6. Compare the value of the IAT Sensor (1) with the ambient temperature.

Does the value of the IAT Sensor (1) differ 5.4 deg.F (3 deg.C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

MAF sensor/IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P050B

DTC P050B : Cold Start Ignition Timing Control System Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P050B Cold Start Ignition Timing Control System Performance Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any Pending or Confirmed DTCs other than P050B indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Intake air tube visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check for a poor connection or blockage at the intake air tube** .

   Is it OK?

   YES

   Go to step 3.

   NO

   Reconnect or repair the intake air tube.

3. Air cleaner housing visual check

   -1. **Check for a poor connection or blockage at the air cleaner housing** .

Is it OK?

YES

Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. **Check for dirt or debris on the air cleaner element** .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Let the engine cool until the value of ECT Sensor 1 is 122 deg.F (50 deg.C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-4. Monitor the OBD STATUS for DTC P050B in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P050B Cold Start Ignition Timing Control System Performance Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor, the throttle body, MAF sensor/IAT sensor 1, ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-1 and recheck.

6. Determine possible failure area (CKP sensor, others)

-1. **Check the ignition timing** .

Is the ignition timing OK?

YES

Go to step 8.

NO

Go to step 7.

7. CKP sensor and CKP pulse plate visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the CKP sensor** .

   -3. Check for damage at the CKP sensor and CKP pulse plate.

   Is the CKP sensor and CKP pulse plate damaged?

   YES

   Replace the CKP sensor and/or **the CKP pulse plate** .

   NO

   The CKP sensor and the CKP pulse plate are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

8. Throttle body check

   -1. Select the ETCS(TAC) TEST in the Function Test Menu with the HDS.

   ETCS(TAC) TEST

   Is the THROTTLE ACTUATOR CONTROL VALVE normal?

   YES

   Go to step 9.

   NO

   Replace the throttle body .

9. MAF sensor performance check

   -1. **Enter the maintenance mode, then start the engine** .

   -2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -3. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor	7.5 - 10.5	g/s	B	B

   Do the current condition(s) match the malfunction threshold?

YES

Go to step 10.

NO

Replace MAF sensor/IAT sensor 1 .

10. ECT sensor 1 and ECT sensor 2 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of the ECT Sensor 1 and ECT Sensor 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
ECT Sensor 2	B	B

-6. Compare the value of ECT Sensor 1 and the value of ECT Sensor 2 with the ambient temperature individually.

Does either sensor differ more than 5.4 deg.F (3 deg.C) from the ambient temperature?

YES

Replace the sensor that differed more than 3 deg.C (5.4 deg.F) from the ambient temperature.

NO

ECT sensor 1 and ECT sensor 2 are OK. Check and repair any problems with the following items. Repair or replace them if needed. If every item is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

- Engine compression and cylinder leakdown
- Engine oil
- A/C system

DTC P050D

DTC P050D : Cold Start Idle Speed Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P050D Cold Start Idle Speed Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any Pending or Confirmed DTCs other than P050D indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Electric powertrain system DTC check

-1. Check for electric powertrain system DTCs with the HDS.

Battery Condition Monitor Module

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

Motor Control Module (Generator Motor)

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

Motor Control Module (Traction Motor)

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

Are any Pending or Confirmed DTCs indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 3.

3. Intake air tube visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for a poor connection or blockage at the intake air tube .

Is it OK?

YES

Go to step 4.

NO

Reconnect or repair the intake air tube.

4. Air cleaner housing visual check

-1. **Check for a poor connection or blockage at the air cleaner housing** .

Is it OK?

YES

Go to step 5.

NO

Replace the air cleaner housing .

5. Air cleaner element visual check

-1. **Check for dirt or debris on the air cleaner element** .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 6.

6. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT Sensor 1 is 122 deg.F (50 deg.C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-5. Monitor the OBD STATUS for DTC P050D in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P050D Cold Start Idle Speed Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 7.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor, the throttle body, MAF sensor/IAT sensor 1, IAT sensor 2, ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the

HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 6-2 and recheck.

7. MAF sensor performance check

   -1. **Enter the maintenance mode, then start the engine** .

   -2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -3. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor	7.5 - 10.5	g/s	B	B

   Do the current condition(s) match the malfunction threshold?

   YES

   Go to step 8.

   NO

   Replace MAF sensor/IAT sensor 1 .

8. IAT sensor 1 performance check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Allow the engine to cool to ambient temperature.

   -3. Note the ambient temperature.

   -4. Turn the vehicle to the ON mode.

   -5. Quickly note the value of the IAT Sensor (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1)	B	B

   -6. Compare the value of the IAT Sensor (1) with the ambient temperature.

   Does the value of the IAT Sensor (1) differ 5.4 deg.F (3 deg.C) or more from the ambient temperature?

   YES

   Replace MAF sensor/IAT sensor 1 .

   NO

   MAF sensor/IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P0522

DTC P0522 : Engine Oil Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0522 Engine Oil Pressure Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Malfunction Threshold		Current conditions	
	Values	Unit	Values	Unit
Rocker Arm Oil Pressure Sensor Voltage	Less than 0.18	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the engine oil pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (OPSEN line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Engine oil pressure sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Malfunction Threshold		Current conditions	
	Values	Unit	Values	Unit
Rocker Arm Oil Pressure Sensor Voltage	Less than 0.18	V	B	B

   Do the current condition(s) match the threshold?

   YES

   Go to step 5.

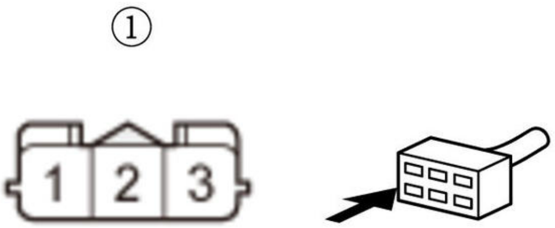
   NO

   Go to step 3.

3. Determine possible failure area (engine oil pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Engine oil pressure sensor 3P connector: disconnected
Test point 1	Engine oil pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Engine oil pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the engine oil pressure sensor .

NO

Go to step 4.

4. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

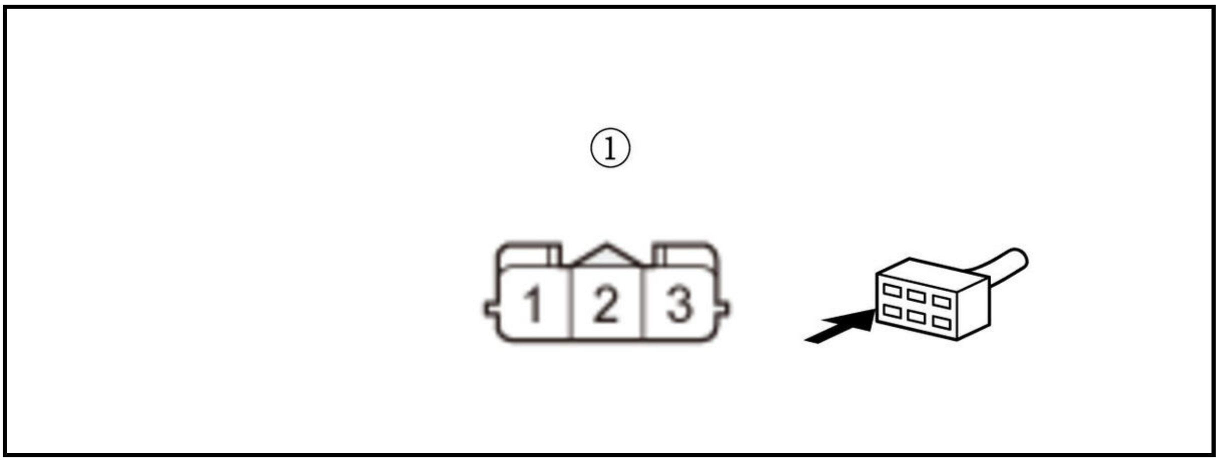
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Engine oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Engine oil pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there 1.0 Ω or less?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC2 wire between the PCM (E77) and the engine oil pressure sensor.

5. Shorted wire check (OPSEN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

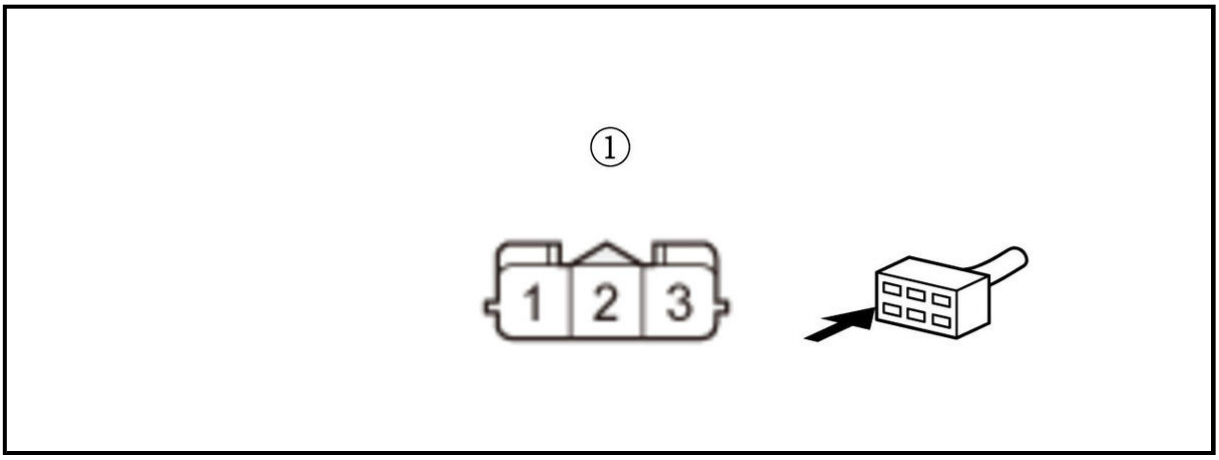
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Engine oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Engine oil pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The OPSEN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the OPSEN wire between the PCM (E58) and the engine oil pressure sensor.

DTC P0523

DTC P0523 : Engine Oil Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0523 Engine Oil Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Malfunction Threshold		Current conditions	
	Values	Unit	Values	Unit
Rocker Arm Oil Pressure Sensor Voltage	More than 4.79	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the engine oil pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (engine oil pressure sensor, others)

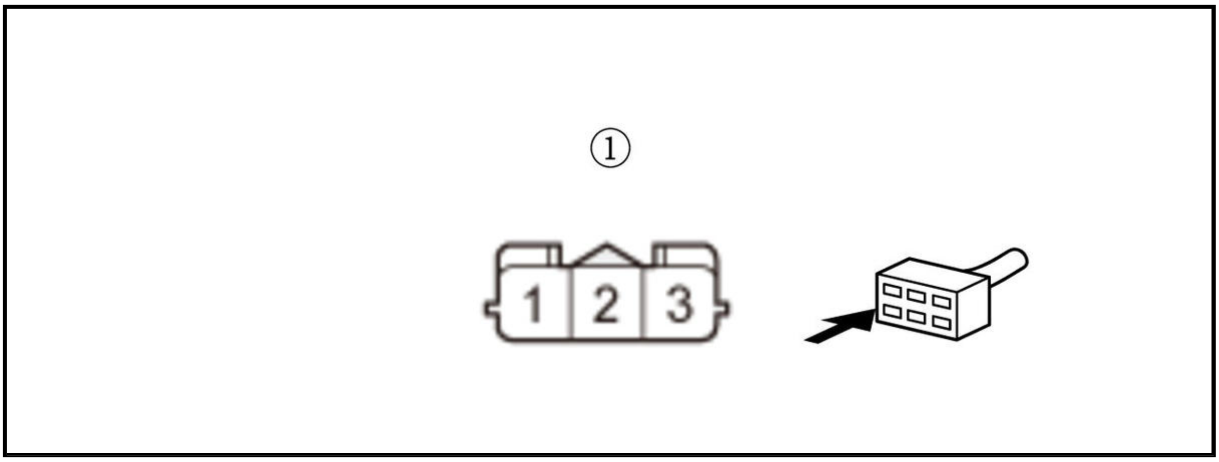
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Engine oil pressure sensor 3P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	Engine oil pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	Engine oil pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Malfunction Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Rocker Arm Oil Pressure Sensor Voltage	More than 4.79	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Replace the engine oil pressure sensor .

3. Determine possible failure area (SG2 line, others)

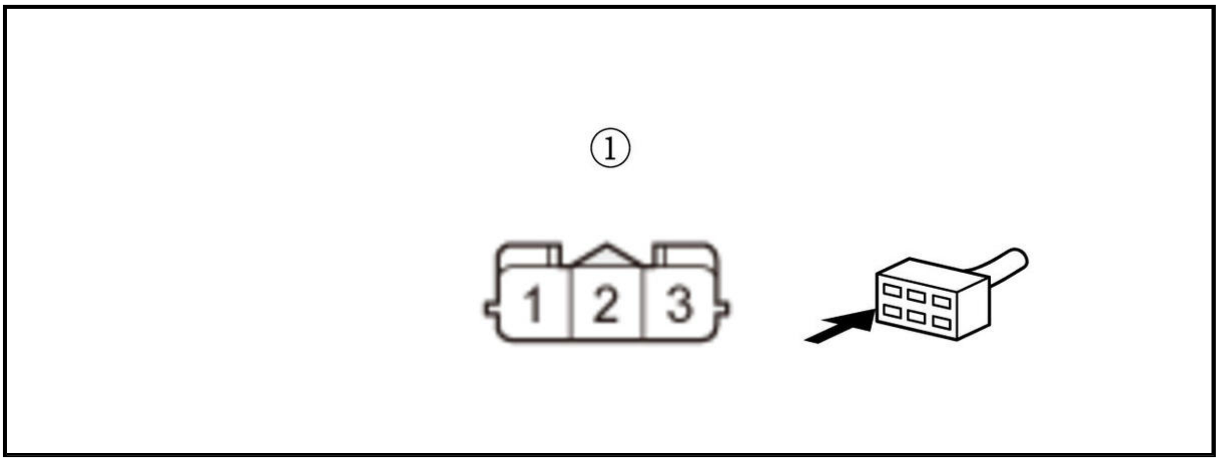
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the engine oil pressure sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Engine oil pressure sensor 3P connector: disconnected
Test point 1	Engine oil pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Engine oil pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (OPSEN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

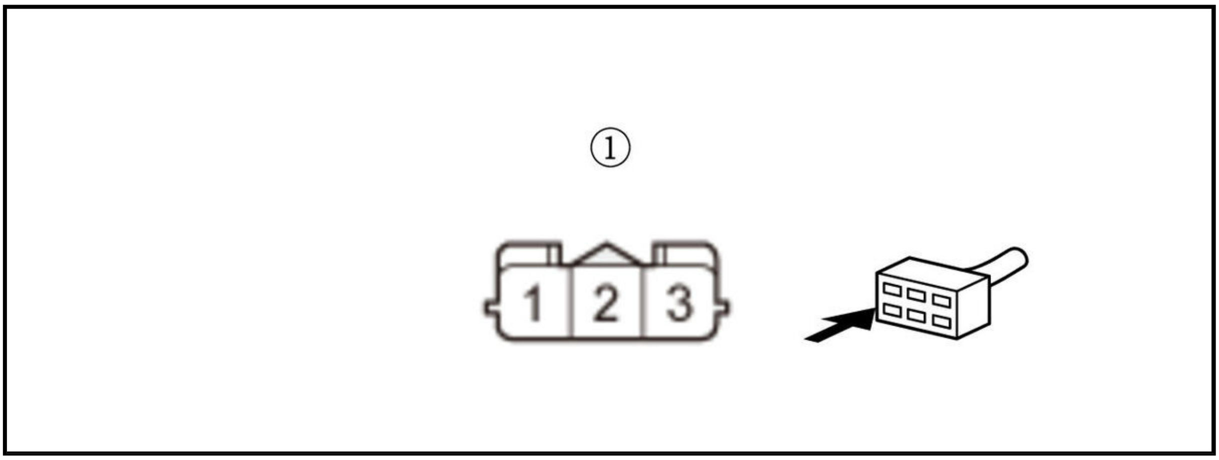
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Engine oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Engine oil pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 58**



Is there 1.0 Ω or less?

YES

The OPSEN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the OPSEN wire between the PCM (E58) and the engine oil pressure sensor.

5. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

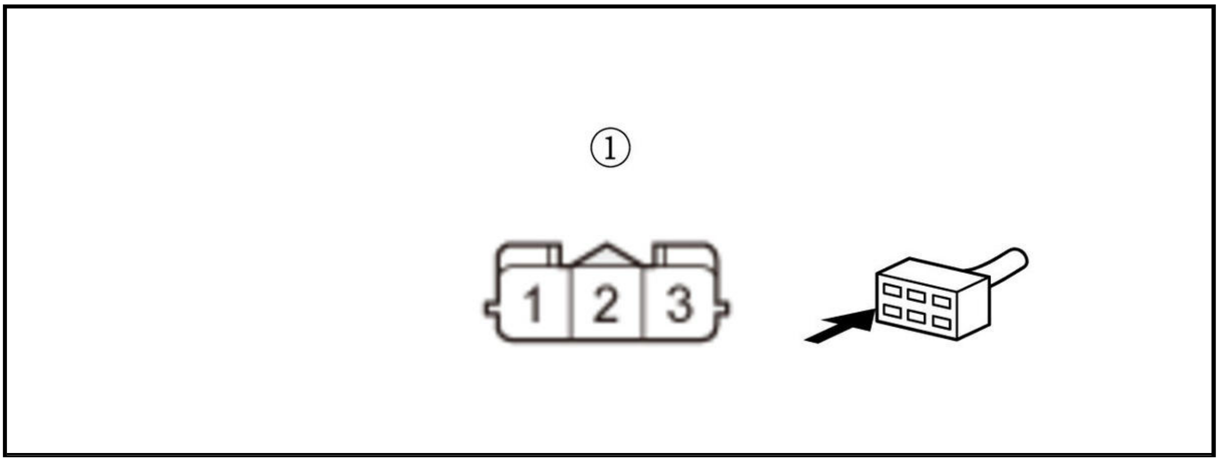
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Engine oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Engine oil pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and the engine oil pressure sensor.

DTC P0532

DTC P0532 : A/C Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0532 A/C Pressure Sensor Circuit Low Voltage	B	B

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Turn the blower switch on.

   -3. Turn the A/C switch on.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
A/C Pressure Sensor Voltage	Less than 0.24	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (PD_SENSOR line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

A/C pressure sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
A/C Pressure Sensor Voltage	Less than 0.24	V	B	B

   Do the current condition(s) match the threshold?

   YES

   Go to step 5.

   NO

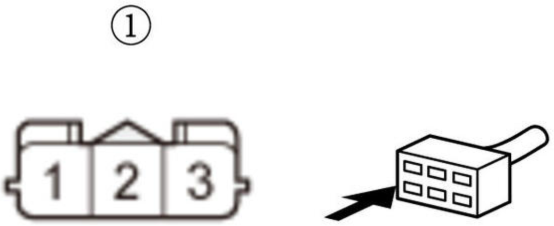
   Go to step 3.

3. Determine possible failure area (A/C pressure sensor, others)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

B	A/C pressure sensor 3P connector: disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	A/C pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the A/C pressure sensor .

NO

Go to step 4.

4. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

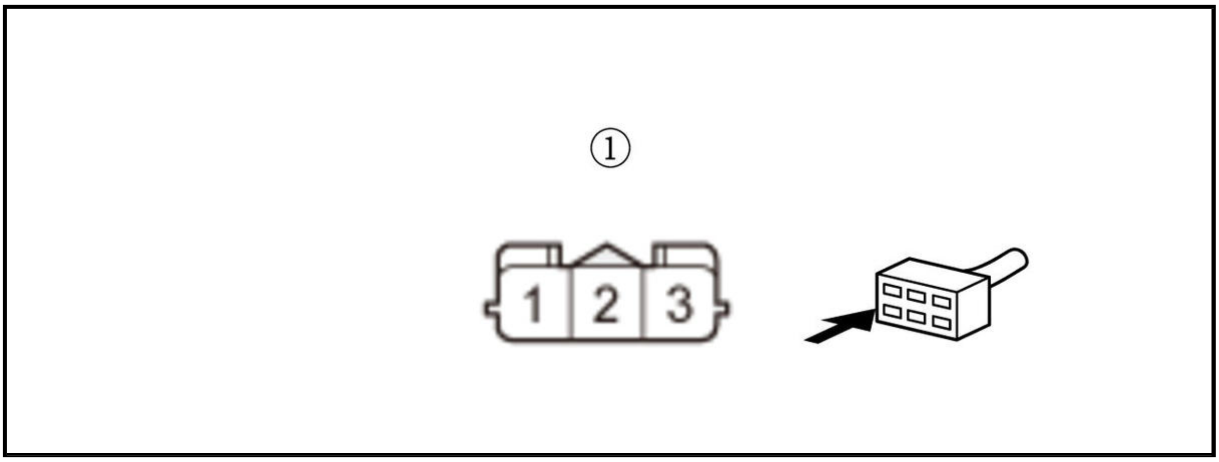
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 63**



Is there 1.0 Ω or less?

YES

The VCC6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC6 wire between the PCM (E63) and the A/C pressure sensor.

5. Shorted wire check (PD_SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

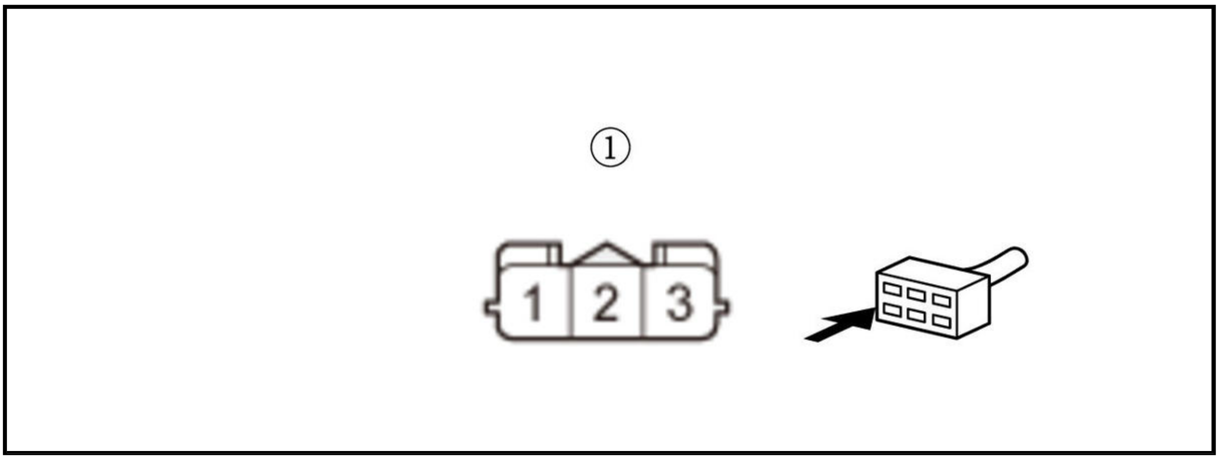
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The PD_SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the PD_SENSOR wire between the PCM (A33) and the A/C pressure sensor.

DTC P0533

DTC P0533 : A/C Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0533 A/C Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Turn the blower switch on.

   -3. Turn the A/C switch on.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/C Pressure Sensor Voltage	More than 4.76	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/C pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (A/C pressure sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

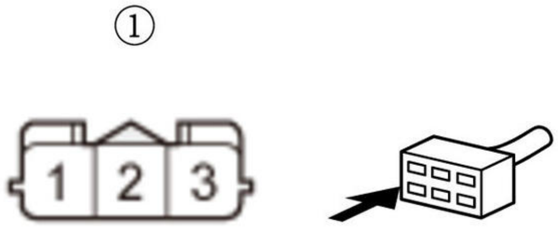
   -2. Disconnect the following connector.

A/C pressure sensor 3P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	A/C pressure sensor 3P connector (female terminals) No. 1: ①

Terminal B	A/C pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
A/C Pressure Sensor Voltage	More than 4.76	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Replace the A/C pressure sensor .

3. Determine possible failure area (SG6 line, others)

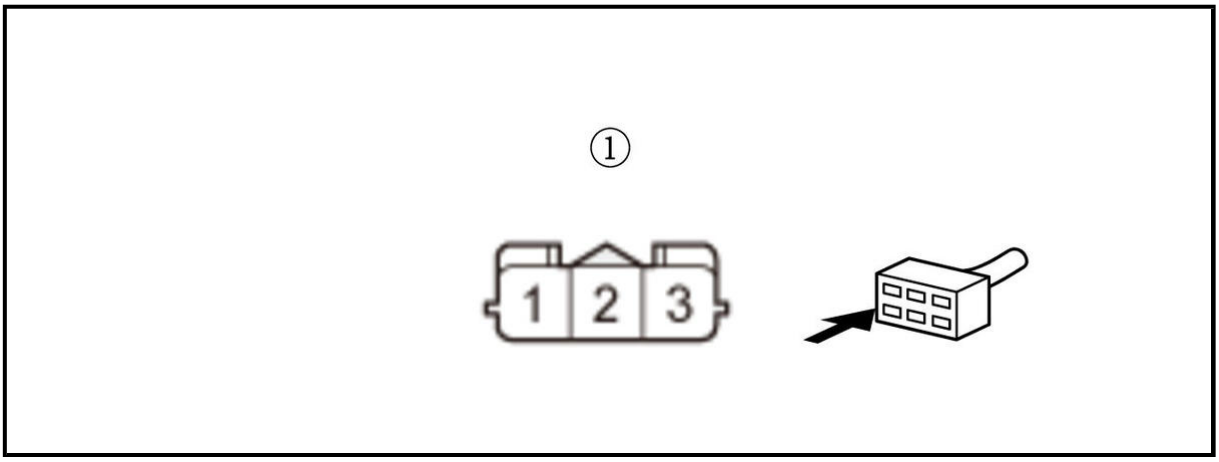
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the A/C pressure sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/C pressure sensor 3P connector: disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	A/C pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (PD_SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

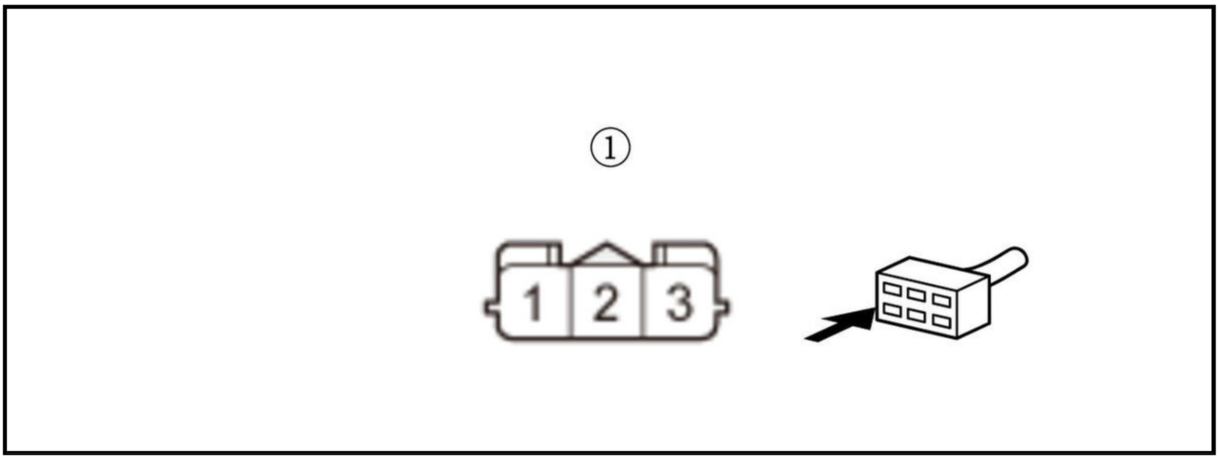
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 33**



Is there 1.0 Ω or less?

YES

The PD_SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the PD_SENSOR wire between the PCM (A33) and the A/C pressure sensor.

5. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

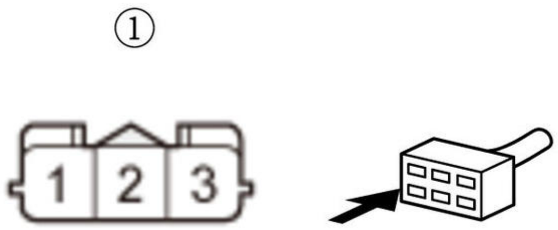
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	A/C pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	A/C pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 45**



Is there 1.0 Ω or less?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and the A/C pressure sensor.

DTC P055B

DTC P055B : Rocker Arm Oil Pressure Sensor Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P055B Rocker Arm Oil Pressure Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

 -1. Turn the vehicle to the ON mode.

 -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
(Rocker Arm) Oil Pressure Sensor (B) Voltage	Less than 0.28	V	B	B

 Do the current condition(s) match the threshold?

 YES

 The failure is duplicated. Go to step 2.

 NO

 Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (POIL line, others)

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Disconnect the following connector.

Rocker arm oil pressure sensor 3P connector

 -3. Turn the vehicle to the ON mode.

 -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
(Rocker Arm) Oil Pressure Sensor (B) Voltage	Less than 0.28	V	B	B

 Do the current condition(s) match the threshold?

 YES

 Go to step 5.

 NO

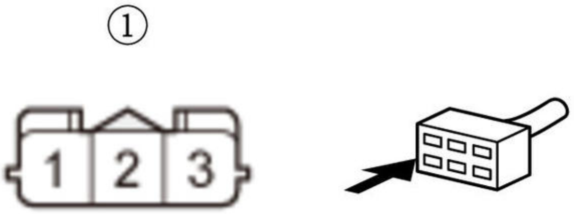
 Go to step 3.

3. Determine possible failure area (rocker arm oil pressure sensor, others)

 -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rocker arm oil pressure sensor 3P connector: disconnected

Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Rocker arm oil pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the rocker arm oil pressure sensor .

NO

Go to step 4.

4. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

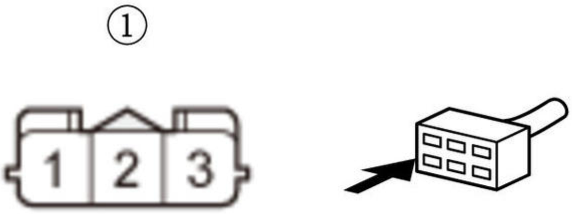
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rocker arm oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there 1.0 Ω or less?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC2 wire between the PCM (E77) and the rocker arm oil pressure sensor.

5. Shorted wire check (POIL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

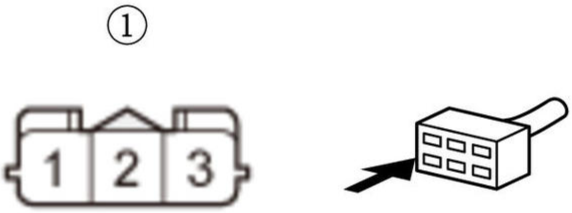
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rocker arm oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The POIL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the POIL wire between the PCM (E59) and the rocker arm oil pressure sensor.

DTC P055C

DTC P055C : Rocker Arm Oil Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P055C Rocker Arm Oil Pressure Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
(Rocker Arm) Oil Pressure Sensor (B) Voltage	Less than 0.18	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (POIL line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rocker arm oil pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
(Rocker Arm) Oil Pressure Sensor (B) Voltage	Less than 0.18	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 5.

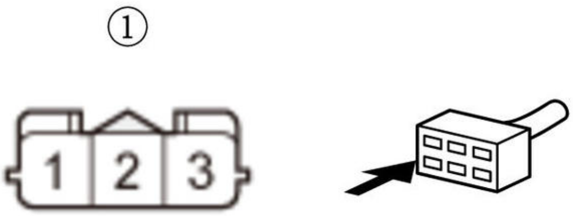
NO

Go to step 3.

3. Determine possible failure area (rocker arm oil pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Rocker arm oil pressure sensor 3P connector: disconnected
Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Rocker arm oil pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Replace the rocker arm oil pressure sensor .

NO

Go to step 4.

4. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

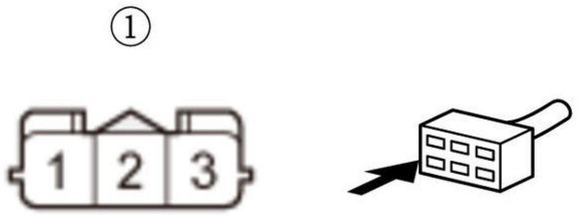
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rocker arm oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there 1.0 Ω or less?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC2 wire between the PCM (E77) and the rocker arm oil pressure sensor.

5. Shorted wire check (POIL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

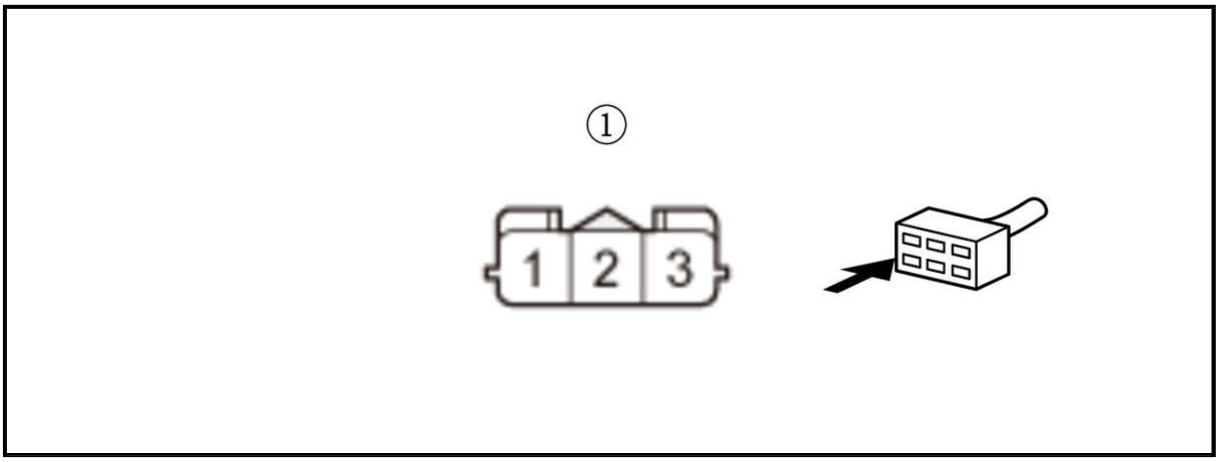
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rocker arm oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The POIL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the POIL wire between the PCM (E59) and the rocker arm oil pressure sensor.

DTC P055D

DTC P055D : Rocker Arm Oil Pressure Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P055D Rocker Arm Oil Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
(Rocker Arm) Oil Pressure Sensor (B) Voltage	More than 4.79	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (rocker arm oil pressure sensor, others)

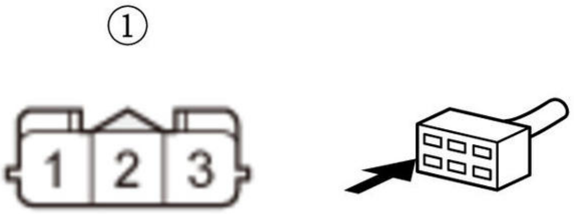
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rocker arm oil pressure sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Rocker arm oil pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	Rocker arm oil pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
(Rocker Arm) Oil Pressure Sensor (B) Voltage	More than 4.79	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Replace the rocker arm oil pressure sensor .

3. Determine possible failure area (SG2 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

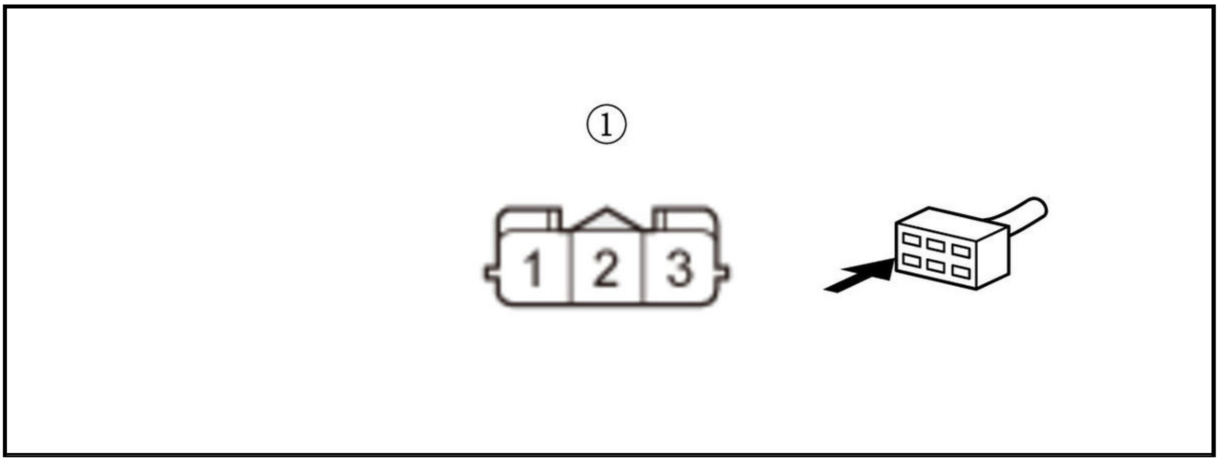
-2. Remove the jumper wire from the rocker arm oil pressure sensor 3P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

B	Rocker arm oil pressure sensor 3P connector: disconnected
Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Rocker arm oil pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (SG2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

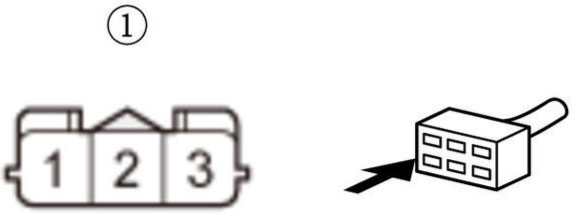
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rocker arm oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 78**



Is there 1.0 Ω or less?

YES

The SG2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG2 wire between the PCM (E78) and the rocker arm oil pressure sensor.

5. Open wire check (POIL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

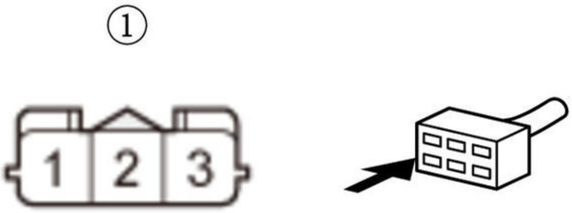
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Rocker arm oil pressure sensor 3P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	Rocker arm oil pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 59**



Is there 1.0 Ω or less?

YES

The POIL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the POIL wire between the PCM (E59) and the rocker arm oil pressure sensor.

DTC P0560

DTC P0560 : PCM Power Source Circuit Unexpected Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0560 PCM Power Source Circuit Unexpected Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Wait 5 seconds or more.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0560 PCM Power Source Circuit Unexpected Voltage	B	B

Is DTC P0560 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the **No. A12 fuse** and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A12**

Is the fuse OK?

YES

Go to step 3.

NO

Repair a short in the +B_BACKUP_FI-ECU wire between the PCM (A7) and the No. A12 fuse. Also replace the No. A12 fuse.

3. Open wire check (+B_BACKUP_FI-ECU line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 7**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_BACKUP_FI-ECU wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the +B_BACKUP_FI-ECU wire between the PCM (A7) and the **No. A12 fuse** .

DTC P0563

DTC P0563 : PCM Power Source Circuit Unexpected Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0563 PCM Power Source Circuit Unexpected Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Wait 10 seconds.

-5. Turn the vehicle to the ON mode.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0563 PCM Power Source Circuit Unexpected Voltage	B	B

Is DTC P0563 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at PGM-FI main relay 1 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (FI_MAIN_RLY_OUT line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 8**
Test point 2	Body ground

Is there battery voltage?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted wire check (FI_MAIN_RLY_CL- line)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	**PCM connector A (50P) No. 5**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 5.

NO

Repair a short in the FI_MAIN_RLY_CL- wire between the PCM (A5) and the relay circuit board.

4. Shorted wire check (FI_MAIN_RLY_OUT line to power)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PCM connector A (50P): disconnected Relay circuit board connector C (18P): disconnected
Test point 1	**PCM connector A (50P) No. 8**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the FI_MAIN_RLY_OUT wire between the PCM (A8) and the relay circuit board.

NO

Go to step 5.

5. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the relay circuit board .

DTC P0571

DTC P0571 : Brake Pedal Position Switch Circuit Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the accelerator pedal is pressed with pressing the brake pedal lightly and continuously for 5 minutes or more, this DTC will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0571 Brake Pedal Position Switch Circuit Malfunction	B	B

DTC (PGM-FI)

1. Brake lights check 1

-1. Check the brake lights without the brake pedal pressed.

Do the brake lights stay on?

YES

Go to step 9.

NO

Go to step 2

2. Brake lights check 2

-1. Check the brake lights with the brake pedal pressed.

Do the brake lights come on?

YES

Go to step 3.

NO

Go to step 5.

3. Brake pedal position switch signal check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
Brake Switch	B	B

Does the signal change ON and OFF when the brake pedal is pressed and released?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the brake pedal position switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Go to step 4.

4. Open wire check (STOP_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Press the brake pedal and measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Brake pedal: pressed
Test point 1	**PCM connector A (50P) No. 26**
Test point 2	Body ground

Is there battery voltage?

YES

The STOP_SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the STOP_SW wire between the PCM (A26) and the brake pedal position switch.

5. Brake pedal position switch check

-1. **Test the brake pedal position switch** .

Is the brake pedal position switch normal?

YES

Go to step 6.

NO

Replace the brake pedal position switch .

6. Fuse check

-1. Check the following fuse.

Fuse	**No. A9**

Is the fuse OK?

YES

Go to step 7.

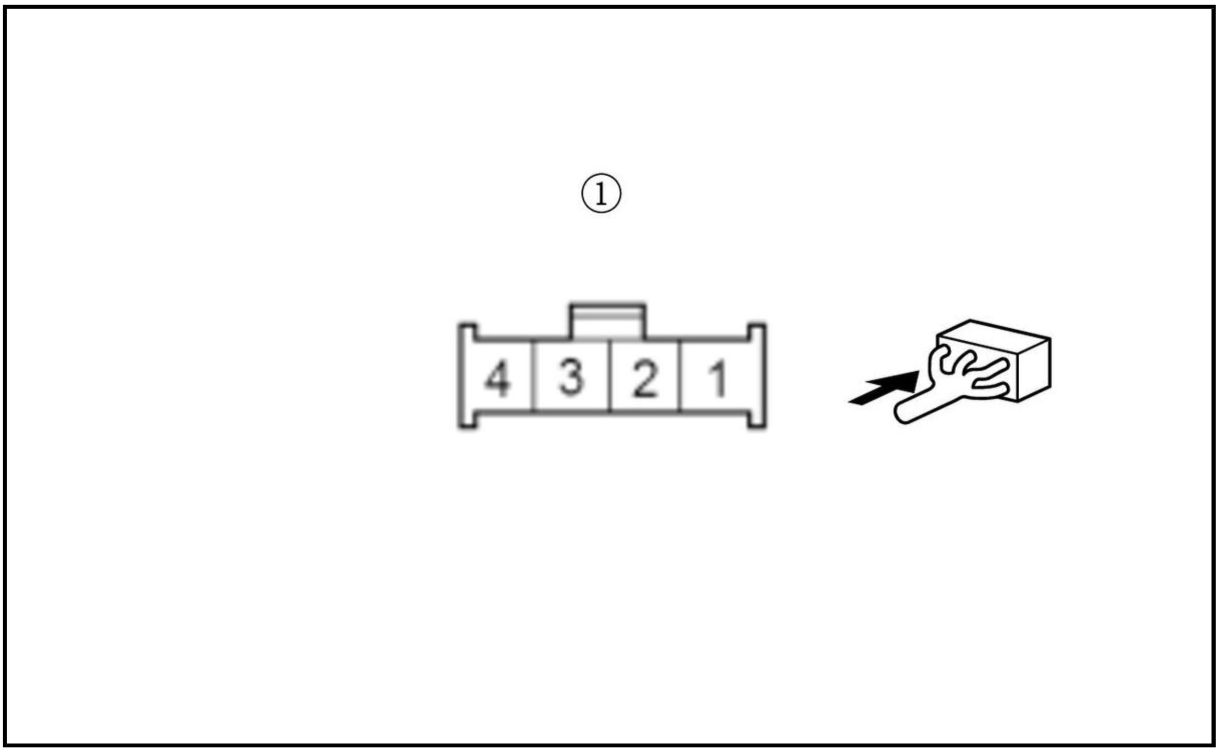
NO

Replace the No. A9 fuse. Also check for a short to ground on the No. A9 fuse circuit if needed.

7. Open wire check (+B_STOP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Brake pedal position switch 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 8.

NO

Repair an open in the +B_STOP wire between the **No. A9 fuse** and the brake pedal position switch.

8. Open wire check (STOP_SW line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Press the brake pedal and measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	Brake pedal: pressed
Test point 1	**PCM connector A (50P) No. 26**
Test point 2	Body ground

Is there battery voltage?

YES

The STOP_SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the STOP_SW wire between the PCM (A26) and the brake pedal position switch.

9. Brake pedal position switch installation check

   -1. **Remove the brake pedal position switch with the connector connected** .

   -2. Check the brake lights with the rod of the brake pedal position switch pressed.

   Do the brake lights go off?

   YES

   The brake pedal position switch installation is incorrect, **install the brake pedal position switch** and **adjust the pedal height.**

   NO

   Go to step 10.

10. Brake pedal position switch check

   -1. **Test the brake pedal position switch** .

   Is the switch normal?

   YES

   The brake pedal position switch is OK, repair a short to power in the STOP_SW wire between the PCM (A26) and the brake pedal position switch.

   NO

   Replace the brake pedal position switch .

DTC P059F, P05A3, P05A8, P05C0

DTC P059F : Shutter Grille Assembly (Upper) Malfunction

DTC P05A3 : Shutter Grille Actuator (Upper) Malfunction

DTC P05A8 : Shutter Grille Actuator (Upper) Malfunction

DTC P05C0 : Shutter Grille Actuator (Upper) Temperature Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P059F Shutter Grille Assembly (Upper) Malfunction	B	B
P05A3 Shutter Grille Actuator (Upper) Malfunction	B	B
P05A8 Shutter Grille Actuator (Upper) Malfunction	B	B
P05C0 Shutter Grille Actuator (Upper) Temperature Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

-4. **Enter the maintenance mode, then start the engine** , and let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P059F Shutter Grille Assembly (Upper) Malfunction	B	B
P05A3 Shutter Grille Actuator (Upper) Malfunction	B	B
P05A8 Shutter Grille Actuator (Upper) Malfunction	B	B
P05C0 Shutter Grille Actuator (Upper) Temperature Malfunction	B	B

Is DTC P059F, P05A3, P05A8, or P05C0 is indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shutter grille condition check

-1. Check for condition (damage, fixation, foreign material, etc.) at shutter grille.

Is the shutter grille OK?

YES

Go to step 3.

NO

Reassembly or repair the shutter grille if needed.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A22**

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the +B_FR_FOG/VMP wire between the No. A22 fuse and the shutter grille. Also replace the No. A22 fuse.

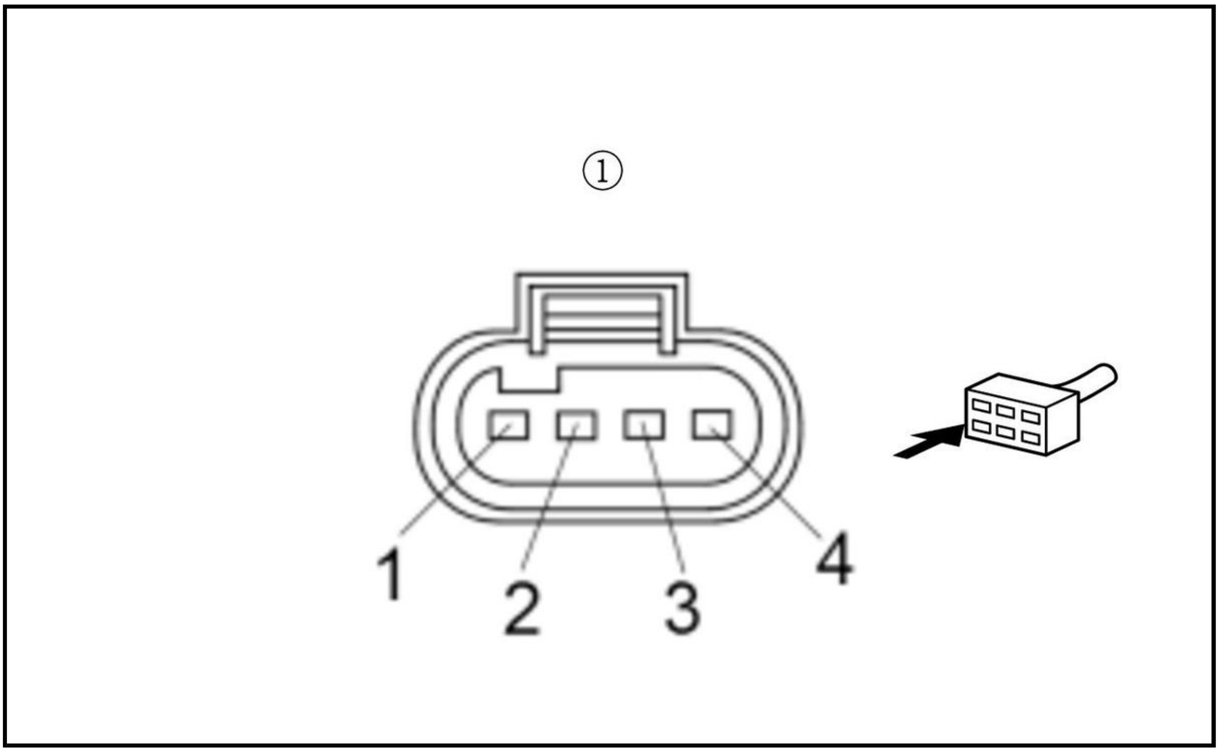
4. Open wire check (+B_FR_FOG/VMP line)

-1. Disconnect the following connector.

Shutter grille 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille 4P connector: disconnected
Test point 1	Shutter grille 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_FR_FOG/VMP wire is OK. Go to step 5.

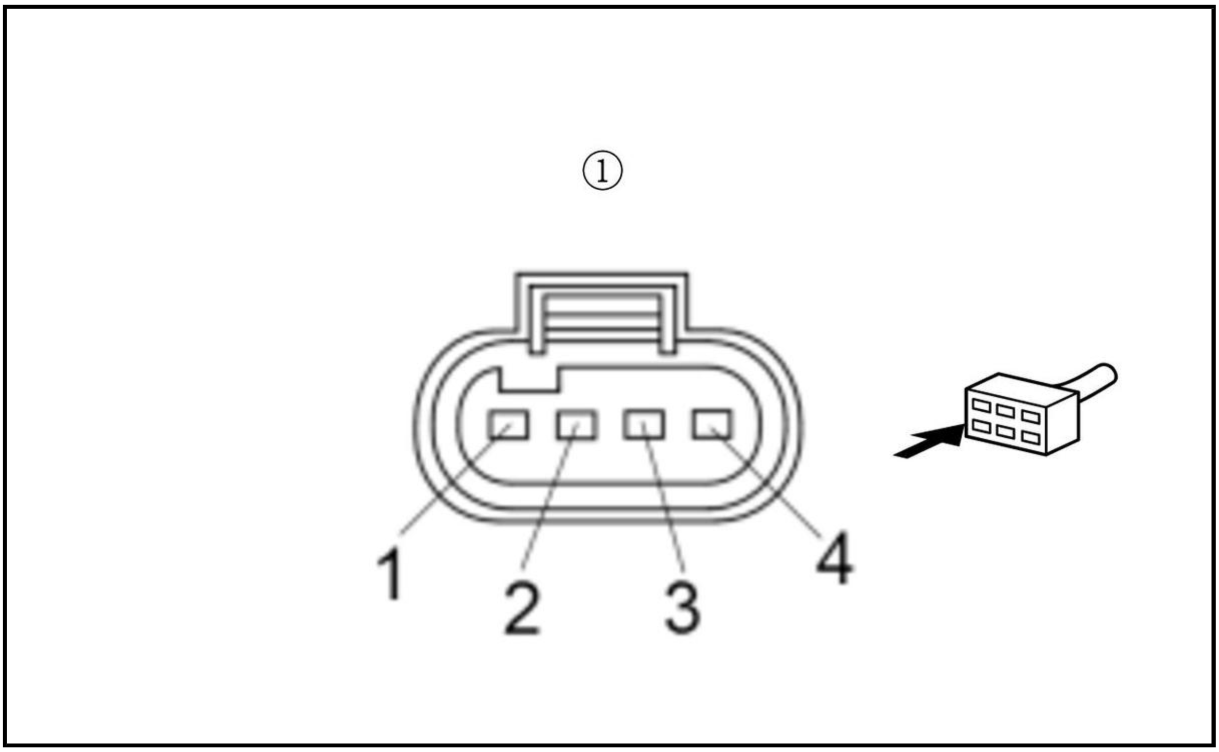
NO

Repair an open in the +B_FR_FOG/VMP wire between the shutter grille and the **No. A22 fuse** .

5. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille 4P connector: disconnected
Test point 1	Shutter grille 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. **Replace the shutter grille** .

NO

Repair an open in the GND wire between the shutter grille and G351.

DTC P05A0

DTC P05A0 : Shutter Grille Assembly (Upper) Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P05A0 Shutter Grille Assembly (Upper) Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Enter the maintenance mode, then start the engine** , and let it idle.

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Upper shutter grille block error	Normal	B	B	B

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Upper shutter grille initial learning error	Completed	B	B	B

Do the current condition(s) match the threshold?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. Go to step 2.

2. Shutter grille condition check

-1. Check for condition (damage, fixation, foreign material, etc.) at shutter grille.

Is the shutter grille OK?

YES

Go to step 3.

NO

Reassembly or repair the shutter grille if needed.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A22**

Is the fuse OK?

YES

Go to step 4.

NO

Repair a short in the +B_FR_FOG/VMP wire between the No. A22 fuse and the shutter grille. Also replace the No. A22 fuse.

4. Open wire check (+B_FR_FOG/VMP line)

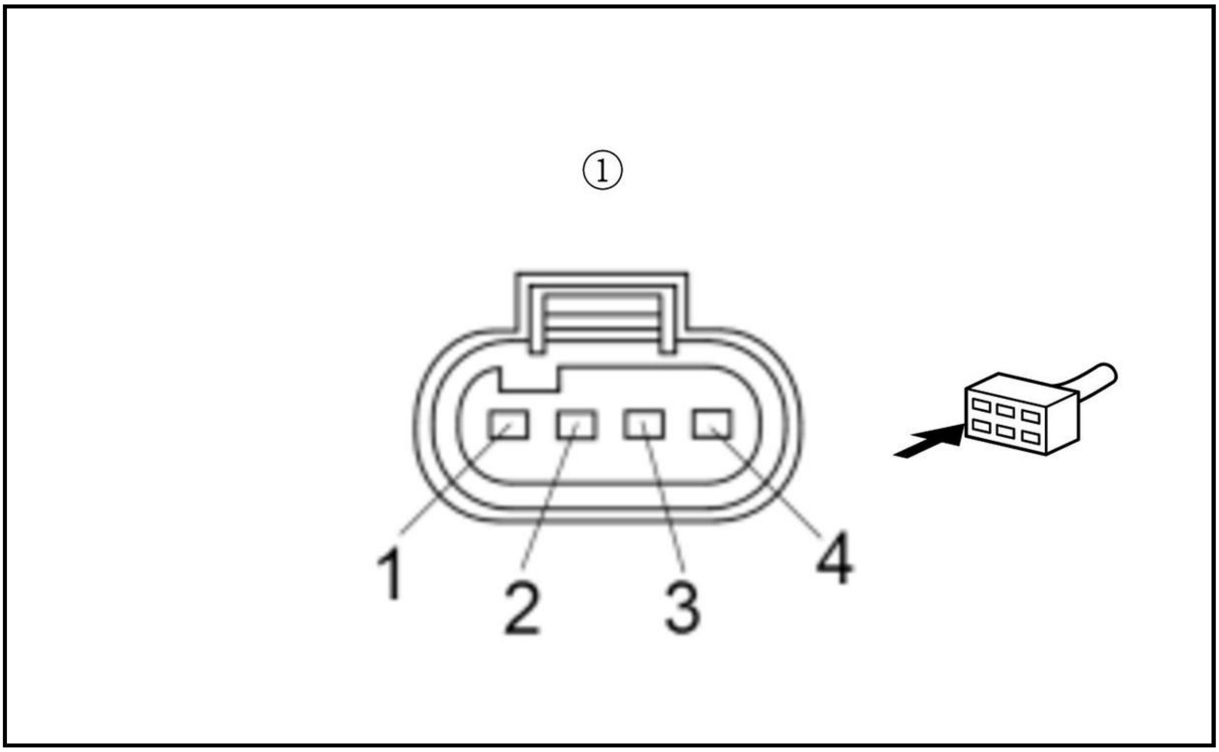
-1. Disconnect the following connector.

Shutter grille 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Shutter grille 4P connector: disconnected
Test point 1	Shutter grille 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_FR_FOG/VMP wire is OK. Go to step 5.

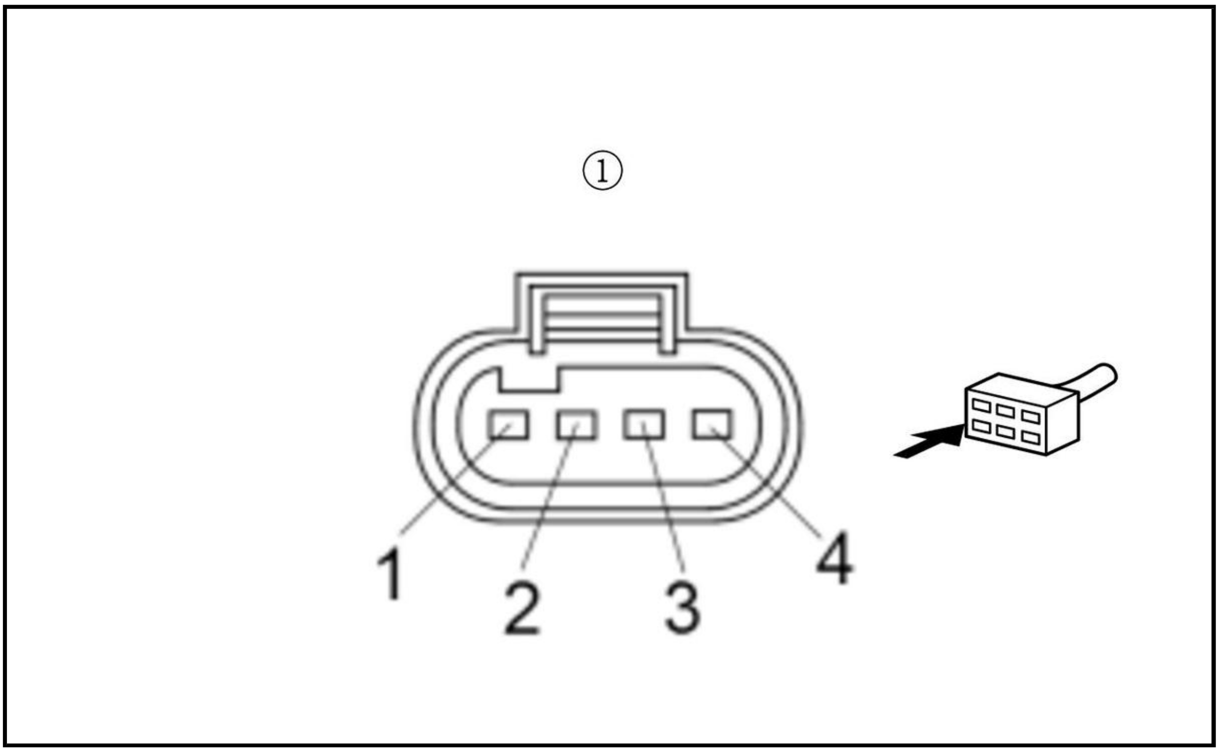
NO

Repair an open in the +B_FR_FOG/VMP wire between the shutter grille and the **No. A22 fuse** .

5. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille 4P connector: disconnected
Test point 1	Shutter grille 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. **Replace the shutter grille** .

NO

Repair an open in the GND wire between the shutter grille and G351.

DTC P05CC (2021)

DTC P05CC : Cold Start VTC System Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC will be stored when the DC-DC converter output voltage is higher than the specified voltage (DC-DC converter failure).

DTC Description	Confirmed DTC	Pending DTC
P05CC Cold Start VTC System Malfunction	B	B

DTC (PGM-FI)

1. Electric powertrain system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Select Electric Powertrain system, and clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   Enter the maintenance mode, then start the engine , and wait for 2 minutes under these conditions:

   - Headlights on high beam
   - Blower fan at maximum speed

- Rear window defogger on
- A/C switch ON, heater on, max hot

-5. Select Electric Powertrain system, and check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A94 DC-DC Converter Performance	B	B	B

DTC (Electric Powertrain)

Is DTC P0A94 indicated?

YES

Go to the troubleshooting for **DTC P0A94** .

NO

Go to step 2.

2. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Leave the vehicle to cool the engine.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-7. Monitor the OBD STATUS for DTC P05CC with the HDS.

DTC Description	OBD STATUS
P05CC Cold Start VTC System Malfunction	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 3.

NO

If the HDS indicates PASSED, it is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the electric VTC motor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. VTC actuator installation check

-1. **Check the installation of the VTC actuator** .

Is the VTC actuator installed correctly?

YES

Replace the electric VTC motor .

NO

Reinstall the VTC actuator, or replace it if it is worn or damaged .

DTC P0600

DTC P0600 : PCM Serial Communication Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0600 PCM Serial Communication Failure	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** , and let it idle for 5 seconds or more.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0600 PCM Serial Communication Failure	B	B

Is DTC P0600 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0602 (PGM-FI SYSTEM)

DTC P0602 : PCM Programming Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is indicated when the PCM update procedure is not completed.
- Do not press the power button while updating the PCM. If you do, the PCM can be damaged.

DTC Description	Confirmed DTC	Pending DTC
P0602 PCM Programming Error	B	B

DTC (PGM-FI)

1. Problem verification (update)

   -1. Update the PCM .

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0602 PCM Programming Error	B	B

Is DTC P0602 indicated?

YES

Replace the PCM .

NO

Update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0606 (PGM-FI SYSTEM)

DTC P0606 : PCM Processor Malfunction

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If DTC P0606 is indicated alone, do the troubleshooting for DTC P1A48, P1A49, and P1A4A using the on-board snapshot for P0606.
- If any of the DTCs listed below are indicated at the same time as DTC P0606, troubleshoot those DTCs first, then recheck for P0606.
-
    - -

      P1A48, P1A49, P1A4A: PCM internal circuit

DTC Description	Confirmed DTC	Pending DTC
P0606 PCM Processor Malfunction	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1A48 PCM Internal Malfunction (SBW Different Run)	B	B
P1A49 PCM Internal Malfunction (SBW Parking Position)	B	B
P1A4A PCM Internal Malfunction (SBW Display Position)	B	B
P0606 PCM Processor Malfunction	B	B

Are DTC P1A48, P1A49, or P1A4A and P0606 indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC P1A48** , **DTC P1A49** , and **DTC P1A4A** using the on-board snapshot for DTC P0606.

DTC P060A

DTC P060A : PCM Internal Control Module Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P060A PCM Internal Control Module Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P060A PCM Internal Control Module Malfunction	B	B

Is DTC P060A indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P061B (PGM-FI SYSTEM)

DTC P061B : PCM Internal Malfunction (Torque Calculation)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P061B is indicated alone, do the troubleshooting for DTC P1A51, P1A52, and P1A53 using the on-board snapshot for P061B.
- If any of the DTCs listed below are indicated at the same time as DTC P061B, troubleshoot those DTCs first, then recheck for P061B.

-
    - -

      P1A51, P1A52, P1A53: PCM internal circuit

DTC Description	Confirmed DTC	Pending DTC
P061B PCM Internal Malfunction (Torque Calculation)	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1A51 PCM Internal Malfunction (Torque Calculation Acceleration)	B	B
P1A52 PCM Internal Malfunction (Torque Calculation Deceleration)	B	B
P1A53 PCM Internal Malfunction (Torque Calculation Different Run)	B	B
P061B PCM Internal Malfunction (Torque Calculation)	B	B

   Are DTC P1A51, P1A52, or P1A53 and P061B indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC P1A51** , **DTC P1A52** , and **DTC P1A53** using the on-board snapshot for DTC P061B.

DTC P062F (PGM-FI SYSTEM)

DTC P062F : PCM Internal Control Module Keep Alive Memory (KAM) Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P062F PCM Internal Control Module Keep Alive Memory (KAM) Error	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P062F PCM Internal Control Module Keep Alive Memory (KAM) Error	B	B

Is DTC P062F indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0630

DTC P0630 : VIN Not Programmed or Mismatch

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- This DTC is stored only when the PCM does not have the VIN information of the vehicle. Use the HDS to input the missing VIN information.

DTC Description	Confirmed DTC	Pending DTC
P0630 VIN Not Programmed or Mismatch	B	B

DTC (PGM-FI)

1. VIN check

   -1. Turn the vehicle to the ON mode.

   -2. Check the VIN with the HDS.

   Does the HDS show the vehicle's VIN?

   YES

   Go to step 4.

   NO

   Go to step 2.

2. VIN check (rewrite)

   -1. Input the VIN to the PCM with the HDS.

   Does the HDS show COMPLETE?

   YES

   Go to step 4.

   NO

Go to step 3.

3. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P062F PCM Internal Control Module Keep Alive Memory (KAM) Error	B	B

Is DTC P062F indicated?

YES

Go to the troubleshooting for **DTC P062F**.

NO

Go to step 4.

4. PCM check

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode, and wait 5 seconds or more.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0630 VIN Not Programmed or Mismatch	B	B

Is DTC P0630 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P0641

DTC P0641 : Sensor Reference Voltage A Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM and these parts. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** :

- CKP sensor
- MAP sensor
- Throttle body
- APP sensor

2. Determine possible failure area (VCC lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the connectors from these parts:

CKP sensor 3P connector
MAP sensor 3P connector
Throttle body 6P connector
APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

Go to step 5.

NO

Go to step 3.

3. Shorted part check:

Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:

- CKP sensor 3P connector
- MAP sensor 3P connector
- Throttle body 6P connector
- APP sensor 6P connector

DTC Description	Confirmed DTC	Pending DTC
P0641 Sensor Reference Voltage A Malfunction	B	B

Is DTC P0641 indicated?

YES

Replace the part that caused the DTC when it was reconnected.

NO

Check for poor connections or loose terminals at the PCM and the following parts, then go to step 1.

- CKP sensor
- MAP sensor
- Throttle body
- APP sensor

4. Shorted wire check (VCC lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
PCM connector E (80P)

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between these test points and body ground individually.

Test condition	Vehicle ON mode
	CKP sensor 3P connector: disconnected
	MAP sensor 3P connector: disconnected
	Throttle body 6P connector: disconnected
	APP sensor 6P connector: disconnected
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected

Connector	Terminal
PCM connector A (50P)	No. 45
PCM connector E (80P)	No. 70 and No. 75

Is there any voltage?

YES

Repair a short to power in the VCC wire(s) between the PCM (A45, E70, E75) and each part that was disconnected in step 2.

NO

Go to step 5.

5. Shorted wire check (VCC lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
	CKP sensor 3P connector: disconnected
	MAP sensor 3P connector: disconnected
	Throttle body 6P connector: disconnected
	APP sensor 6P connector: disconnected
	PCM connector A (50P): disconnected
	PCM connector E (80P): disconnected

Connector	Terminal
PCM connector A (50P)	No. 45
PCM connector E (80P)	No. 70 and No. 75

Is there 1 MΩ or more?

YES

The VCC wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short to ground in the VCC wire(s) between the PCM (A45, E70, E75) and each part that was disconnected in step 2.

DTC P0651

DTC P0651 : Sensor Reference Voltage B Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

Is DTC P0651 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCM and these parts. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** :

- CMP sensor A
- CMP sensor B
- EGR valve
- Rocker arm oil pressure sensor
- Engine oil pressure sensor
- Transmission fluid pressure sensor
- APP sensor
- A/C pressure sensor
- EVAP leak check module

2. Determine possible failure area (VCC lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

CMP sensor A 3P connector
CMP sensor B 3P connector
EGR valve 5P connector
Rocker arm oil pressure sensor 3P connector
Engine oil pressure sensor 3P connector
Transmission fluid pressure sensor 3P connector
APP sensor 6P connector
A/C pressure sensor 3P connector
EVAP leak check module 8P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

Is DTC P0651 indicated?

YES

Go to step 5.

NO

Go to step 3.

3. Shorted part check:

   Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:

   - CMP sensor A
   - CMP sensor B
   - EGR valve
   - Rocker arm oil pressure sensor
   - Engine oil pressure sensor
   - Transmission fluid pressure sensor
   - APP sensor
   - A/C pressure sensor
   - EVAP leak check module

DTC Description	Confirmed DTC	Pending DTC
P0651 Sensor Reference Voltage B Malfunction	B	B

   Is DTC P0651 indicated?

   YES

   Replace the part that caused the DTC when it was reconnected.

   NO

   Check for poor connections or loose terminals at the PCM and the following parts, then go to step 1.

   - CMP sensor A
   - CMP sensor B
   - EGR valve
   - Rocker arm oil pressure sensor
   - Engine oil pressure sensor
   - Transmission fluid pressure sensor
   - APP sensor
   - A/C pressure sensor
   - EVAP leak check module
4. Shorted wire check (VCC lines to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector A (50P)
PCM connector E (80P)

   -4. Turn the vehicle to the ON mode.

   -5. Measure the voltage between these test points and body ground individually.

Test condition	Vehicle ON mode

B	CMP sensor A 3P connector: disconnected
B	CMP sensor B 3P connector: disconnected
B	EGR valve 5P connector: disconnected
B	Rocker arm oil pressure sensor 3P connector: disconnected
B	Engine oil pressure sensor 3P connector: disconnected
B	Transmission fluid pressure sensor 3P connector: disconnected
B	APP sensor 6P connector: disconnected
B	A/C pressure sensor 3P connector: disconnected
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
B	PCM connector E (80P): disconnected

Connector	Terminal
PCM connector A (50P)	No. 44
PCM connector E (80P)	No. 63 and No. 77

Is there any voltage?

YES

Repair a short to power in the VCC wire(s) between the PCM (A44, E63, E77) and each part that was disconnected in step 2.

NO

Go to step 5

5. Shorted wire check (VCC lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	CMP sensor A 3P connector: disconnected
B	CMP sensor B 3P connector: disconnected
B	EGR valve 5P connector: disconnected
B	Rocker arm oil pressure sensor 3P connector: disconnected
B	Engine oil pressure sensor 3P connector: disconnected
B	Transmission fluid pressure sensor 3P connector: disconnected
B	APP sensor 6P connector: disconnected
B	A/C pressure sensor 3P connector: disconnected
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
B	PCM connector E (80P): disconnected

Connector	Terminal
PCM connector A (50P)	No. 44
PCM connector E (80P)	No. 63 and No. 77

Is there 1 MΩ or more?

YES

The VCC wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short to ground in the VCC(s) wire between the PCM (A44, E63, E77) and each part that was disconnected in step 2.

DTC P0657

DTC P0657 : PCM Power Supply Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0657 PCM Power Supply Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0657 PCM Power Supply Circuit Malfunction	B	B

   Is DTC P0657 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Fuse check

-1. Check the following fuse.

Fuse	**No. A7**

Is the fuse OK?

YES

Go to step 7.

NO

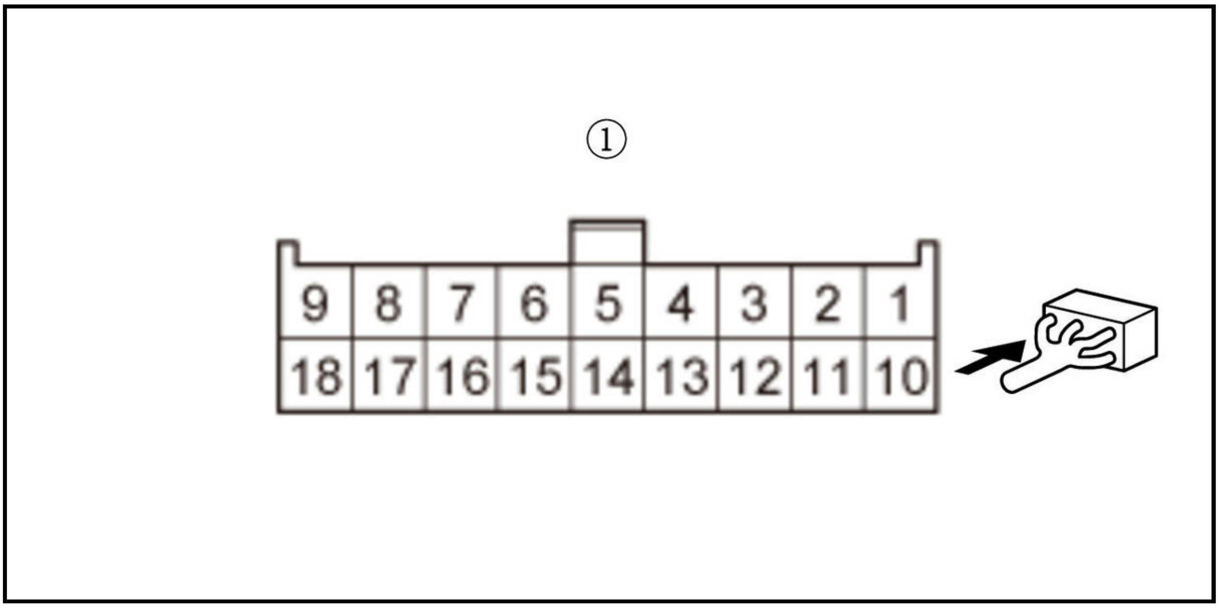
Go to step 4.

4. Determine possible failure area (+B_IGP line, others)

-1. Remove the blown **No. A7 fuse** .

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 5.

NO

Repair a short in the +B_IGP wire between the No. A7 fuse and the relay circuit board. Also replace the No. A7 fuse.

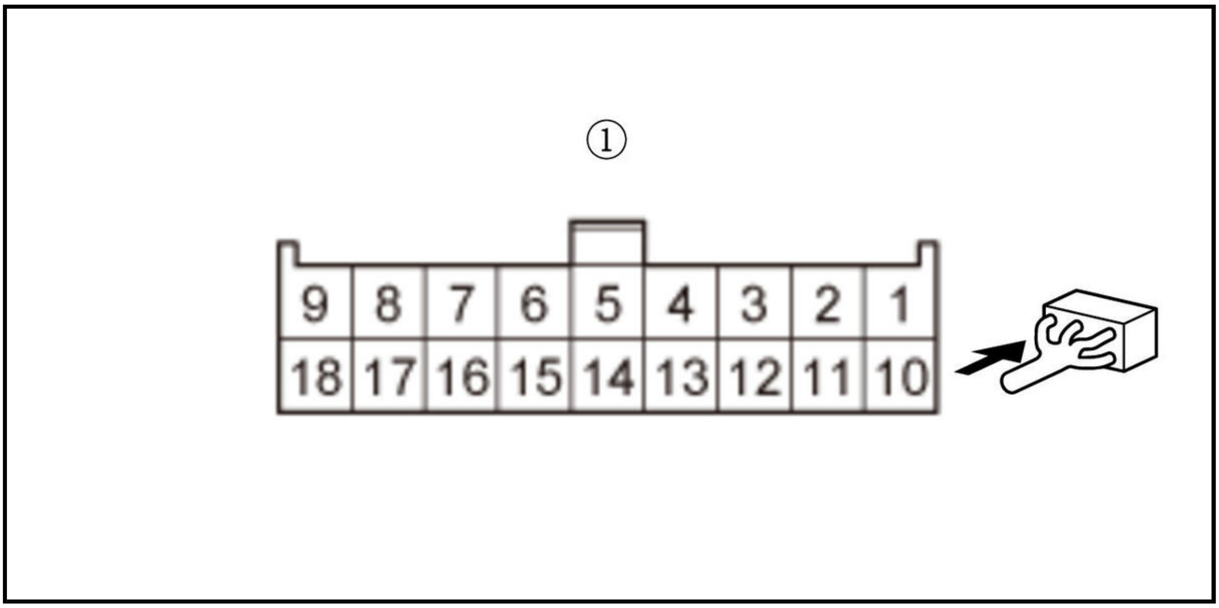
5. Parts internal circuit check

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

Check for continuity between test points 1 and 2 while disconnecting these parts or connectors, one at a time:

- PGM-FI main relay 2
- PCM connector A (50P)
- Each injector 2P connector

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	Body ground



Does continuity go away with the part(s) removed?

YES

Replace the part that continuity goes away when it was disconnected. If the part is PCM, Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** . Also replace the **No. A7 fuse** .

NO

Go to step 6.

6. Shorted wire check (FI_MAIN_RLY_OUT line)

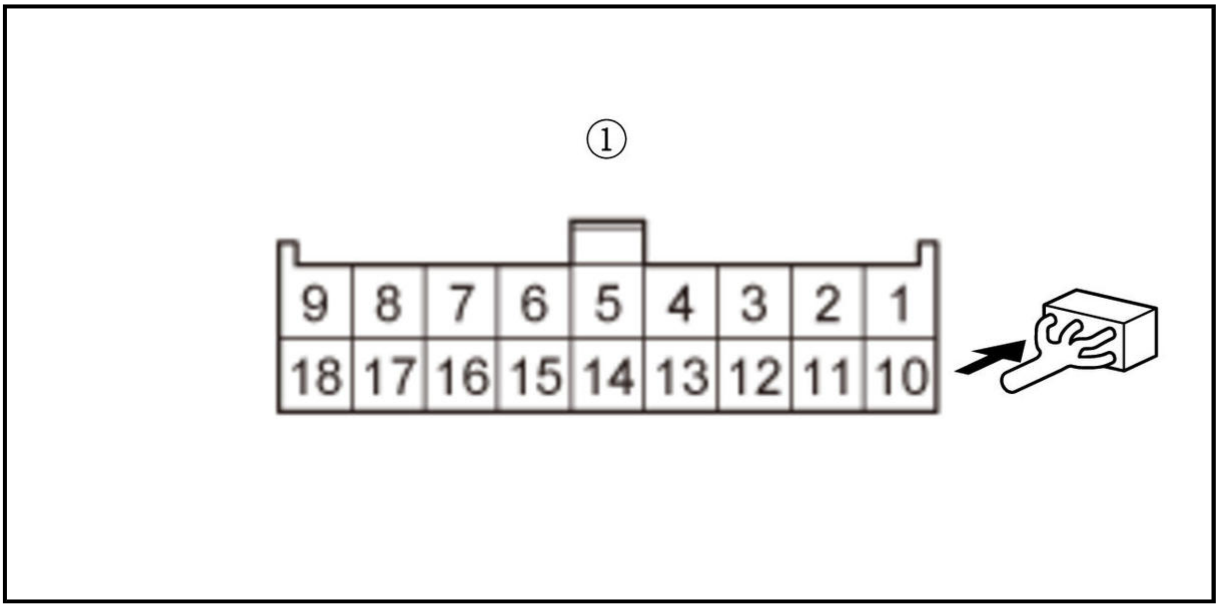
-1. Disconnect the following parts and connectors.

PGM-FI main relay 2
PCM connector A (50P)
Each injector 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board: removed
	PGM-FI main relay 2: disconnected

	PCM connector A (50P): disconnected
	Each injector 2P connector: disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 17: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Replace the relay circuit board . Also replace the **No. A7 fuse** .

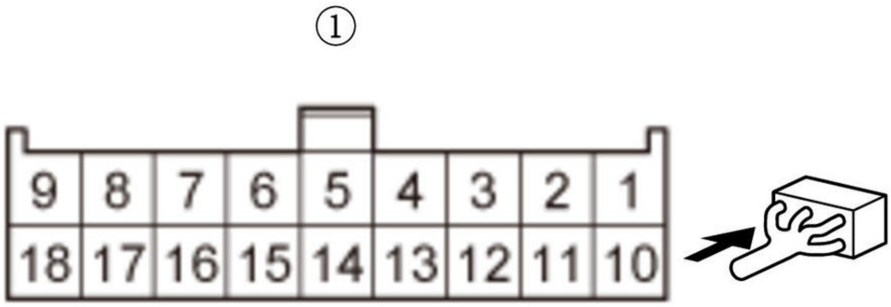
NO

Repair a short in the FI_MAIN_RLY_OUT wire between the PCM (A8), PGM-FI main relay 2, the injectors, and the relay circuit board. Also replace the No. A7 fuse.

7. Open wire check (+B_IGP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 18: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_IGP wire is OK. Go to step 8.

NO

Repair an open in the +B_IGP wire between the **No. A7 fuse** and the relay circuit board.

8. Open wire check (FI_MAIN_RLY_CL- line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 5: ①
Test point 2	**PCM connector A (50P) No. 5**

11
10

Is there 1.0 Ω or less?

YES

The FI_MAIN_RLY_OUT wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the FI_MAIN_RLY_OUT wire between the PCM (A8) and the relay circuit board.

DTC P06A8

DTC P06A8 : Internal VCC Power Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P06A8 Internal VCC Power Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. **Reset the PCM with the HDS** .

Reset PCM

-3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P06A8 Internal VCC Power Malfunction	B	B

Is DTC P06A8 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time.

DTC P0700, P14A0

DTC P0700 : Transmission Control System (MIL Reqest)

DTC P14A0 : Engine Abnormal Vibration

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0700 Transmission Control System (MIL Reqest)/A/T SYSTEM MALFUNCTION	B	B
P14A0 Engine Abnormal Vibration	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any Pending or Confirmed DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting .

   NO

   Go to step 2.

2. Electric powertrain system DTC check

   -1. Check for electric powertrain system DTCs with the HDS.

   Motor Control Module (Generator motor)

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   Motor Control Module (Traction motor)

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   Are any Pending or Confirmed DTCs indicated?

   YES

   Go to the indicated DTC troubleshooting..

   NO

   Go to step 3.

3. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0700 Transmission Control System (MIL Reqest)/A/T SYSTEM MALFUNCTION	B	B
P14A0 Engine Abnormal Vibration	B	B

Is DTC P0700, or P14A0 is indicated?

YES

Check the installation of the engine and transmission mounts, then recheck.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P0703

DTC P0703 : Brake Pedal Position Switch (NC) Malfunction

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the accelerator pedal is pressed with pressing the brake pedal lightly and continuously for 5 minutes or more, this DTC will be stored.

DTC Description	Confirmed DTC	Pending DTC
P0703 Brake Pedal Position Switch (NC) Malfunction	B	B

DTC (PGM-FI)

1. Brake pedal position switch signal (BKSWNC) check 1

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS without pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Cruise Brake Sw/Idle Stop Sw	CLOSE	B	B	B

   Do the current condition(s) match the malfunction threshold?

   YES

   Go to step 7.

   NO

   Go to step 2.

2. Brake pedal position switch installation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Adjust the brake pedal and the brake pedal position switch** .

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS without pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Cruise Brake Sw/Idle Stop Sw	CLOSE	B	B	B

Do the current condition(s) match the threshold?

YES

The failure is not duplicated.

NO

Go to step 3.

3. Determine possible failure area (brake pedal position switch, others)

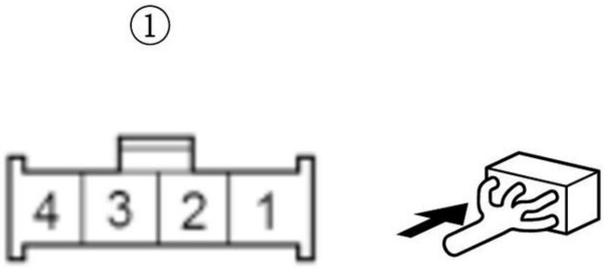
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Brake pedal position switch 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Brake pedal position switch 4P connector (female terminals) No. 2: ①
Terminal B	Brake pedal position switch 4P connector (female terminals) No. 3: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Cruise Brake Sw/Idle Stop Sw	CLOSE	B	B	B

Do the current condition(s) match the malfunction threshold?

YES

Replace the brake pedal position switch .

NO

Go to step 4.

4. Determine possible failure area (IG1_ACG line, others)

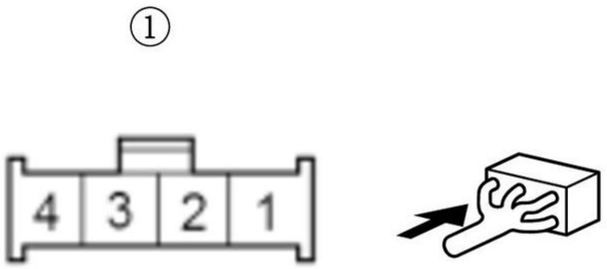
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the brake pedal position switch 4P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Brake pedal position switch 4P connector: disconnected
Test point 1	Brake pedal position switch 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

NO

Go to step 6.

5. Open wire check (BKSWNC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

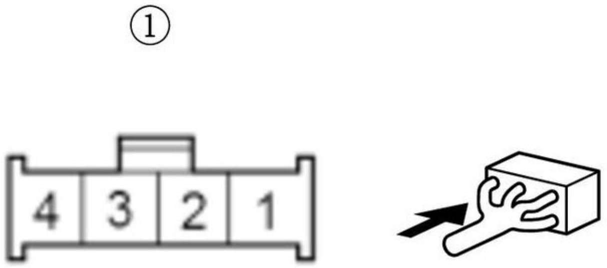
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	Brake pedal position switch 4P connector (female terminals) No. 2: ①
Terminal B	Brake pedal position switch 4P connector (female terminals) No. 3: ①



-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Brake pedal position switch 4P connector: disconnected
	PCM connector A (50P): disconnected
	Brake pedal position switch 4P connector No. 2 and No. 3: jumped
Test point 1	**PCM connector A (50P) No. 49**
Test point 2	Body ground

Is there battery voltage?

YES

The BKSWNC wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the BKSWNC wire between the PCM (A49) and the brake pedal position switch.

6. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D21

Is the fuse OK?

YES

Repair an open in the IG1_ACG wire between the No. D21 fuse and the brake pedal position switch.

NO

Replace the No. D21 fuse. Also check for a short to ground on the No. D21 fuse circuit if needed.

7. Brake pedal position switch signal (BKSWNC) check 2

-1. Press the brake pedal.

-2. Check the parameter(s) below with the HDS while pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Cruise Brake Sw/Idle Stop Sw	OPEN	B	B	B

Do the current condition(s) match the malfunction threshold?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the brake pedal position switch and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

Go to step 8.

8. Brake pedal position switch check

-1. **Test the brake pedal position switch** .

Is the switch OK?

YES

The brake pedal position switch is OK. Repair a short to power in the BKSWNC wire between the PCM (A49) and the brake pedal position switch.

NO

Replace the brake pedal position switch .

DTC P0751

DTC P0751 : Shift Solenoid Valve A Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0751 Shift Solenoid Valve A Stuck OFF	B	B	B

DTC (Gear)

1. ATF check

   -1. Check the ATF level to make sure that the transmission is filled to the proper level, and check for fluid leaks.

   -2. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES

   Replace the transmission (e-CVT) .

   NO

   Replace the ATF , then go to step 2.

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. Select the ENERGY FLOW screen on the MID.

   -5. Enter the VSA maintenance mode .

   -6. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

   WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0751 Shift Solenoid Valve A Stuck OFF	B	B	B

   Is DTC P0751 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Shift solenoid valve A check

-1. Select Shift Solenoid Valve A in the Miscellaneous Test Menu with the HDS, and check that shift solenoid valve A operates.

Shift Solenoid Test

Is a clicking sound heard?

YES

Shift solenoid valve A is OK. Faulty shift valve A. **Replace the valve body assembly** .

NO

Replace shift solenoid valve A .

DTC P0752 (2020)

DTC P0752 : Shift Solenoid Valve A Stuck ON

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0752 Shift Solenoid Valve A Stuck ON	B	B	B

DTC (Gear)

1. ATF check

   -1. **Check the ATF level** to make sure that the transmission is filled to the proper level, and check for fluid leaks.

   -2. **Drain the ATF** through a strainer. Inspect the strainer for metal debris or excessive clutch material.

   Does the strainer have metal debris or excessive clutch material?

   YES

   Replace the transmission (e-CVT) .

   NO

   Replace the ATF , then go to step 2.

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. Select the ENERGY FLOW screen on the MID.

   -5. **Enter the VSA maintenance mode** .

   -6. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0752 Shift Solenoid Valve A Stuck ON	B	B	B

Is DTC P0752 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Shift solenoid valve A check

-1. Select Shift Solenoid Valve A in the Miscellaneous Test Menu with the HDS, and check that shift solenoid valve A operates.

Shift Solenoid Test

Is a clicking sound heard?

YES

Shift solenoid valve A is OK. Faulty shift valve A. **Replace the valve body assembly** .

NO

Replace shift solenoid valve A .

DTC P0752 (2021)

DTC P0752 : Shift Solenoid Valve A Stuck ON

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- If DTC P2872 is stored at the same time as DTC P0752, troubleshoot DTC P2872 first, then recheck for P0752.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0752 Shift Solenoid Valve A Stuck ON	B	B	B

DTC (Gear)

1. ATF check

-1. **Check the ATF level** to make sure that the transmission is filled to the proper level, and check for fluid leaks.

-2. **Drain the ATF** through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES

Replace the transmission (e-CVT) .

NO

Replace the ATF , then go to step 2.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. Select the ENERGY FLOW screen on the MID.

-5. **Enter the VSA maintenance mode** .

-6. Select the HV mode by pressing the HV button.

NOTE: The HV indicator in the gauge assembly comes on.

-7. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0752 Shift Solenoid Valve A Stuck ON	B	B	B

Is DTC P0752 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Shift solenoid valve A check

-1. Select Shift Solenoid Valve A in the Function Test Menu with the HDS, and check that shift solenoid valve A operates.

Shift Solenoid Test

Is a clicking sound heard?

YES

Shift solenoid valve A is OK. Faulty shift valve A. **Replace the valve body assembly** .

NO

Replace shift solenoid valve A .

DTC P0756

DTC P0756 : Shift Solenoid Valve B Stuck OFF

NOTE: Before you troubleshoot, review the General Troubleshooting Information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0756 Shift Solenoid Valve B Stuck OFF	B	B	B

DTC (Gear)

1. ATF check

-1. Check the ATF level to make sure that the transmission is filled to the proper level, and check for fluid leaks.

-2. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES

Replace the transmission (e-CVT) .

NO

Replace the ATF , then go to step 2.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. Select the ENERGY FLOW screen on the MID.

-5. Enter the VSA maintenance mode .

-6. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0756 Shift Solenoid Valve B Stuck OFF	B	B	B

Is DTC P0756 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Shift solenoid valve B check

-1. Select Shift Solenoid Valve B in the Miscellaneous Test Menu with the HDS, and check that shift solenoid valve B operates.

Shift Solenoid Test

Is a clicking sound heard?

YES

Shift solenoid valve B is OK. Faulty shift valve B. **Replace the valve body assembly** .

NO

Replace shift solenoid valve B .

DTC P0757 (2020)

DTC P0757 : Shift Solenoid Valve B Stuck ON

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0757 Shift Solenoid Valve B Stuck ON	B	B	B

DTC (Gear)

1. ATF check

-1. **Check the ATF level** to make sure that the transmission is filled to the proper level, and check for fluid leaks.

-2. **Drain the ATF** through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES

Replace the transmission (e-CVT) .

NO

Replace the ATF , then go to step 2.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. Select the ENERGY FLOW screen on the MID.

-5. **Enter the VSA maintenance mode** .

-6. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0757 Shift Solenoid Valve B Stuck ON	B	B	B

Is DTC P0757 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Shift solenoid valve B check

-1. Select Shift Solenoid Valve B in the Miscellaneous Test Menu with the HDS, and check that shift solenoid valve B operates.

Shift Solenoid Test

Is a clicking sound heard?

YES

Shift solenoid valve B is OK. Faulty shift valve B. **Replace the valve body assembly** .

NO

Replace shift solenoid valve B .

DTC P0757 (2021)

DTC P0757 : Shift Solenoid Valve B Stuck ON

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- If DTC P2872 is stored at the same time as DTC P0757, troubleshoot DTC P2872 first, then recheck for P0757.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0757 Shift Solenoid Valve B Stuck ON	B	B	B

DTC (Gear)

1. ATF check

-1. Check the ATF level to make sure that the transmission is filled to the proper level, and check for fluid leaks.

-2. Drain the ATF through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES

Replace the transmission (e-CVT) .

NO

Replace the ATF , then go to step 2.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. Select the ENERGY FLOW screen on the MID.

-5. Enter the VSA maintenance mode .

-6. Select the HV mode by pressing the HV button.

NOTE: The HV indicator in the gauge assembly comes on.

-7. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0757 Shift Solenoid Valve B Stuck ON	B	B	B

Is DTC P0757 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Shift solenoid valve B check

-1. Select Shift Solenoid Valve B in the Function Test Menu with the HDS, and check that shift solenoid valve B operates.

Shift Solenoid Test

Is a clicking sound heard?

YES

Shift solenoid valve B is OK. Faulty shift valve B. **Replace the valve body assembly** .

NO

Replace shift solenoid valve B .

DTC P07B3

DTC P07B3 : Transmission Park Position Sensor/Switch A Circuit Low

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P07B3 Transmission Park Position Sensor/Switch A Circuit Low	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

   -5. Monitor the OBD STATUS for P07B3 and P07B9 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P07B3 Transmission Park Position Sensor/Switch A Circuit Low	B
P07B9 Transmission Park Position Sensor/Switch B Circuit Low	B

   Does the HDS indicate FAILED?

   DTC P07B3 and P07B9 indicate FAILED

   The failure is duplicated. Go to step 2.

   Only DTC P07B3 indicates FAILED

   The failure is duplicated. Go to step 5.

   DTC P07B3 and P07B9 indicate PASSED

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park position sensor and the SBW shifter control module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (park position sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

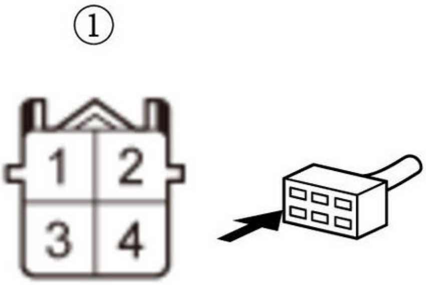
-2. Disconnect the following connector.

Park position sensor 4P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Park position sensor 4P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 1: ①
Test point 2	Park position sensor 4P connector (female terminals) No. 2: ①



Is there about 5 V?

YES

Replace the park position sensor .

NO

Go to step 3.

3. Open wire check (VCC/SBW_VCC line)

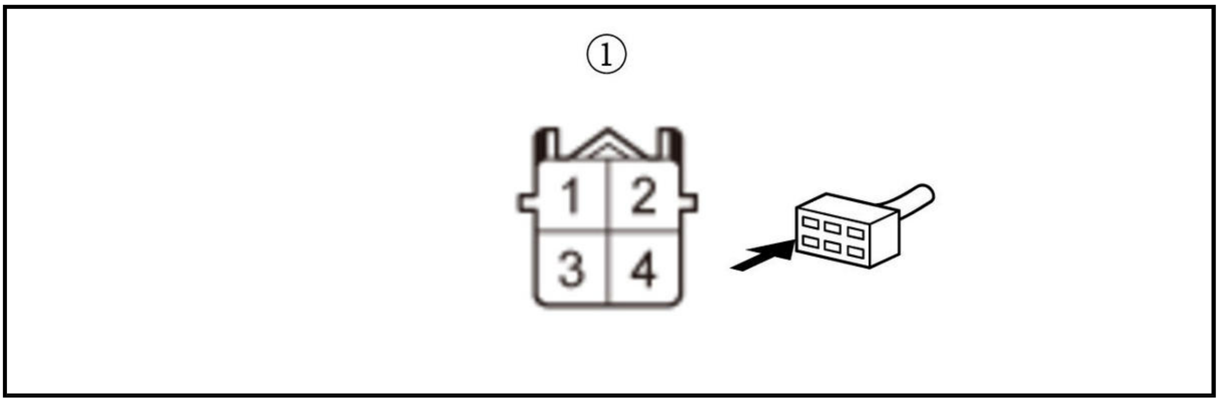
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

SBW shifter control module 20P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 1: ①
Test point 2	**SBW shifter control module 20P connector No. 12**



Is there 1.0 Ω or less?

YES

The VCC/SBW_VCC wire is OK. Go to step 4.

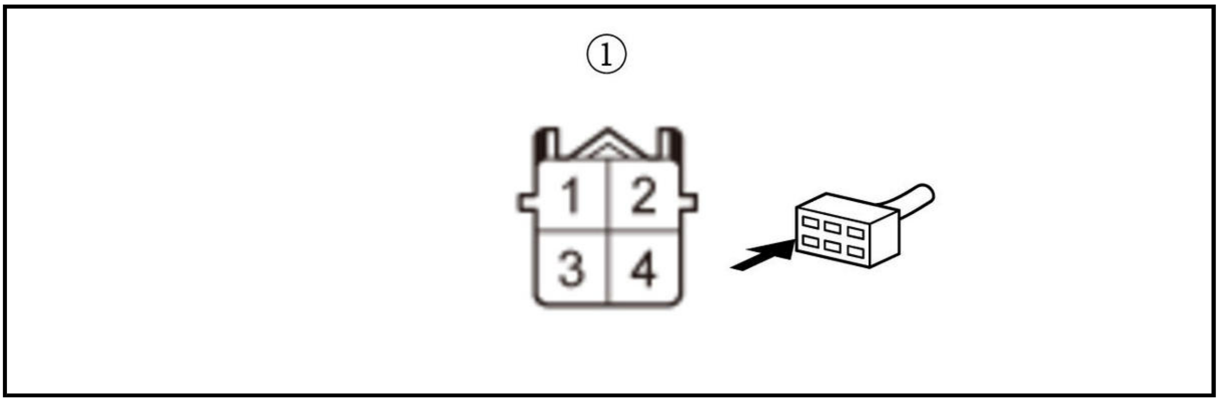
NO

Repair an open in the VCC/SBW_VCC wire between the park position sensor and the SBW shifter control module.

4. Open wire check (GND/SBW SG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 2: ①
Test point 2	**SBW shifter control module 20P connector No. 2**



Is there 1.0 Ω or less?

YES

The GND/SBW SG wire is OK. Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

NO

Repair an open in the GND/SBW SG wire between the park position sensor and the SBW shifter control module.

5. Shorted wire check (PSEN1/SBW PPOS1 line)

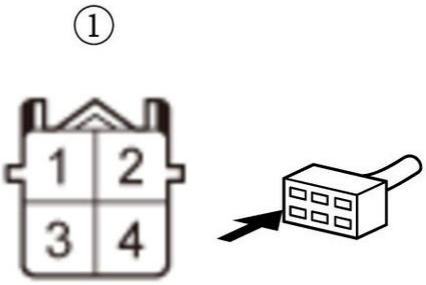
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Park position sensor 4P connector
SBW shifter control module 20P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The PSEN1/SBW PPOS1 wire is not shorted. Go to step 6.

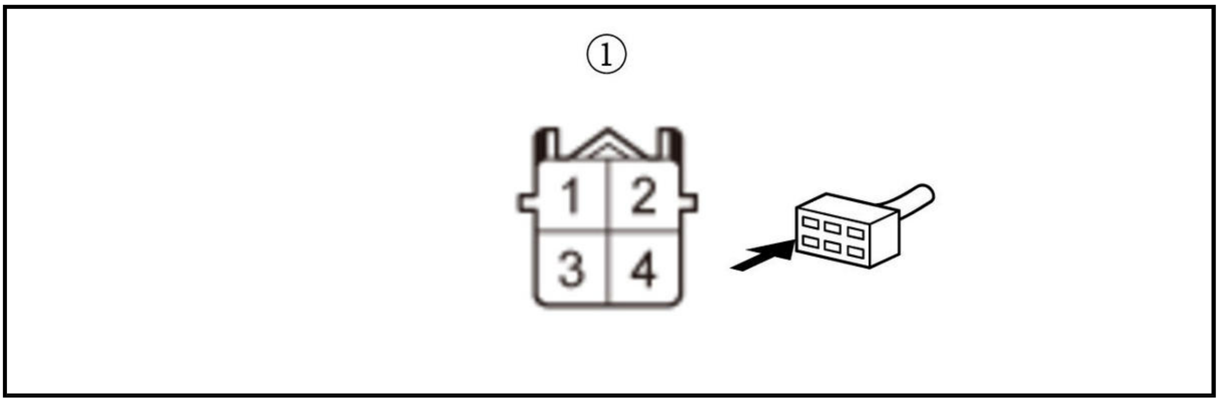
NO

Repair a short to ground in the PSEN1/SBW PPOS1 wire between the park position sensor and the SBW shifter control module.

6. Open wire check (PSEN1/SBW PPOS1 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 3: ①
Test point 2	**SBW shifter control module 20P connector No. 11**



Is there 1.0 Ω or less?

YES

The PSEN1/SBW PPOS1 wire is OK. Go to step 7.

NO

Repair an open in the PSEN1/SBW PPOS1 wire between the park position sensor and the SBW shifter control module.

7. Determine possible failure area (park position sensor, SBW shifter control module)

-1. Reconnect all connectors.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**SBW shifter control module 20P connector No. 2**
Test point 2	**SBW shifter control module 20P connector No. 11**

Is there 0.1 V or more?

YES

Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

NO

Replace the park position sensor .

DTC P07B4

DTC P07B4 : Transmission Park Position Sensor/Switch A Circuit High

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P07B4 Transmission Park Position Sensor/Switch A Circuit High	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. Monitor the OBD STATUS for P07B4 in the DTCs MENU with the HDS.

DTC Description	**OBD Status**
P07B4 Transmission Park Position Sensor/Switch A Circuit High	B

Does the HDS indicate FAILED?

DTC P07B4 indicates FAILED

The failure is duplicated. Go to step 2.

DTC P07B4 indicates PASSED

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park position sensor and the SBW shifter control module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PSEN1 line to power)

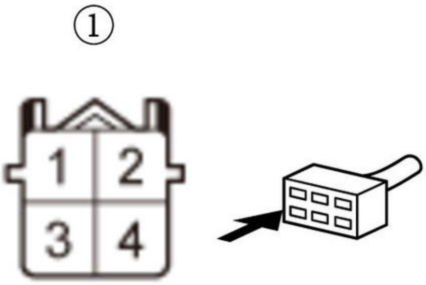
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Park position sensor 4P connector
SBW shifter control module 20P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 1: ①
Test point 2	Park position sensor 4P connector (female terminals) No. 3: ①



Is there 1 MΩ or more?

YES

The PSEN1 wire is OK. Go to step 3.

NO

Repair a short to power in the PSEN1 wire between the park position sensor and the SBW shifter control module.

3. Park position sensor check

-1. Reconnect all connectors.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**SBW shifter control module 20P connector No. 2**
Test point 2	**SBW shifter control module 20P connector No. 11**

Is there 4.8 V or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original park position sensor** . If the DTC does not clear, **replace the SBW shifter assembly** .

NO

The park position sensor is OK. Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

DTC P07B9

DTC P07B9 : Transmission Park Position Sensor/Switch B Circuit Low

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P07B9 Transmission Park Position Sensor/Switch B Circuit Low	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. Monitor the OBD STATUS for P07B3 and P07B9 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P07B3 Transmission Park Position Sensor/Switch A Circuit Low	B
P07B9 Transmission Park Position Sensor/Switch B Circuit Low	B

Does the HDS indicate FAILED?

DTC P07B3 and P07B9 indicate FAILED

The failure is duplicated. Go to step 2.

Only DTC P07B9 indicates FAILED

The failure is duplicated. Go to step 5.

DTC P07B3 and P07B9 indicate PASSED

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park position sensor and the SBW shifter control module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (park position sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

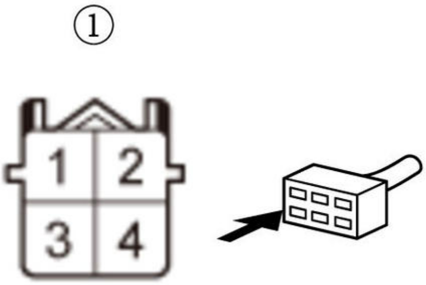
   -2. Disconnect the following connector.

Park position sensor 4P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Park position sensor 4P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 1: ①
Test point 2	Park position sensor 4P connector (female terminals) No. 2: ①



Is there about 5 V?

YES

Replace the park position sensor .

NO

Go to step 3.

3. Open wire check (VCC/SBW_VCC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

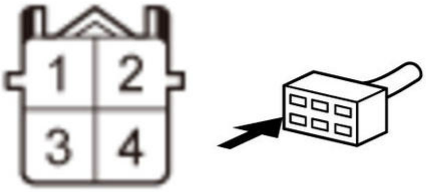
-2. Disconnect the following connector.

SBW shifter control module 20P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 1: ①
Test point 2	**SBW shifter control module 20P connector No. 12**

①



Is there 1.0 Ω or less?

YES

The VCC/SBW_VCC wire is OK. Go to step 4.

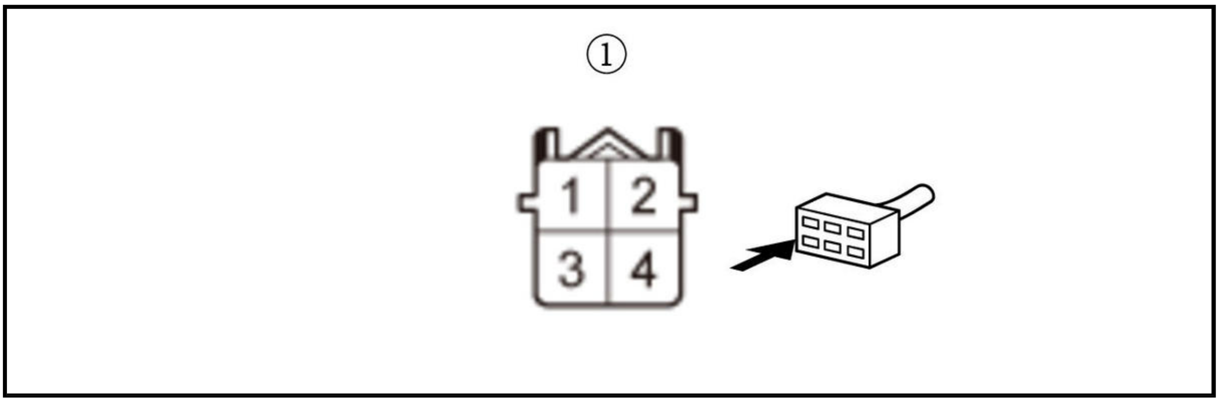
NO

Repair an open in the VCC/SBW_VCC wire between the park position sensor and the SBW shifter control module.

4. Open wire check (GND/SBW SG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 2: ①
Test point 2	**SBW shifter control module 20P connector No. 2**



Is there 1.0 Ω or less?

YES

The GND/SBW SG wire is OK. Faulty SBW shifter control module. Replace the SBW shifter assembly
.

NO

Repair an open in the GND/SBW SG wire between the park position sensor and the SBW shifter control module.

5. Shorted wire check (PSEN2/SBW PPOS2 line)

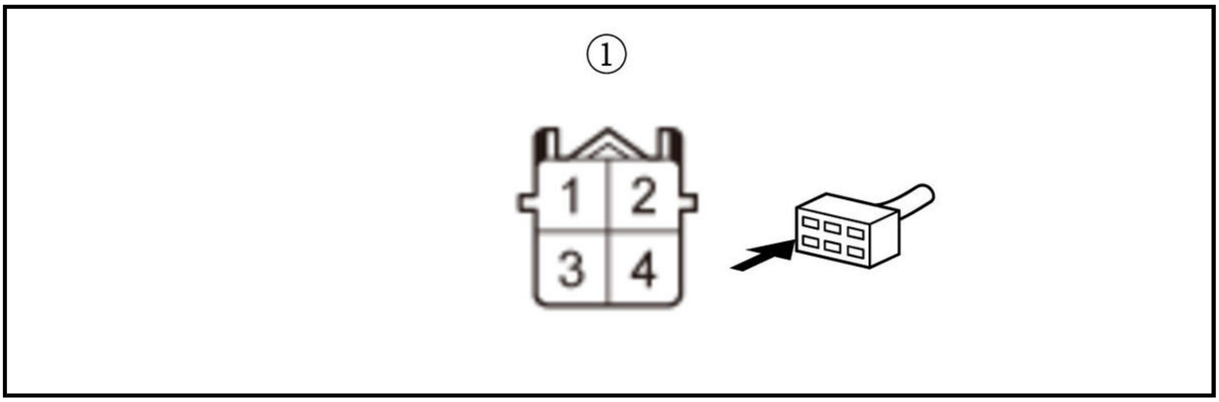
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Park position sensor 4P connector
SBW shifter control module 20P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The PSEN2 wire is not shorted. Go to step 6.

NO

Repair a short to ground in the PSEN2/SBW PPOS2 wire between the park position sensor and the SBW shifter control module.

6. Open wire check (PSEN2/SBW PPOS2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 4: ①
Test point 2	**SBW shifter control module 20P connector No. 4**

Is there 1.0 Ω or less?

YES

The PSEN2/SBW PPOS2 wire is OK. Go to step 7.

NO

Repair an open in the PSEN2/SBW PPOS2 wire between the park position sensor and the SBW shifter control module.

7. Determine possible failure area (park position sensor, SBW shifter control module)

-1. Reconnect all connectors.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**SBW shifter control module 20P connector No. 2**
Test point 2	**SBW shifter control module 20P connector No. 4**

Is there 0.1 V or more?

YES

Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

NO

Replace the park position sensor .

DTC P07BA

DTC P07BA : Transmission Park Position Sensor/Switch B Circuit High

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P07BA Transmission Park Position Sensor/Switch B Circuit High	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

   -5. Monitor the OBD STATUS for P07BA in the DTCs MENU with the HDS.

DTC Description	**OBD Status**
P07BA Transmission Park Position Sensor/Switch B Circuit High	B

Does the HDS indicate FAILED?

DTC P07BA indicates FAILED

The failure is duplicated. Go to step 2.

DTC P07BA indicates PASSED

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park position sensor and the SBW shifter control module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PSEN2/SBW PPOS2 line to power)

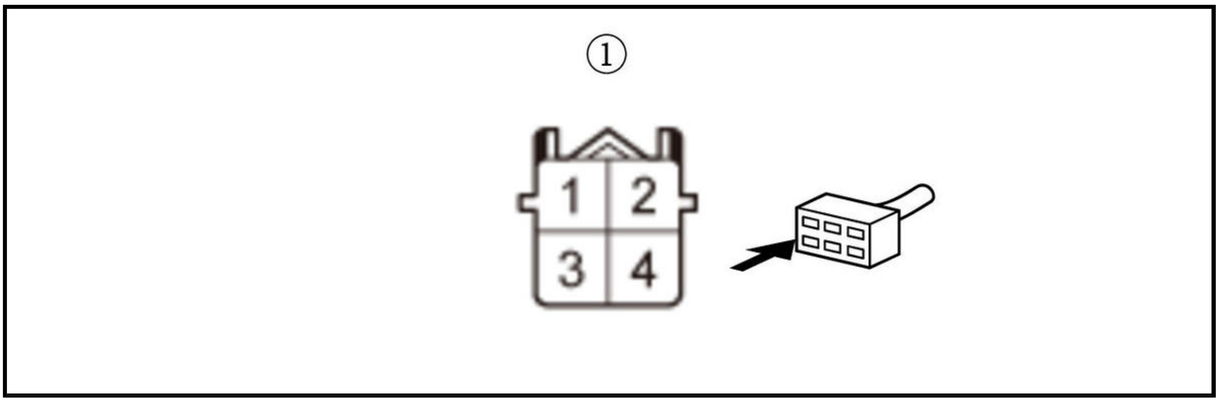
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Park position sensor 4P connector
SBW shifter control module 20P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 1: ①
Test point 2	Park position sensor 4P connector (female terminals) No. 4: ①



Is there 1 MΩ or more?

YES

The PSEN2/SBW PPOS2 wire is OK. Go to step 3.

NO

Repair a short to power in the PSEN2/SBW PPOS2 wire between the park position sensor and the SBW shifter control module.

3. Park position sensor check

-1. Reconnect all connectors.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	**SBW shifter control module 20P connector No. 2**
Test point 2	**SBW shifter control module 20P connector No. 4**

Is there 4.8 V or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original park position sensor** . If the DTC does not clear, **replace the SBW shifter assembly** .

NO

The park position sensor is OK. Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

DTC P07BE

DTC P07BE : Transmission Park Position Sensor/Switch A/B Incorrect Voltage Correlation

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P07BE Transmission Park Position Sensor/Switch A/B Incorrect Voltage Correlation	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for at least 2 seconds.

   -5. While pressing the brake pedal, shift the transmission to N position/mode, then shift to P position/mode.

   -6. Monitor the OBD STATUS for P07BE in the DTCs MENU with the HDS.

DTC Description	**OBD Status**
P07BE Transmission Park Position Sensor/Switch A/B Incorrect Voltage Correlation	B

   Does the HDS indicate FAILED?

   DTC P07BE indicates FAILED

   The failure is duplicated. Go to step 2.

   DTC P07BE indicates PASSED

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park position sensor and the SBW shifter control module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PSEN1/SBW PPOS1 line to PSEN2/SBW PPOS2 line)

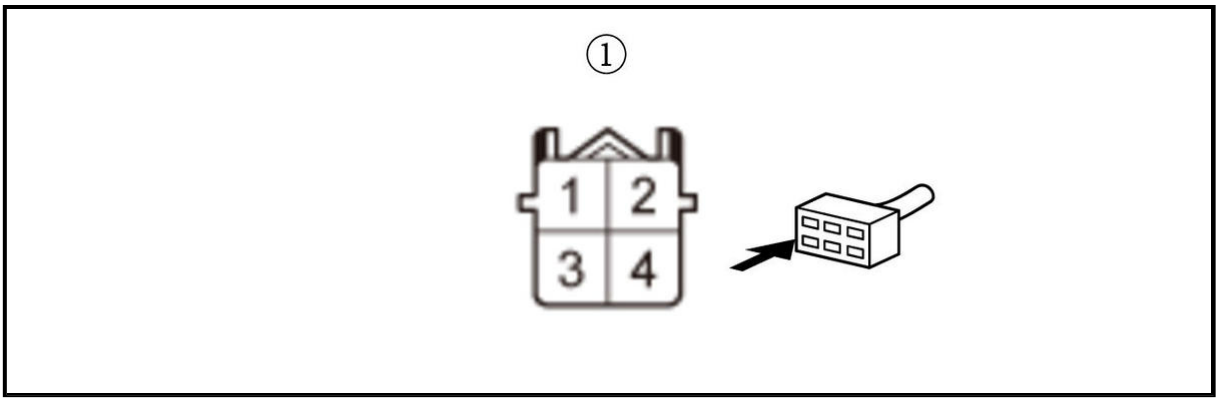
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Park position sensor 4P connector
SBW shifter control module 20P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park position sensor 4P connector: disconnected
B	SBW shifter control module 20P connector: disconnected
Test point 1	Park position sensor 4P connector (female terminals) No. 3: ①
Test point 2	Park position sensor 4P connector (female terminals) No. 4: ①



Is there 1 MΩ or more?

YES

The PSEN1/SBW PPOS1 wire and the PSEN2/SBW PPOS2 wire are OK. Go to step 3.

NO

Repair a short in the PSEN1/SBW PPOS1 wire to the PSEN2/SBW PPOS2 wire between the park position sensor and the SBW shifter control module.

3. Park position sensor check

-1. Reconnect all connectors.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2 individually.

Test condition	Vehicle ON mode
Test point 1	**SBW shifter control module 20P connector No. 2**
Test point 2	**SBW shifter control module 20P connector No. 11**
B	B
Test point 1	**SBW shifter control module 20P connector No. 2**
Test point 2	**SBW shifter control module 20P connector No. 4**

Are these voltages matched?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original park position sensor** . If the DTC does not clear, **replace the SBW shifter assembly** .

NO

The park position sensor is OK. Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

DTC P0811

DTC P0811 : Excessive Clutch A Slippage

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0811 Excessive Clutch A Slippage	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. Select the ENERGY FLOW screen on the MID.

   -5. **Enter the VSA maintenance mode** .

   -6. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

   WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0811 Excessive Clutch A Slippage	B	B	B

   Is DTC P0811 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Over drive clutch pressure check

   -1. **Measure the over drive clutch pressure** .

   Is the over drive clutch pressure within the service limit?

   YES

   The over drive clutch pressure is OK. **Replace the over drive clutch** or **replace the transmission (e-CVT)** .

   NO

   Go to step 3.

3. Over drive clutch hydraulic circuit check

   -1. **Measure the line pressure** .

   Is the line pressure within the service limits?

   YES

Clogged over drive clutch hydraulic circuit. **Replace the transmission (e-CVT)** .

NO

The over drive clutch hydraulic circuit is OK. Faulty ATF pump or main regulator valve. **Replace the valve body assembly** , or **replace the transmission (e-CVT)** .

DTC P0840 (2020)

DTC P0840 : Transmission Fluid Pressure Sensor Malfunction

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0840 Transmission Fluid Pressure Sensor Malfunction	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode** , then start the engine until the cooling fan comes on.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the ON mode.

-6. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-7. Select the ENERGY FLOW screen on the MID.

-8. **Enter the VSA maintenance mode** .

-9. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-10.

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0840 Transmission Fluid Pressure Sensor Malfunction	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173A Transmission Fluid Pressure Sensor Performance High	B	B	B
P173B Transmission Fluid Pressure Sensor Performance Low	B	B	B

Is DTC P0840, P173A, or P173B indicated?

DTC P0840 is indicated

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

DTC P173A is indicated

Do the troubleshooting for DTC P173A .

DTC P173B is indicated

Do the troubleshooting for DTC P173B .

DTC P0840 (2021)

DTC P0840 : Transmission Fluid Pressure Sensor Malfunction

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0840 Transmission Fluid Pressure Sensor Malfunction	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Oil Pressure Sensor 1 Voltage	0.34 or less	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid pressure sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (PODCL line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Transmission fluid pressure sensor 3P connector

   -3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Oil Pressure Sensor 1 Voltage	0.34 or less	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (PODCL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

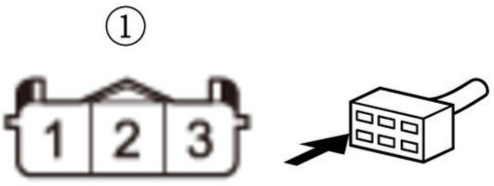
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmission fluid pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Transmission fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the PODCL wire between the transmission fluid pressure sensor and the PCM.

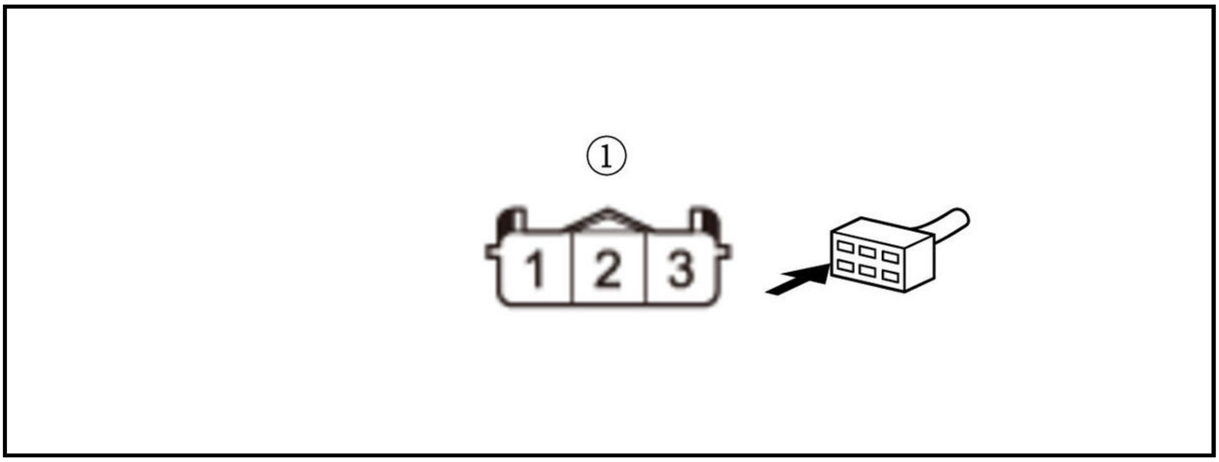
NO

The PODCL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

4. Open wire check (VCC2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Transmission fluid pressure sensor 3P connector: disconnected
Test point 1	Transmission fluid pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The VCC2 wire is OK. **Replace the transmission fluid pressure sensor** .

NO

Repair an open in the VCC2 wire between transmission fluid pressure sensor and the PCM.

DTC P0841 (2021)

DTC P0841 : Transmission Fluid Pressure Sensor Performance

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0841 Transmission Fluid Pressure Sensor Performance	B	B	B

DTC (Gear)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0841 Transmission Fluid Pressure Sensor Performance	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173A Transmission Fluid Pressure Sensor Performance High	B	B	B
P173B Transmission Fluid Pressure Sensor Performance Low	B	B	B

Is DTC P173A or P173B indicated?

DTC P173A is indicated

Do the troubleshooting for DTC P173A .

DTC P173B is indicated

Do the troubleshooting for DTC P173B .

DTC P0842

DTC P0842 : Transmission Fluid Pressure Switch A (2nd Clutch) Circuit Low/Transmission Fluid Pressure Sensor Circuit Low Input

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0842 Transmission Fluid Pressure Switch A (2nd Clutch) Circuit Low/Transmission Fluid Pressure Sensor Circuit Low Input	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Oil pressure sensor 1 voltage	0.25 or less	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid pressure sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (PODCL line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Transmission fluid pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Oil pressure sensor 1 voltage	0.25 or less	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (PODCL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

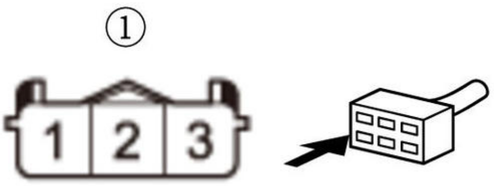
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmission fluid pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Transmission fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The PODCL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

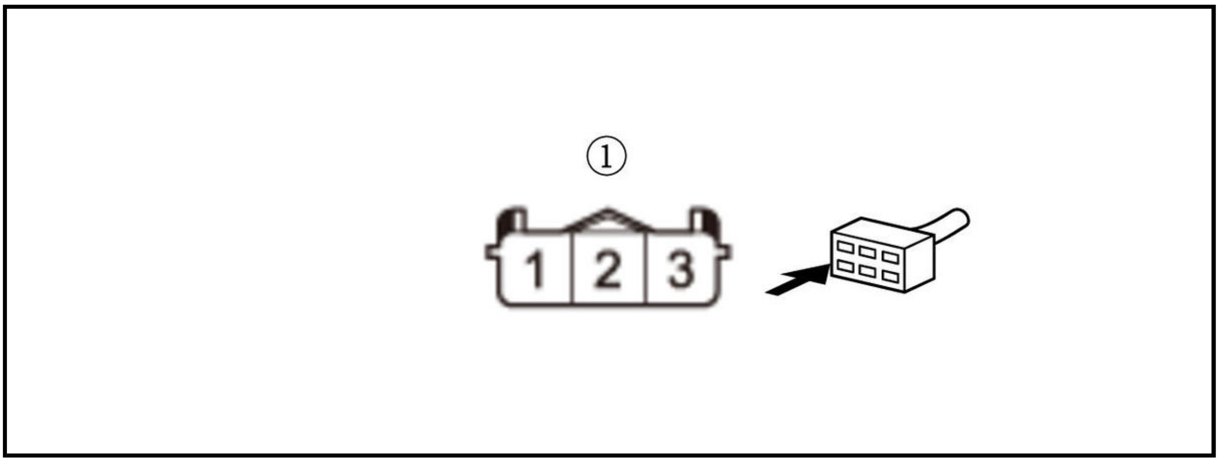
Repair a short to ground in the PODCL wire between the transmission fluid pressure sensor and the PCM.

4. Open wire check (VCC2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Transmission fluid pressure sensor 3P connector: disconnected

Test point 1	Transmission fluid pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The VCC2 wire is OK. **Replace the transmission fluid pressure sensor** .

NO

Repair an open in the VCC2 wire between transmission fluid pressure sensor and the PCM.

DTC P0843

DTC P0843 : Transmission Fluid Pressure Switch A (2nd Clutch) Circuit High/Transmission Fluid Pressure Sensor Circuit High Input

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0843 Transmission Fluid Pressure Switch A (2nd Clutch) Circuit High/Transmission Fluid Pressure Sensor Circuit High Input	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Oil pressure sensor 1 voltage	4.65 or more	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid pressure sensor and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (PODCL line, others)

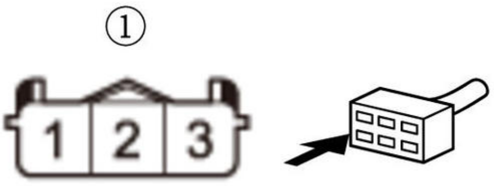
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Transmission fluid pressure sensor 3P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Transmission fluid pressure sensor 3P connector (female terminals) No. 1: ①
Terminal B	Transmission fluid pressure sensor 3P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Oil pressure sensor 1 voltage	4.65 or more	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

3. Open wire check (PODCL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

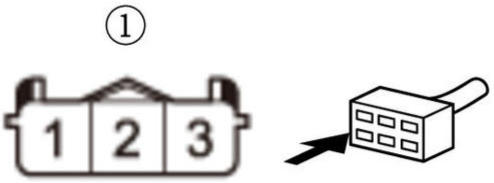
-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector E (80P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmission fluid pressure sensor 3P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Transmission fluid pressure sensor 3P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 33**



Is there 1.0 Ω or less?

YES

The PODCL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the PODCL wire between the transmission fluid pressure sensor and the PCM.

4. Transmission fluid pressure sensor check

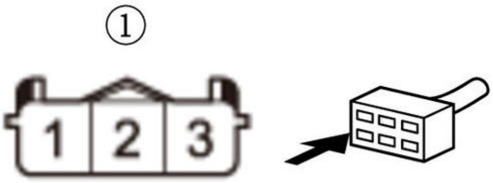
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Transmission fluid pressure sensor 3P connector: disconnected
Test point 1	Transmission fluid pressure sensor 3P connector (female terminals) No. 1: ①
Test point 2	Transmission fluid pressure sensor 3P connector (female terminals) No. 3: ①



Is there about 5 V?

YES

Replace the transmission fluid pressure sensor .

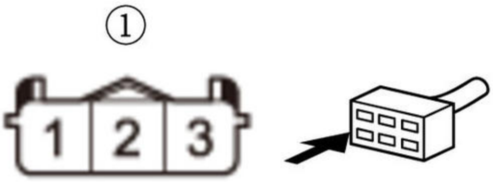
NO

Transmission fluid pressure sensor is OK, go to step 5.

5. Open wire check (VCC2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Transmission fluid pressure sensor 3P connector: disconnected
Test point 1	Transmission fluid pressure sensor 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The VCC2 wire is OK. Repair an open in the SG2 wire between the transmission fluid pressure sensor and the PCM.

NO

Repair an open in the VCC2 wire between the transmission fluid pressure sensor and the PCM.

DTC P084F

DTC P084F : Park/Neutral Switch Output Circuit

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P084F Park/Neutral Switch Output Circuit	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the READY TO DRIVE mode.

   -5. While pressing the brake pedal, shift the transmission to N position/mode, and wait for at least 10 seconds.

   -6. While pressing the brake pedal, shift the transmission to P position/mode, and wait for at least 10 seconds.

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P084F Park/Neutral Switch Output Circuit	B	B	B

   Is DTC P084F indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the SBW shifter control module and the body control module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. SBW shifter control module internal ATP-P line check

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	SBW shifter control module 20P connector No. 14
Test point 2	Body ground

Is there battery voltage?

YES

Faulty SBW shifter control module. Replace the SBW shifter assembly .

NO

The SBW shifter control module internal ATP-P line is OK. Go to step 3.

3. Shorted wire check (ATP-P line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

SBW shifter control module 20P connector

-3. Check for continuity between test points 1 and 2 while disconnecting following connector.

Body control module connector C (28P)
Power tailgate control unit connector A (24P) (With power tailgate)
Power seat control unit connector A (20P) (With DPMS)

Test condition	Vehicle OFF (LOCK) mode
B	SBW shifter control module 20P connector: disconnected
Test point 1	SBW shifter control module 20P connector No. 14
Test point 2	Body ground

Does continuity go away when the connector is disconnected?

YES

Replace the part that any resistance was detected when it was disconnected.

NO

Repair a short to ground in the ATP-P wire between the SBW shifter control module and the body control module.

DTC P0973

DTC P0973 : Shift Solenoid Valve A Control Circuit Low (Short)

NOTE: Before you troubleshoot, review the General Troubleshooting Information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0973 Shift Solenoid Valve A Control Circuit Low (Short)	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. Select the ENERGY FLOW screen on the MID.

-5. **Enter the VSA maintenance mode** .

-6. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0973 Shift Solenoid Valve A Control Circuit Low (Short)	B	B	B

Is DTC P0973 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve A and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (shift solenoid valve A, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Shift solenoid valve A 2P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. **Enter the VSA maintenance mode** .

-6. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0973 Shift Solenoid Valve A Control Circuit Low (Short)	B	B	B

Is DTC P0973 indicated?

YES

Go to step 3.

NO

Replace shift solenoid valve A .

3. Shorted wire check (SHA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve A 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 26**

Test point 2	Body ground

Is there 1 MΩ or more?

YES

The SHA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair a short to ground in the SHA wire between shift solenoid valve A and the PCM.

DTC P0974

DTC P0974 : Shift Solenoid Valve A Control Circuit High (Open)

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0974 Shift Solenoid Valve A Control Circuit High (Open)	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the READY TO DRIVE mode, and wait for at least 1 second.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0974 Shift Solenoid Valve A Control Circuit High (Open)	B	B	B

Is DTC P0974 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve A and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (shift solenoid valve A, others)

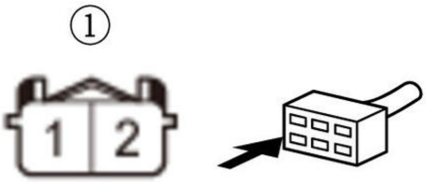
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Shift solenoid valve A 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Shift solenoid valve A 2P connector (female terminals) No. 1: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-7. Select the ENERGY FLOW screen on the MID.

-8. **Enter the VSA maintenance mode**.

-9. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-10.

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0973 Shift Solenoid Valve A Control Circuit Low (Short)	B	B	B

Is DTC P0973 indicated?

YES

Go to step 3.

NO

Go to step 4.

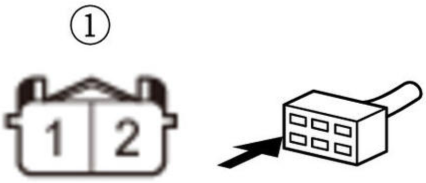
3. Shift solenoid valve A check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve A 2P connector: disconnected
Test point 1	Shift solenoid valve A 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Replace shift solenoid valve A .

NO

Shift solenoid valve A is OK. Repair an open in the PG wire between shift solenoid valve A and ground (G101), or repair poor ground (G101).

4. Open wire check (SHA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

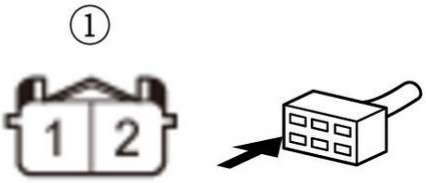
-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector E (80P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve A 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Shift solenoid valve A 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 26**



Is there 1.0 Ω or less?

YES

The SHA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the SHA wire between shift solenoid valve A and the PCM.

DTC P0976

DTC P0976 : Shift Solenoid Valve B Control Circuit Low (Short)

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0976 Shift Solenoid Valve B Control Circuit Low (Short)	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. Select the ENERGY FLOW screen on the MID.

-5. **Enter the VSA maintenance mode** .

-6. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0976 Shift Solenoid Valve B Control Circuit Low (Short)	B	B	B

Is DTC P0976 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve B and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (shift solenoid valve B, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Shift solenoid valve B 2P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. **Enter the VSA maintenance mode** .

-6. Run the vehicle in the engine drive mode for at least 10 seconds. Bring the wheels to a complete halt after more than 10 seconds.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0976 Shift Solenoid Valve B Control Circuit Low (Short)	B	B	B

Is DTC P0976 indicated?

YES

Go to step 3.

NO

Replace shift solenoid valve B .

3. Shorted wire check (SHB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve B 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 25**

Test point 2	Body ground

Is there 1 MΩ or more?

YES

The SHB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair a short to ground in the SHB wire between shift solenoid valve B and the PCM.

DTC P0977

DTC P0977 : Shift Solenoid Valve B Control Circuit High (Open)

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0977 Shift Solenoid Valve B Control Circuit High (Open)	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the READY TO DRIVE mode, and wait for at least 1 second.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0977 Shift Solenoid Valve B Control Circuit High (Open)	B	B	B

Is DTC P0977 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve B and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (shift solenoid valve B, others)

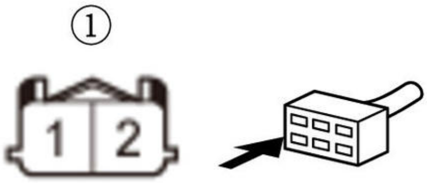
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Shift solenoid valve B 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Shift solenoid valve B 2P connector (female terminals) No. 1: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-7. Select the ENERGY FLOW screen on the MID.

-8. Enter the VSA maintenance mode .

-9. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-10.

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0976 Shift Solenoid Valve B Control Circuit Low (Short)	B	B	B

Is DTC P0976 indicated?

YES

Go to step 3.

NO

Go to step 4.

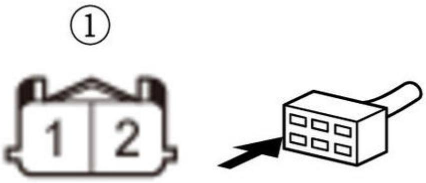
3. Shift solenoid valve B check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve B 2P connector: disconnected
Test point 1	Shift solenoid valve B 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Replace shift solenoid valve B .

NO

Shift solenoid valve B is OK. Repair an open in the PG wire between shift solenoid valve B and ground (G101), or repair poor ground (G101).

4. Open wire check (SHB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

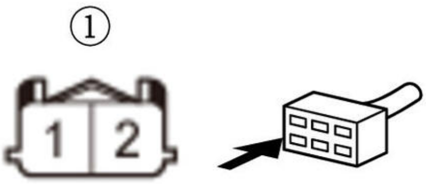
-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector E (80P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve B 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Shift solenoid valve B 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 25**



Is there 1.0 Ω or less?

YES

The SHB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the SHB wire between shift solenoid valve B and the PCM.

DTC P0C2F

DTC P0C2F : GEN-ENG Angular Speed Correlation Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P0C2F GEN-ENG Angular Speed Correlation Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. **Enter the maintenance mode, then start the engine** , and let it idle for 30 seconds or more.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0C2F GEN-ENG Angular Speed Correlation Malfunction	B	B

   Is DTC P0C2F indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the PCU and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Electric powertrain system DTC check

   -1. Check for electric powertrain system DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0A4B Generator Motor Rotor Position Sensor Circuit	B	B	B

   Is DTC P0A4B indicated?

   YES

   Go to the troubleshooting for **DTC P0A4B** .

   NO

   Go to step 3.

3. CKP sensor DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0335 CKP Sensor No Signal	B	B
P0339 CKP Sensor Circuit Intermittent Interruption	B	B

   Is DTC P0335 and/or P0339 indicated?

   YES

Replace the CKP sensor .

NO

Go to step 4.

4. Shorted wire check (NGENPLS/NOTPLS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCU 33P connector
PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCU 33P connector: disconnected

B	PCM connector E (80P): disconnected
Test point 1	PCM connector E (80P) No. 66
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The NGENPLS/NOTPLS wire is not shorted. Go to step 5.

NO

Repair a short in the NGENPLS/NOTPLS wire between the PCM (E66) and the PCU.

5. Open wire check (NGENPLS/NOTPLS line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	PCU 33P connector No. 29
Terminal B	Body ground

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCU 33P connector: disconnected
	PCM connector E (80P): disconnected
	PCU 33P connector No. 29: jumped to body ground
Test point 1	PCM connector E (80P) No. 66
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The NGENPLS/NOTPLS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the NGENPLS/NOTPLS wire between the PCM (E66) and the PCU.

DTC P100A

DTC P100A : Electric VTC Motor Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P100A Electric VTC Motor Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Select the VTC TEST in the Function Test Menu with the HDS.

VTC TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P100A Electric VTC Motor Circuit Malfunction	B	B

Is DTC P100A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the electric VTC motor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. C1-4**

Is the fuse OK?

YES

Go to step 6.

NO

Go to step 3.

3. Shorted wire check (+B_EVTC line)

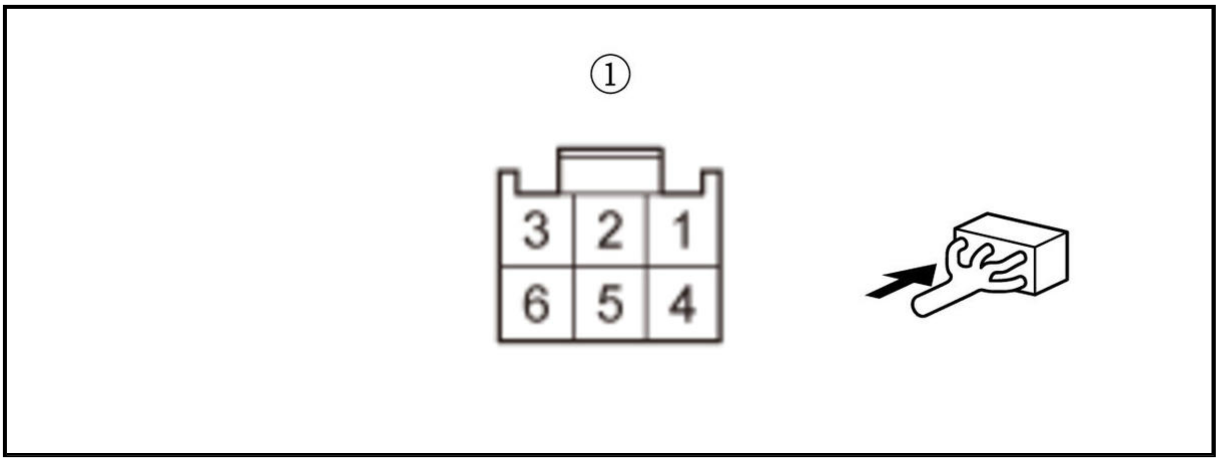
-1. Remove the blown **No. C1-4 fuse** .

-2. Disconnect the following connector.

Relay circuit board connector B (6P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Relay circuit board connector B (6P): disconnected
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 4.

NO

Repair a short in the +B_EVTC wire between No. C1-4 fuse and the relay circuit board. Also replace the No. C1-4 fuse.

4. Shorted wire check (IG_COIL_RLY_OUT/VB1 line, IG_COIL_RLY_OUT/VB2 line)

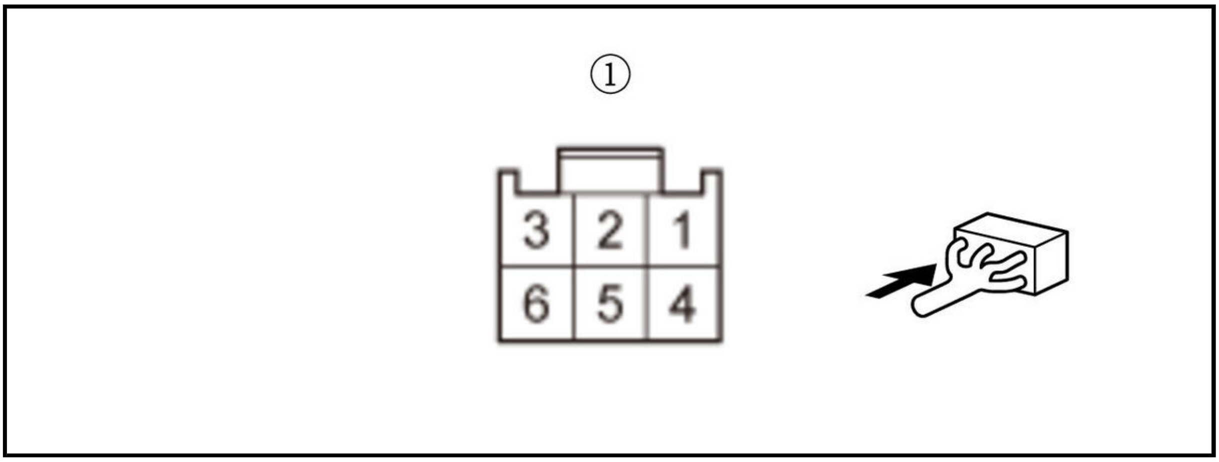
-1. Disconnect the following connectors.

Electric VTC motor connector A (2P)
Electric VTC motor connector B (5P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	Relay circuit board connector B (6P): disconnected
	Electric VTC motor connector A (2P): disconnected
	Electric VTC motor connector B (5P): disconnected
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 5: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 5.

NO

Repair a short in the IG_COIL_RLY_OUT/VB1 wire and/or the IG_COIL_RLY_OUT/VB2 wire between the relay circuit board and the electric VTC motor. Also replace the **No. C1-4 fuse** .

5. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Replace the electric VTC motor . Also replace the **No. C1-4 fuse** .

NO

Replace the relay circuit board . Also replace the **No. C1-4 fuse** .

6. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 7.

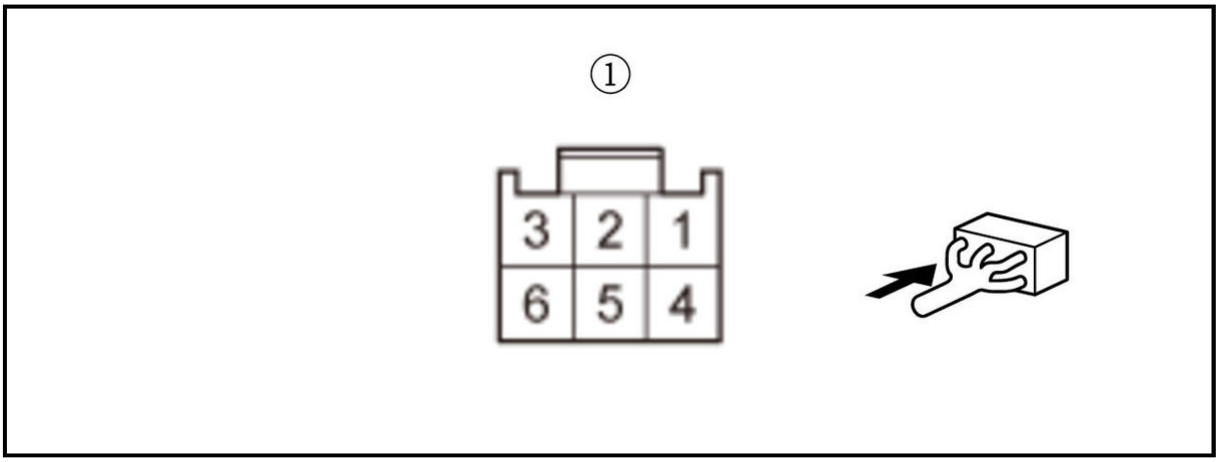
NO

Replace the relay circuit board .

7. Open wire check (+B_EVTC line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board: removed
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_EVTC wire is OK. Go to step 8.

NO

Repair an open in the +B_EVTC wire between the **No. C1-4 fuse** and the relay circuit board.

8. Open wire check (EVTC_RLY_CL- line)

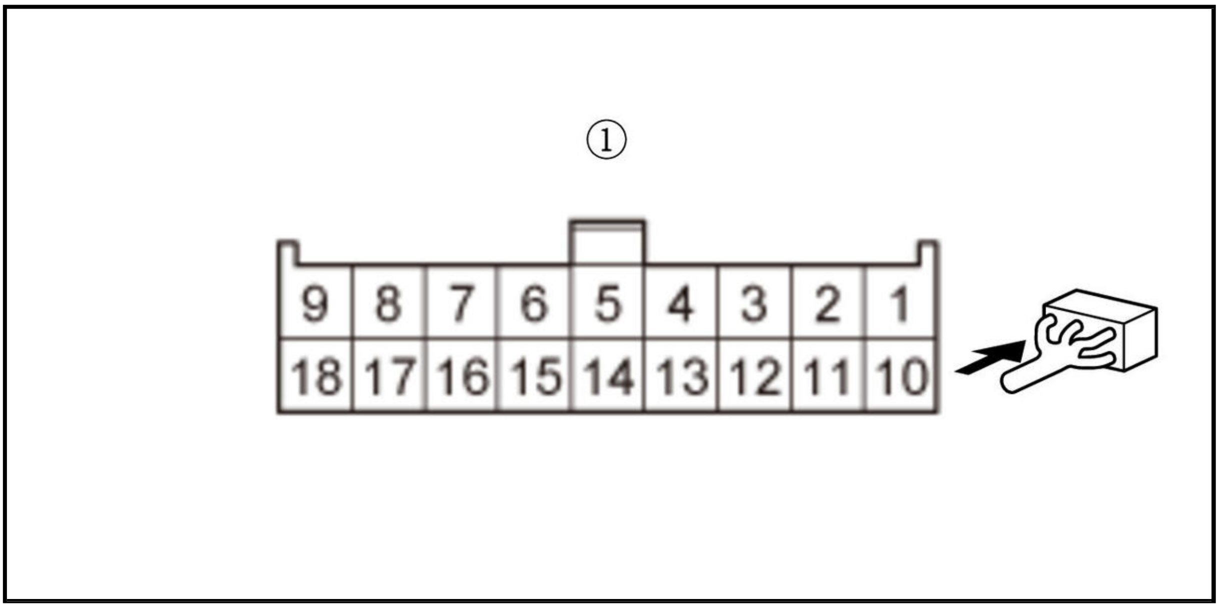
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 30**



Is there 1.0 Ω or less?

YES

The EVTC_RLY_CL- wire is OK. Go to step 9.

NO

Repair an open in the EVTC_RLY_CL- wire between the PCM (A30) and the relay circuit board.

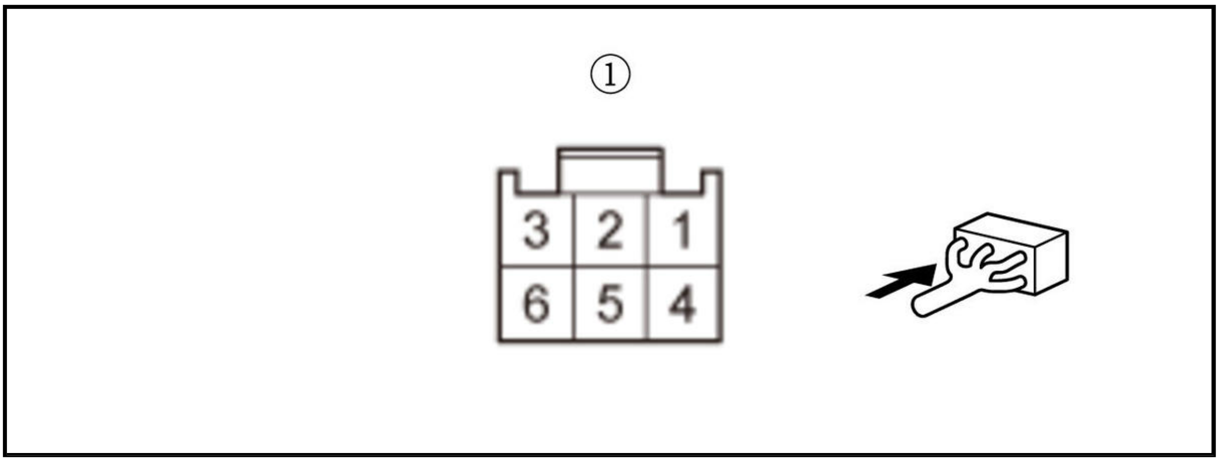
9. Open wire check (IG_COIL_RLY_OUT/VB1 line)

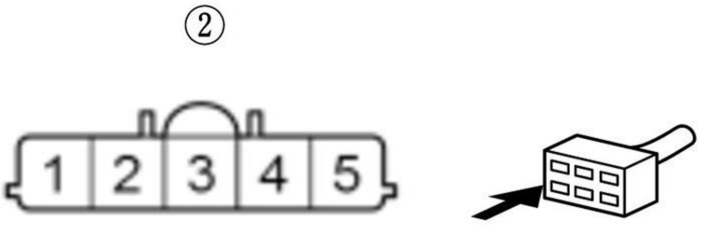
-1. Disconnect the following connector.

Electric VTC motor connector B (5P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
B	Electric VTC motor connector B (5P): disconnected
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 5: ①
Test point 2	Electric VTC motor connector B (5P) (female terminals) No. 5: ②





Is there 1.0 Ω or less?

YES

The IG_COIL_RLY_OUT/VB1 wire is OK. Go to step 10

NO

Repair an open in the IG_COIL_RLY_OUT/VB1 wire between the relay circuit board and the electric VTC motor.

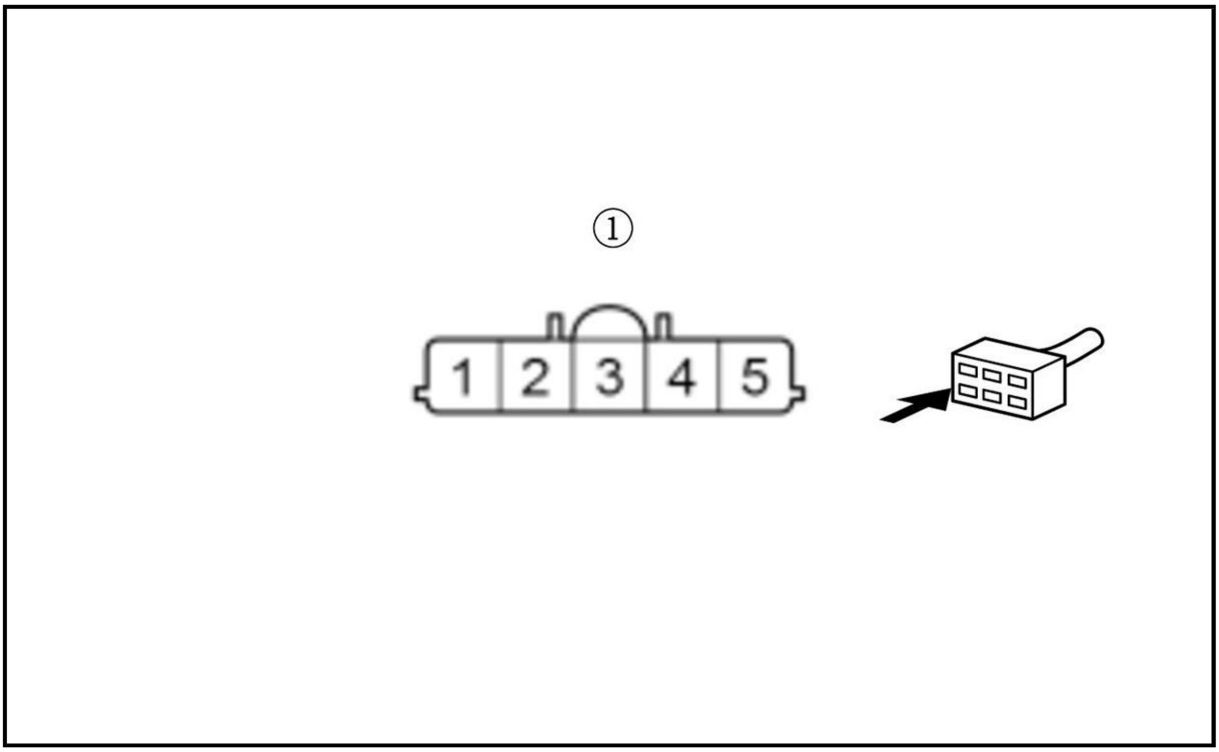
10. Shorted wire check (EVTP line)

-1. Disconnect the following connector.

PCM connector E (80P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The EVTP wire is not shorted. Go to step 11.

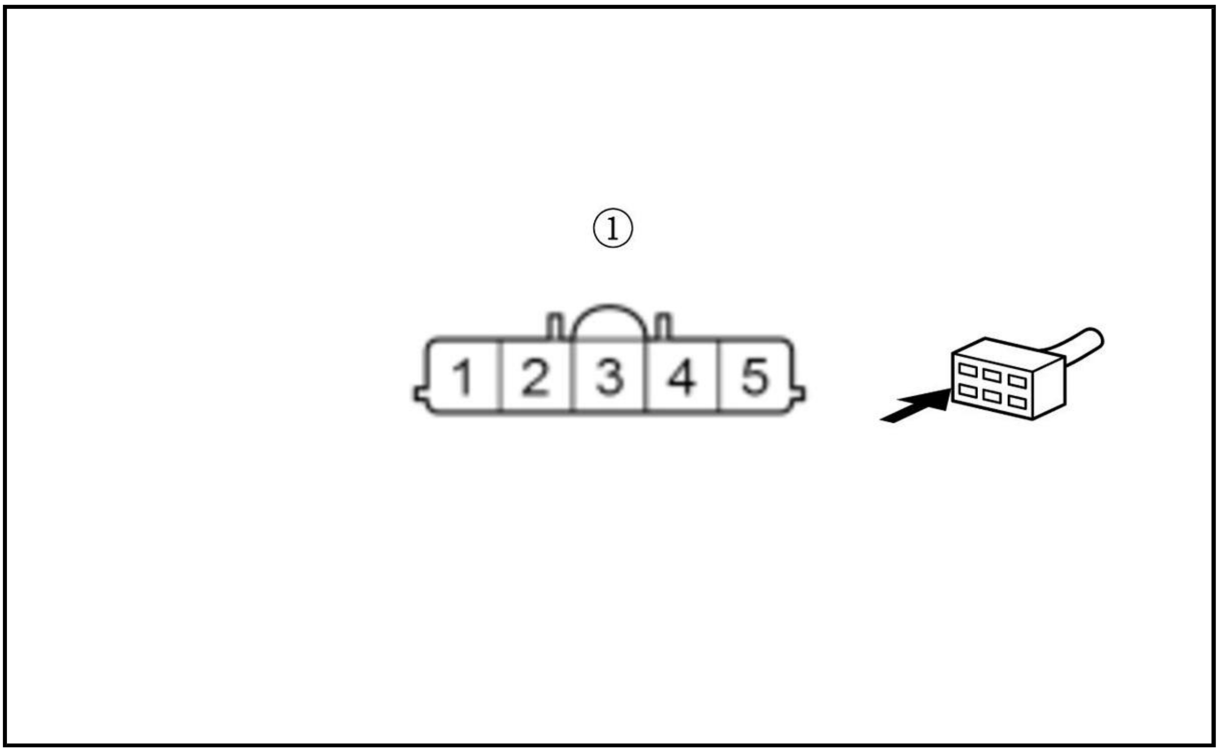
NO

Repair a short in the EVTP wire between the PCM (E31) and the electric VTC motor.

11. Open wire check (EVTP line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 31**



Is there 1.0 Ω or less?

YES

The EVTP wire is OK. Go to step 12.

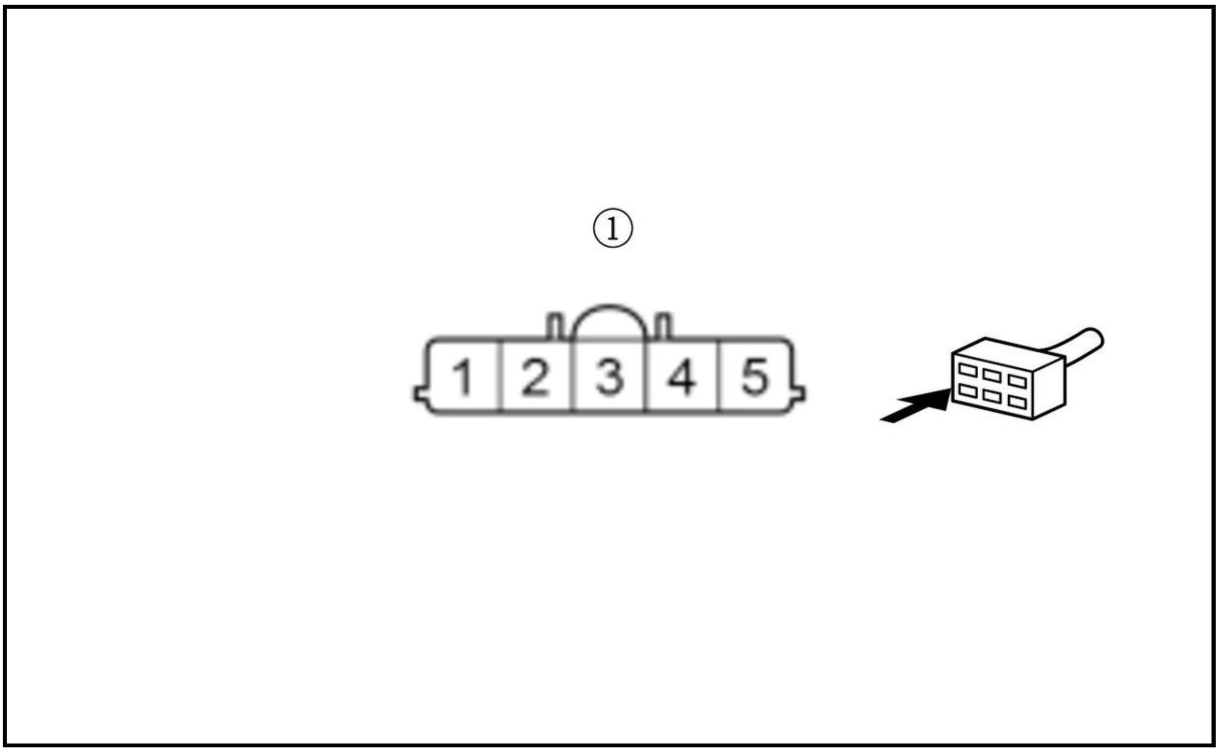
NO

Repair an open in the EVTP wire between the PCM (E31) and the electric VTC motor.

12. Shorted wire check (EVTM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The EVTM wire is not shorted. Go to step 13.

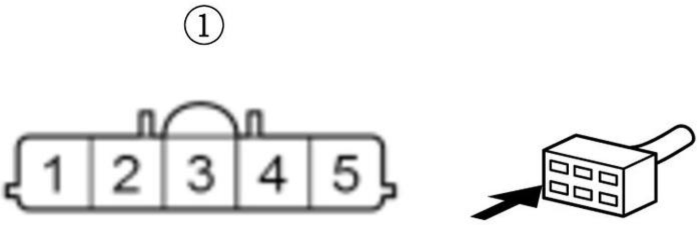
NO

Repair a short in the EVTM wire between the PCM (E57) and the electric VTC motor.

13. Open wire check (EVTM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 57**



Is there 1.0 Ω or less?

YES

The EVTM wire is OK. Go to step 14.

NO

Repair an open in the EVTM wire between the PCM (E57) and the electric VTC motor.

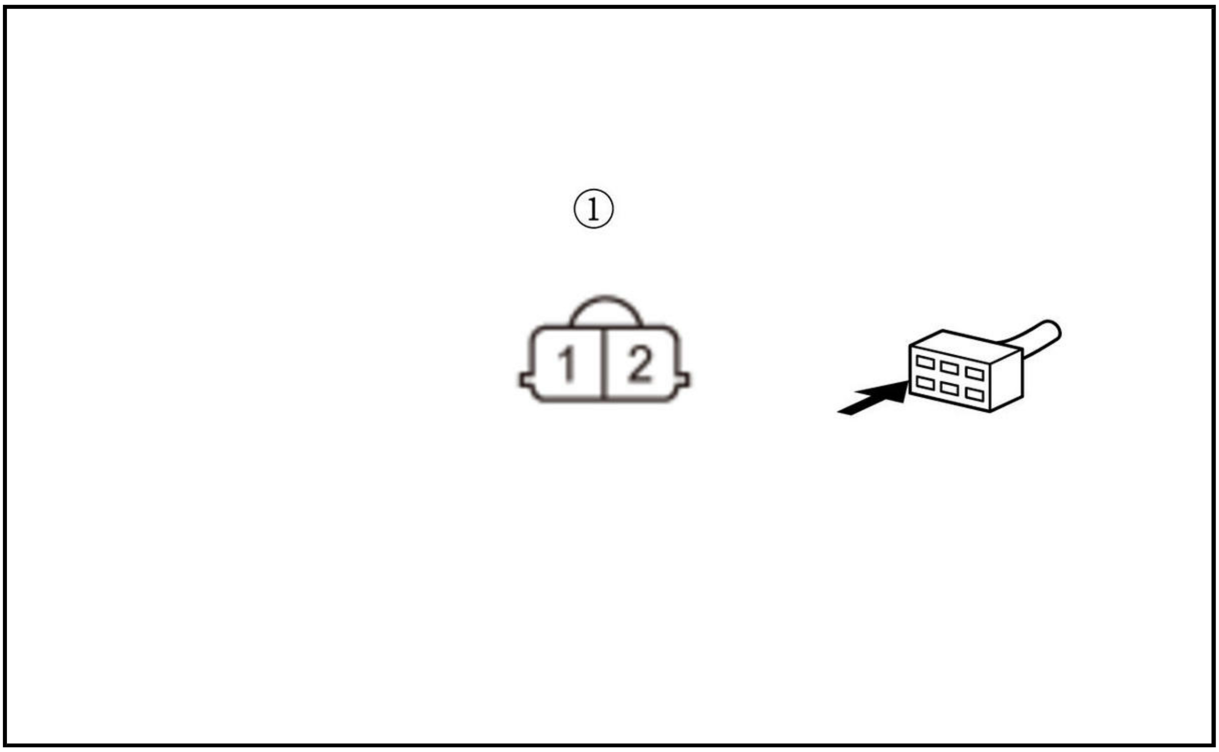
14. Open wire check (EVTC_GND line)

-1. Disconnect the following connector.

Electric VTC motor connector A (2P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
B	Electric VTC motor connector A (2P): disconnected
Test point 1	Electric VTC motor connector A (2P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The EVTC_GND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the EVTC_GND wire between the electric VTC motor and G102.

DTC P100B

DTC P100B : Electric VTC Motor Control Module Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P100B Electric VTC Motor Control Module Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 5 seconds or more.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P100B Electric VTC Motor Control Module Malfunction	B	B

Is DTC P100B indicated?

YES

The failure is duplicated. **Replace the electric VTC motor** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the electric VTC motor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P100C

DTC P100C : Electric VTC Motor Speed Signal Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P100C Electric VTC Motor Speed Signal Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the VTC TEST in the Function Test Menu with the HDS.

   VTC TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P100C Electric VTC Motor Speed Signal Circuit Malfunction	B	B

   Is DTC P100C indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the electric VTC motor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (EVTS line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

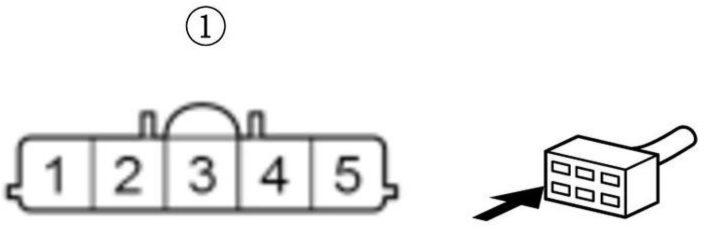
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

Electric VTC motor connector B (5P)
PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The EVTS wire is not shorted. Go to step 3.

NO

Repair a short in the EVTS wire between the PCM (E30) and the electric VTC motor.

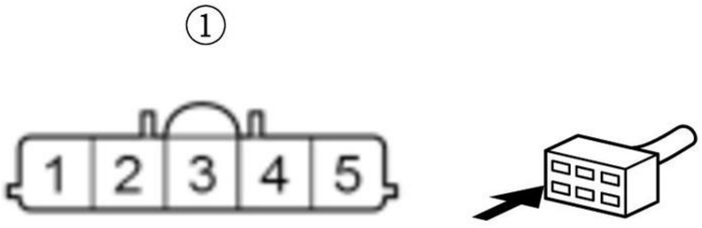
3. Open wire check (EVTS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected

Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 3: ①

Test point 2	**PCM connector E (80P) No. 30**



Is there 1.0 Ω or less?

YES

The EVTS wire is OK. Go to step 4.

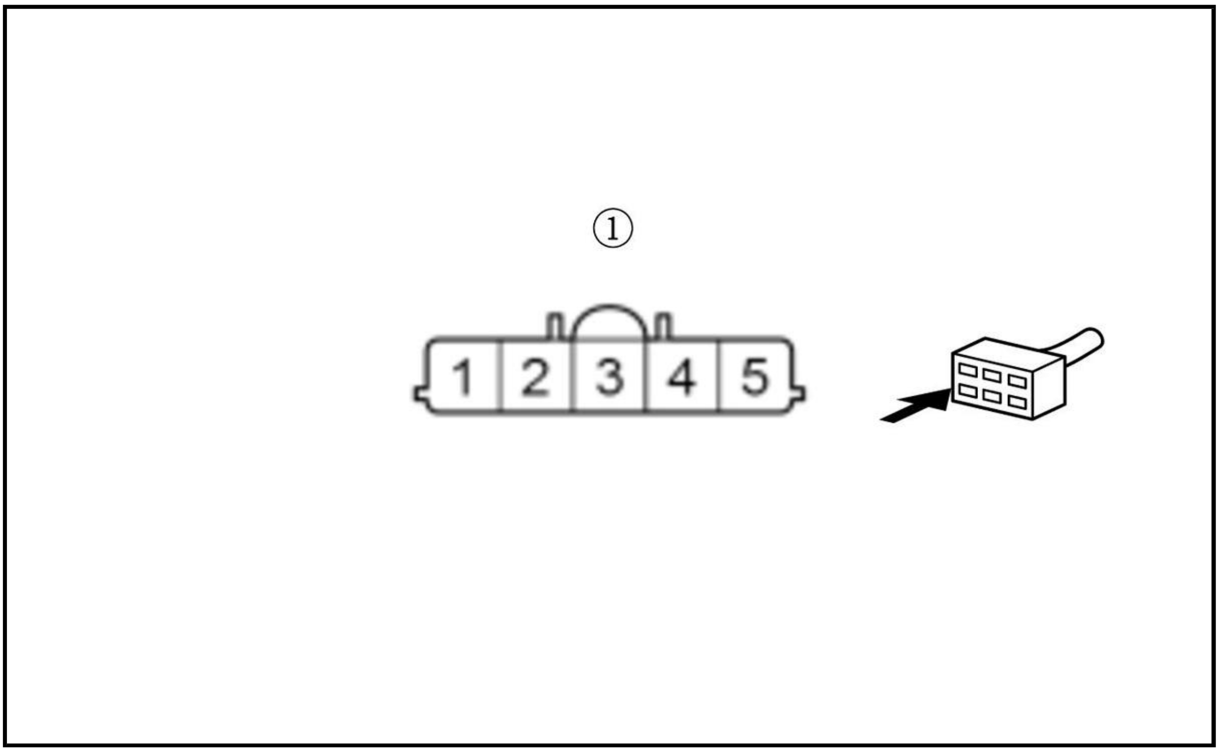
NO

Repair an open in the EVTS wire between the PCM (E30) and the electric VTC motor.

4. Shorted wire check (EVTD line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The EVTD wire is not shorted. Go to step 5.

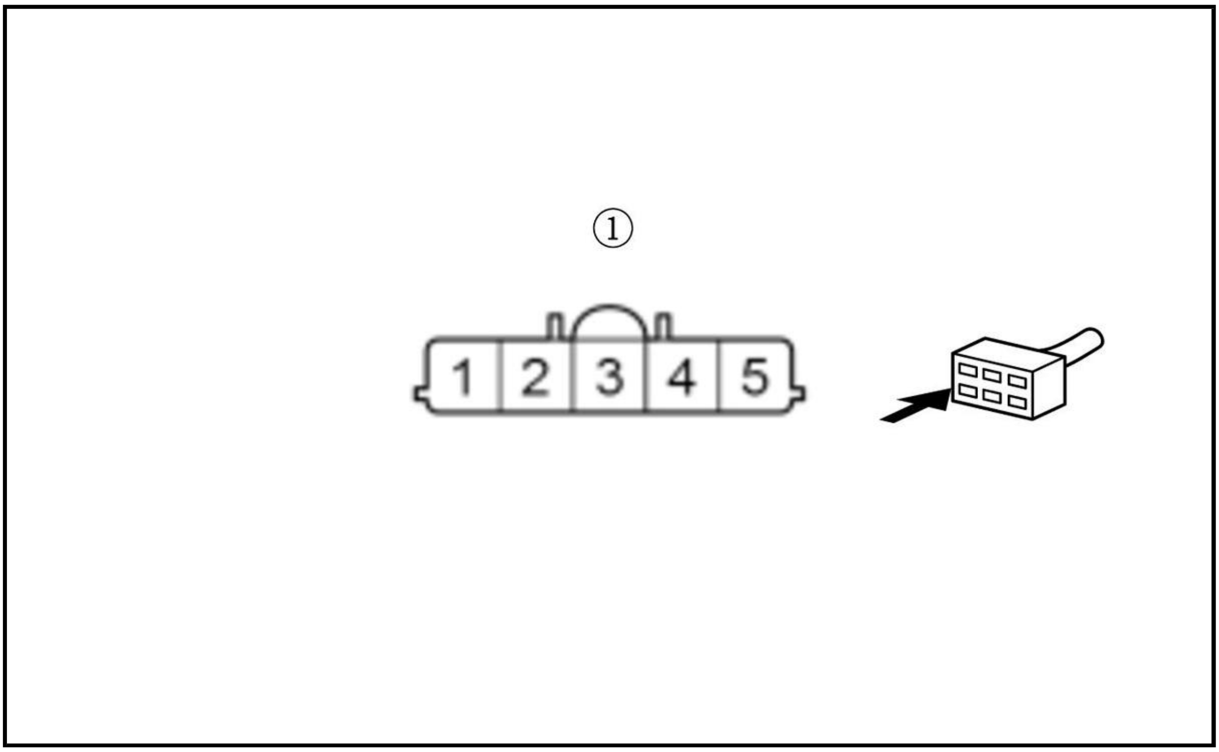
NO

Repair a short in the EVTD wire between the PCM (E46) and the electric VTC motor.

5. Open wire check (EVTD line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 46**



Is there 1.0 Ω or less?

YES

The EVTD wire is OK. Go to step 6.

NO

Repair an open in the EVTD wire between the PCM (E46) and the electric VTC motor.

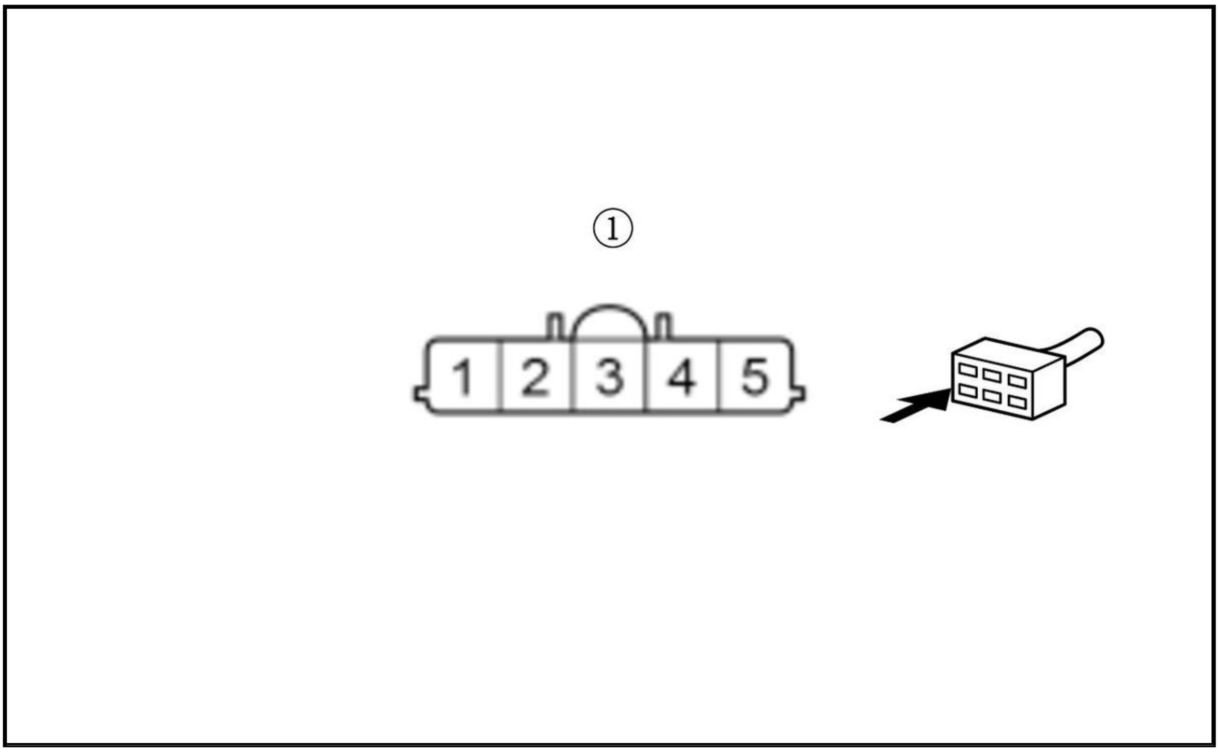
6. PCM internal circuit check

-1. Reconnect PCM connector E (80P).

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Electric VTC motor connector B (5P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 2 and No. 3: ①
Test point 2	Body ground



Is there any voltage?

YES

The PCM internal circuit is OK. **Replace the electric VTC motor** .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P100D

DTC P100D : Electric VTC Motor Power Relay Circuit Stuck On

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P100D Electric VTC Motor Power Relay Circuit Stuck On	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 5 seconds or more.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P100D Electric VTC Motor Power Relay Circuit Stuck On	B	B

Is DTC P100D indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the electric VTC motor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay circuit board check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 3.

NO

Replace the relay circuit board .

3. Shorted wire check (EVTC_RLY_CL- line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 30**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 4

NO

Repair a short in the EVTC_RLY_CL- wire between the PCM (A30) and the relay circuit board.

4. Shorted wire check (IG_COIL_RLY_OUT/VB1 line to power)

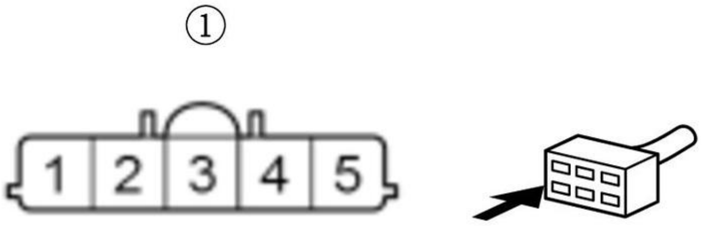
-1. Disconnect the following connector.

Electric VTC motor connector B (5P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
B	Electric VTC motor connector B (5P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair a short to power in the IG_COIL_RLY_OUT/VB1 wire between the relay circuit board and the electric VTC motor.

NO

Go to step 5

5. Shorted wire check (EVTM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

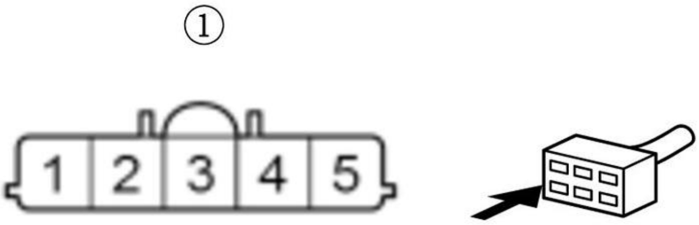
-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
B	Electric VTC motor connector B (5P): disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric VTC motor connector B (5P) (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The EVTM wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the EVTM wire between the PCM (E57) and the electric VTC motor.

DTC P145E

DTC P145E : EVAP System Purge Flow Malfunction 2

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P145E is indicated alone, do the troubleshooting for DTC P04AE and P04F1 using the on-board snapshot for P145E.
- If DTC P04AE, P04F1, and P145E are stored at the same time, check for a poor connection, a blockage, or damage at the EVAP canister purge line between EVAP canister purge valve 2 and the EVAP canister. Also check for a stuck closed EVAP canister purge valve 2.
- If any of the DTCs listed below are indicated at the same time as DTC P145E, troubleshoot those DTCs first, then recheck for P145E.

  P04AE, P04F1: EVAP system purge flow

DTC Description	Confirmed DTC	Pending DTC
P145E EVAP System Purge Flow Malfunction 2	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Select the EVAP TEST in the Function Test, then select the FUNCTION TEST with the HDS.

   EVAP TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P04AE EVAP System High Purge Flow Detected 2	B	B
P04F1 EVAP System Low Purge Flow Detected	B	B
P145E EVAP System Purge Flow Malfunction 2	B	B

   Are DTC P145E and P04AE or P04F1 indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC P04AE** and **DTC P04F1** using the on-board snapshot for DTC P145E.

DTC P145F, P1461, P1462, P24C1

DTC P145F : EVAP Leak Check Module Pressure Sensor Range/Performance Problem

DTC P1461 : EVAP Leak Check Module Pressure Sensor Shifts

DTC P1462 : EVAP Leak Check Module Pressure Decompression Defect

DTC P24C1 : Canister Change Over Valve Stuck Close

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P145F EVAP Leak Check Module Pressure Sensor Range/Performance Problem	B	B
P1461 EVAP Leak Check Module Pressure Sensor Shifts	B	B
P1462 EVAP Leak Check Module Pressure Decompression Defect	B	B
P24C1 Canister Change Over Valve Stuck Close	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST

Is the result OK?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. Go to step 2.

2. EVAP leak check module drain hose check

-1. **Remove the EVAP leak check module** and the **EVAP canister filter** , then check the blockage in the drain hoses and the EVAP canister filter.

Are the parts OK?

YES

Replace the EVAP leak check module .

NO

Remove the blockage from them, or replace the part(s) if needed.

DTC P154A

DTC P154A : Battery Sensor Internal Failure

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P154A Battery Sensor Internal Failure	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait more than 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P154A Battery Sensor Internal Failure	B	B

Is DTC P154A indicated?

YES

The failure is duplicated. **Replace the 12 volt battery sensor** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 12 volt battery sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P161B

DTC P161B : Park Pawl Control Module Programming Error

WARNING: **If the vehicle cannot be turned to the ACCESSORY and ON modes when the DTC P161B is stored, troubleshoot "Security indicator blinks" Symptom Troubleshooting in the Keyless Access System first, then do this troubleshooting.**

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- DTC P161B is stored when the park pawl actuator driver unit updated incomplete.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P161B Park Pawl Control Module Programming Error	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 5 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P161B Park Pawl Control Module Programming Error	B	B	B

Is DTC P161B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Park pawl actuator driver unit check

-1. Update the park pawl actuator driver unit .

WARNING: **Do not turn the vehicle to the OFF (LOCK) mode. Turning the vehicle to the OFF (LOCK) mode during an update can damage the park pawl actuator driver unit.**

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 5 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P161B Park Pawl Control Module Programming Error	B	B	B

Is DTC P161B indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or replace the original park pawl actuator driver unit .

NO

Update is complete.

DTC P1658

DTC P1658 : ETCS Control Relay ON Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Select the ETCS(TAC) TEST in the Function Test Menu with the HDS.

ETCS(TAC) TEST

Is the RELAY circuit OK?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

NO

The failure is duplicated. Go to step 2.

2. Relay circuit board check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove and test the relay circuit board** .

   Is the relay circuit board OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Shorted wire check (FI_SUB_RLY_CL- line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   -2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 25**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 4.

NO

Repair a short in the FI_SUB_RLY_CL- wire between the PCM (A25) and the relay circuit board.

4. Shorted wire check (FI_SUB_RLY_OUT line to power)

   -1. Turn the vehicle to the ON mode.

   -2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 16**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the FI_SUB_RLY_OUT wire between the PCM (A16) and the relay circuit board.

NO

The FI_SUB_RLY_OUT wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P1659

DTC P1659 : ETCS Control Relay OFF Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1659 ETCS Control Relay OFF Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1659 ETCS Control Relay OFF Malfunction	B	B

   Is DTC P1659 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the relay circuit board and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A8**

   Is the fuse OK?

   YES

   Go to step 3.

   NO

Go to step 7.

3. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Go to step 4.

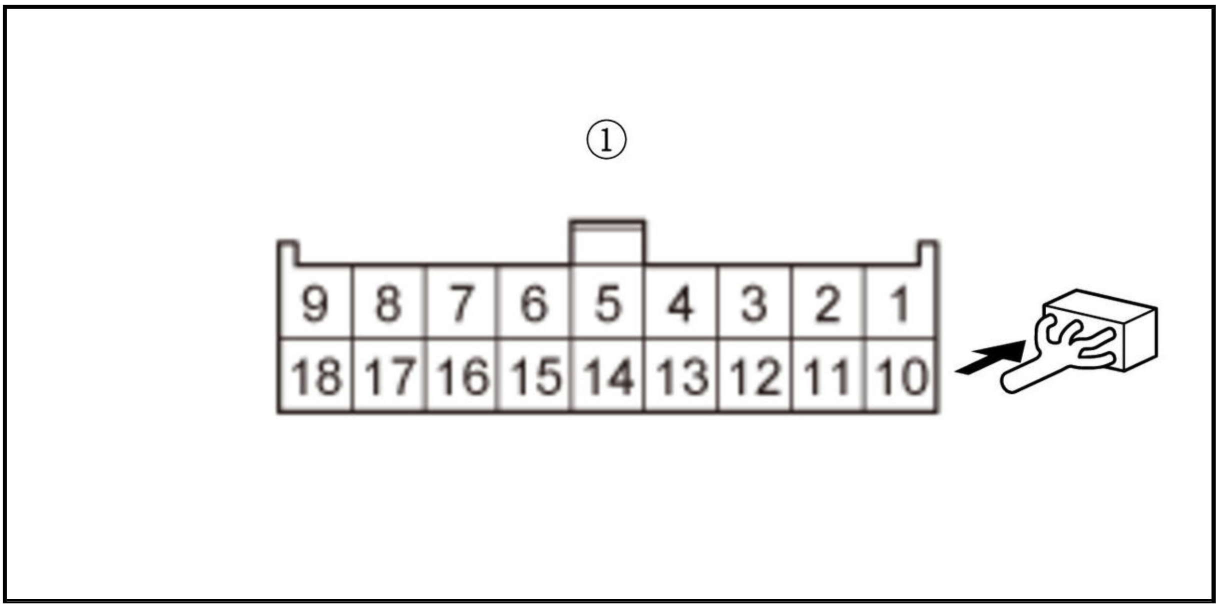
NO

Replace the relay circuit board .

4. Open wire check (+B_FI_SUB line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 14: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

NO

Repair an open in the +B_FI_SUB wire between the **No. A8 fuse** and the relay circuit board.

5. Open wire check (FI_SUB_RLY_OUT line)

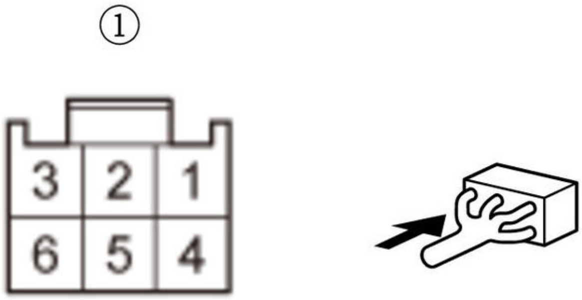
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 3: ①
Test point 2	**PCM connector A (50P) No. 16**



Is there 1.0 Ω or less?

YES

Go to step 6.

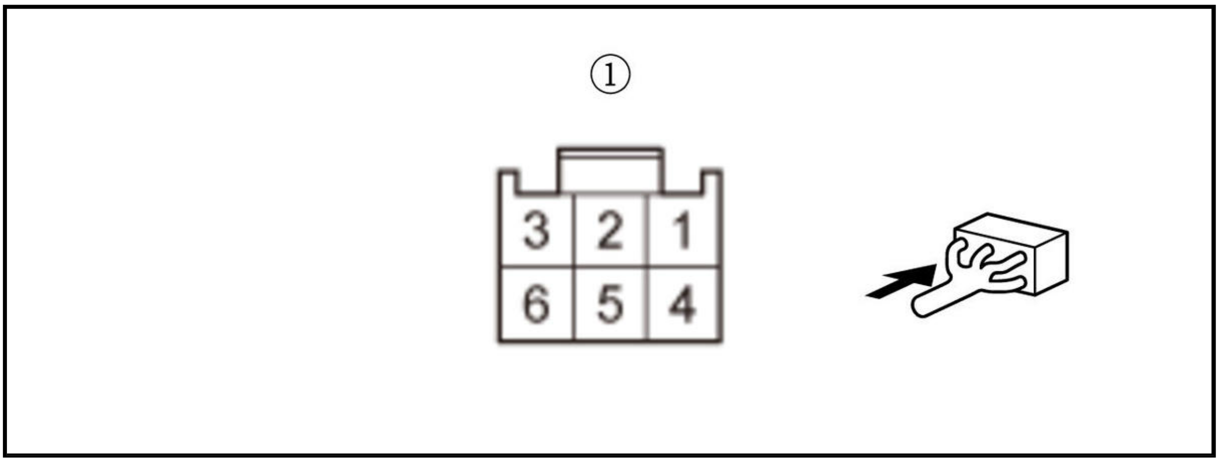
NO

Repair an open in the FI_SUB_RLY_OUT wire between the PCM (A16) and the relay circuit board.

6. Open wire check (FI_SUB_RLY_CL- line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Relay circuit board: removed
B	PCM connector A (50P): disconnected
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 25**



Is there 1.0 Ω or less?

YES

The FI_SUB_RLY_CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the FI_SUB_RLY_CL- wire between the PCM (A25) and the relay circuit board.

7. Shorted wire check (FI_SUB_RLY_OUT line)

   -1. Remove the **No. A11 fuse** .

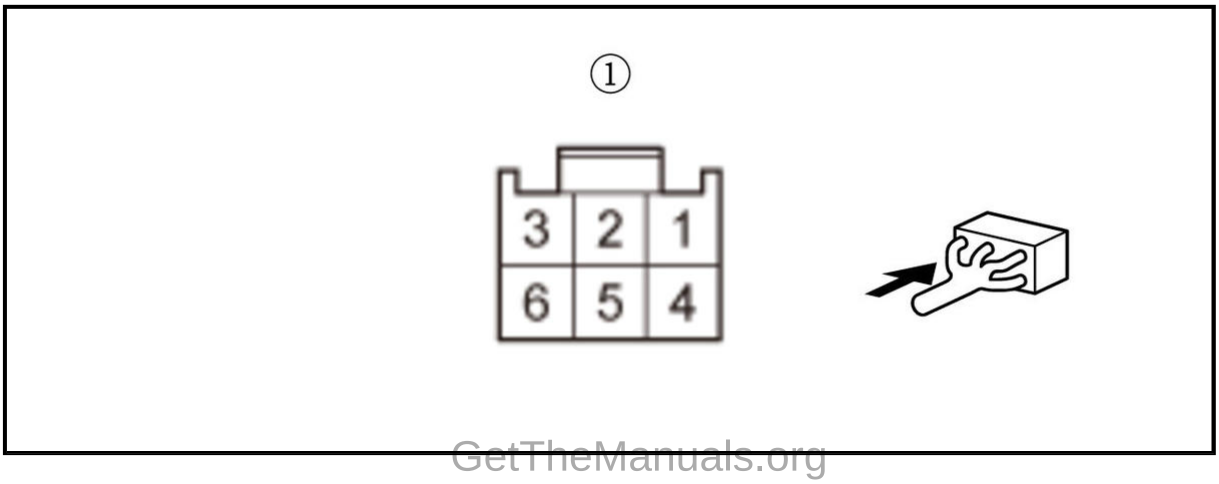
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector A (50P)
Relay circuit board connector B (6P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	No. A11 fuse: removed
B	PCM connector A (50P): disconnected
B	Relay circuit board connector B (6P): disconnected
Test point 1	Relay circuit board connector B (6P) (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The FI_SUB_RLY_OUT wire is OK. Go to step 8.

NO

Repair a short in the FI_SUB_RLY_OUT wire between the PCM (A16), No. A11 fuse, and the relay circuit board. Also replace the No. A8 fuse.

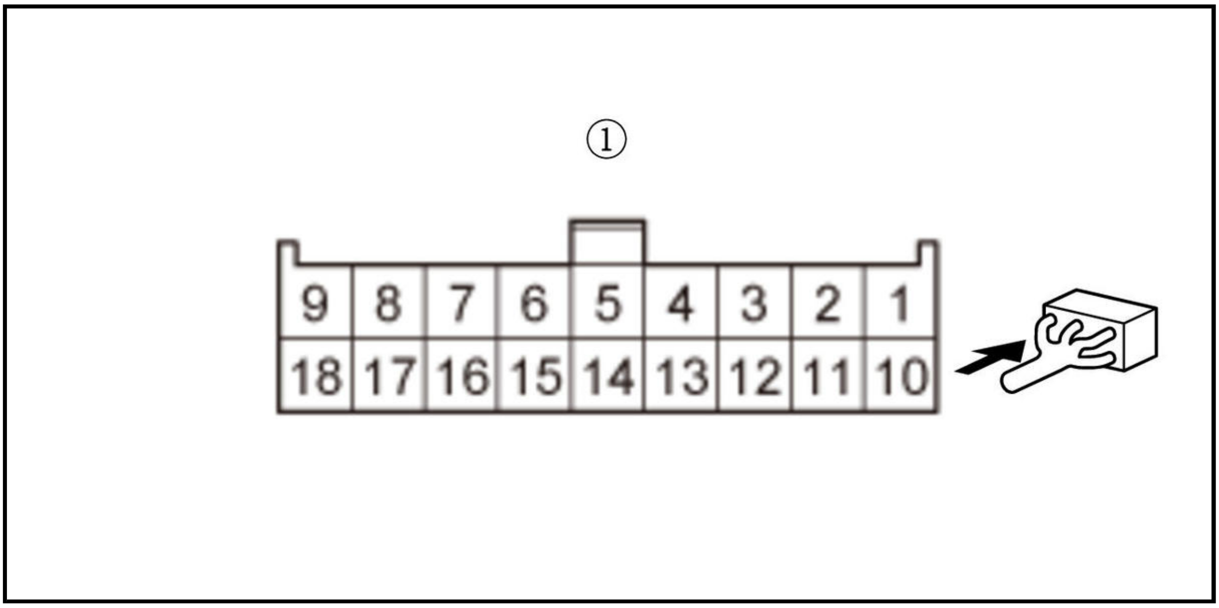
8. Shorted wire check (+B_FI_SUB line)

-1. Disconnect the following connector.

Relay circuit board connector C (18P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	No. A11 fuse: removed
B	PCM connector A (50P): disconnected
B	Relay circuit board connector B (6P): disconnected
B	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 14: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The +B_FI_SUB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the +B_FI_SUB wire between the **No. A8 fuse** and the relay circuit board. Also replace the No. A8 fuse

DTC P1683 : Throttle Valve Default Position Spring Performance Problem

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

   -6. Turn the vehicle to the ON mode.

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B

   Is DTC P1683 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

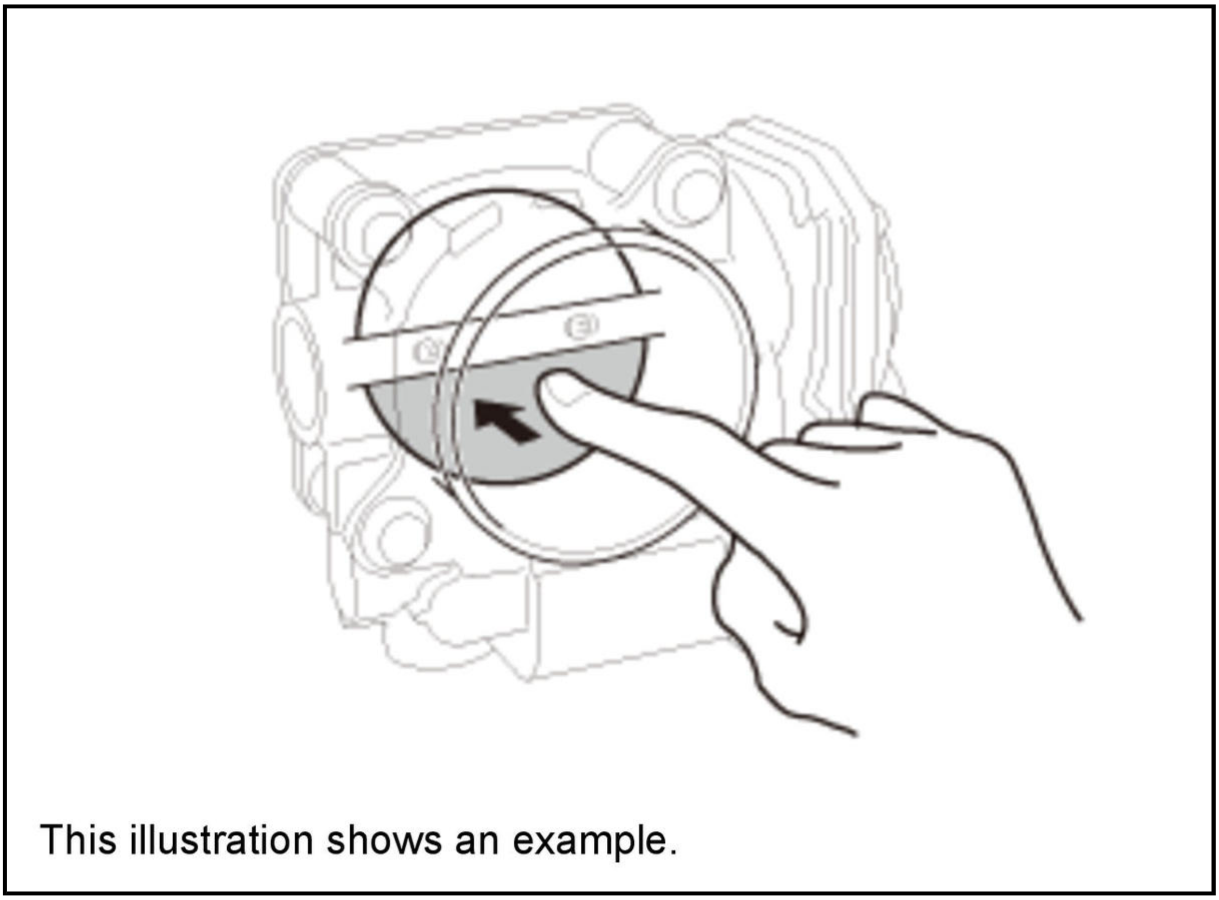
   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body default position spring check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the air cleaner** .

   -3. Push the throttle valve closed as shown.



This illustration shows an example.

-4. Release the throttle valve.

Does the throttle valve return?

YES

Clean the throttle body , and recheck. If DTC P1683 is indicated again, **replace the throttle body** .

NO

Replace the throttle body .

DTC TROUBLESHOOTING

DTC P1684

DTC P1684 : Throttle Valve Return Spring Performance Problem

WARNING: Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1684 Throttle Valve Return Spring Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Turn the vehicle to the OFF (LOCK) mode, and wait for 10 seconds.

   -6. Turn the vehicle to the ON mode.

   -7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1684 Throttle Valve Return Spring Performance Problem	B	B

   Is DTC P1684 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

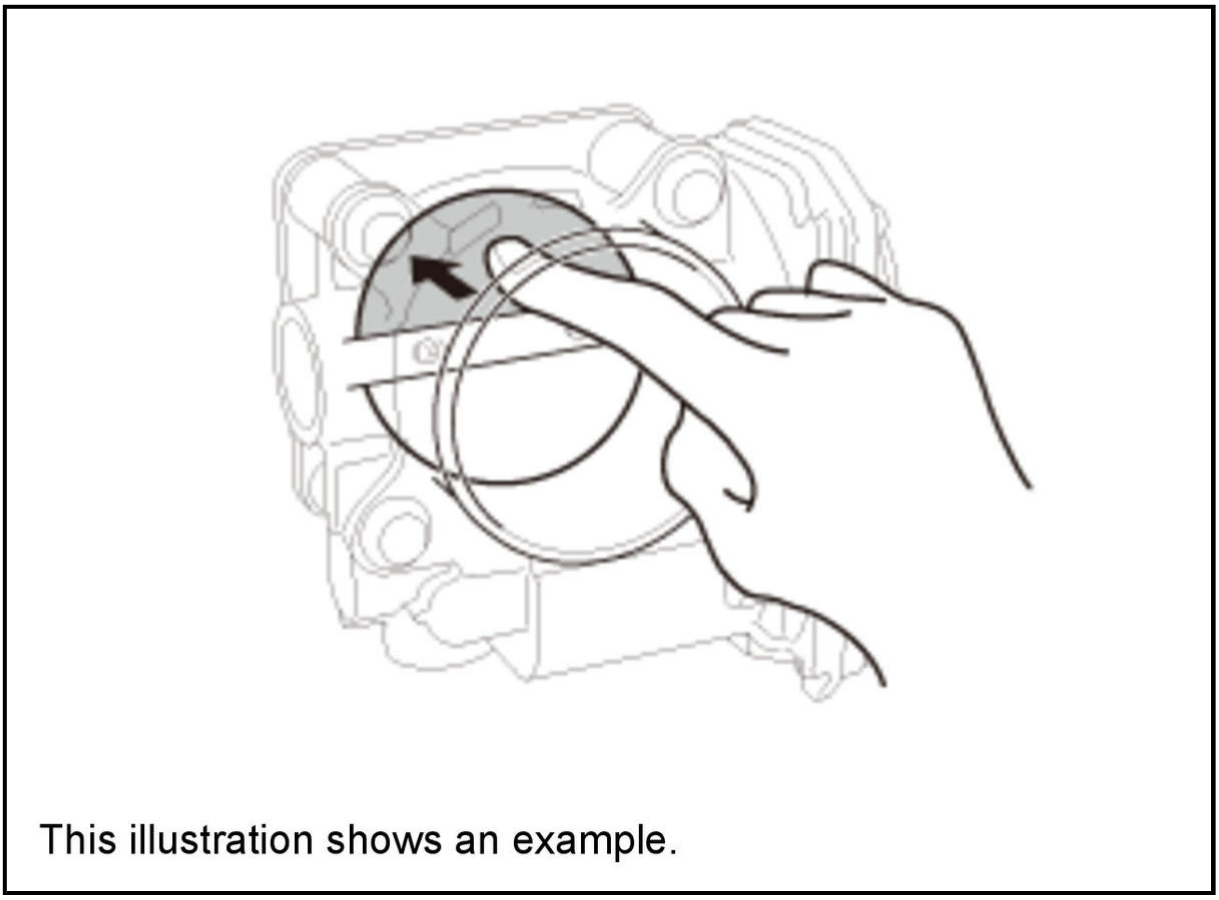
   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body condition check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the air cleaner** .

-3. Push the throttle valve open as shown.



This illustration shows an example.

-4. Release the throttle valve.

Does the throttle valve return?

YES

Clean the throttle body , and recheck. If DTC P1684 is indicated again, **replace the throttle body** .

NO

Replace the throttle body .

DTC P16E3

DTC P16E3 : PGM-FI-Battery Sensor LIN Communication Error

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- Check for loose terminals on the 12 volt battery sensor (12 volt battery negative (-) terminal).

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

DTC (PGM-FI)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

Is DTC P16E3 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the 12 volt battery sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

Is DTC P16E8 indicated?

YES

Go to step 3.

NO

Go to step 7.

3. Determine possible failure area (short in LIN(BATT_SENSOR) line, others)

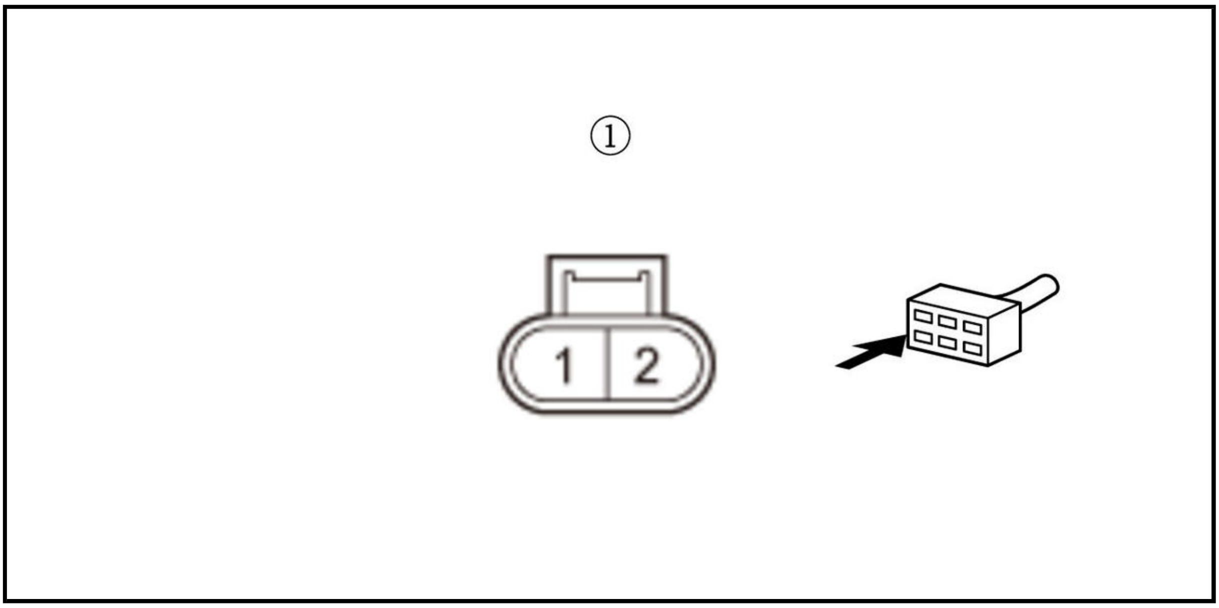
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (LIN(BATT_SENSOR) line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between 12 volt battery sensor 2P connector (female terminals) terminal No. 2 and body ground, while disconnecting these connectors, one at a time:

   - PCM connector A (50P)
   - Shutter grille 4P connector

   Does continuity go away when one of the above connectors is disconnected?

   YES

   The LIN(BATT_SENSOR) wire is OK. Replace the part that caused an open when it was disconnected.

   NO

   Repair a short in the LIN(BATT_SENSOR) wire between the PCM (A10), the 12 volt battery sensor, and the shutter grille.

5. Determine possible failure area (12 volt battery sensor, others)

   -1. Reconnect the 12 volt battery sensor 2P connector.

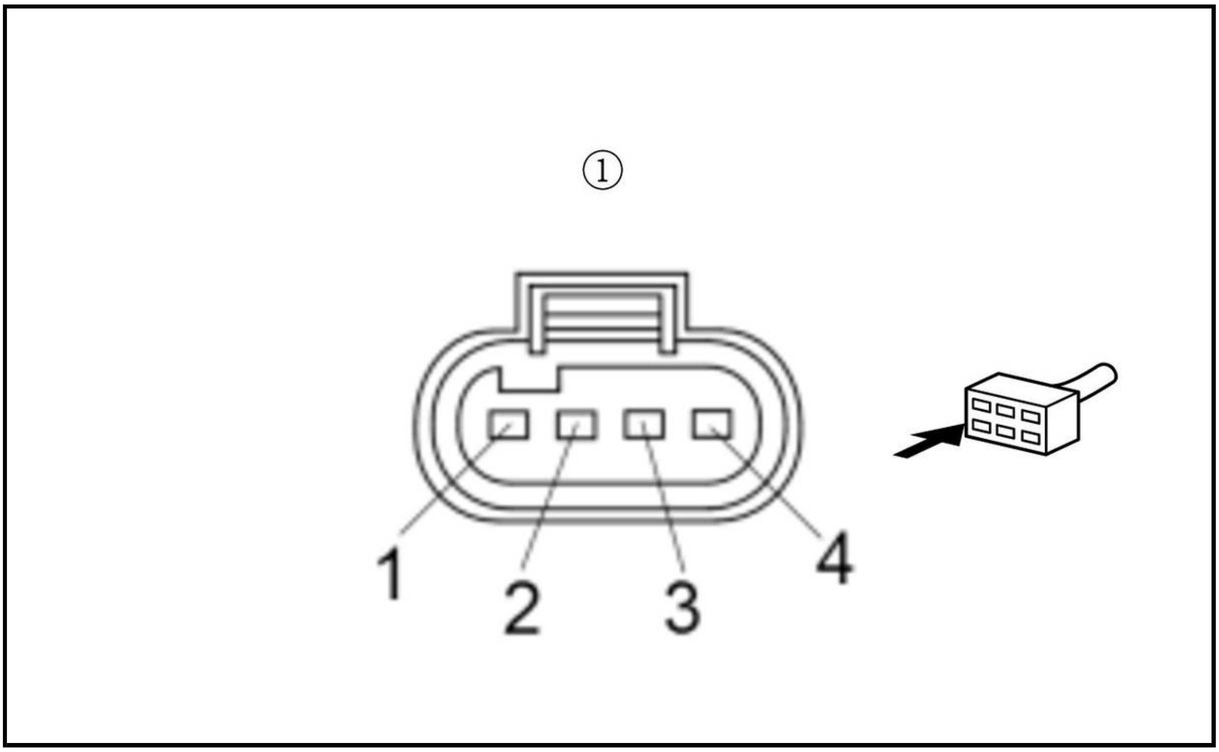
   -2. Disconnect the following connector.

Shutter grille 4P connector

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Shutter grille 4P connector: disconnected
Test point 1	Shutter grille 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 6.

NO

Replace the 12 volt battery sensor .

6. Open wire check (LIN(BATT_SENSOR) line)

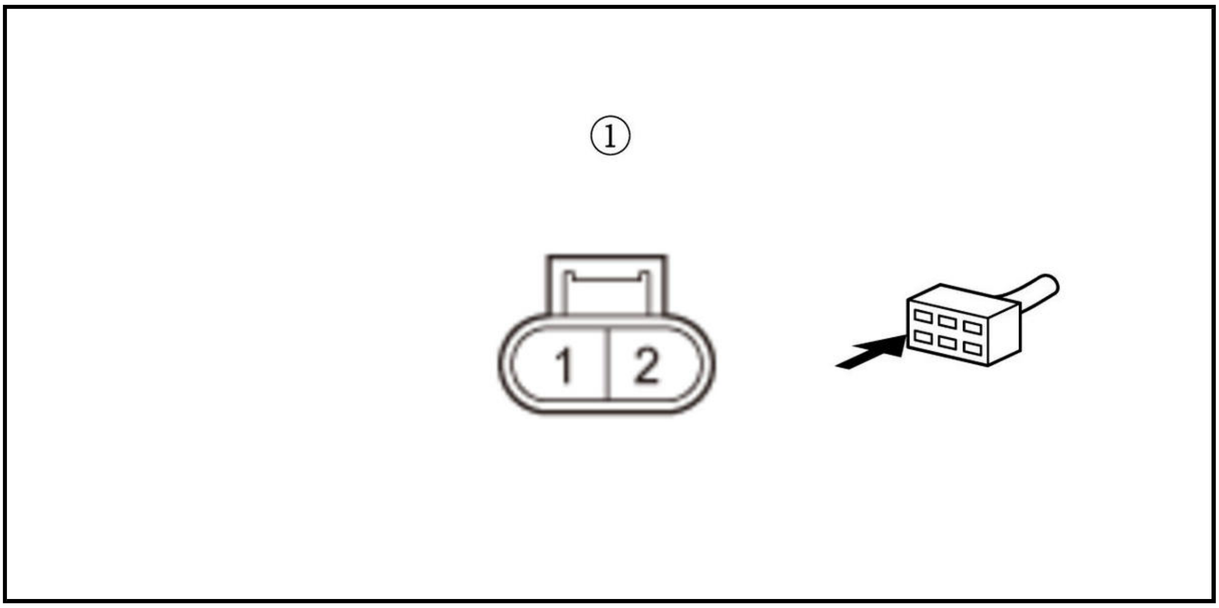
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

PCM connector A (50P)
12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille 4P connector: disconnected
B	PCM connector A (50P): disconnected
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN(BATT_SENSOR) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN(BATT_SENSOR) wire between the PCM (A10) and the 12 volt battery sensor.

7. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A24**

Is the fuse OK?

YES

Go to step 8.

NO

Repair a short in the +B_HORN wire between the No. A24 fuse and the 12 volt battery sensor. Also replace the No. A24 fuse.

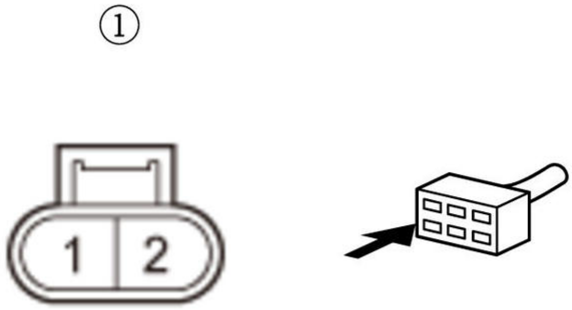
8. Open wire check (+B_HORN line)

-1. Disconnect the following connector.

12 volt battery sensor 2P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 9.

NO

Repair an open in the +B_HORN wire between the **No. A24 fuse** and the 12 volt battery sensor.

9. Open wire check (LIN(BATT_SENSOR) line)

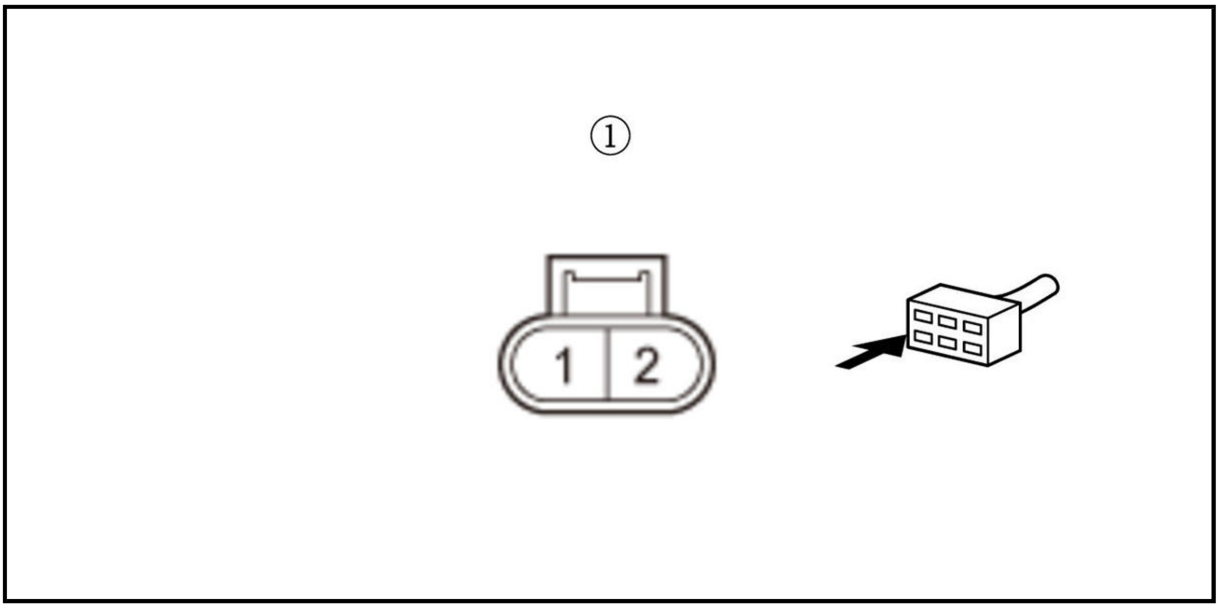
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN(BATT_SENSOR) wire is OK. **Replace the 12 volt battery sensor** .

NO

Repair an open in the LIN(BATT_SENSOR) wire between the PCM (A10) and the 12 volt battery sensor.

DTC P16E8

DTC P16E8 : PGM-FI-Shutter Grille LIN Communication Error

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E8 PGM-FI-Shutter Grille LIN Communication Error	B	B

Is DTC P16E8 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the shutter grille and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16E3 PGM-FI-Battery Sensor LIN Communication Error	B	B

Is DTC P16E3 indicated?

YES

Go to step 3.

NO

Go to step 7.

3. Determine possible failure area (LIN(BATT_SENSOR) line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

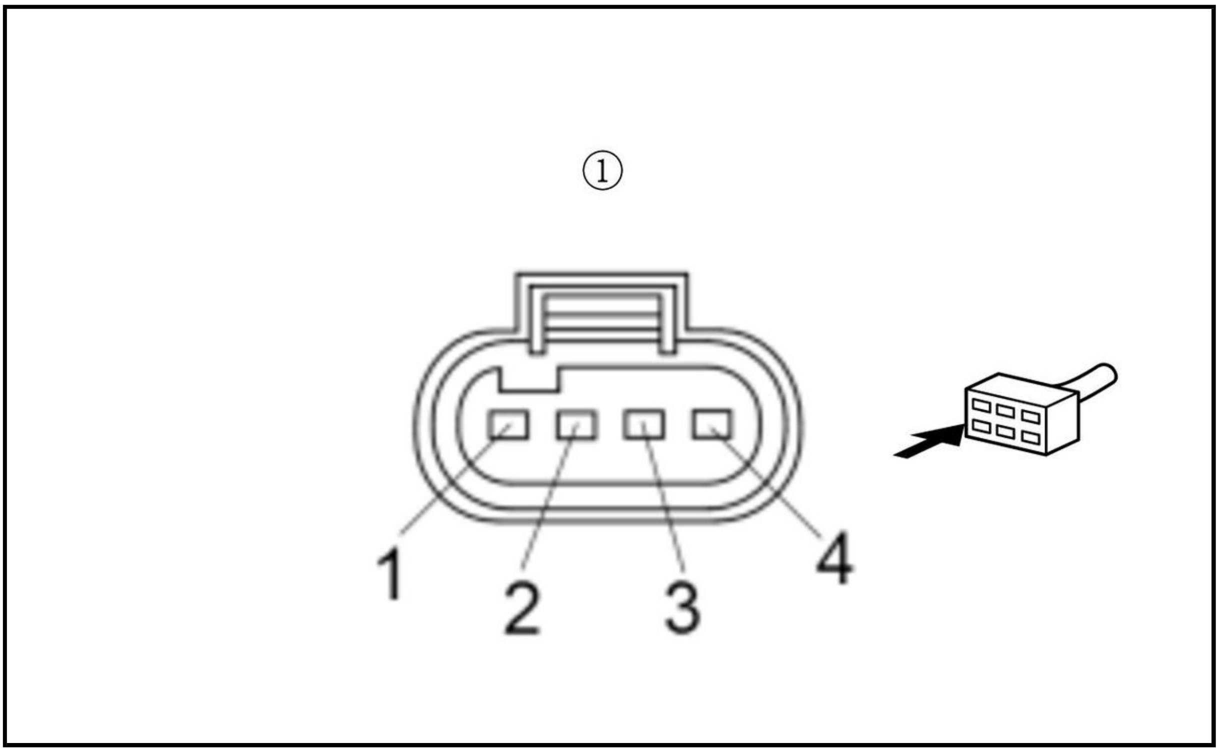
-2. Disconnect the following connector.

Shutter grille 4P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Shutter grille 4P connector: disconnected
Test point 1	Shutter grille 4P connector (female terminal) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 5.

NO

Go to step 4.

4. Shorted wire check (LIN(BATT_SENSOR) line)

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   Continue to check for continuity between the shutter grille 4P connector (female terminals) terminal No. 3 and body ground, while disconnecting these connectors, one at a time:

   - PCM connector A (50P)
   - 12 volt battery sensor 2P connector

   Does continuity go away when one of the above connectors is disconnected?

   YES

   The LIN(BATT_SENSOR) wire is OK. Replace the part that caused an open when it was disconnected.

   NO

   Repair a short in the LIN(BATT_SENSOR) wire between the PCM (A10), the 12 volt battery sensor and the shutter grille.

5. Determine possible failure area (shutter grille, others)

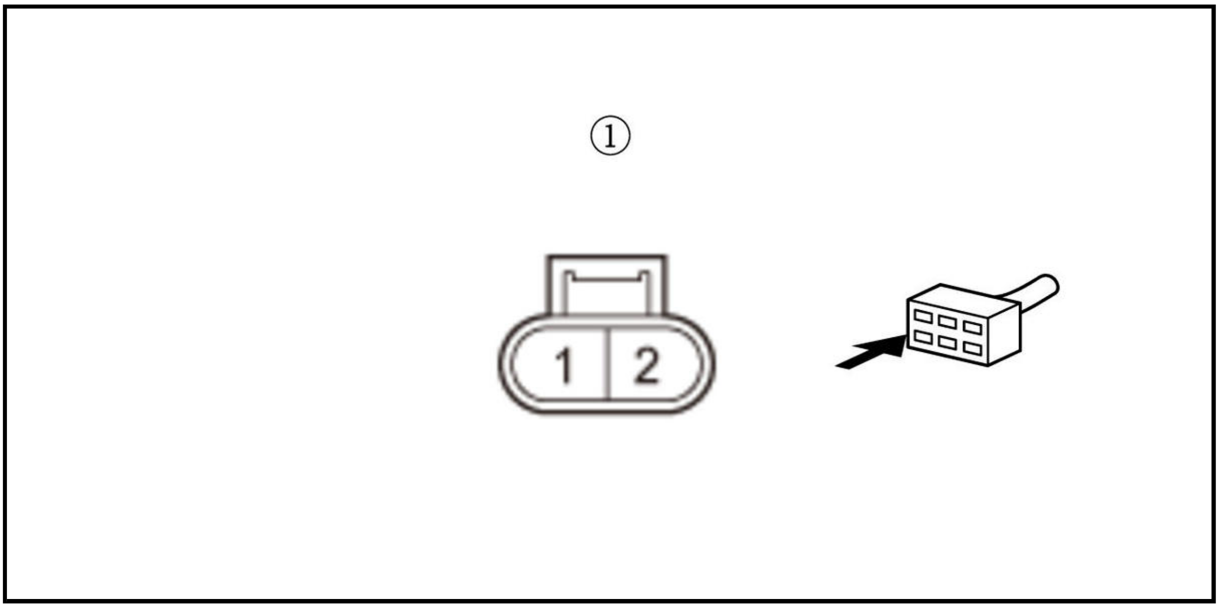
   -1. Reconnect the shutter grille 4P connector.

   -2. Disconnect the following connector.

12 volt battery sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
Test point 1	12 volt battery sensor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 6.

NO

Replace the shutter grille .

6. Open wire check (LIN(BATT_SENSOR) line)

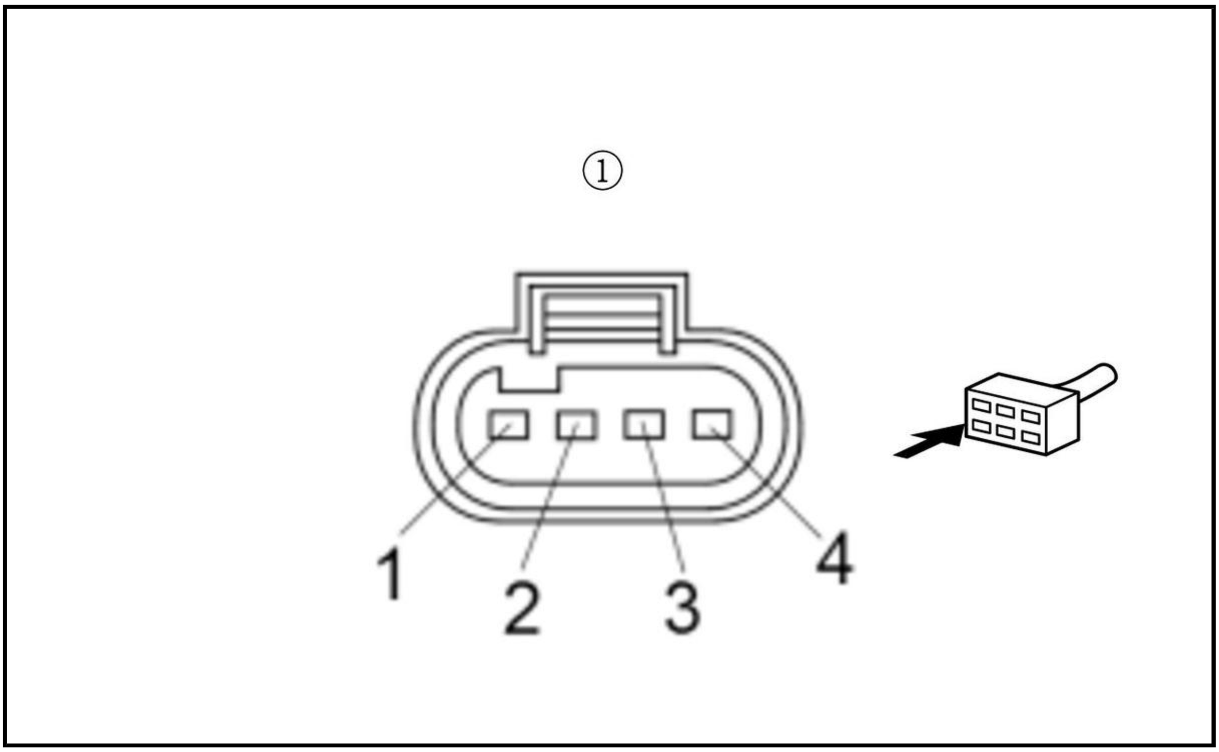
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connectors.

Shutter grille 4P connector
PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	12 volt battery sensor 2P connector: disconnected
B	Shutter grille 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Shutter grille 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN(BATT_SENSOR) wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the LIN(BATT_SENSOR) wire between the PCM (A10) and the shutter grille.

7. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A22**

Is the fuse OK?

YES

Go to step 8.

NO

Check for a short in the VMP/+B_FR_FOG wire between the No. A22 fuse and the shutter grille. Also replace the No. A22 fuse.

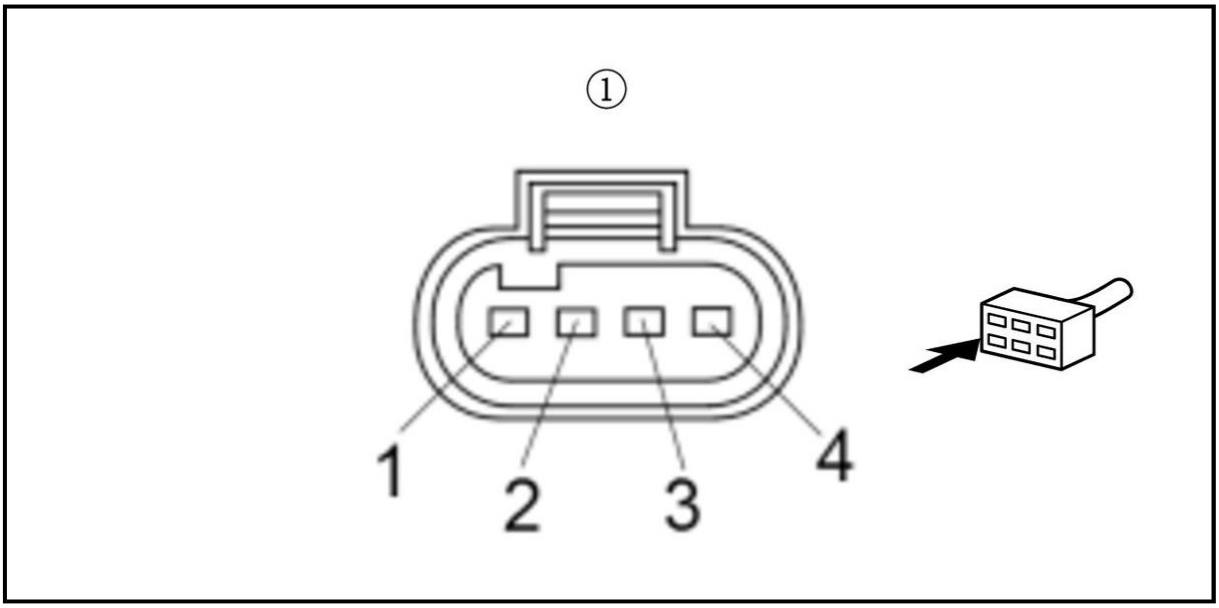
8. Determine possible failure area (LIN(BATT_SENSOR) line, others)

-1. Disconnect the following connector.

Shutter grille 4P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille 4P connector: disconnected
Test point 1	Shutter grille 4P connector (female terminals) No. 1: ①
Test point 2	Shutter grille 4P connector (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 10.

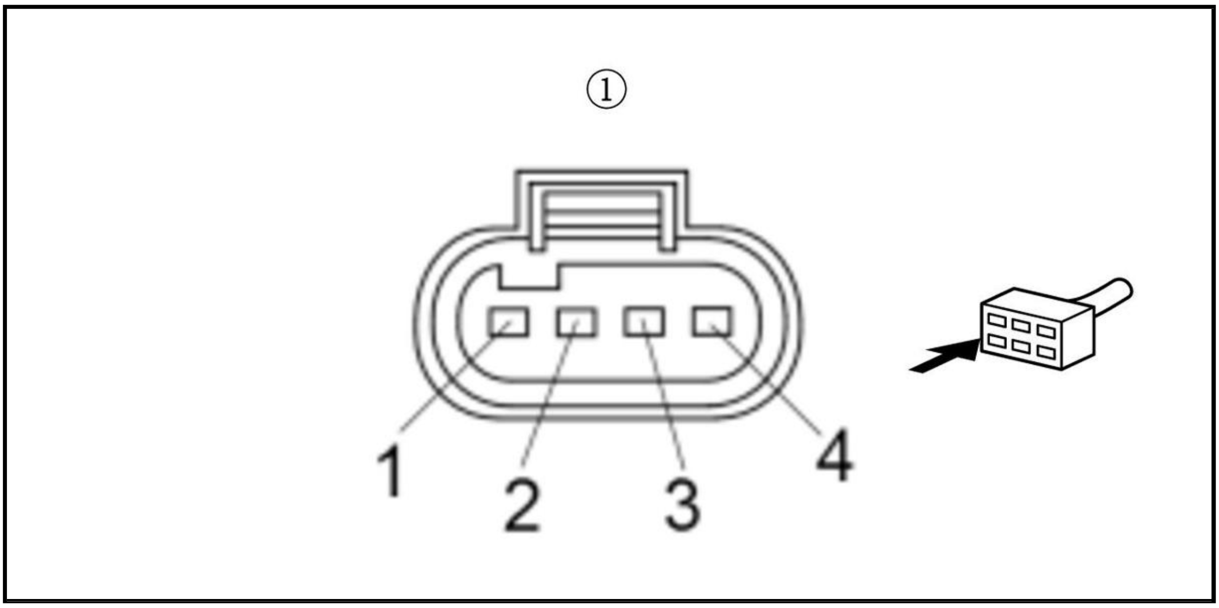
NO

Go to step 9.

9. Open wire check (VMP/+B_FR_FOG line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille 4P connector: disconnected
Test point 1	Shutter grille 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair an open in the GND wire between the shutter grille and G351.

NO

Repair an open in the VMP/+B_FR_FOG wire between the shutter grille and the **No. A22 fuse** .

10. Open wire check (LIN(BATT_SENSOR) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

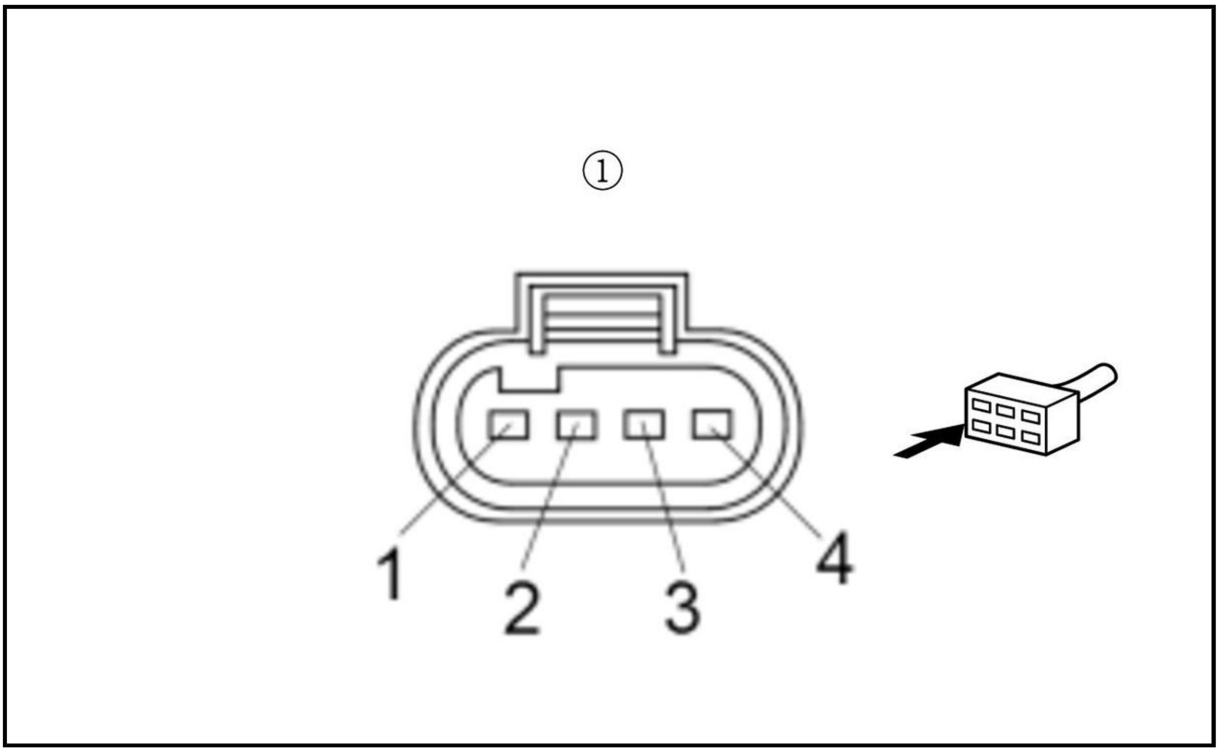
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

Shutter grille 4P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shutter grille 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Shutter grille 4P connector (female terminal) No. 3: ①
Test point 2	**PCM connector A (50P) No. 10**



Is there 1.0 Ω or less?

YES

The LIN(BATT_SENSOR) wire is OK. **Replace the shutter grille** .

NO

Repair an open in the LIN(BATT_SENSOR) wire between the PCM (A10) and the shutter grille.

DTC P16EA

DTC P16EA : Electric Engine Coolant Pump Relay Stuck On

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P16EA Electric Engine Coolant Pump Relay Stuck On	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P16EA Electric Engine Coolant Pump Relay Stuck On	B	B

Is DTC P16EA indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the engine EWP relay and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the engine EWP relay** .

-3. **Test the engine EWP relay** .

Is the relay OK?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the engine EWP relay.

DTC P170E

DTC P170E : Park Pawl Motor Power Relay Circuit High

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P170E Park Pawl Motor Power Relay Circuit High	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P170E Park Pawl Motor Power Relay Circuit High	B	B	B
P272C Park Pawl Motor Control Circuit	B	B	B

Is DTC P170E and/or P272C indicated?

Only DTC P170E is indicated

The failure is duplicated. Go to step 2

DTC P272C is indicated

The failure is duplicated. **Do the troubleshooting for DTC P272C**.

No DTCs are indicated

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park pawl actuator relay, the park pawl actuator, and the park pawl actuator driver unit. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Park pawl actuator relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the park pawl actuator relay** .

-3. **Test the park pawl actuator relay** .

Is the relay OK?

YES

The park pawl actuator relay is OK. Keep the relay removed, and go to step 3.

NO

Replace the park pawl actuator relay.

3. Shorted wire check (P-ACT_RLY_CL- line)

-1. Disconnect the following connector.

Park pawl actuator driver unit 26P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator relay: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	**Park pawl actuator driver unit 26P connector No. 23**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Repair a short to ground in the P-ACT_RLY_CL- wire between the park pawl actuator relay and the park pawl actuator driver unit.

NO

Repair a short to power in the BMA/P-ACT RLY OUT wire between the park pawl actuator relay and the park pawl actuator.

DTC P170F

DTC P170F : Park Pawl Unit Communication Circuit (PWM)

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P170F Park Pawl Unit Communication Circuit (PWM)	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P170F Park Pawl Unit Communication Circuit (PWM)	B	B	B
P1721 Park Pawl Unit IG1 SW No Signal	B	B	B

   Is DTC P170F and/or P1721 indicated?

   Only DTC P170F is indicated

   The failure is duplicated. Go to step 2.

   DTC P170F and P1721 are indicated

   The failure is duplicated. **Do the troubleshooting for DTC P1721**. After troubleshooting, recheck for DTC P170F.

   No DTCs are indicated

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the under-hood fuse/relay box, the park pawl actuator driver unit, and the PCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (PARKCMD line, PARKBUSY line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector E (80P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Park pawl actuator driver unit 26P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**Park pawl actuator driver unit 26P connector No. 10**
Test point 2	**PCM connector E (80P) No. 64**

Test point 1	**Park pawl actuator driver unit 26P connector No. 11**
Test point 2	**PCM connector E (80P) No. 32**

Is there 1.0 Ω or less?

YES

The PARKCMD wire and the PARKBUSY wire are OK. Go to step 3.

NO

Repair an open in the PARKCMD wire and/or the PARKBUSY wire between the park pawl actuator driver unit and the PCM.

3. Shorted wire check (PARKCMD line, PARKBUSY line to ground)

-1. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator driver unit 26P connector: disconnected
B	PCM connector E (80P): disconnected

Connector	Terminal
Park pawl actuator driver unit 26P connector	No. 10
	No. 11

Is there 1 MΩ or more?

YES

The PARKCMD wire and the PARKBUSY wire are not shorted to ground. Go to step 4.

NO

Repair a short to ground in the PARKCMD wire and/or the PARKBUSY wire between the park pawl actuator driver unit and the PCM.

4. Shorted wire check (PARKCMD line, PARKBUSY line to power)

-1. Reconnect all connectors.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between the following test points and body ground individually.

Test condition	Vehicle ON mode

Connector	Terminal
Park pawl actuator driver unit 26P connector	No. 10
	No. 11

Is there 5 V or more?

YES

Repair a short to power in the PARKCMD wire and/or the PARKBUSY wire between the park pawl actuator driver unit and the PCM.

NO

The PARKCMD wire and the PARKBUSY wire are not shorted to power. Go to step 5.

5. Park pawl actuator driver unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good park pawl actuator driver unit** .

-3. Connect the following connectors.

Park pawl actuator driver unit 26P connector
PCM connector E (80P)

-4. Turn the vehicle to the ON mode.

-5. **Update the park pawl actuator driver unit** .

WARNING: **Do not turn the vehicle to the OFF (LOCK) mode. Turing the vehicle to the OFF (LOCK) mode during an update can damage the park pawl actuator driver unit.**

-6. Clear the DTC with the HDS.

-7. Turn the vehicle to the OFF (LOCK) mode.

-8. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-9. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P170F Park Pawl Unit Communication Circuit (PWM)	B	B	B

Is DTC P170F indicated?

YES

The park pawl actuator driver unit is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Replace the original park pawl actuator driver unit .

DTC P1711

DTC P1711 : Park Pawl Unit Malfunction

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1711 Park Pawl Unit Malfunction	B	B	B

DTC (Gear)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1711 Park Pawl Unit Malfunction	B	B	B

Is DTC P1711 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original park pawl actuator driver unit** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1719

DTC P1719 : Park Pawl System Stuck Malfunction

Special Tools Required

SPLINE HOLDER, DETENT SHAFT 070AB-5M50100

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1719 Park Pawl System Stuck Malfunction	B	B	B

DTC (Gear)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

    -5. With the brake pedal pressed and the accelerator released, shift the transmission to N position/mode, then shift back to P position/mode, and wait for at least 5 seconds.

    -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1719 Park Pawl System Stuck Malfunction	B	B	B
P271A Park Pawl Position Sensor A Circuit Low	B	B	B

Is DTC P1719 or P271A indicated?

DTC P1719 is indicated

The failure is duplicated. Go to step 2.

DTC P271A is indicated

The failure is duplicated. **Do the troubleshooting for DTC P271A**.

No DTCs are indicated

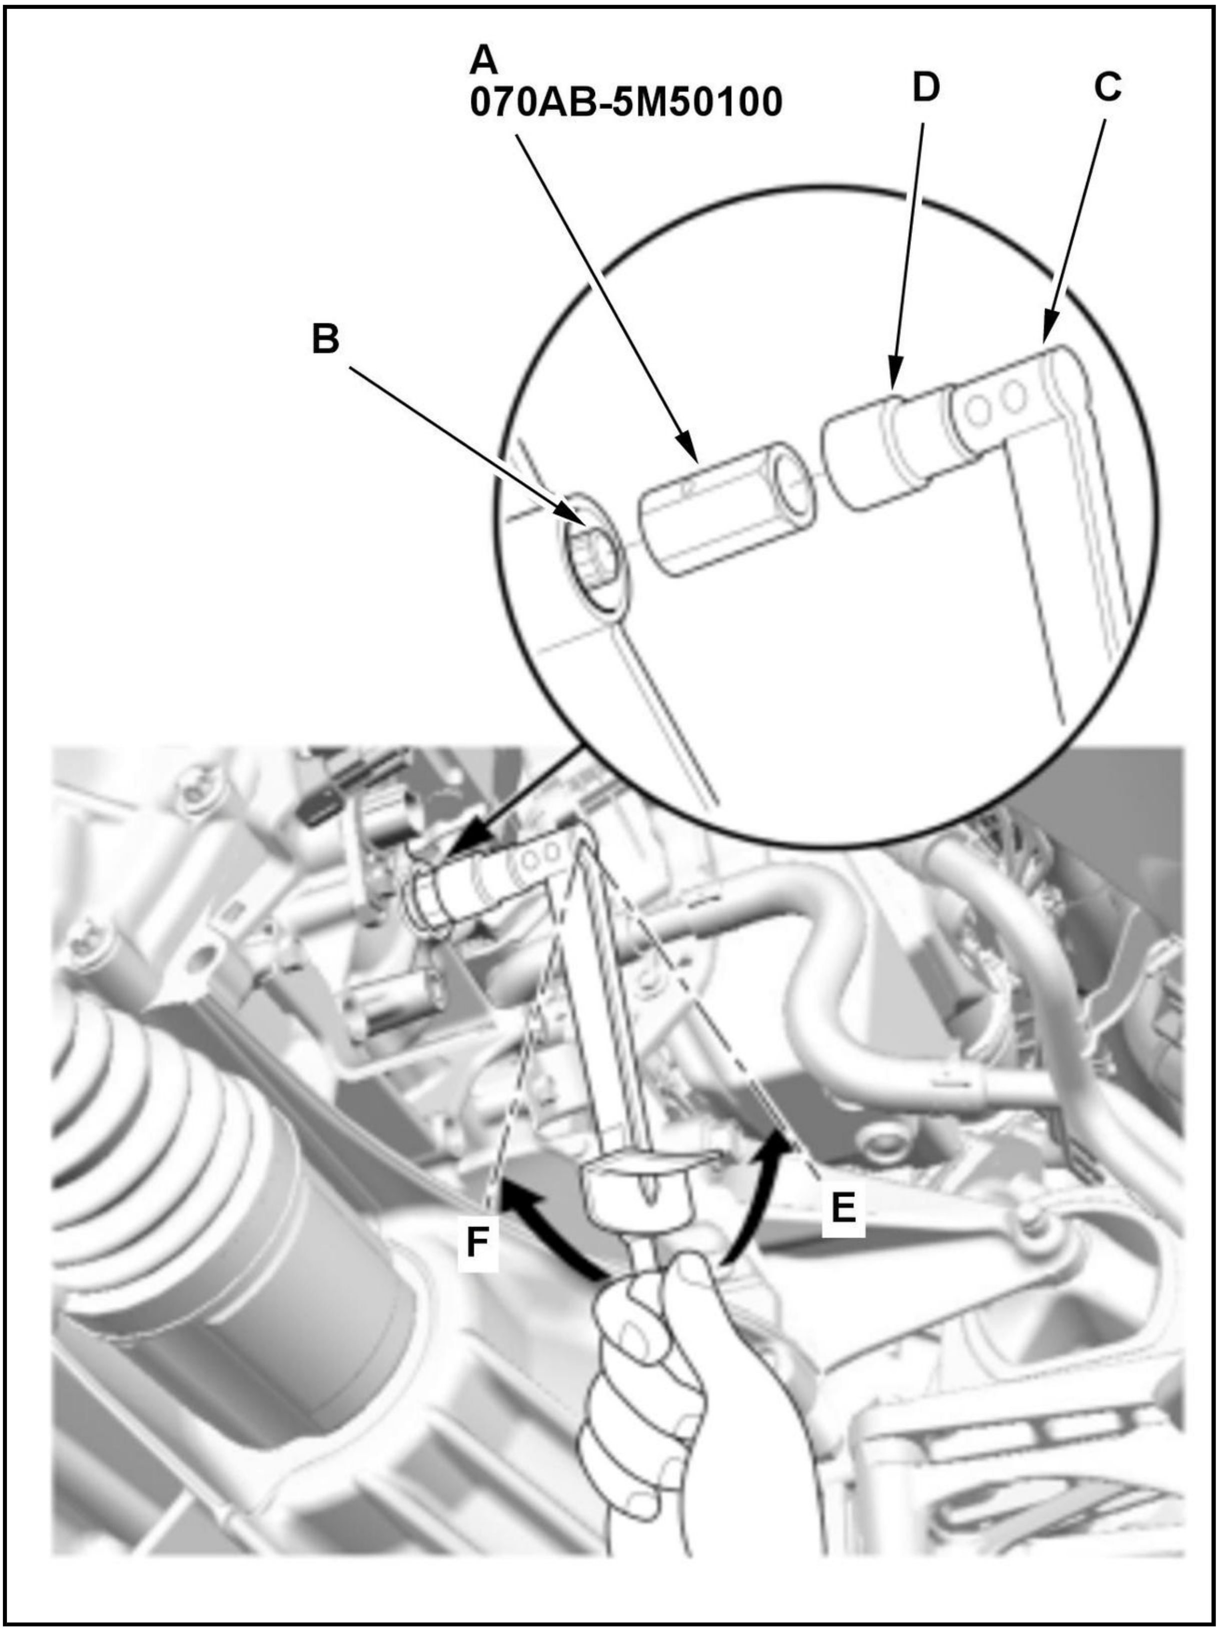
Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission park mechanism check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the park pawl actuator** .

-3. Set the detent shaft spline holder (A) to the detent shaft (B).



-4. Use a torque wrench (C) and the socket (D) to rotate the detent shaft, and check that the detent shaft moves smoothly. Move it back and forth between the P position (E) and the P released position (F) several times.

- -

  Operation angle: approx. 21 deg.

- -

  Operation torque: approx. 4.0 N.m (0.41 kgf.m, 3.0 lbf.ft)

-5. Check that the wheels are locked when putting the detent shaft in the P position. Additionally, check that the wheels rotate when putting the detent shaft in the P released position.

Is the transmission park mechanism OK?

YES

The transmission park mechanism is OK. Put the detent shaft in the P position, and **replace the park pawl actuator** .

NO

Faulty transmission park mechanism. **Replace the transmission (e-CVT)** .

DTC P171A

DTC P171A : Park Pawl System Position Control Error

Special Tools Required

SPLINE HOLDER, DETENT SHAFT 070AB-5M50100

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P171A Park Pawl System Position Control Error	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. With the brake pedal pressed and the accelerator released, shift the transmission to N position/mode, then shift back to P position/mode, and wait for at least 5 seconds.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P171A Park Pawl System Position Control Error	B	B	B
P271A Park Pawl Position Sensor A Circuit Low	B	B	B

Is DTC P171A or P271A indicated?

DTC P171A is indicated

The failure is duplicated. Go to step 2.

DTC P271A is indicated

The failure is duplicated. **Do the troubleshooting for DTC P271A**.

No DTCs are indicated

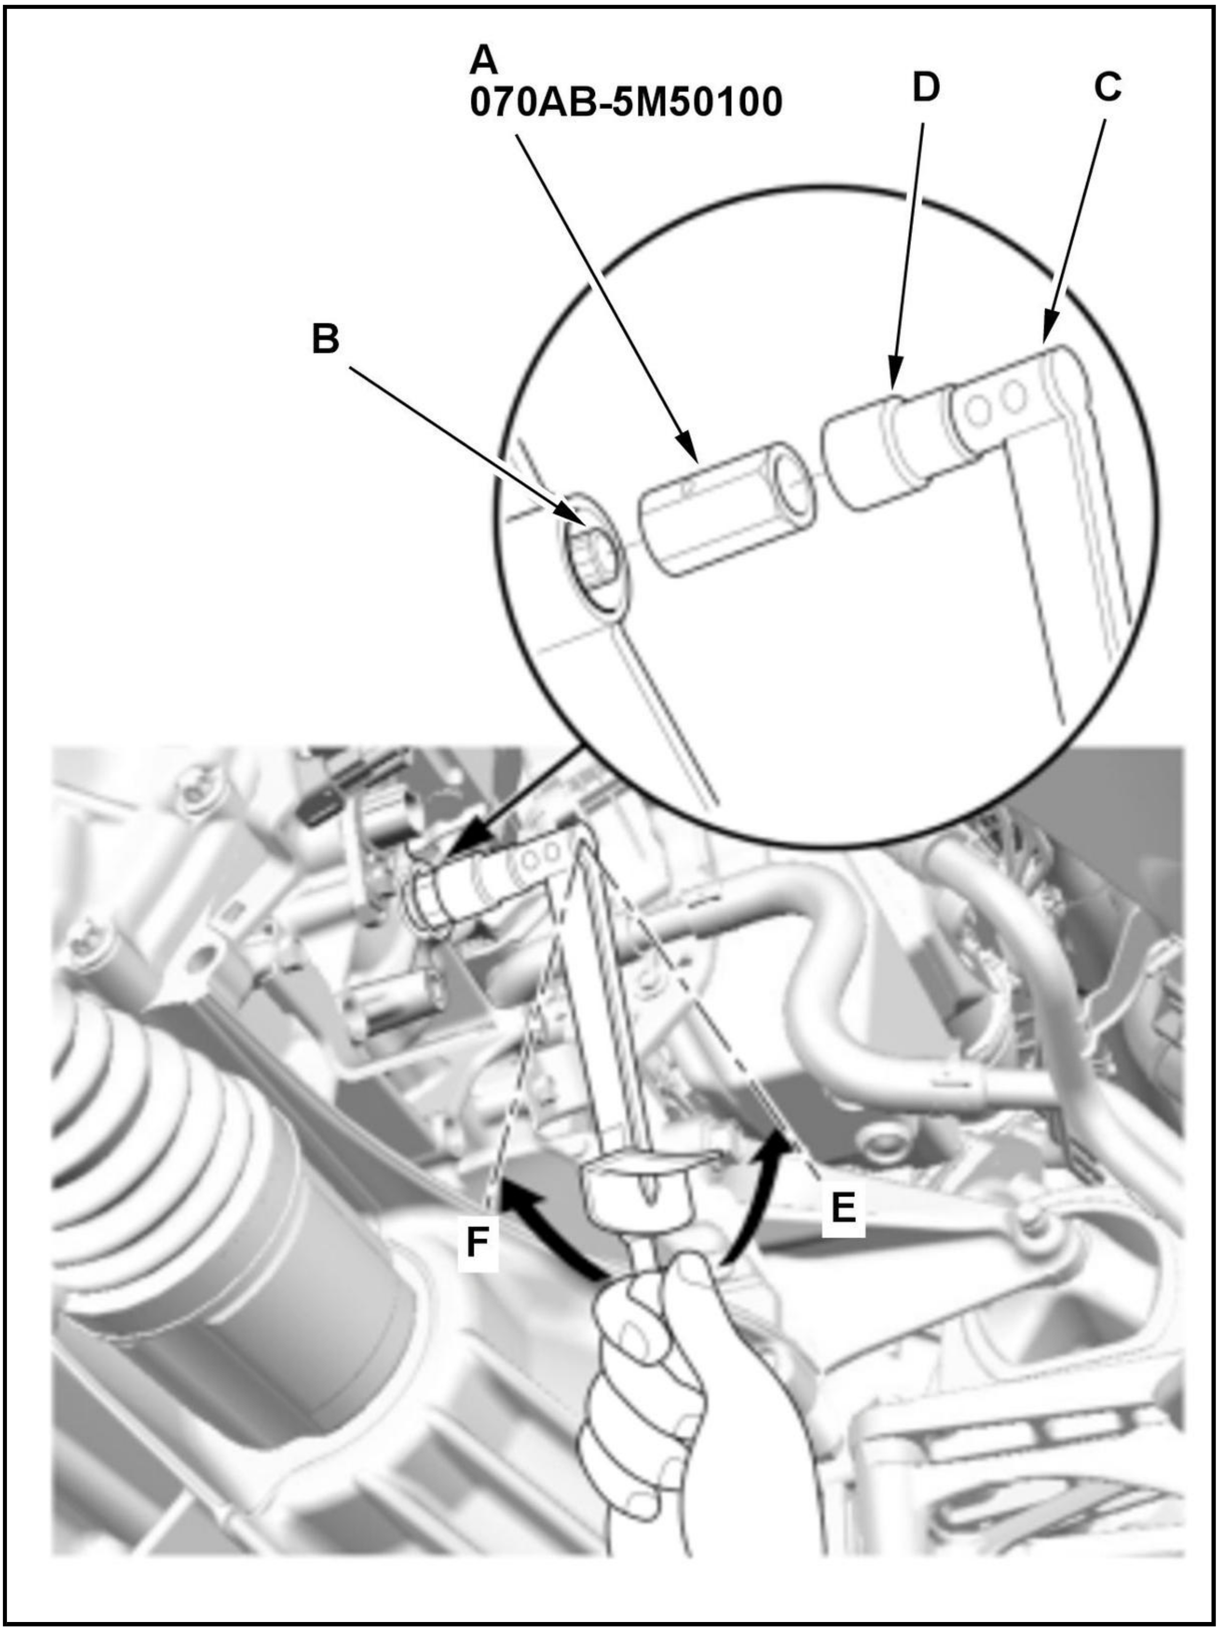
Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission park mechanism check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the park pawl actuator** .

   -3. Set the detent shaft spline holder (A) to the detent shaft (B).



-4. Use a torque wrench (C) and the socket (D) to rotate the detent shaft, and check that the detent shaft moves smoothly. Move it back and forth between the P position (E) and the P released position (F) several times.

- -

  Operation angle: approx. 21 deg.

- -

  Operation torque: approx. 4.0 N.m (0.41 kgf.m, 3.0 lbf.ft)

-5. Check that the wheels are locked when putting the detent shaft in the P position. Additionally, check that the wheels rotate when putting the detent shaft in the P released position.

Is the transmission park mechanism OK?

YES

The transmission park mechanism is OK. Put the detent shaft in the P position, and **replace the park pawl actuator** .

NO

Faulty transmission park mechanism. **Replace the transmission (e-CVT)** .

DTC P171C

DTC P171C : Park Pawl System Multiple Sensor Correlation

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P171C Park Pawl System Multiple Sensor Correlation	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. With the brake pedal pressed and the accelerator released, shift the transmission to N position/mode, then shift back to P position/mode, and wait for at least 5 seconds.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P07B3 Transmission Park Position Sensor/Switch A Circuit Low	B	B	B
P07B4 Transmission Park Position Sensor/Switch A Circuit High	B	B	B
P07B9 Transmission Park Position Sensor/Switch B Circuit Low	B	B	B
P07BA Transmission Park Position Sensor/Switch B Circuit High	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P07BE Transmission Park Position Sensor/Switch A/B Incorrect Voltage Correlation	B	B	B
P171C Park Pawl System Multiple Sensor Correlation	B	B	B

Is DTC P07B3, P07B4, P07B9, P07BA, P07BE, and/or P171C indicated?

Only DTC P171C is indicated

The failure is duplicated. Go to step 2.

Except DTC P171C is indicated

The failure is duplicated. Go to the indicated DTC's troubleshooting.

- **DTC P07B3**
- **DTC P07B4**
- **DTC P07B9**
- **DTC P07BA**
- **DTC P07BE**

No DTCs are indicated

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Park pawl actuator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Substitute a known-good park pawl actuator** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode.

-6. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-7. With the brake pedal pressed and the accelerator released, shift the transmission to N position/mode, then shift back to P position/mode, and wait for at least 5 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P171C Park Pawl System Multiple Sensor Correlation	B	B	B

Is DTC P171C indicated?

YES

The park pawl actuator is OK. Go to step 3.

NO

Replace the original park pawl actuator .

3. Park mechanism component part check

-1. **Remove the transmission (e-CVT)** .

-2. **Disassemble the transmission (e-CVT)** .

Check the following park mechanism component parts on the transmission housing for wear and damage.

- Parking gear
- Parking pawl spring
- Parking brake pawl
- Parking shaft
- Parking brake rod holder and its lock washer

Is there any worn or damaged part?

YES

Replace the worn or damaged component part on the transmission housing.

NO

The park mechanism component parts are OK. Faulty transmission park mechanism. **Replace the transmission (e-CVT)** .

DTC P171E

DTC P171E : Park Pawl System Malfunction of learning mode

Special Tools Required

SPLINE HOLDER, DETENT SHAFT 070AB-5M50100

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P171E Park Pawl System Malfunction of learning mode	B	B	B

DTC (Gear)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

   -3. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

   -4. With the brake pedal pressed and the accelerator released, shift the transmission to N position/mode, then shift back to P position/mode, and wait for at least 5 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

   Gear System

P07BE Transmission Park Position Sensor/Switch A/B Incorrect Voltage Correlation	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P171E Park Pawl System Malfunction of learning mode	B	B	B
P271A Park Pawl Position Sensor A Circuit Low	B	B	B

PGM-FI System

DTC Description	Confirmed DTC	Pending DTC
U0103 F-CAN Malfunction (ECM/PCM-Shifter)	B	B
U12AA EP-CAN Malfunction (PCM-SBW Shifter)	B	B

Is DTC P07B3, P07B4, P07B9, P07BA, P07BE, P171E, P271A, U0103, or U12AA indicated?

DTC P171E is indicated

The failure is duplicated. Go to step 2.

Except DTC P171E is indicated

The failure is duplicated. Go to the indicated DTC's troubleshooting.

- **DTC P07B3**
- **DTC P07B4**
- **DTC P07B9**
- **DTC P07BA**
- **DTC P07BE**
- **DTC P271A**
- **DTC U0103**
- **DTC U12AA**

No DTCs are indicated

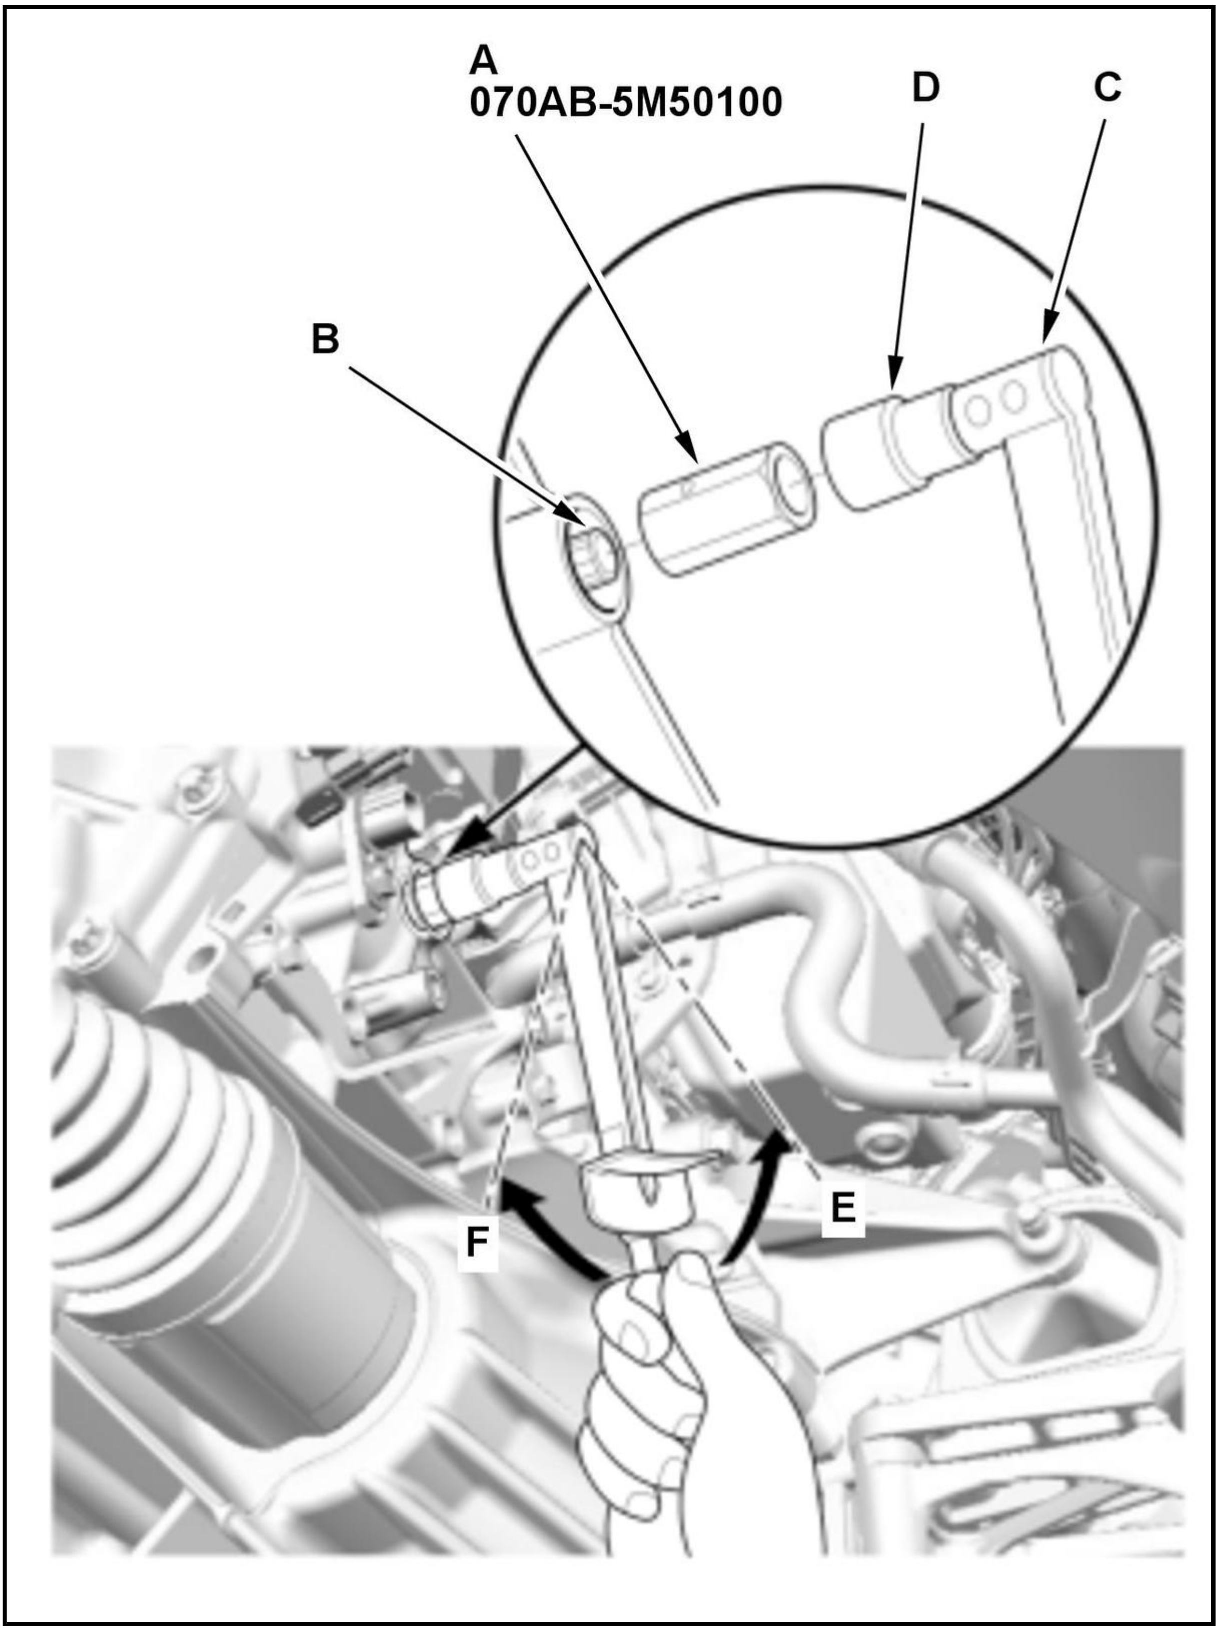
Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission park mechanism check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the park pawl actuator** .

-3. Set the detent shaft spline holder (A) to the detent shaft (B).



-4. Use a torque wrench (C) and the socket (D) to rotate the detent shaft, and check that the detent shaft moves smoothly. Move it back and forth between the P position (E) and the P released position (F) several times.

- -

  Operation angle: approx. 21 deg.

- -

  Operation torque: approx. 4.0 N.m (0.41 kgf.m, 3.0 lbf.ft)

-5. Check that the wheels are locked when putting the detent shaft in the P position. Additionally, check that the wheels rotate when putting the detent shaft in the P released position.

Is the transmission park mechanism OK?

YES

The transmission park mechanism is OK. Put the detent shaft in the P position, and **replace the park pawl actuator** .

NO

Faulty transmission park mechanism. **Replace the transmission (e-CVT)** .

DTC P171F

DTC P171F : Park Pawl System Stuck Malfunction After learning mode/Time-out

Special Tools Required

SPLINE HOLDER, DETENT SHAFT 070AB-5M50100

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P171F Park Pawl System Stuck Malfunction After learning mode/Time-out	B	B	B

DTC (Gear)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-4. With the brake pedal pressed and the accelerator released, shift the transmission to N position/mode, then shift back to P position/mode, and wait for at least 5 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

Gear System

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P07B3 Transmission Park Position Sensor/Switch A Circuit Low	B	B	B
P07B4 Transmission Park Position Sensor/Switch A Circuit High	B	B	B

PGM-FI System

DTC Description	Confirmed DTC	Pending DTC
U0103 F-CAN Malfunction (PCM-SBW Shifter)	B	B
U12AA EP-CAN Malfunction (PCM-SBW Shifter)	B	B

Is DTC P07B3, P07B4, P07B9, P07BA, P07BE, P171F, P1720, U0103, or U12AA indicated?

DTC P171F is indicated

The failure is duplicated. Go to step 2.

Except DTC P171F is indicated

The failure is duplicated. Go to the indicated DTC's troubleshooting.

- **DTC P07B3**
- **DTC P07B4**
- **DTC P07B9**
- **DTC P07BA**
- **DTC P07BE**
- **DTC P271A**
- **DTC U0103**
- **DTC U12AA**

No DTCs are indicated

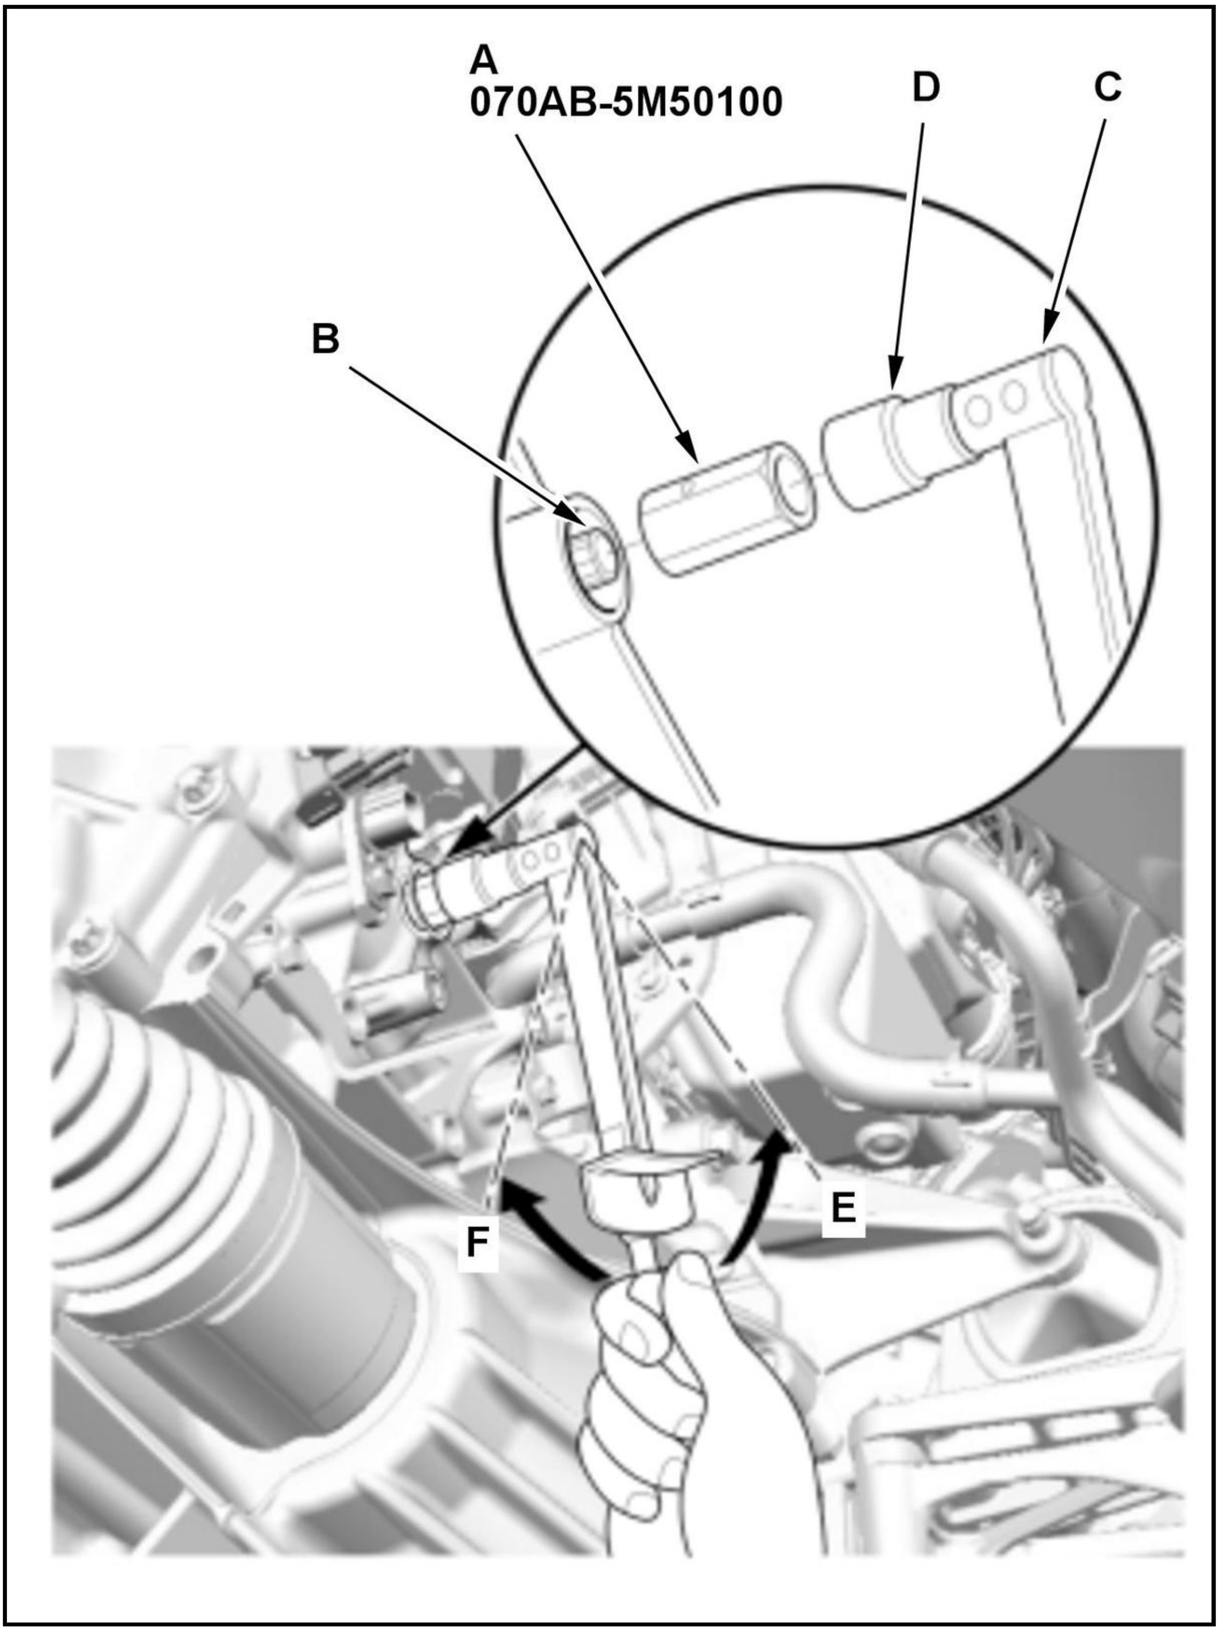
Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission park mechanism check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the park pawl actuator** .

-3. Set the detent shaft spline holder (A) to the detent shaft (B).



-4. Use a torque wrench (C) and the socket (D) to rotate the detent shaft, and check that the detent shaft moves smoothly. Move it back and forth between the P position (E) and the P released position (F) several times.

- -

  Operation angle: approx. 21 deg.

- -

  Operation torque: approx. 4.0 N.m (0.41 kgf.m, 3.0 lbf.ft)

-5. Check that the wheels are locked when putting the detent shaft in the P position. Additionally, check that the wheels rotate when putting the detent shaft in the P released position.

Is the transmission park mechanism OK?

YES

The transmission park mechanism is OK. Put the detent shaft in the P position, and **replace the park pawl actuator** .

NO

Faulty transmission park mechanism. **Replace the transmission (e-CVT)** .

DTC P1720

DTC P1720 : Park Pawl Motor Current Range/Performance

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1720 Park Pawl Motor Current Range/Performance	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1720 Park Pawl Motor Current Range/Performance	B	B	B

   Is DTC P1720 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park pawl actuator and the park pawl actuator driver unit. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (MAU/P-ACT MTR U line, MAV/P-ACT MTR V line, MAW/P-ACT MTR W line to power)

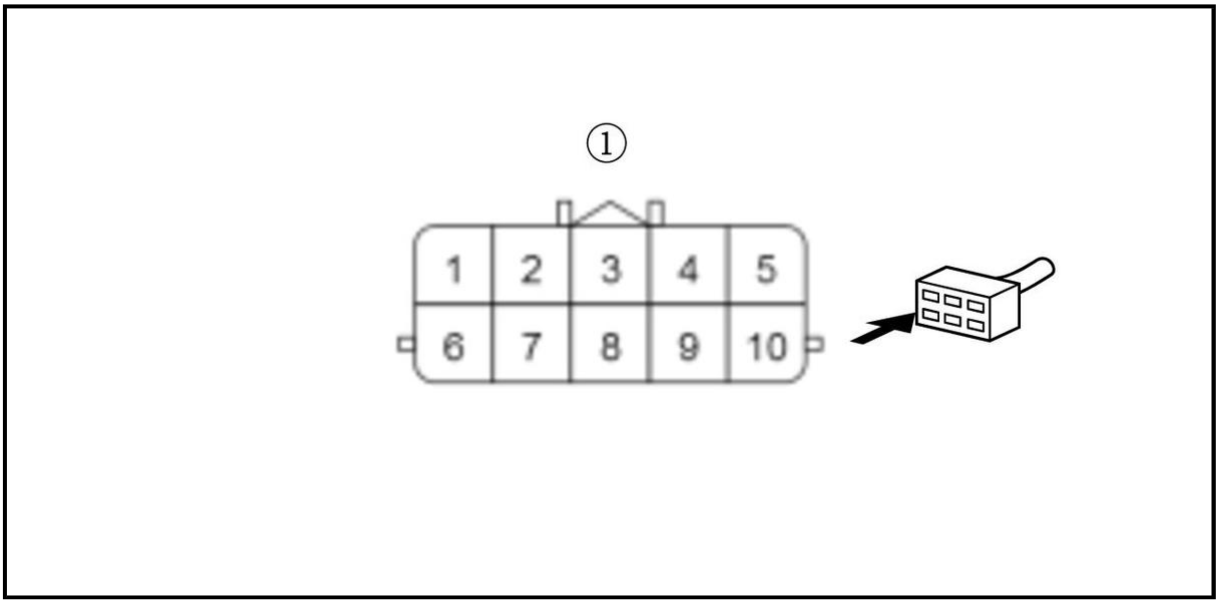
   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Park pawl actuator 10P connector
Park pawl actuator driver unit 26P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	Park pawl actuator 10P connector (female terminals) No. 1: ①
Test point 2	Body ground
B	B
Test point 1	Park pawl actuator 10P connector (female terminals) No. 6: ①
Test point 2	Body ground
B	B
Test point 1	Park pawl actuator 10P connector (female terminals) No. 7 ①
Test point 2	Body ground



Is there voltage?

YES

Repair a short to power in the MAU/P-ACT MTR U wire, the MAV/P-ACT MTR V wire, and/or the MAW/P-ACT MTR W wire between the park pawl actuator and the park pawl actuator driver unit. .

NO

The MAU/P-ACT MTR U wire, MAV/P-ACT MTR V wire, and/or MAW/P-ACT MTR W wire are not shorted to power. Go to step 3.

3. Park pawl actuator driver unit check

-1. **Substitute a known-good park pawl actuator driver unit** .

-2. Connect the following connectors.

Park pawl actuator 10P connector
Park pawl actuator driver unit 26P connector

-3. Turn the vehicle to the ON mode.

-4. Update the park pawl actuator driver unit .

WARNING: **Do not turn the vehicle to the OFF (LOCK) mode. Turing the vehicle to the OFF (LOCK) mode during an update can damage the park pawl actuator driver unit.**

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait for at least 5 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1720 Park Pawl Motor Current Range/Performance	B	B	B

Is DTC P1720 indicated?

YES

The park pawl actuator driver unit is OK. Replace the park pawl actuator .

NO

Replace the original park pawl actuator driver unit .

DTC P1721

DTC P1721 : Park Pawl Unit IG1 SW No Signal

NOTE: Before you troubleshoot, review the General Troubleshooting Information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1721 Park Pawl Unit IG1 SW No Signal	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1721 Park Pawl Unit IG1 SW No Signal	B	B	B

Is DTC P1721 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the under-dash fuse/relay box and the park pawl actuator driver unit. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. D6**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short to ground in the fuse circuit.

3. Open wire check (IG1_SRS2 line)

-1. Disconnect the following connector.

Park pawl actuator driver unit 26P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	**Park pawl actuator driver unit 26P connector No. 15**
Test point 2	Body ground

Is there battery voltage?

YES

IG1_SRS2 wire is OK, go to step 4.

NO

Repair an open in the IG1_SRS2 wire between the **No. D6** fuse and the park pawl actuator driver unit.

4. Park pawl actuator driver unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Substitute a known-good park pawl actuator driver unit .

-3. Connect the following connectors.

Park pawl actuator driver unit 26P connector

-4. Turn the vehicle to the ON mode.

-5. Update the park pawl actuator driver unit .

WARNING: **Do not turn the vehicle to the OFF (LOCK) mode. Turing the vehicle to the OFF (LOCK) mode during an update can damage the park pawl actuator driver unit.**

-6. Clear the DTC with the HDS.

-7. Turn the vehicle to the OFF (LOCK) mode.

-8. Turn the vehicle to the ON mode, and wait for at least 5 seconds.

-9. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1721 Park Pawl Unit IG1 SW No Signal	B	B	B

Is DTC P1721 indicated?

YES

The park pawl actuator driver unit is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or replace the original PCM .

NO

Replace the original park pawl actuator driver unit .

DTC P1722

DTC P1722 : Park Pawl Motor Torque Malfunction of learning mode

NOTE: Before you troubleshoot, review the General Troubleshooting Information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1722 Park Pawl Motor Torque Malfunction of learning mode	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1722 Park Pawl Motor Torque Malfunction of learning mode	B	B	B

Is DTC P1722 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original park pawl actuator driver unit** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1723

DTC P1723 : Park Pawl System Initial Check Error

Special Tools Required

SPLINE HOLDER, DETENT SHAFT 070AB-5M50100

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1723 Park Pawl System Initial Check Error	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. With the brake pedal pressed and the accelerator released, shift the transmission to N position/mode, then shift back to P position/mode, and wait for at least 5 seconds.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1723 Park Pawl System Initial Check Error	B	B	B
P271A Park Pawl Position Sensor A Circuit Low	B	B	B

Is DTC P1723 or P271A indicated?

Only DTC P1723 is indicated

The failure is duplicated. Go to step 2.

DTC P1723 and P271A are indicated

The failure is duplicated. **Do the troubleshooting for DTC P271A**.

No DTCs are indicated

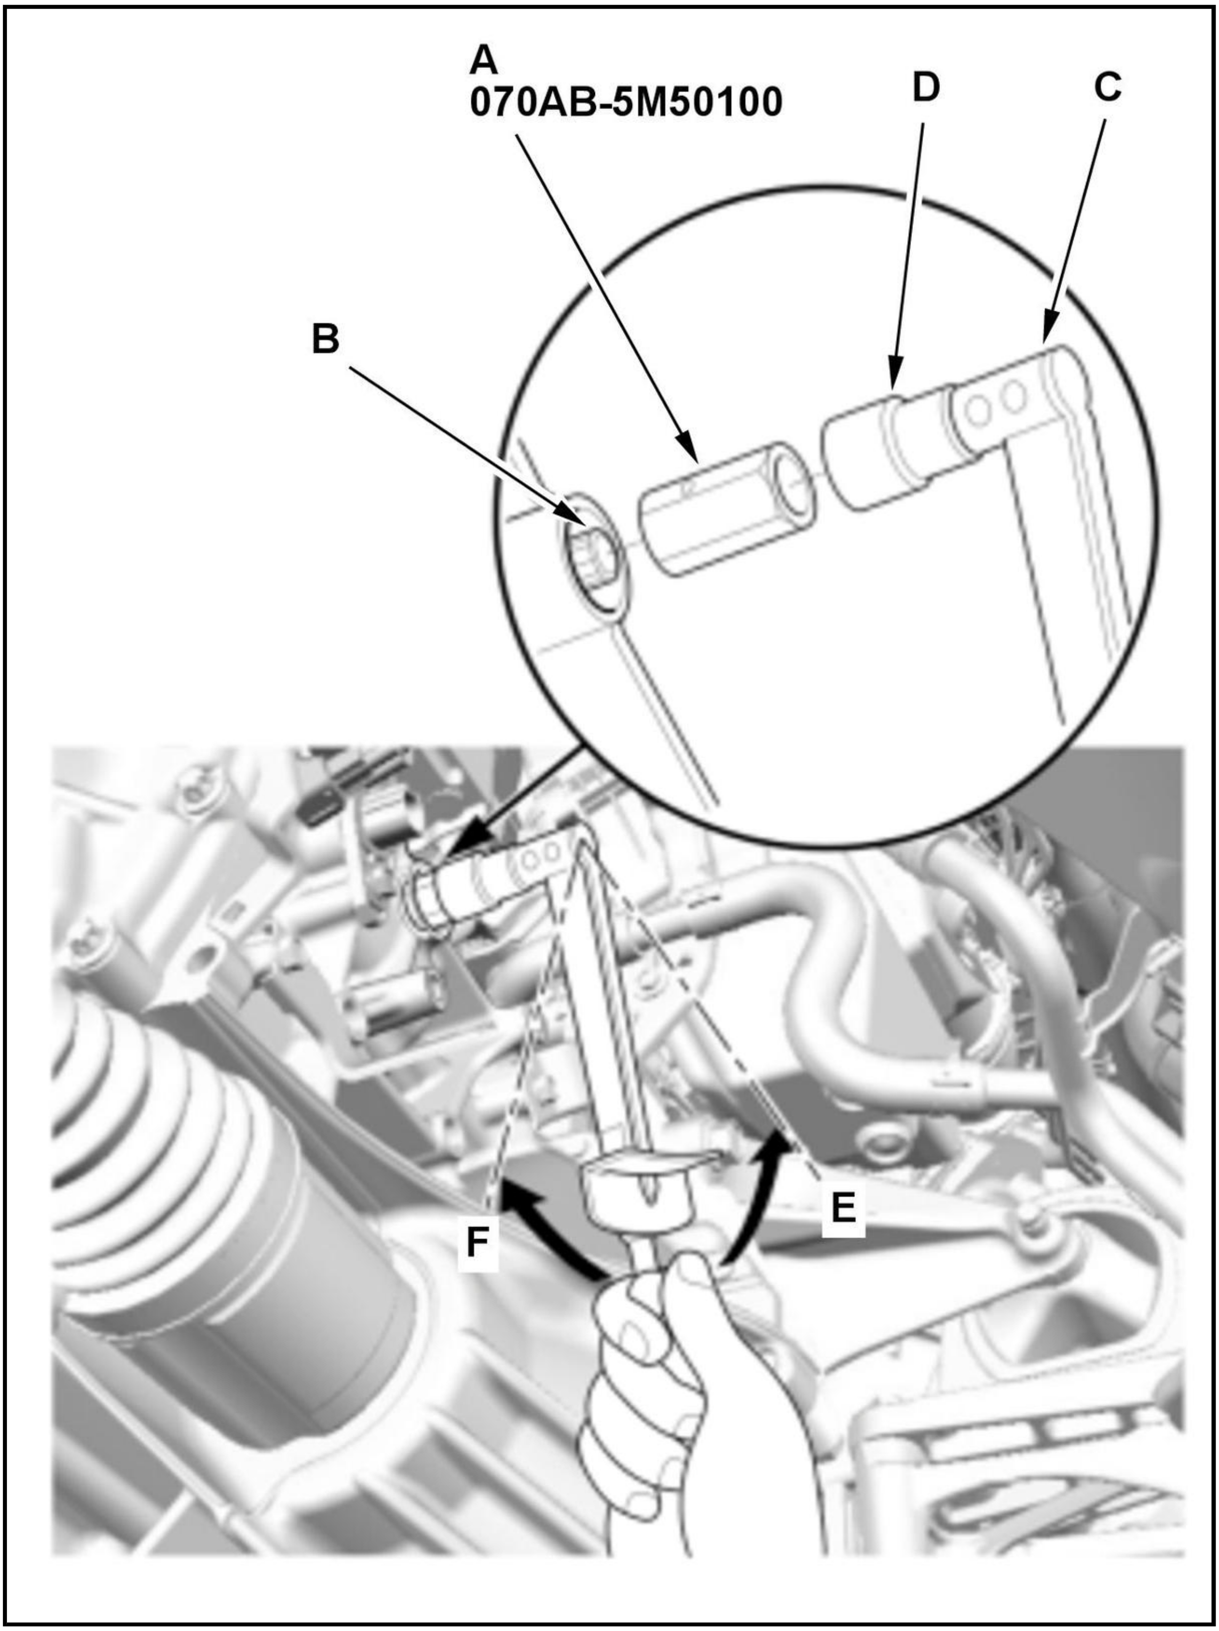
Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Transmission park mechanism check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the park pawl actuator** .

   -3. Set the detent shaft spline holder (A) to the detent shaft (B).



-4. Use a torque wrench (C) and the socket (D) to rotate the detent shaft, and check that the detent shaft moves smoothly. Move it back and forth between the P position (E) and the P released position (F) several times.

- -

  Operation angle: approx. 21 deg.

- -

  Operation torque: approx. 4.0 N.m (0.41 kgf.m, 3.0 lbf.ft)

-5. Check that the wheels are locked when putting the detent shaft in the P position. Additionally, check that the wheels rotate when putting the detent shaft in the P released position.

Is the transmission park mechanism OK?

YES

The transmission park mechanism is OK. Put the detent shaft in the P position, and **replace the park pawl actuator** .

NO

Faulty transmission park mechanism. **Replace the transmission (e-CVT)** .

DTC P172A

DTC P172A : KEY-Release Wake-up Output Circuit Malfunction

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P172A KEY-Release Wake-up Output Circuit Malfunction	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

   -5. Monitor the OBD STATUS for P172A in the DTCs MENU with the HDS.

DTC Description	OBD Status
P172A KEY-Release Wake-up Output Circuit Malfunction	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 2.

   NO

   If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the SBW shifter control module and the body control module. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot. If the HDS indicates NOT COMPLETED, go to step 1

2. Determine possible failure area (SBW shifter control module, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

SBW shifter control module 20P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	SBW shifter control module 20P connector: disconnected
Test point 1	**SBW shifter control module 20P connector No. 7**
Test point 2	Body ground

Is there voltage?

YES

SBW shifter control module is OK, go to step 3.

NO

Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

3. Shorted wire check (MTR_CUT2(IG1) line to power)

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	SBW shifter control module 20P connector: disconnected
B	Body control module connector G (32P): disconnected
Test point 1	**SBW shifter control module 20P connector No. 7**
Test point 2	Body ground

Is there voltage?

YES

Repair a short to power in the MTR_CUT2(IG1) wire between the SBW shifter control module and the body control module.

NO

The MTR_CUT2(IG1) wire is OK. **Replace the body control module** .

DTC P172B

DTC P172B : KEY-Release Switch Input Circuit Malfunction

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P172B KEY-Release Switch Input Circuit Malfunction	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode and wait for at least 1 minute.

-5. Monitor the OBD STATUS for P172B in the DTCs MENU with the HDS.

DTC Description	OBD Status
P172B KEY-Release Switch Input Circuit Malfunction	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot. If the HDS indicates NOT COMPLETED, go to step 1

DTC P173A (2020)

DTC P173A : Transmission Fluid Pressure Sensor Performance High

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173A Transmission Fluid Pressure Sensor Performance High	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode** , then start the engine until the cooling fan comes on.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the ON mode.

-6. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-7. Select the ENERGY FLOW screen on the MID.

-8. **Enter the VSA maintenance mode** .

-9. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not turn the vehicle to the OFF (LOCK) mode. Turing the vehicle to the OFF (LOCK) mode during an update can damage the park pawl actuator driver unit.**

-10.

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173A Transmission Fluid Pressure Sensor Performance High	B	B	B

Is DTC P173A indicated?

YES

The failure is duplicated. **Replace the transmission fluid pressure sensor** .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

DTC P173A, P2872 (2021)

DTC P173A : Transmission Fluid Pressure Sensor Performance High

DTC P2872 : Over Drive Clutch Stuck Engaged

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173A Transmission Fluid Pressure Sensor Performance High	B	B	B
P2872 Over Drive Clutch Stuck Engaged	B	B	B

DTC (Gear)

1. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173A Transmission Fluid Pressure Sensor Performance High	B	B	B

   Is DTC P173A indicated?

   YES

   The failure is duplicated. Go to step 2

   NO

   The failure is not duplicated. Go to step 3

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode** , then start the engine until the cooling fan comes on.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the ON mode.

-6. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-7. Select the ENERGY FLOW screen on the MID.

-8. **Enter the VSA maintenance mode** .

-9. Select the HV mode by pressing the HV button.

NOTE: The HV indicator in the gauge assembly comes on.

-10.

Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-11.

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173A Transmission Fluid Pressure Sensor Performance High	B	B	B

Is DTC P173A indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good transmission fluid pressure sensor** , then recheck. If this DTC goes away and the transmission fluid pressure sensor was substituted, **replace the original transmission fluid pressure sensor** . If the DTC does not clear, **replace the original PCM** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode** .

WARNING: **If multiple failure exists during the problem verification, the engine may stall when entering the maintenance mode.**

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the ON mode.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2872 Over Drive Clutch Stuck Engaged	B	B	B
P0752 Shift Solenoid Valve A Stuck ON	B	B	B
P0757 Shift Solenoid Valve B Stuck ON	B	B	B

Is DTC P2872, P0752, P0757 indicated?

YES

The failure is duplicated. Go to step 4

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

4. ATF check

-1. **Check the ATF level** to make sure that the transmission is filled to the proper level, and check for fluid leaks.

-2. **Drain the ATF** through a strainer. Inspect the strainer for metal debris or excessive clutch material.

Does the strainer have metal debris or excessive clutch material?

YES

Replace the transmission (e-CVT) .

NO

Replace shift solenoid valve A and shift solenoid valve B and **the valve body assembly** .

DTC P173B

DTC P173B : Transmission Fluid Pressure Sensor Performance Low

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173B Transmission Fluid Pressure Sensor Performance Low	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode** , then start the engine until the cooling fan comes on.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the ON mode.

-6. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-7. Select the ENERGY FLOW screen on the MID.

-8. **Enter the VSA maintenance mode** .

-9. Run the vehicle in the engine drive mode for at least 10 seconds. Apply the brakes, and slowly bring the wheels to a stop.

WARNING: **Do not brake hard when working on a running vehicle on a lift. It may cause some damage to the drive-line.**

-10.

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P173B Transmission Fluid Pressure Sensor Performance Low	B	B	B

Is DTC P173B indicated?

YES

The failure is duplicated. **Replace the transmission fluid pressure sensor** .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

DTC P1A48, P1A49, P1A4A

DTC P1A48 : PCM Internal Malfunction (SBW Different Run)

DTC P1A49 : PCM Internal Malfunction (SBW Parking Position)

DTC P1A4A : PCM Internal Malfunction (SBW Display Position)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1A48 PCM Internal Malfunction (SBW Different Run)	B	B
P1A49 PCM Internal Malfunction (SBW Parking Position)	B	B
P1A4A PCM Internal Malfunction (SBW Display Position)	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the READY TO DRIVE mode.

-5. Wait 10 seconds or more with the shift position in P.

-6. Wait 10 seconds or more with each shift position in R, N, D.

-7. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1A48 PCM Internal Malfunction (SBW Different Run)	B	B
P1A49 PCM Internal Malfunction (SBW Parking Position)	B	B
P1A4A PCM Internal Malfunction (SBW Display Position)	B	B

Is DTC P1A48, P1A49, and/or P1A4A indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P1A51, P1A52, P1A53

DTC P1A51 : PCM Internal Malfunction (Torque Calculation Acceleration)

DTC P1A52 : PCM Internal Malfunction (Torque Calculation Deceleration)

DTC P1A53 : PCM Internal Malfunction (Torque Calculation Different Run)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P1A51 PCM Internal Malfunction (Torque Calculation Acceleration)	B	B
P1A52 PCM Internal Malfunction (Torque Calculation Deceleration)	B	B
P1A53 PCM Internal Malfunction (Torque Calculation Different Run)	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the READY TO DRIVE mode.

-5. Wait 5 seconds or more with the shift position in P.

-6. With the brake pedal pressed, change the shift position to R, N, and D, and wait 5 seconds in each shift position.

Test-drive the vehicle under these conditions:

- Accelerate 5 seconds or more, then decelerate 5 seconds or more with depressing the brake pedal.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1A51 PCM Internal Malfunction (Torque Calculation Acceleration)	B	B
P1A52 PCM Internal Malfunction (Torque Calculation Deceleration)	B	B

DTC Description	Confirmed DTC	Pending DTC
P1A53 PCM Internal Malfunction (Torque Calculation Different Run)	B	B

Is DTC P1A51, P1A52, and/or P1A53 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2096, P2097

DTC P2096 : Post Catalyst Fuel Trim System Too Lean

DTC P2097 : Post Catalyst Fuel Trim System Too Rich

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are stored at the same time as DTC P2096 and/or P2097, troubleshoot those DTCs first, then recheck for P2096 or P2097.

  P0130, P0133, P2237, P2238, P2243, P2245, P2251, P2252, P2A00: A/F sensor (Sensor 1)

  P0134, P0135: A/F sensor (Sensor 1) heater

  P0137, P0138, P0139, P2270, P2A01: Secondary HO2S (Sensor 2)

  P0141: Secondary HO2S (Sensor 2) heater

  P0171, P0172: Fuel system

  P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector(s)

  P0300: Random misfire

P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil(s)

DTC Description	Confirmed DTC	Pending DTC
P2096 Post Catalyst Fuel Trim System Too Lean	B	B
P2097 Post Catalyst Fuel Trim System Too Rich	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle under these conditions:

- ECT Sensor 1 above 158 deg.F (70 deg.C)
- Transmission in D
- Engine speed below 4, 000 rpm
- Drive at a steady speed between 15-75 mph (24-120 km/h) for 1 minute or more

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
Engine Speed	B	B
Vehicle Speed	B	B

-6. Monitor the OBD STATUS for DTC P2096 and/or P2097 with the HDS.

DTC Description	OBD STATUS
P2096 Post Catalyst Fuel Trim System Too Lean	B
P2097 Post Catalyst Fuel Trim System Too Rich	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1), the secondary HO2S (Sensor 2), and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep the test conditions until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 1-5 and recheck.

2. Exhaust system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for leakage, clogging, or blockage in the exhaust system.

Is there leakage in the exhaust system between the A/F sensor (Sensor 1) and the secondary HO2S (Sensor 2), or any clogging or restrictions in the exhaust system?

YES

Repair or replace the exhaust system .

NO

Go to step 3.

3. A/F sensor (Sensor 1) check

-1. **Substitute a known-good A/F sensor (Sensor 1)** .

-2. Reconnect all connectors.

-3. Turn the vehicle to the ON mode.

-4. **Reset the PCM with the HDS** .

Reset PCM

-5. **Enter the maintenance mode, then start the engine** .

-6. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle under these conditions:

- ECT Sensor 1 above 158 deg.F (70 deg.C)
- Transmission in D
- Engine speed below 4, 000 rpm
- Drive at a steady speed between 15-75 mph (24-120 km/h) for 1 minute or more

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
Engine Speed	B	B
Vehicle Speed	B	B

-8. Monitor the OBD STATUS for DTC P2096 and/or P2097 with the HDS.

DTC Description	OBD STATUS
P2096 Post Catalyst Fuel Trim System Too Lean	B
P2097 Post Catalyst Fuel Trim System Too Rich	B

Does the HDS indicate PASSED?

YES

Replace the original A/F sensor (Sensor 1) .

NO

If the HDS indicates FAILED, replace the secondary HO2S (Sensor 2) . If the HDS indicates EXECUTING, keep the test conditions until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 3-7 and recheck.

DTC P2101

DTC P2101 : ETCS Malfunction

WARNING: Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

DTC (PGM-FI)

1. ETCS system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the ETCS (TAC) TEST in the Function Test Menu with the HDS.

   ETCS (TAC) TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

   Is DTC P2101 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   The failure is not duplicated. Go to step 2.

2. Problem verification:

   Test-drive the vehicle for several minutes in the range of these recorded on-board snapshot parameters:

   - ENGINE SPEED
   - VEHICLE SPEED
   - APP SENSOR

   On-board Snapshot

Signal	Current conditions	
	Values	Unit
Engine Speed	B	B
Vehicle Speed	B	B

Signal	Current conditions	
	Values	Unit
APP Sensor	B	B

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2101 ETCS Malfunction	B	B

Is DTC P2101 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (throttle body, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the air cleaner** .

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Visually check the throttle valve operation while doing the ETCS (TAC) TEST in the Function Test Menu with the HDS.

ETCS (TAC) TEST

Does the throttle valve operate smoothly?

YES

Clean the throttle body , and recheck. If DTC P2101 is indicated, **replace the throttle body** .

NO

Go to step 4.

4. Open wire check (MTR1 line, MTR2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

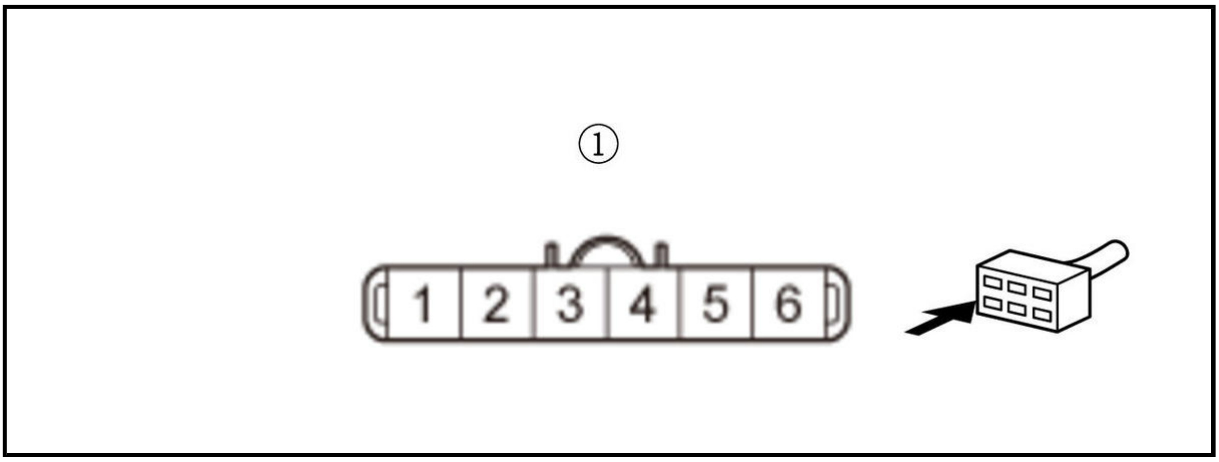
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Connect terminals A and B with a jumper wire.

Terminal A	Throttle body 6P connector (female terminals) No. 1: ①
Terminal B	Throttle body 6P connector (female terminals) No. 2: ①



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
B	Throttle body 6P connector No. 1 and No. 2: jumped
Test point 1	**PCM connector E (80P) No. 27**
Test point 2	**PCM connector E (80P) No. 28**

Is there 1.0 Ω or less?

YES

Go to step 5.

NO

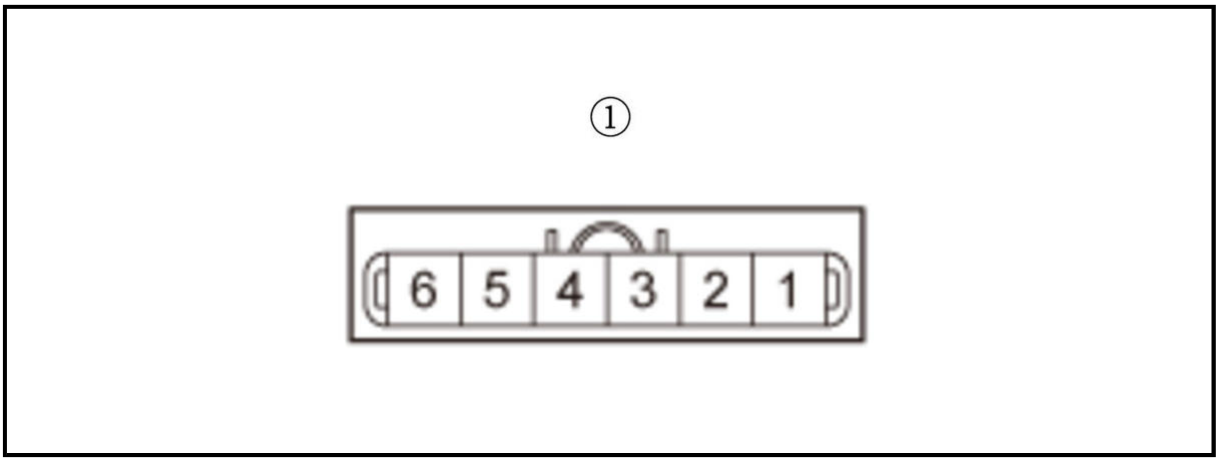
Repair an open in the MTR1 wire or the MTR2 wire between the PCM (E27, E28) and the throttle body.

5. Throttle body internal circuit check

-1. Remove the jumper wire from the throttle body 6P connector.

-2. At the throttle body side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (male terminals) No. 1 (throttle body side): ①
Test point 2	Throttle body 6P connector (male terminals) No. 2 (throttle body side): ①



Is there about 1.0 kΩ or more?

YES

Replace the throttle body .

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

DTC P2108

DTC P2108 : Throttle Actuator Control Module Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2108 is indicated alone, do the troubleshooting for DTC P1658 and P1659 using the on-board snapshot for P2108.
- If any of the DTCs listed below are indicated at the same time as DTC P2108, troubleshoot those DTCs first, then recheck for P2108.
-
    - -

      P1658, P1659: Throttle Actuator Control

DTC Description	Confirmed DTC	Pending DTC
P2108 Throttle Actuator Control Module Performance	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1658 ETCS Control Relay ON Malfunction	B	B
P1659 ETCS Control Relay OFF Malfunction	B	B
P2108 Throttle Actuator Control Module Performance	B	B

Are DTC P1658 or P1659 and P2108 indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC P1658** and **DTC P1659** using the on-board snapshot for DTC P2108.

DTC P2118

DTC P2118 : Throttle Actuator Current Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2118 Throttle Actuator Current Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Slowly press the accelerator pedal to the floor.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2118 Throttle Actuator Current Range/Performance Problem	B	B

   Is DTC P2118 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM, then **clean the throttle body** . **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (SG3(DBW) line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

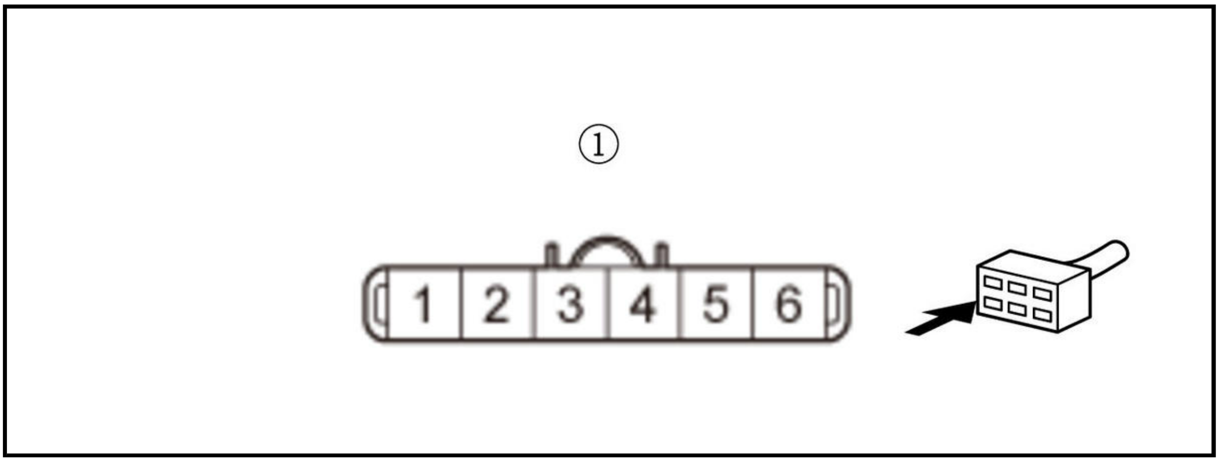
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 3: ①
Test point 2	**PCM connector E (80P) No. 76**



Is there 1.0 Ω or less?

YES

Go to step 3.

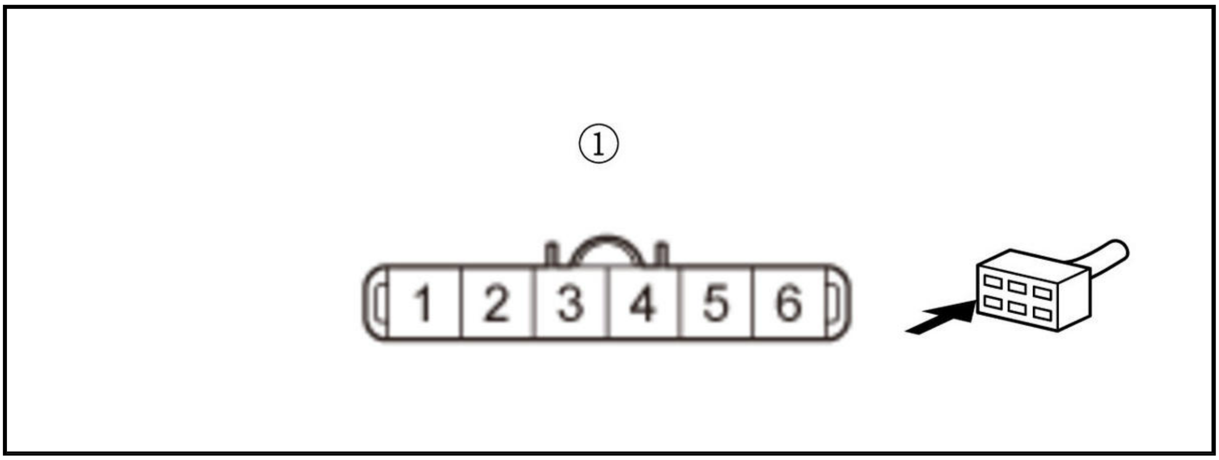
NO

Repair an open in the SG3(DBW) wire between the PCM (E76) and the throttle body.

3. Shorted wire check (MTR1 line to MTR2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 1: ①
Test point 2	Throttle body 6P connector (female terminals) No. 2: ①



Is there 1 MΩ or more?

YES

Go to step 4.

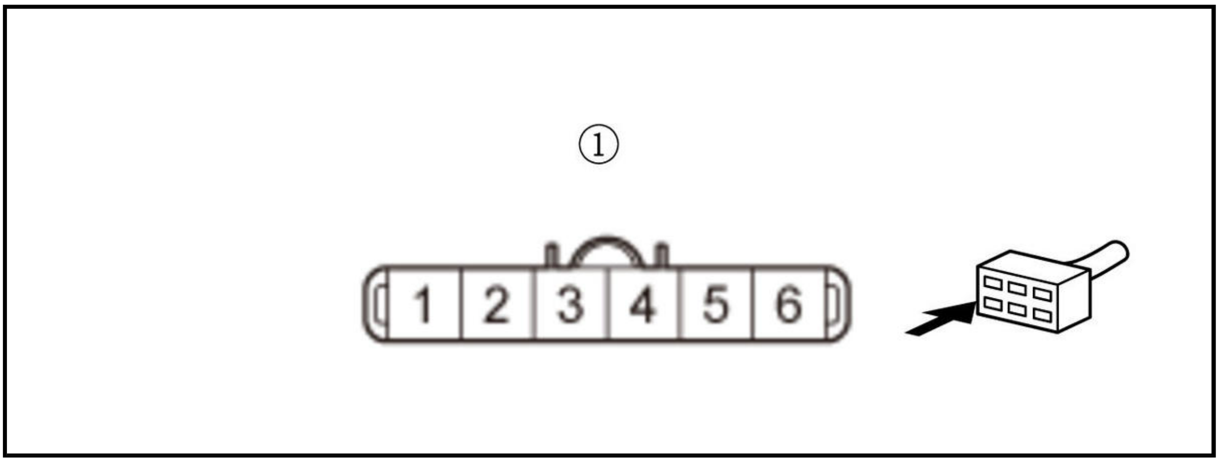
NO

Repair a short in the MTR1 wire to the MTR2 wire between the PCM (E27, E28) and the throttle body.

4. Shorted wire check (MTR1 line, MTR2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (female terminals) No. 1 and No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The MTR1 wire and the MTR2 wire are OK. Go to step 5.

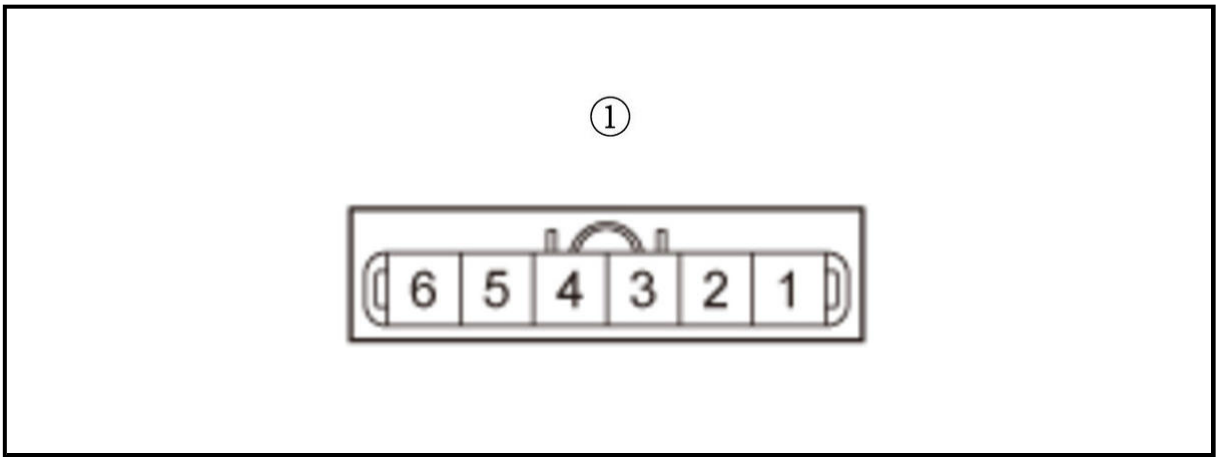
NO

Repair a short in the MTR1 wire or the MTR2 wire between the PCM (E27, E28) and the throttle body.

5. Throttle body internal circuit check (short in wires)

-1. At the throttle body side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (male terminals) No. 1 (throttle body side): ①
Test point 2	Throttle body 6P connector (male terminals) No. 2 (throttle body side): ①



Is there about 1.2 - 1.0 kΩ?

YES

Go to step 6.

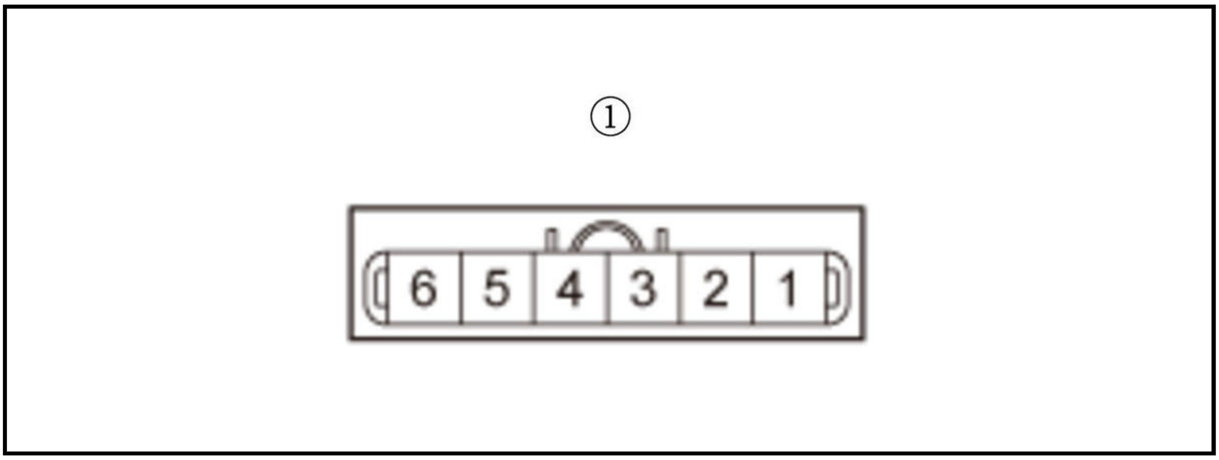
NO

Replace the throttle body .

6. Throttle body internal circuit check (short to ground)

-1. At the throttle body side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	Throttle body 6P connector (male terminals) No. 1 (throttle body side) and No. 2 (throttle body side): ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the throttle body .

DTC P2119

DTC P2119 : Throttle Actuator Control Throttle Body Range/Performance

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2119 is indicated alone, do the troubleshooting for DTC P1683 and P1684 using the on-board snapshot for P2119.
- If any of the DTCs listed below are indicated at the same time as DTC P2119, troubleshoot those DTCs first, then recheck for P2119.
-
    - -

      P1683, P1684: Throttle Valve Spring

DTC Description	Confirmed DTC	Pending DTC
P2119 Throttle Actuator Control Throttle Body Range/Performance	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P1683 Throttle Valve Default Position Spring Performance Problem	B	B
P1684 Throttle Valve Return Spring Performance Problem	B	B
P2119 Throttle Actuator Control Throttle Body Range/Performance	B	B

   Are DTC P1683 or P1684 and P2119 indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC P1683** and **DTC P1684** using the on-board snapshot for DTC P2119.

DTC P2121

DTC P2121 : APP Sensor A (TP Sensor D) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2121 APP Sensor A (TP Sensor D) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor A Voltage	Less than 0.69	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC4 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

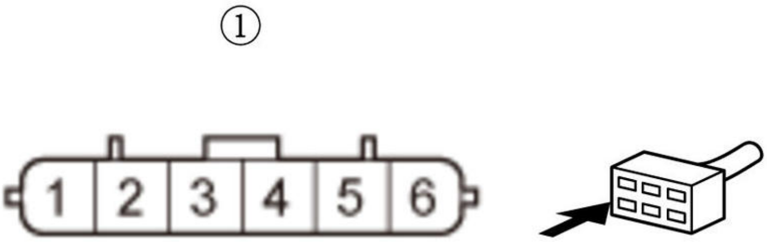
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Go to step 3.

NO

Go to step 6.

3. Shorted wire check (APS1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

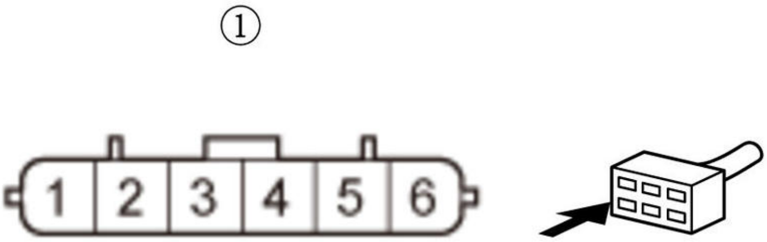
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The APS1 wire is not shorted. Go to step 4.

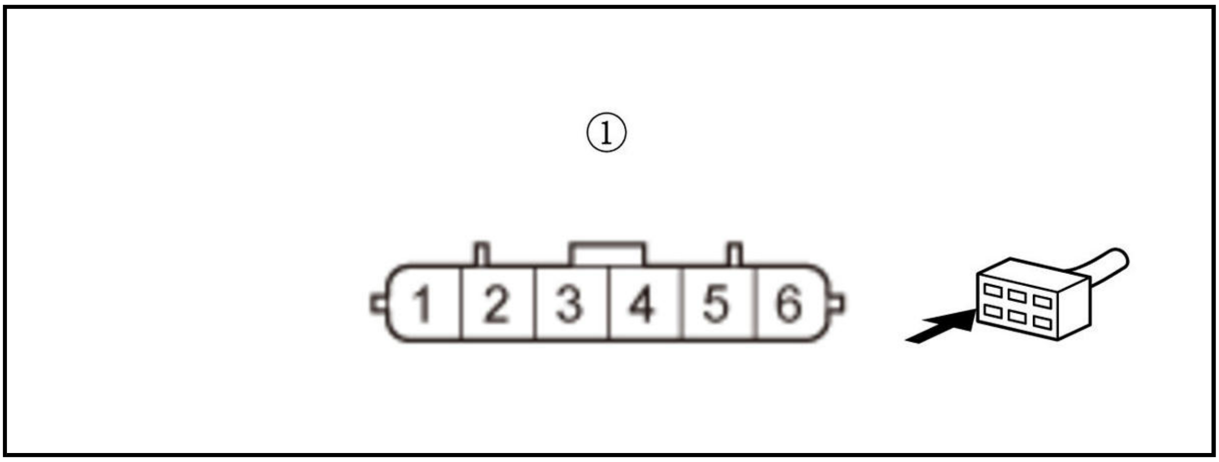
NO

Repair a short in the APS1 wire between the PCM (A32) and the APP sensor.

4. Open wire check (APS1 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 6: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 6: jumped to body ground
Test point 1	**PCM connector A (50P) No. 32**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The APS1 wire is OK. Go to step 5.

NO

Repair an open in the APS1 wire between the PCM (A32) and the APP sensor.

5. PCM internal circuit check

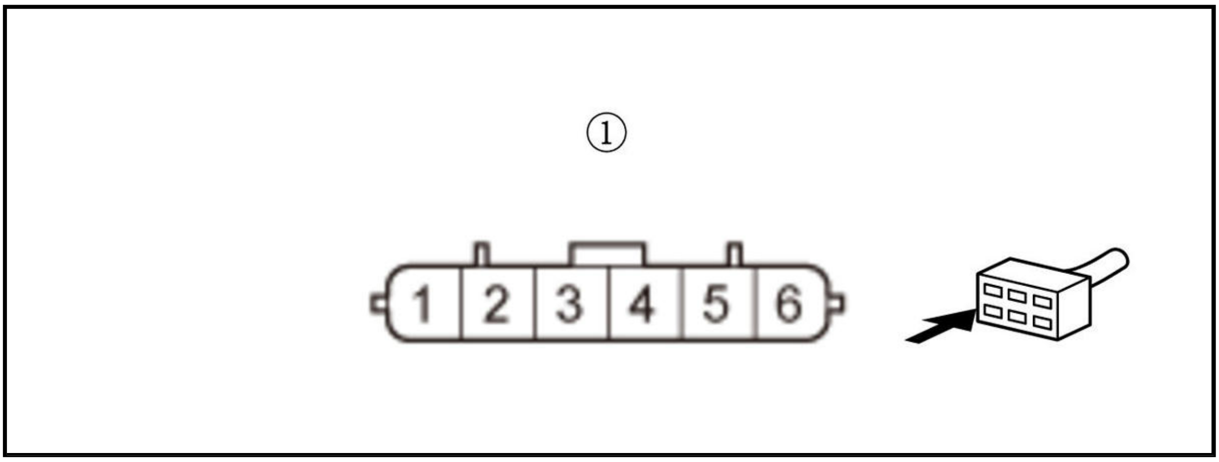
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	APP sensor 6P connector (female terminals) No. 6: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor A Voltage	Less than 0.69	V	B	B

Do the current condition(s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the accelerator pedal module .

6. Open wire check (VCC4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

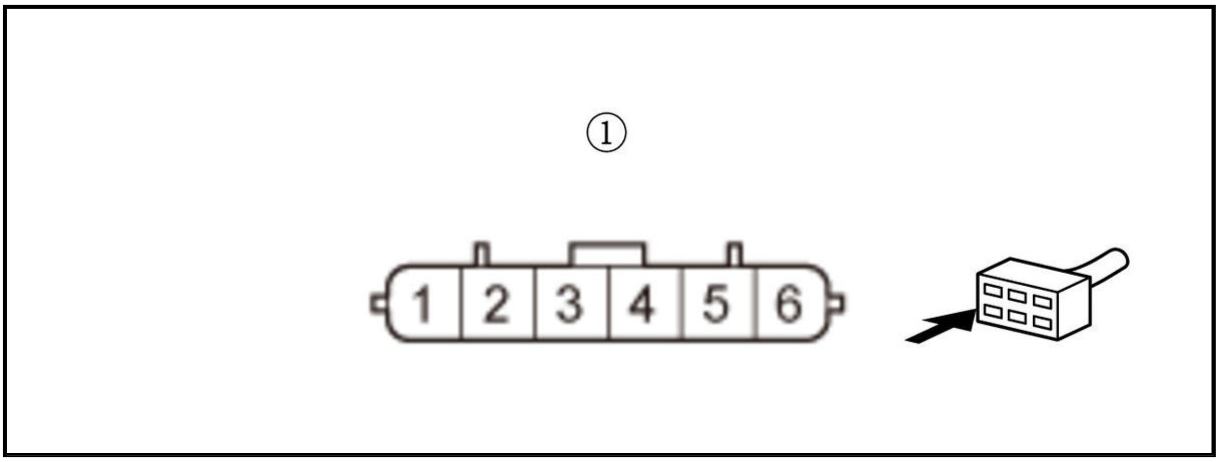
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 4: jumped to body ground
Test point 1	**PCM connector A (50P) No. 45**

Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The VCC4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC4 wire between the PCM (A45) and the APP sensor.

DTC P2122

DTC P2122 : APP Sensor A (TP Sensor D) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2122 APP Sensor A (TP Sensor D) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor A Voltage	Less than 0.2	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC4 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

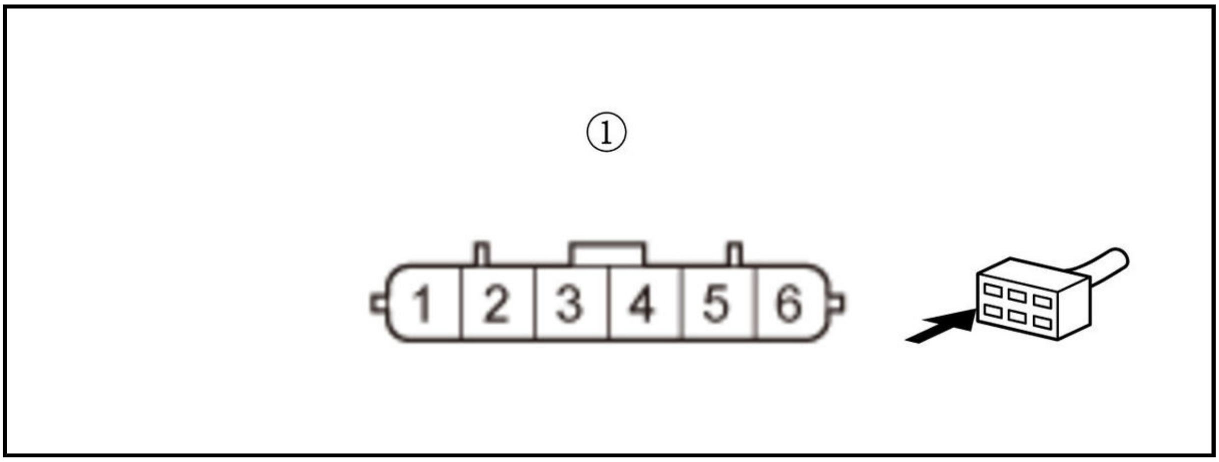
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Go to step 3.

NO

Go to step 6.

3. Shorted wire check (APS1 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

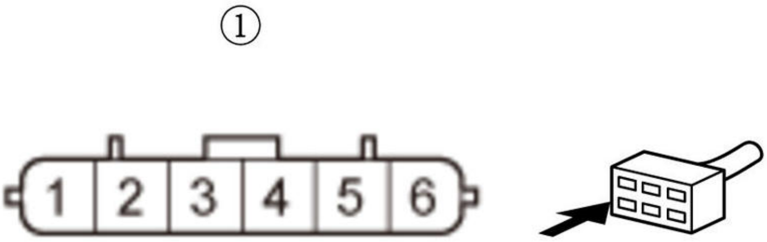
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The APS1 wire is not shorted. Go to step 4.

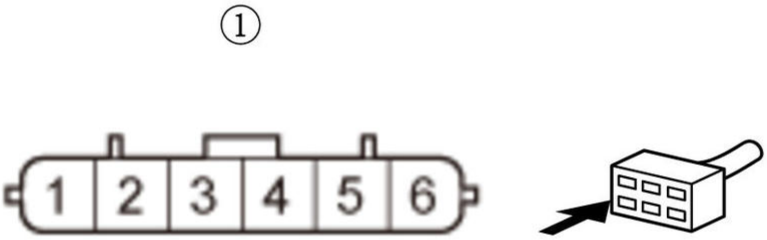
NO

Repair a short in the APS1 wire between the PCM (A32) and the APP sensor.

4. Open wire check (APS1 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 6: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 6: jumped to body ground
Test point 1	**PCM connector A (50P) No. 32**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The APS1 wire is OK. Go to step 5.

NO

Repair an open in the APS1 wire between the PCM (A32) and the APP sensor.

5. PCM internal circuit check

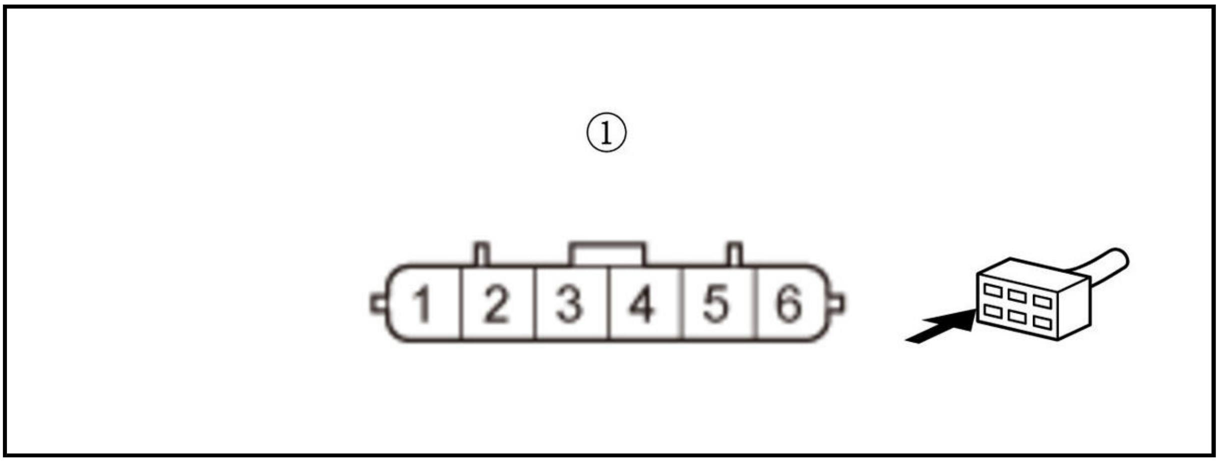
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	APP sensor 6P connector (female terminals) No. 6: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
APP Sensor A Voltage	Less than 0.2	V	B	B

Do the current condition(s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the accelerator pedal module .

6. Open wire check (VCC4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

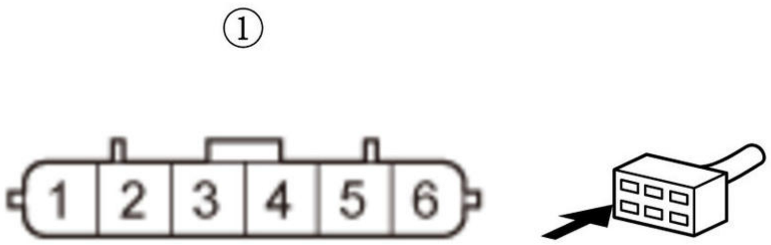
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 4: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 4: jumped to body ground
Test point 1	**PCM connector A (50P) No. 45**

Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The VCC4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC4 wire between the PCM (A45) and the APP sensor.

DTC P2123

DTC P2123 : APP Sensor A (TP Sensor D) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2123 APP Sensor A (TP Sensor D) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor A Voltage	More than 4.9	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (APP sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

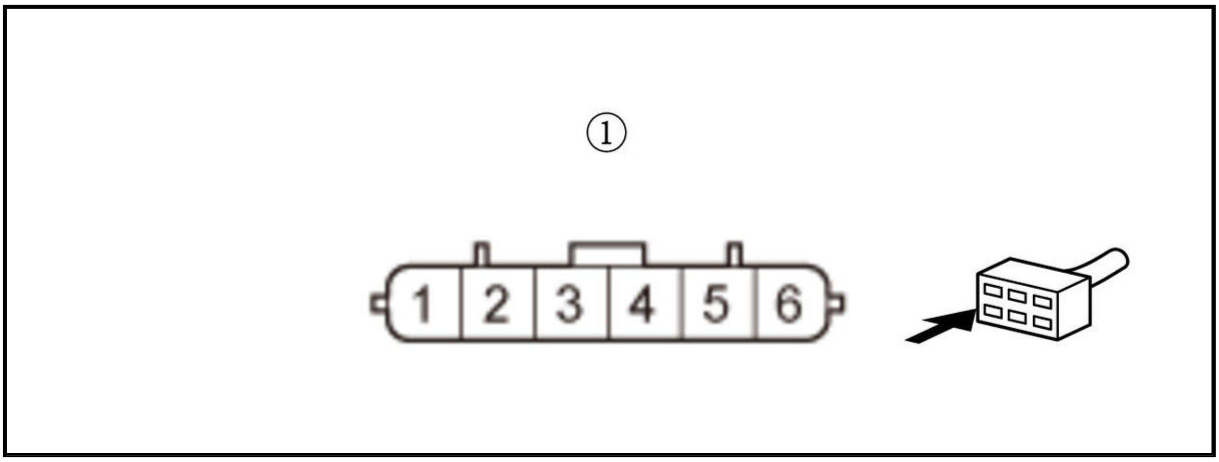
   -2. Disconnect the following connector.

APP sensor 6P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 4: ①
Test point 2	APP sensor 6P connector (female terminals) No. 5: ①



Is there about 5.0 V?

YES

Replace the accelerator pedal module .

NO

Go to step 3.

3. Open wire check (SG4 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

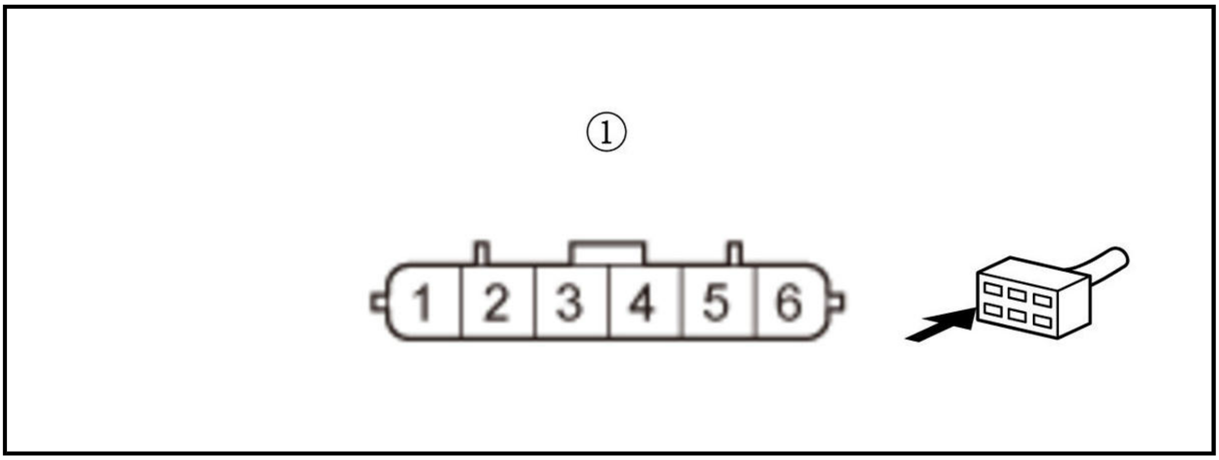
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 5: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected

B	APP sensor 6P connector No. 5: jumped to body ground
Test point 1	**PCM connector A (50P) No. 46**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SG4 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG4 wire between the PCM (A46) and the APP sensor.

DTC P2126

DTC P2126 : APP Sensor B (TP Sensor E) Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2126 APP Sensor B (TP Sensor E) Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor B Voltage	Less than 0.23	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Problem verification 2

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor B Voltage	More than 2.66	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 8.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (VCC5 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

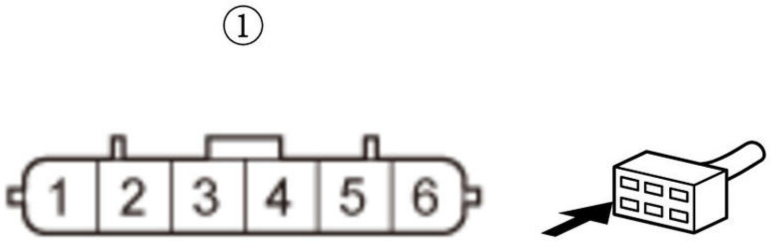
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (APS2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

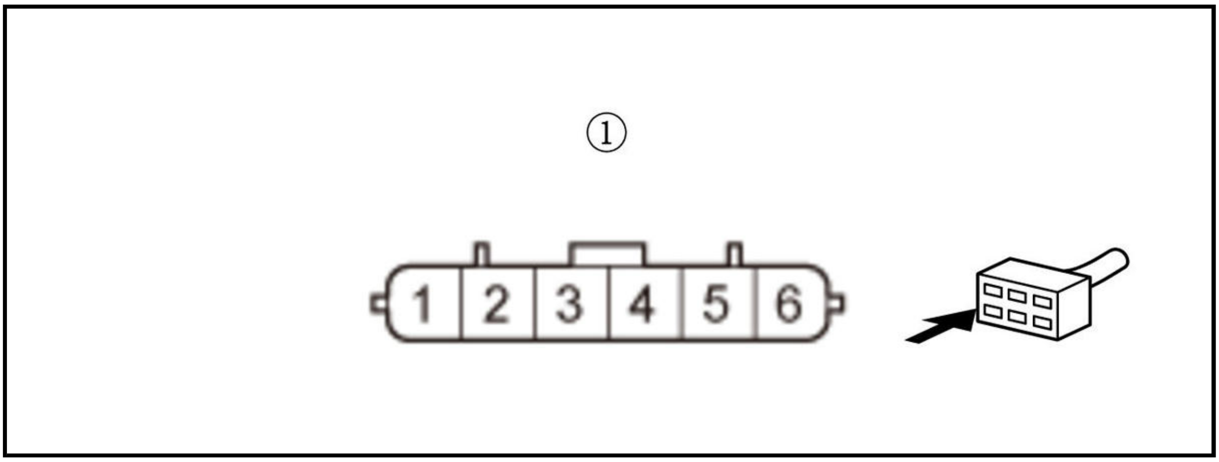
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 5.

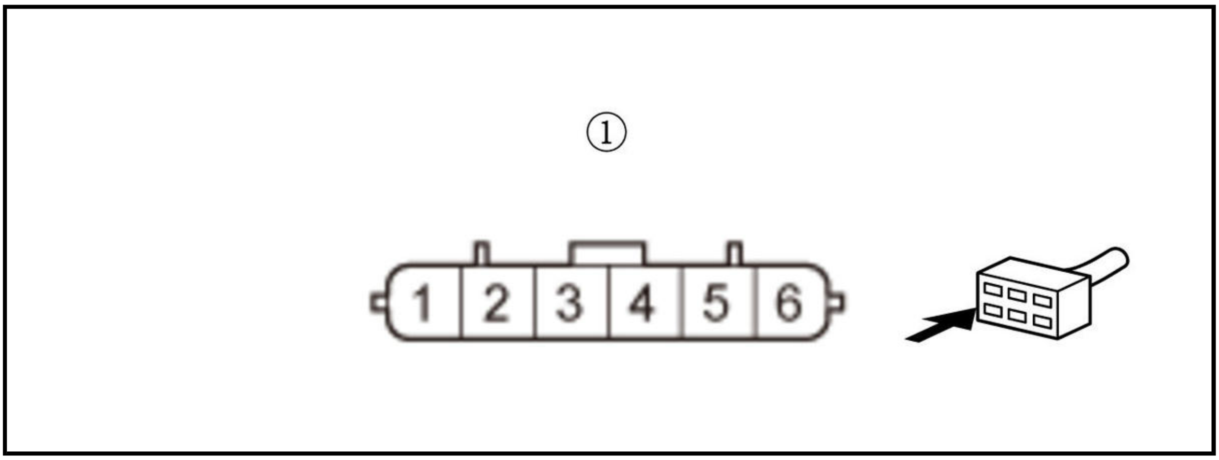
NO

Repair a short in the APS2 wire between the PCM (A34) and the APP sensor.

5. Open wire check (APS2 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 3: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 3: jumped to body ground
Test point 1	**PCM connector A (50P) No. 34**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 6.

NO

Repair an open in the APS2 wire between the PCM (A34) and the APP sensor.

6. PCM internal circuit check

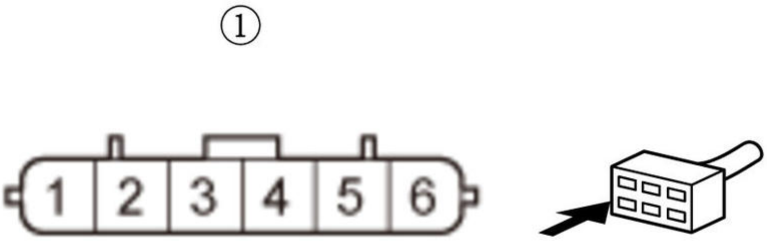
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	APP sensor 6P connector (female terminals) No. 3: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter(s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
APP Sensor B Voltage	Less than 0.23	V	B	B

Do the current condition(s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the accelerator pedal module .

7. Open wire check (VCC5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

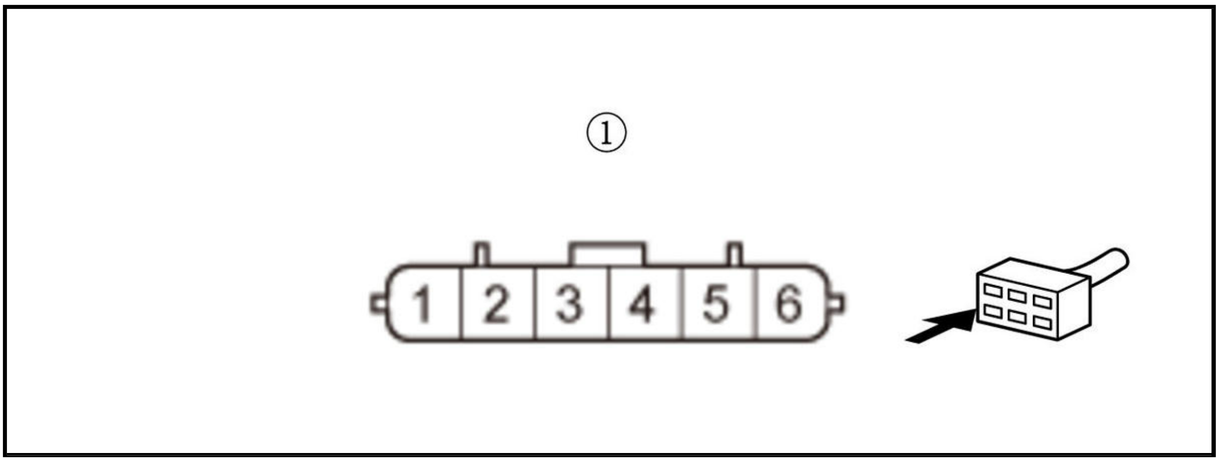
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 1: jumped to body ground
Test point 1	**PCM connector A (50P) No. 44**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The VCC5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC5 wire between the PCM (A44) and the APP sensor.

8. Determine possible failure area (APP sensor, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

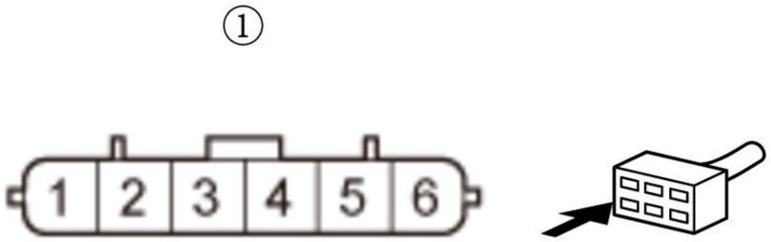
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Replace the accelerator pedal module .

NO

Go to step 9.

9. Open wire check (SG5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

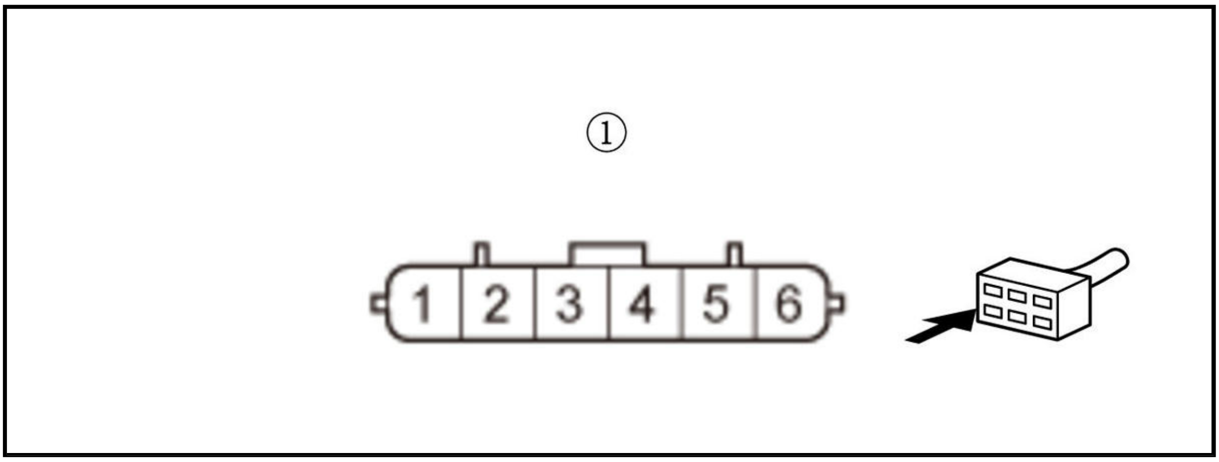
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 2: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 2: jumped to body ground
Test point 1	**PCM connector A (50P) No. 43**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SG5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG5 wire between the PCM (A43) and the APP sensor.

DTC P2127

DTC P2127 : APP Sensor B (TP Sensor E) Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2127 APP Sensor B (TP Sensor E) Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor B Voltage	Less than 0.2	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (VCC5 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

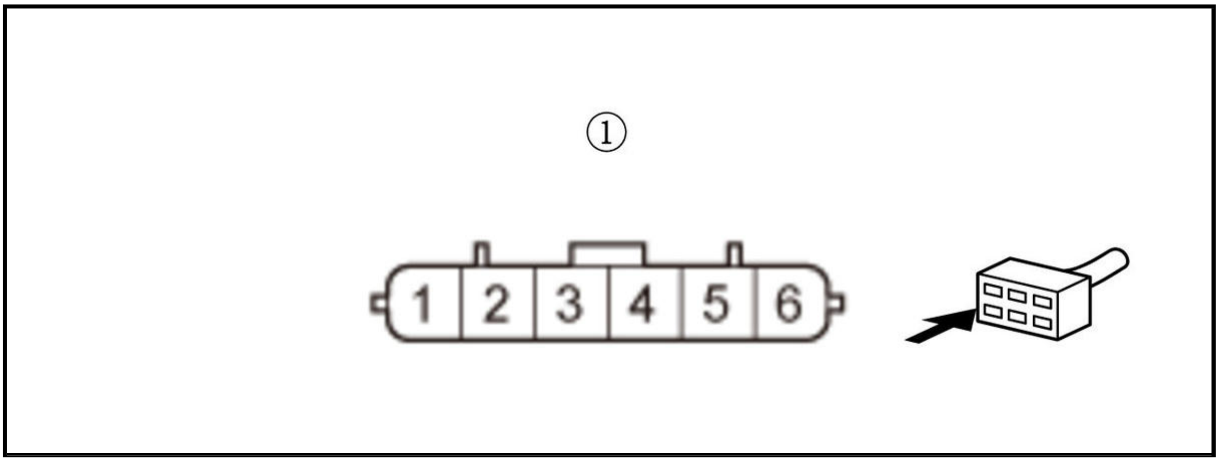
-2. Disconnect the following connector.

APP sensor 6P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Go to step 3.

NO

Go to step 6.

3. Shorted wire check (APS2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

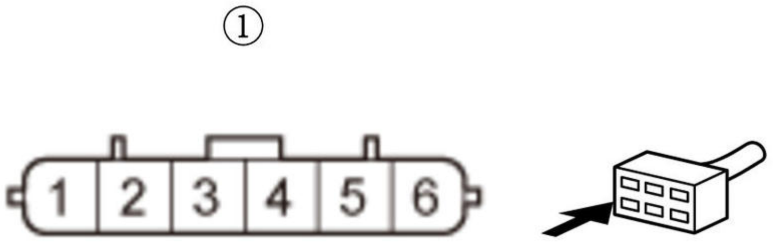
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 4.

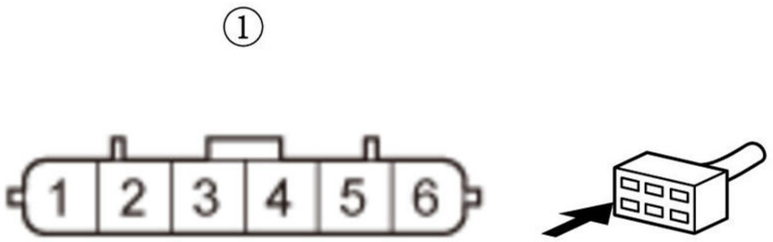
NO

Repair a short in the APS2 wire between the PCM (A34) and the APP sensor.

4. Open wire check (APS2 line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 3: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 3: jumped to body ground
Test point 1	**PCM connector A (50P) No. 34**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Go to step 5.

NO

Repair an open in the APS2 wire between the PCM (A34) and the APP sensor.

5. PCM internal circuit check

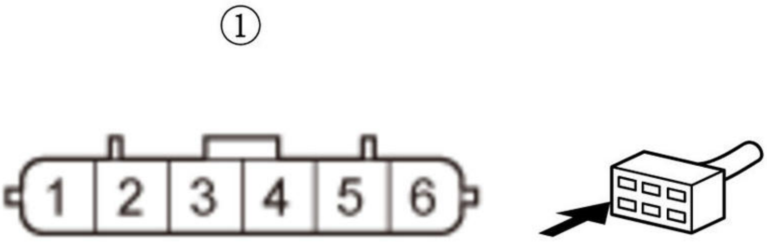
-1. Remove the jumper wire from the APP sensor 6P connector.

-2. Reconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	APP sensor 6P connector (female terminals) No. 3: ①



-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor B Voltage	Less than 0.2	V	B	B

Do the current condition(s) match the threshold?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the accelerator pedal module .

6. Open wire check (VCC5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

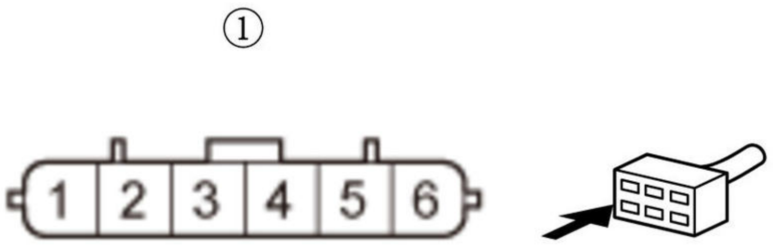
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 1: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector No. 1: jumped to body ground
Test point 1	**PCM connector A (50P) No. 44**

Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The VCC5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC5 wire between the PCM (A44) and the APP sensor.

DTC P2128

DTC P2128 : APP Sensor B (TP Sensor E) Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2128 APP Sensor B (TP Sensor E) Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
APP Sensor B Voltage	More than 4.0	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (APP sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

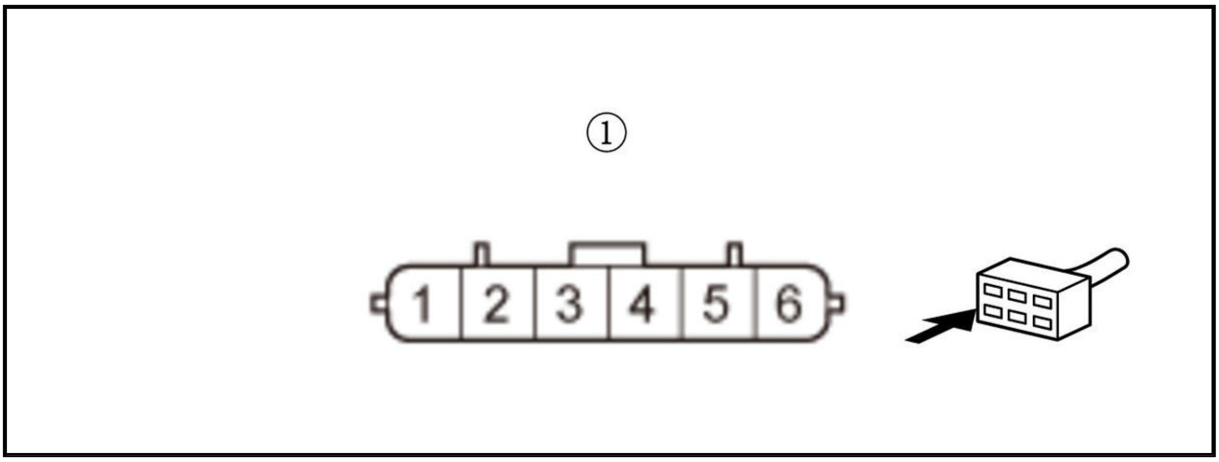
   -2. Disconnect the following connector.

APP sensor 6P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	APP sensor 6P connector: disconnected
Test point 1	APP sensor 6P connector (female terminals) No. 1: ①
Test point 2	APP sensor 6P connector (female terminals) No. 2: ①



Is there about 5.0 V?

YES

Replace the accelerator pedal module .

NO

Go to step 3.

3. Open wire check (SG5 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

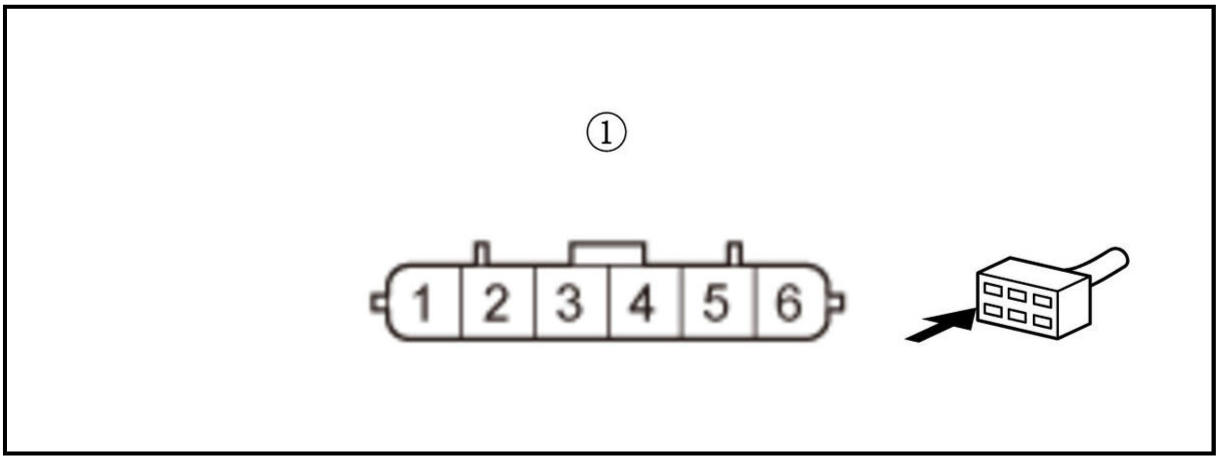
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	APP sensor 6P connector (female terminals) No. 2: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	APP sensor 6P connector: disconnected
B	PCM connector A (50P): disconnected

B	APP sensor 6P connector No. 2: jumped to body ground
Test point 1	**PCM connector A (50P) No. 43**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SG5 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG5 wire between the PCM (A43) and the APP sensor.

DTC P2135

DTC P2135 : TP Sensor A/B Incorrect Voltage Correlation

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2135 TP Sensor A/B Incorrect Voltage Correlation	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Select the ETCS (TAC) TEST in the Function Test Menu with the HDS.

   ETCS (TAC) TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2135 TP Sensor A/B Incorrect Voltage Correlation	B	B

   Is DTC P2135 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (PCM, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 50**
Test point 2	**PCM connector E (80P) No. 51**

Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Go to step 3.

3. Shorted wire check (THL1 line to THL2 line)

-1. Disconnect the following connector.

Throttle body 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
Test point 1	**PCM connector E (80P) No. 50**
Test point 2	**PCM connector E (80P) No. 51**

Is there 1 MΩ or more?

YES

The THL1 wire and the THL2 wire are OK. **Replace the throttle body** .

NO

Repair a short in the THL1 wire to the THL2 wire between the PCM (E50, E51) and the throttle body.

DTC P2138

DTC P2138 : APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2138 APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Press the accelerator pedal to the floor.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2138 APP Sensor A/B (TP Sensor D/E) Incorrect Voltage Correlation	B	B

   Is DTC P2138 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the APP sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (APP sensor, others)

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
APP Sensor A Voltage	B	B
APP Sensor B Voltage	B	B

   Are they the same voltage?

   YES

   Go to step 3.

   NO

   Replace the accelerator pedal module .

3. Determine possible failure area (PCM, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector A (50P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 32**
Test point 2	**PCM connector A (50P) No. 34**

Is there 1 MΩ or more?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Go to step 4.

4. Shorted wire check (APS1 line to APS2 line)

-1. Disconnect the following connector.

APP sensor 6P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
B	APP sensor 6P connector: disconnected
Test point 1	**PCM connector A (50P) No. 32**
Test point 2	**PCM connector A (50P) No. 34**

Is there 1 MΩ or more?

YES

The APS1 wire and the APS2 wire are OK. **Replace the accelerator pedal module** .

NO

Repair a short in the APS1 wire to the APS2 wire between the PCM (A32, A34) and the APP sensor.

DTC P2175 (2021)

DTC P2175 : Throttle Actuator Control System Low Air Flow Detected

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2175 Throttle Actuator Control System Low Air Flow Detected	B	B

DTC (PGM-FI)

1. PGM-FI system check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any Pending or Confirmed DTCs other than P2175 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Intake air duct visual check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check for poor connection or blockage at the intake air duct.

   Is it OK?

   YES

   Go to step 3.

   NO

   Reconnect or repair the intake air duct, or **replace it if needed** .

3. Air cleaner housing visual check

   -1. **Check for poor connection or blockage at the air cleaner housing** .

   Is it OK?

   YES

   Go to step 4.

   NO

   Replace the air cleaner housing .

4. Air cleaner element visual check

   -1. **Check for dirt or debris on the air cleaner element** .

   Is it dirty?

   YES

   Replace the air cleaner element .

   NO

   Go to step 5.

5. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Leave the vehicle to cool the engine.

Signal	Current conditions	
	Values	**Unit**
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-5. Monitor the OBD STATUS for DTC P2175 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2175 Throttle Actuator Control System Low Air Flow Detected	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body, the MAF sensor/IAT sensor 1, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-2 and recheck.

6. Throttle body test

-1. Select the ETCS (TAC) TEST in the Function Test with the HDS.

ETCS (TAC) TEST

Is the throttle actuator control valve normal?

YES

Go to step 7.

NO

Replace the throttle body .

7. Throttle body visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the air cleaner** .

-3. Check for dirt, carbon, or damage in the throttle bore.

Is there dirt, carbon, or damage in the throttle bore?

YES

If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

NO

The throttle body is OK. Go to step 8.

8. MAP sensor performance check

-1. Note the value of MAP Sensor (Hi Res) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

-2. **Enter the maintenance mode, then start the engine** , and let it idle.

-3. Check the MAP Sensor (Hi Res) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
MAP Sensor (Hi Res)	B	B

Does the MAP Sensor (Hi Res) change 0.67 kPa (0.2 inHg, 5 mmHg) or more?

YES

Go to step 9.

NO

Replace the MAP sensor .

9. MAF sensor performance check

-1. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-2. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor	7.5-10.5	g/s	B	B

Do the current condition(s) match the threshold?

YES

The MAF sensor is OK. Go to step 10.

NO

Replace MAF sensor/IAT sensor 1 .

10. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of the IAT Sensor (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1)	B	B

-6. Compare the value of the IAT Sensor (1) with the ambient temperature.

Does the value of the IAT Sensor (1) differ 5.4 deg.F (3 deg.C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P2176

DTC P2176 : Throttle Actuator Control System Idle Position Not Learned

WARNING: **Do not insert your fingers into the installed throttle body when you turn the vehicle to the ON mode, or while the vehicle is in ON mode. If you do, you will seriously injure your fingers if the throttle valve is activated.**

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2135 is stored at the same time as DTC P2176, troubleshoot DTC P2135 first, then recheck for DTC P2176.

DTC Description	Confirmed DTC	Pending DTC
P2176 Throttle Actuator Control System Idle Position Not Learned	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, and wait 10 seconds.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2176 Throttle Actuator Control System Idle Position Not Learned	B	B

Is DTC P2176 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the throttle body and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Throttle body operation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the air cleaner** .

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTC with the HDS.

   -5. Visually check the throttle valve operation while doing the ETCS (TAC) TEST in the Function Test Menu with the HDS.

   ETCS (TAC) TEST

   Does the throttle valve move to its fully closed position?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Throttle body condition check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Remove the throttle body** .

   -3. Check for sludge or carbon on the throttle valve.

   Is there sludge or carbon on the throttle valve?

   YES

   Clean the throttle body .

   NO

   Replace the throttle body .

4. Open wire check (MTR1 line, MTR2 line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

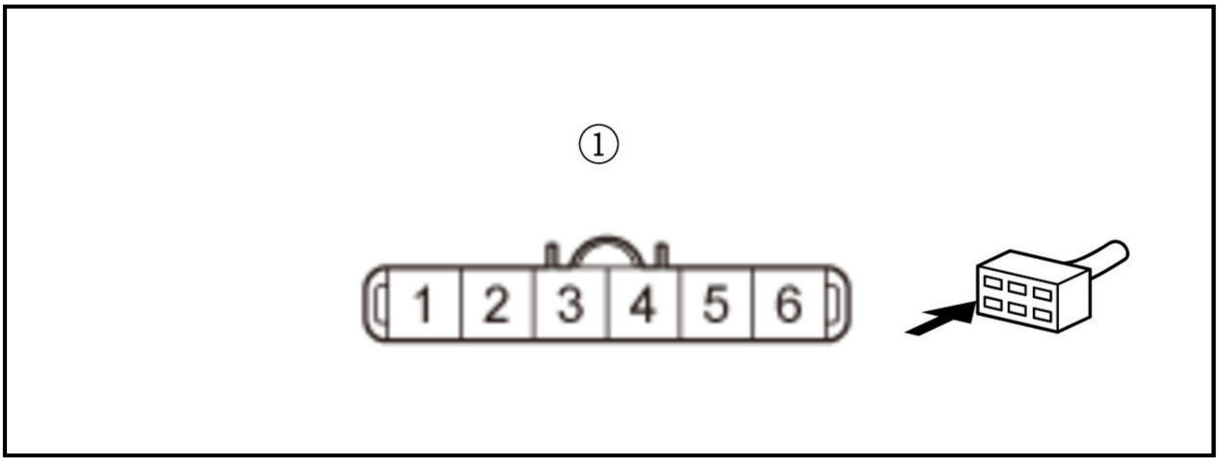
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector E (80P)
Throttle body 6P connector

-4. Connect terminals A and B with a jumper wire.

Terminal A	Throttle body 6P connector (female terminals) No. 1: ①
Terminal B	Throttle body 6P connector (female terminals) No. 2: ①



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	Throttle body 6P connector: disconnected
B	Throttle body 6P connector No. 1 and No. 2: jumped
Test point 1	**PCM connector E (80P) No. 27**
Test point 2	**PCM connector E (80P) No. 28**

Is there 1.0 Ω or less?

1. **YES**

   The MTR1 wire and the MTR2 wire are OK. **Substitute a known-good throttle body** , then recheck:

   - If DTC P2176 is not indicated, **replace the original throttle body** .
   - If DTC P2176 is indicated again, **replace the PCM** .

   NO

   Repair an open in the MTR1 wire and/or the MTR2 wire between the PCM (E27, E28) and the throttle body.

DTC P2182

DTC P2182 : ECT Sensor 2 Out of Range

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2182 ECT Sensor 2 Out of Range	B	B

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT Sensor 2 Voltage	Less than 0.14	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (ECT sensor 2, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

ECT Sensor 2 2P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
ECT Sensor 2 Voltage	Less than 0.14	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 2 .

3. Shorted wire check (TW2/TW2_SENSOR line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

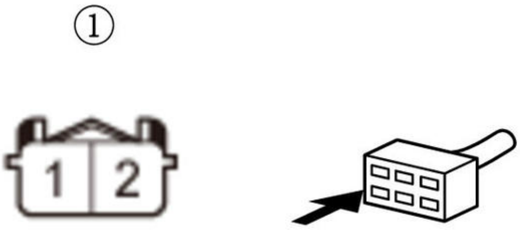
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT Sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The TW2/TW2_SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the TW2/TW2_SENSOR wire between the PCM (E54) and ECT sensor 2.

DTC P2183

DTC P2183 : ECT Sensor 2 Circuit Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0111 is stored at the same time as DTC P2183, troubleshoot DTC P0111 first, then recheck for DTC P2183.

DTC Description	Confirmed DTC	Pending DTC
P2183 ECT Sensor 2 Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals and terminals at these sensors:

   - ECT sensor 1
   - ECT sensor 2

   Are the connections and terminals OK?

YES

Go to step 2.

NO

Repair the connections or terminals.

2. PGM-FI system check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P011A ECT Sensor 1 Circuit Range/Performance Problem	B	B
P2183 ECT Sensor 2 Circuit Range/Performance Problem	B	B

Are DTC P011A and P2183 indicated at the same time?

YES

Go to step 5.

NO

Go to step 3.

3. ECT sensor 2 performance check

-1. **Enter the maintenance mode, then start the engine** , and let it idle for 10 minutes.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 2	Less than 49	deg.C	B	B
	Less than 120	deg.F		

Do the current condition(s) match the threshold?

YES

Replace ECT sensor 2 .

NO

Go to step 4.

4. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow ECT sensor 2 to cool to the ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of ECT Sensor 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT Sensor 2	B	B

Does the value of ECT Sensor 2 differ 5.4 deg.F (3 deg.C) or more from the ambient temperature?

YES

The failure is duplicated. **Replace ECT sensor 2** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

5. ECT sensor 1 performance check

-1. **Enter the maintenance mode, then start the engine** , and let it idle for 10 minutes.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 1	Less than 49	deg.C	B	B
	Less than 120	deg.F		

Do the current condition(s) match the threshold?

YES

Replace ECT sensor 1 .

NO

ECT sensor 1 is OK at this time. Go to step 6.

6. ECT sensor 2 performance check

-1. Let the engine idle for 10 minutes.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 2	Less than 49	deg.C	B	B
	Less than 120	deg.F		

Do the current condition(s) match the threshold?

YES

Replace ECT sensor 2 .

NO

Go to step 7.

7. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the sensors to cool to the ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of ECT Sensor 1 and ECT Sensor 2 in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B
ECT Sensor 2	B	B

-6. Compare the value of ECT Sensor 1 to the ambient temperature, and the value of ECT Sensor 2 to the ambient temperature individually.

Does either sensor differ more than 5.4 deg.F (3 deg.C) from the ambient temperature?

YES

Replace the sensor that differed more than 5.4 deg.F (3 deg.C) from the ambient temperature.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2184

DTC P2184 : ECT Sensor 2 Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2184 ECT Sensor 2 Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 2 Voltage	Less than 0.08	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (ECT sensor 2, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT Sensor 2 2P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 2 Voltage	Less than 0.08	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 2 .

3. Shorted wire check (TW2/TW2_SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

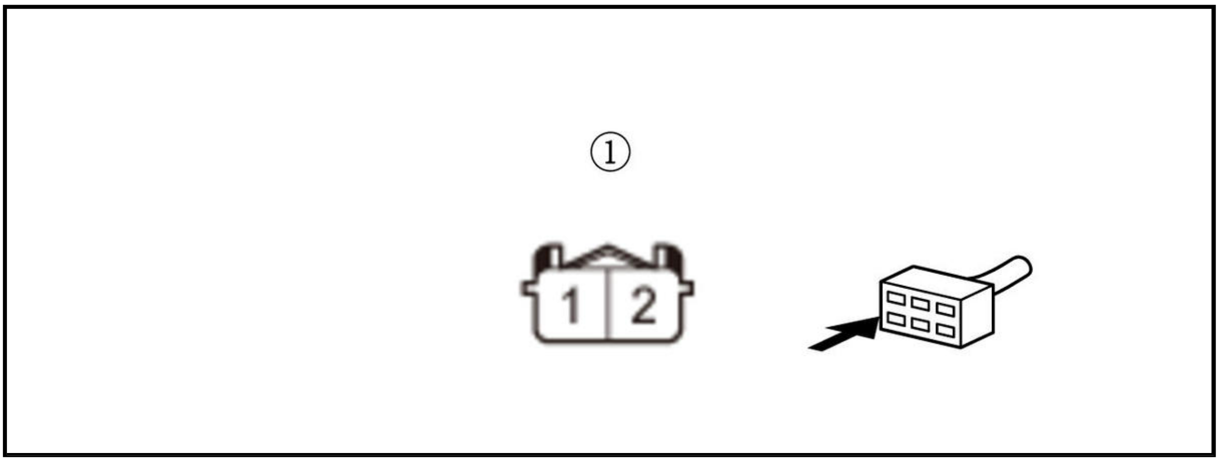
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT Sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The TW2/TW2_SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the TW2/TW2_SENSOR wire between the PCM (E54) and ECT sensor 2.

DTC P2185

DTC P2185 : ECT Sensor 2 Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2185 ECT Sensor 2 Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
ECT Sensor 2 Voltage	More than 4.92	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at ECT sensor 2 and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine of possible failure area (ECT sensor 2, others)

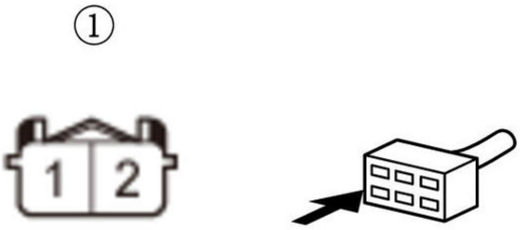
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

ECT sensor 2 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	ECT sensor 2 2P connector (female terminals) No. 1: ①
Terminal B	ECT sensor 2 2P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
ECT Sensor 2 Voltage	More than 4.92	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Replace ECT sensor 2 .

3. Determine possible failure area (TW2/TW2_SENSOR line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

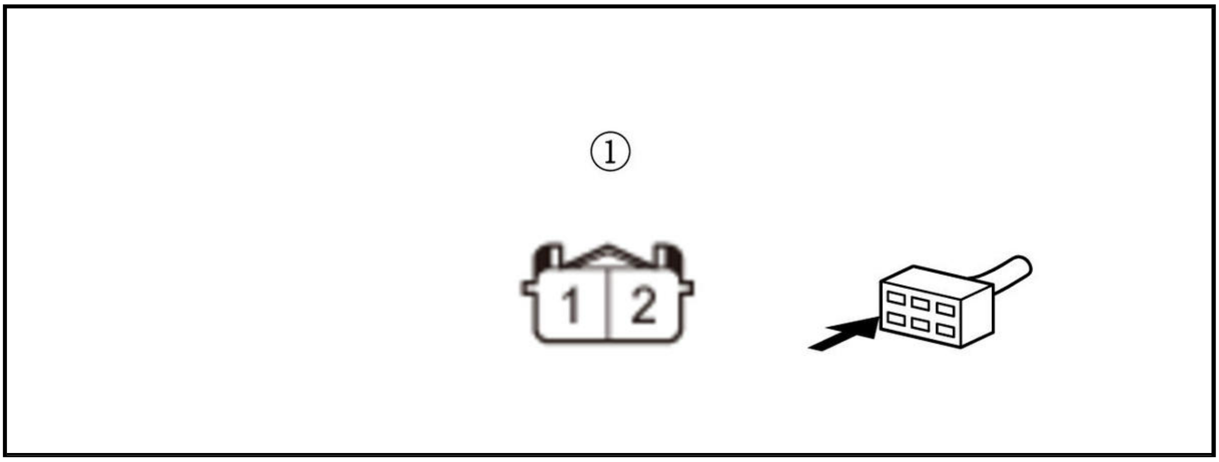
-2. Remove the jumper wire from the ECT sensor 2 2P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	ECT sensor 2 2P connector: disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①

Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 5.

4. Open wire check (SG6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

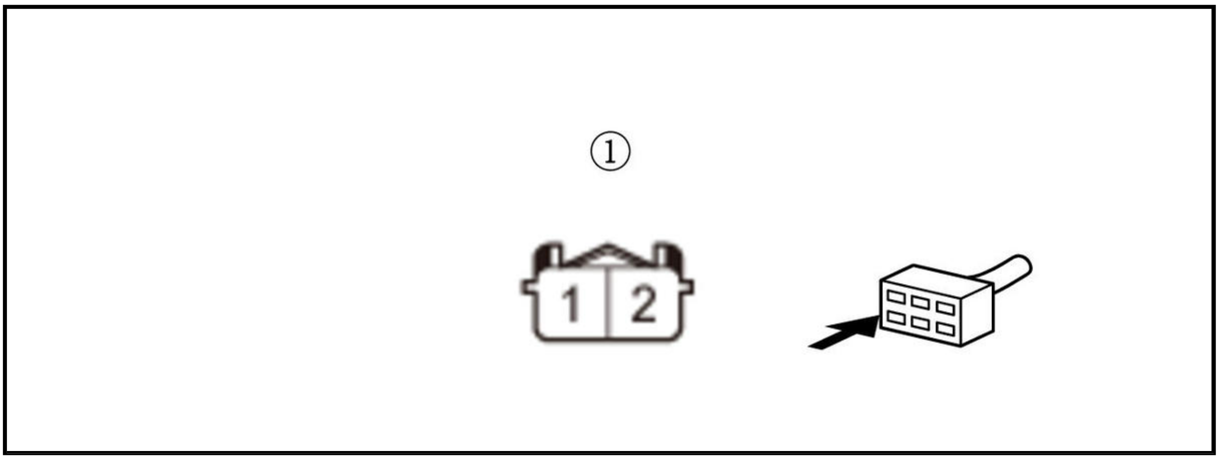
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 45**



Is there 1.0 Ω or less?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and ECT sensor 2.

5. Open wire check (TW2/TW2_SENSOR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

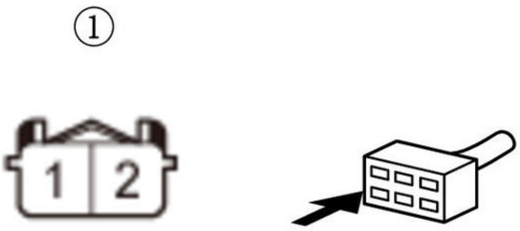
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	ECT sensor 2 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	ECT sensor 2 2P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 54**



Is there 1.0 Ω or less?

YES

The TW2/TW2_SENSOR wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the TW2/TW2_SENSOR wire between the PCM (E54) and ECT sensor 2.

DTC P2195

DTC P2195 : A/F Sensor (Sensor 1) Signal Stuck Lean

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the vehicle was out of fuel and the engine stalled before this DTC was stored, refuel, then clear the DTC with the HDS.
- If DTC P2101, P2118, P2135, P2138, P2176, or a combination of P2122 and P2127, P2122 and P2138 or P2127 and P2138 is stored at the same time as DTC P2195, troubleshoot those DTCs first, then recheck for DTC P2195.

DTC Description	Confirmed DTC	Pending DTC
P2195 A/F Sensor (Sensor 1) Signal Stuck Lean	B	B

DTC (PGM-FI)

1. MAF sensor/IAT sensor 1 visual check

   -1. **Remove MAF sensor/IAT sensor 1** .

   -2. Check for dirt or debris in MAF sensor/IAT sensor 1.

   Is it dirty?

   YES

   Remove the debris. If needed, **replace MAF sensor/IAT sensor 1** .

   NO

   Go to step 2.

2. A/F sensor (Sensor 1) installation check

   -1. Check the installation of the A/F sensor (Sensor 1).

   Is the A/F sensor loose or disconnected from the TWC?

   YES

   Reinstall the A/F sensor (Sensor 1) .

   NO

   Go to step 3.

3. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2195 A/F Sensor (Sensor 1) Signal Stuck Lean	B	B

   Is DTC P2195 indicated?

YES

Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2199

DTC P2199 : IAT Sensor 1-2 Incorrect Correlation

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2199 IAT Sensor1-2 Incorrect Correlation	B	B

DTC (PGM-FI)

1. Connector visual check:

   Check for poor connections or loose terminals of these connectors.

   - ECT sensor 1
   - ECT sensor 2
   - MAF sensor/IAT sensor 1
   - IAT sensor 2

   Are the connection and terminals OK?

   YES

   Replace IAT sensor 2 .

   NO

   Repair the connections or terminals, then recheck.

DTC P219C, P219D, P219E, P219F

DTC P219C : No. 1 Cylinder Air-Fuel Ratio Variation

DTC P219D : No. 2 Cylinder Air-Fuel Ratio Variation

DTC P219E : No. 3 Cylinder Air-Fuel Ratio Variation

DTC P219F : No. 4 Cylinder Air-Fuel Ratio Variation

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If any of the DTCs listed below are indicated at the same time as DTC P219C, P219D, P219E, and/or P219F, troubleshoot those DTCs first, then recheck for P219C, P219D, P219E, and/or P219F.

  P0130, P0133, P2195, P2237, P2238, P2243, P2245, P2251, P2252, P2A00: A/F sensor (Sensor 1)

P0134, P0135: A/F sensor (Sensor 1) heater

P0201, P0202, P0203, P0204: No. 1-No. 4 cylinder injector(s)

P0300: Random misfire

P0301, P0302, P0303, P0304: No. 1-No. 4 cylinder misfire

P0351, P0352, P0353, P0354: No. 1-No. 4 cylinder ignition coil(s)

DTC Description	Confirmed DTC	Pending DTC
P219C No. 1 Cylinder Air-Fuel Ratio Variation	B	B
P219D No. 2 Cylinder Air-Fuel Ratio Variation	B	B
P219E No. 3 Cylinder Air-Fuel Ratio Variation	B	B
P219F No. 4 Cylinder Air-Fuel Ratio Variation	B	B

DTC (PGM-FI)

1. Problem verification 1 (HDS parameter)

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Fuel factor study valve of No1 cylinder	0.83-1.15	B	B	B
Fuel factor study valve of No2 cylinder	0.83-1.15	B	B	B
Fuel factor study valve of No3 cylinder	0.83-1.15	B	B	B
Fuel factor study valve of No4 cylinder	0.83-1.15	B	B	B

NOTE: If the value of Fuel factor study valve is above the threshold, the PCM may detect an over-lean failure. If the value of Fuel factor study valve is below the threshold, the PCM may detect an over-rich failure.

Do the current condition(s) match the threshold?

YES

Go to step 2.

NO

The failure is duplicated. Go to step 4.

2. On-board snapshot check:

   Check the recorded on-board snapshot parameter(s) with the HDS.

   - Fuel factor study valve of No1 cylinder
   - Fuel factor study valve of No2 cylinder
   - Fuel factor study valve of No3 cylinder
   - Fuel factor study valve of No4 cylinder

Do the parameter(s) of the recorded on-board snapshot match the threshold shown in step1-2?

YES

Go to step 3.

NO

The failure is duplicated. Go to step 4.

3. Problem verification 2

-1. **Enter the maintenance mode, then start the engine** .

-2. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Test-drive the vehicle under these conditions:

- Engine coolant temperature (ECT SENSOR 1) above 158 deg.F (70 deg.C)
- Transmission in D
- Drive at a steady engine speed between 1, 000-1, 200 rpm, then accelerate up to 3, 400 rpm at about 10-15 seconds, and repeat this 3 times or more if needed

Signal	**Current conditions**	
	Values	**Unit**
ECT Sensor 1	B	B
Engine Speed	B	B

-4. Check the parameter(s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
Fuel factor study valve of No1 cylinder	0.83-1.15	B	B	B
Fuel factor study valve of No2 cylinder	0.83-1.15	B	B	B
Fuel factor study valve of No3 cylinder	0.83-1.15	B	B	B
Fuel factor study valve of No4 cylinder	0.83-1.15	B	B	B

Do the current condition(s) match the threshold?

YES

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same condition with the on-board snapshot** .

NO

Go to step 4.

4. Engine compression check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Do the cylinder compression test** .

Is there a cylinder with lower compression than the other cylinders?

YES

Repair the engine compression problem.

NO

Go to step 5.

5. Valve clearance check

-1. **Inspect the valve clearance** .

Is the valve clearance OK?

YES

Go to step 6.

NO

Adjust the valve clearance .

6. Injector check

-1. **Exchange the injector from the problem cylinder with one from another cylinder** .

-2. **Enter the maintenance mode, then start the engine** .

-3. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

Check under these conditions:

- A/C off
- All electrical loads off

-5. Do the CYLINDER A/F TEST three times in the Function Test Menu with the HDS.

CYLINDER A/F TEST

Is an injector failure indicated at the cylinder where the injector was exchanged?

YES

Replace the problem injector .

NO

Go to step 7.

7. Intake and exhaust manifold visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for carbon build-up in the intake manifold and the exhaust manifold.

Is there carbon build-up in the intake manifold and/or exhaust manifold?

YES

Check the engine for oil leaks. If needed, repair the engine, also remove the carbon.

NO

Intermittent failure, the system is OK at this time. Check the engine for oil leaks.

DTC P2226

DTC P2226 : BARO Sensor Circuit Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2226 BARO Sensor Circuit Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait 2 seconds or more.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2226 BARO Sensor Circuit Malfunction	B	B

Is DTC P2226 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2228

DTC P2228 : BARO Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2228 BARO Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Baro Sensor	Less than 371	mmHg	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2229

DTC P2229 : BARO Sensor Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2229 BARO Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Baro Sensor	More than 855	mmHg	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2237

DTC P2237 : A/F Sensor (Sensor 1) IP Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2237 A/F Sensor (Sensor 1) IP Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2237 A/F Sensor (Sensor 1) IP Circuit High Voltage	B	B

   Is DTC P2237 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (IP line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

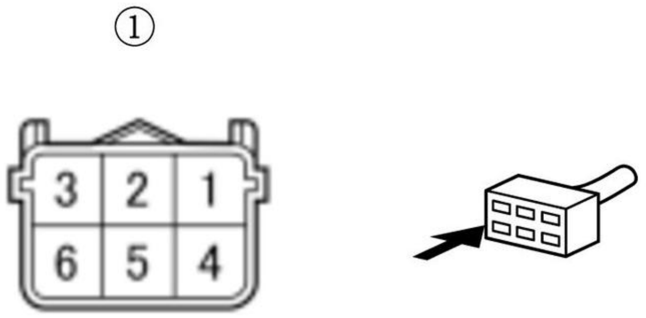
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 48**



Is there 1.0 Ω or less?

YES

Go to step 3.

NO

Repair an open in the IP wire between the PCM (E48) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

PCM connector E (80P)

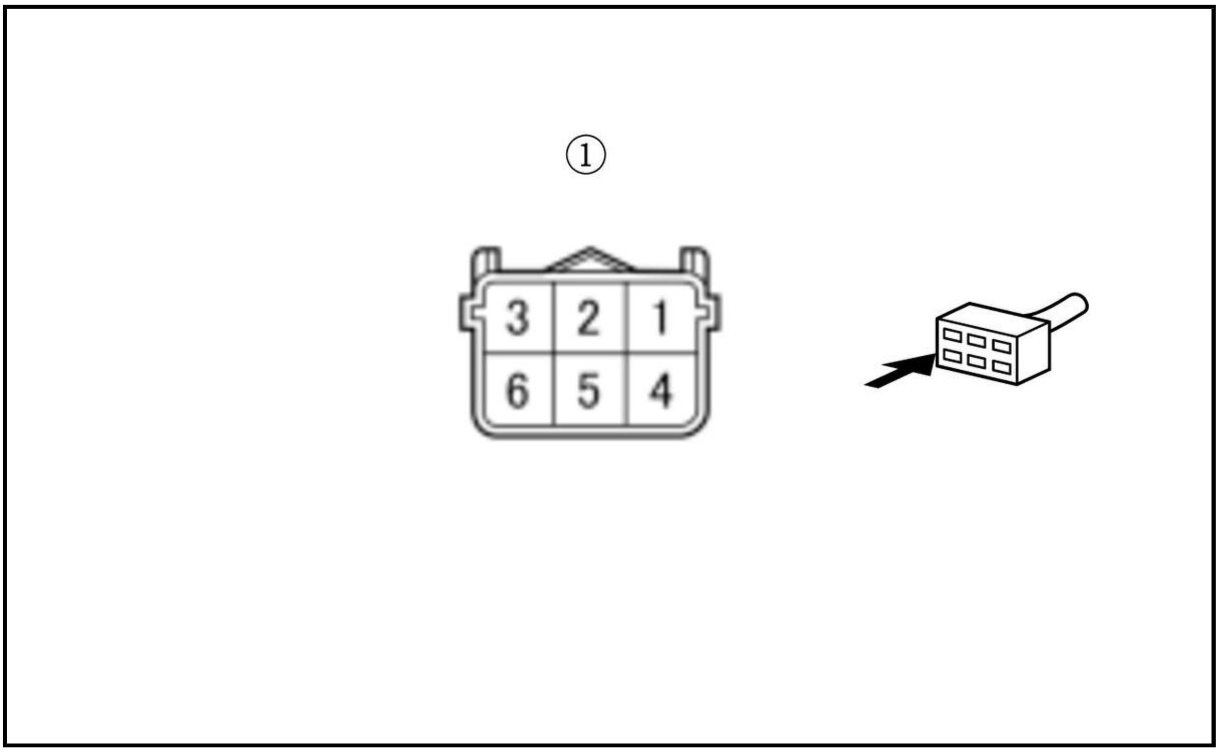
-2. Exit the SCS mode with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Measure the voltage between test points 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 5: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2238

DTC P2238 : A/F Sensor (Sensor 1) IP Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2238 A/F Sensor (Sensor 1) IP Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2238 A/F Sensor (Sensor 1) IP Circuit Low Voltage	B	B

Is DTC P2238 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (IP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	**PCM connector E (80P) No. 48**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 3.

NO

Repair a short in the IP wire between the PCM (E48) and the A/F sensor (Sensor 1).

3. A/F sensor (Sensor 1) check

-1. **Substitute a known-good A/F sensor (Sensor 1)** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. **Reset the PCM with the HDS** .

Reset PCM

-6. **Enter the maintenance mode, then start the engine** .

-7. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2238 A/F Sensor (Sensor 1) IP Circuit Low Voltage	B	B

Is DTC P2238 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original A/F sensor (Sensor 1) .

DTC P2243

DTC P2243 : A/F Sensor (Sensor 1) VCENT Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2243 A/F Sensor (Sensor 1) VCENT Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2243 A/F Sensor (Sensor 1) VCENT Circuit High Voltage	B	B

Is DTC P2243 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (VCENT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

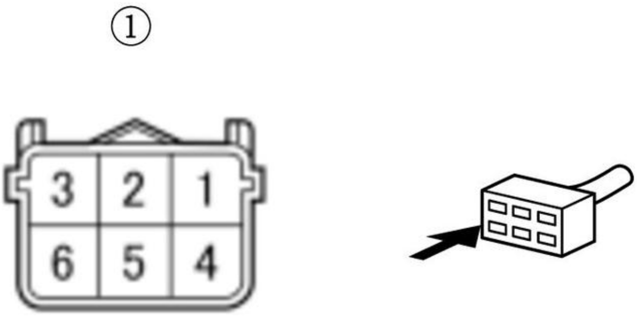
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 6: ①
Test point 2	**PCM connector E (80P) No. 74**



Is there 1.0 Ω or less?

YES

Go to step 3.

NO

Repair an open in the VCENT wire between the PCM (E74) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

PCM connector E (80P)

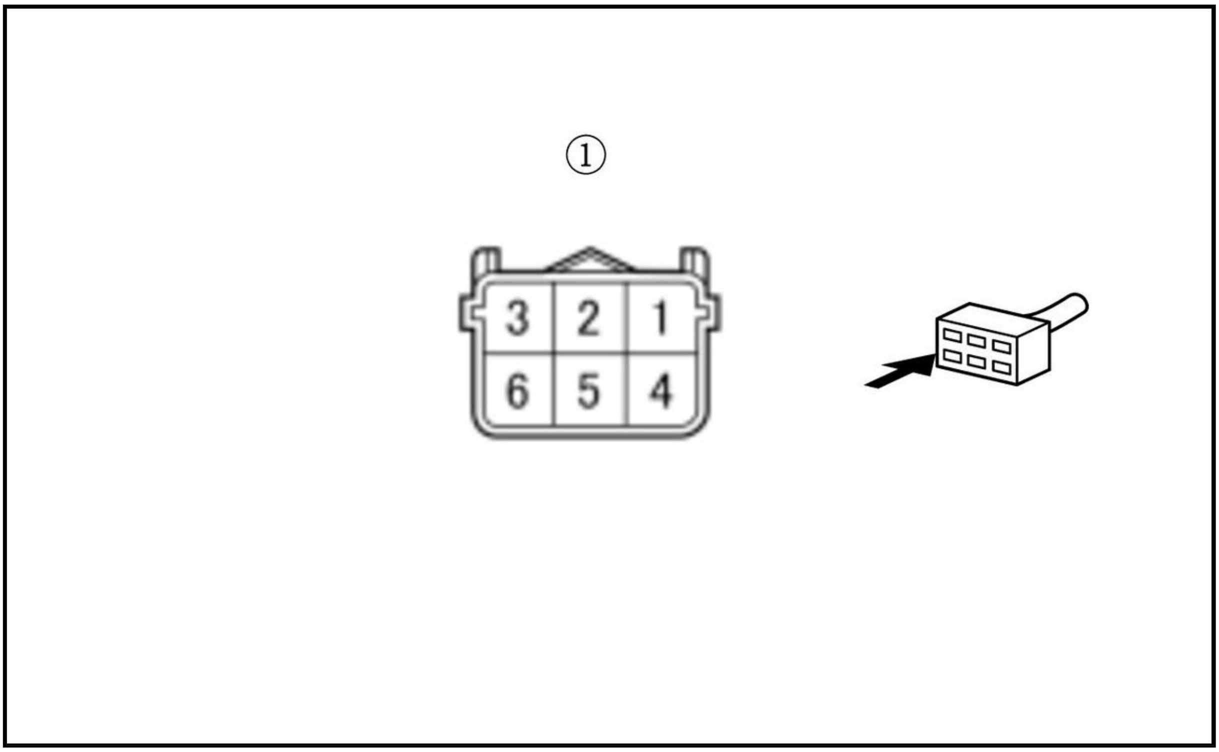
-2. Exit the SCS mode with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Measure the voltage between test points 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 6: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2245

DTC P2245 : A/F Sensor (Sensor 1) VCENT Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2245 A/F Sensor (Sensor 1) VCENT Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2245 A/F Sensor (Sensor 1) VCENT Circuit Low Voltage	B	B

Is DTC P2245 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (VCENT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	**PCM connector E (80P) No. 74**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 3.

NO

Repair a short in the VCENT wire between the PCM (E74) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

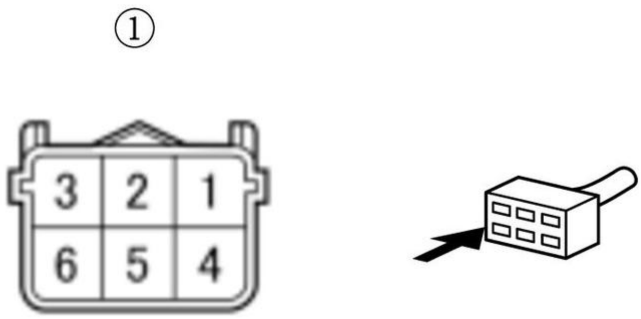
PCM connector E (80P)

-2. Exit the SCS mode with the HDS.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 6: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2251

DTC P2251 : A/F Sensor (Sensor 1) VS Circuit High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2251 is stored at the same time as DTC P0134, troubleshoot DTC P2251 first, then recheck for P0134.

DTC Description	Confirmed DTC	Pending DTC
P2251 A/F Sensor (Sensor 1) VS Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2251 A/F Sensor (Sensor 1) VS Circuit High Voltage	B	B

Is DTC P2251 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (VS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

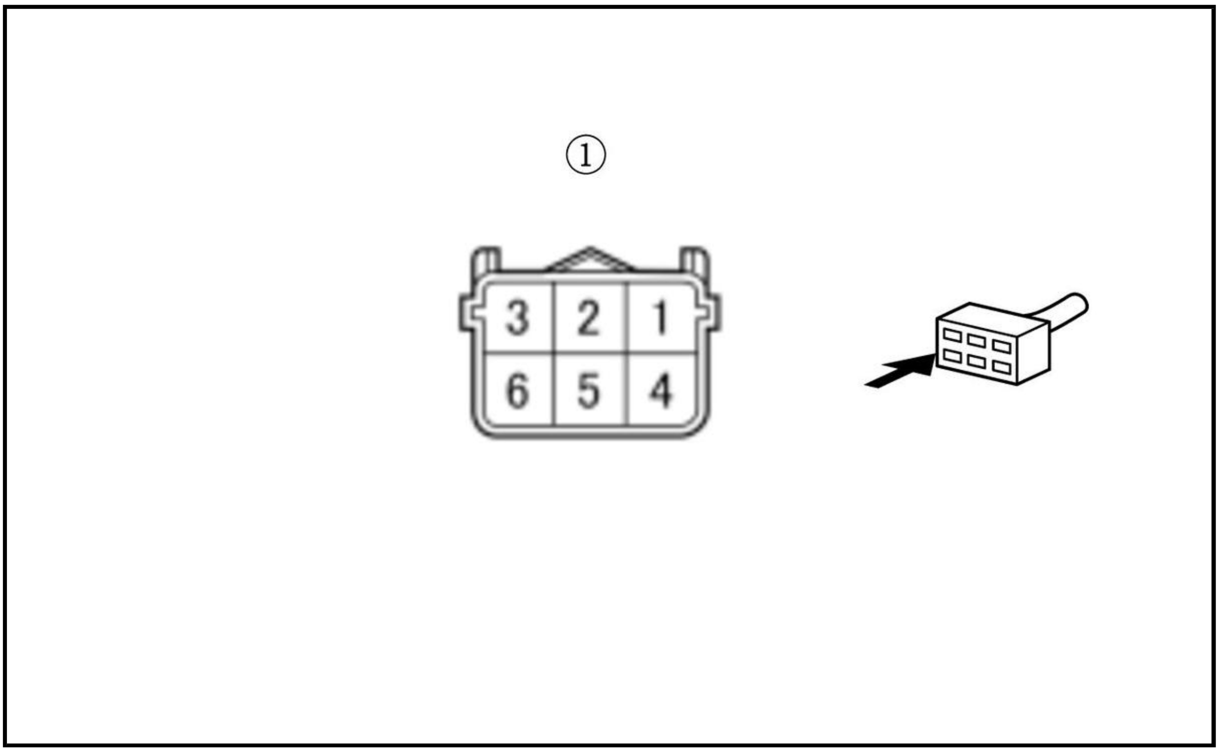
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 73**



Is there 1.0 Ω or less?

YES

Go to step 3.

NO

Repair an open in the VS wire between the PCM (E73) and the A/F sensor (Sensor 1).

3. PCM internal circuit check

-1. Reconnect the following connector.

PCM connector E (80P)

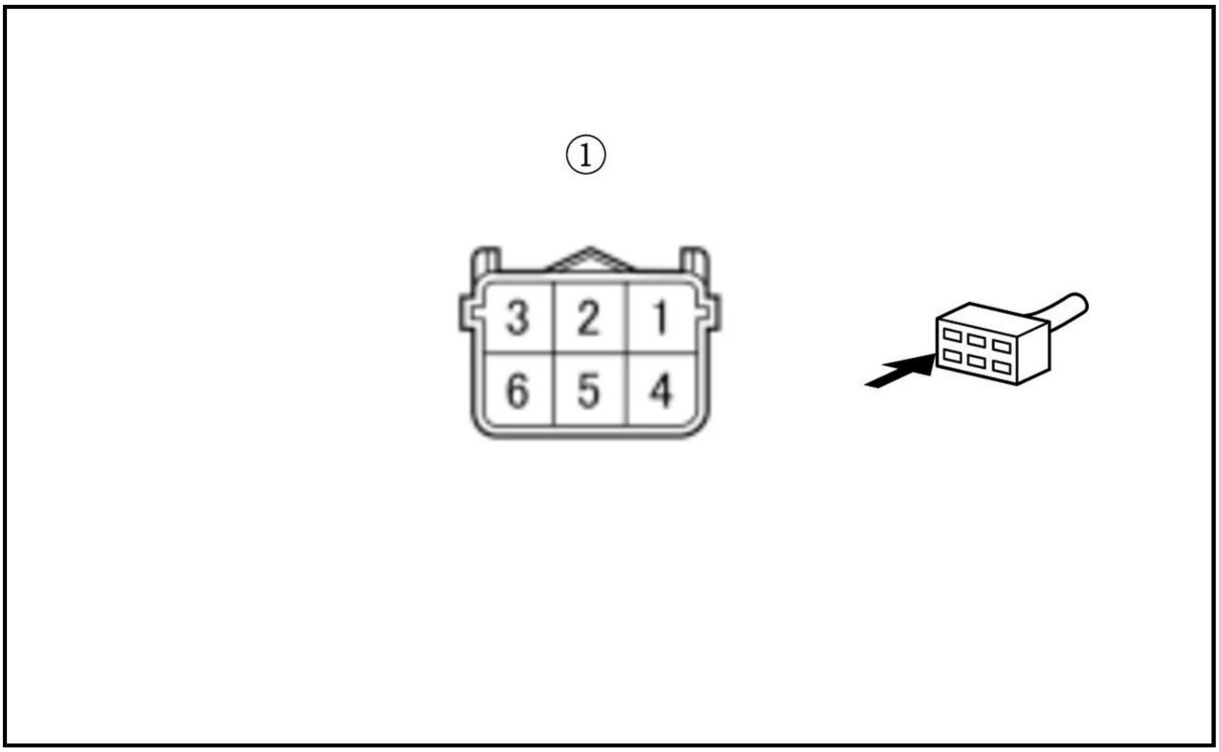
-2. Exit the SCS mode with the HDS.

-3. Enter the maintenance mode, then start the engine .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Measure the voltage between test points 1 and 2.

Test condition	Engine running
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	A/F sensor (Sensor 1) 6P connector (male terminals) No. 4: ①
Test point 2	Body ground



Is there about 0.2 V or less?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

The PCM internal circuit is OK. **Replace the A/F sensor (Sensor 1)** .

DTC P2252

DTC P2252 : A/F Sensor (Sensor 1) VS Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2252 A/F Sensor (Sensor 1) VS Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2252 A/F Sensor (Sensor 1) VS Circuit Low Voltage	B	B

Is DTC P2252 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Shorted wire check (VS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector E (80P)
A/F sensor (Sensor 1) 6P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector E (80P): disconnected
B	A/F sensor (Sensor 1) 6P connector: disconnected
Test point 1	**PCM connector E (80P) No. 73**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 3.

NO

Repair a short in the VS wire between the PCM (E73) and the A/F sensor (Sensor 1).

3. A/F sensor (Sensor 1) check

-1. **Substitute a known-good A/F sensor (Sensor 1)** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. **Reset the PCM with the HDS** .

Reset PCM

-6. **Enter the maintenance mode, then start the engine** .

-7. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2252 A/F Sensor (Sensor 1) VS Circuit Low Voltage	B	B

Is DTC P2252 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original A/F sensor (Sensor 1) .

DTC P2270

DTC P2270 : Secondary HO2S (Sensor 2) Circuit Signal Stuck Lean

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2270 Secondary HO2S (Sensor 2) Circuit Signal Stuck Lean	B	B

DTC (PGM-FI)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2270 Secondary HO2S (Sensor 2) Circuit Signal Stuck Lean	B	B

Is Confirmed DTC P2270 indicated?

YES (Confirmed DTC is indicated)

Replace the secondary HO2S (Sensor 2) .

NO (Pending DTC is indicated)

Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the PCM, and the installation of the secondary HO2S (Sensor 2), then recheck.

DTC P2279

DTC P2279 : Intake Air System Leak

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P0443 is stored at the same time as DTC P2279, troubleshoot DTC P0443 first, then recheck for DTC P2279.

DTC Description	Confirmed DTC	Pending DTC
P2279 Intake Air System Leak	B	B

DTC (PGM-FI)

1. Intake air system visual check:

   Check for vacuum leaks at these parts:

   - PCV valve
   - PCV hose
   - Purge (PCS) line
   - Throttle body
   - Intake manifold

   Are the parts OK?

   YES

   Go to step 2.

   NO

   Repair or replace any leaking part(s).

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle for 1 minute.

   -5. Monitor the OBD STATUS for DTC P2279 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2279 Intake Air System Leak	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. **Check the camshaft timing** and **adjust it if needed** . If the cam timing is OK, **check the valve clearance adjustment and set to specification** .

   NO

   If the HDS indicates PASSED, there is an intermittent failure and the system is OK at this time. Check for vacuum leaks at the PCV valve, the PCV hose, the purge (PCS) line, the throttle body, and the intake manifold. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 2-1 and recheck.

DTC P2401

DTC P2401 : EVAP Leak Check Pump Control Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2401 EVAP Leak Check Pump Control Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST

   Is the result OK?

   YES

   If the test result is PASSED, there is an intermittent failure and the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   The failure is duplicated. Go to step 2.

2. Shorted wire check (ELCMP line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

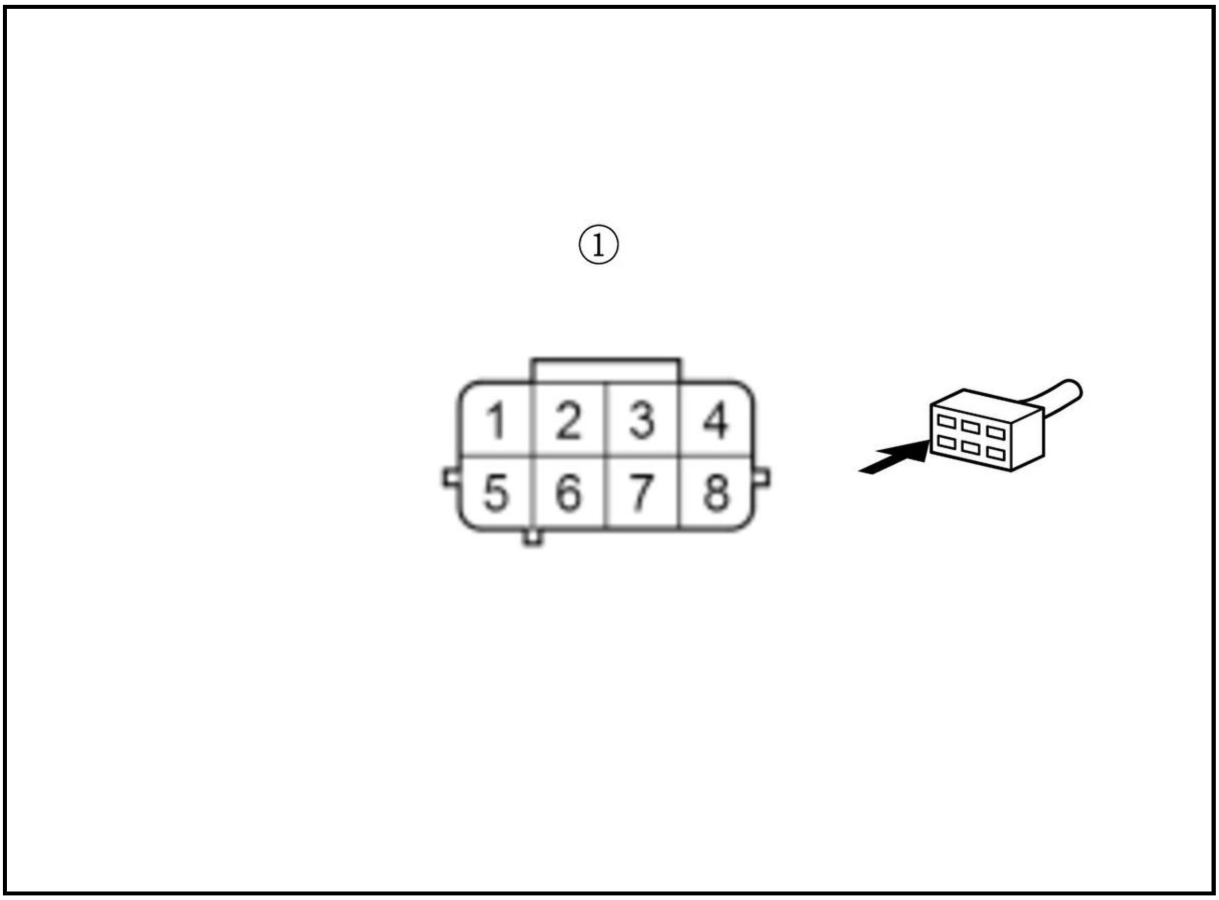
   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

EVAP leak check module 8P connector
PCM connector A (50P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The ELCMP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the ELCMP wire between the PCM (A19) and the EVAP leak check module.

DTC P2402

DTC P2402 : EVAP Leak Check Pump Control Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2402 EVAP Leak Check Pump Control Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST

Is the result OK?

YES

If the test result is PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. Go to step 2.

2. Open wire check (GND line)

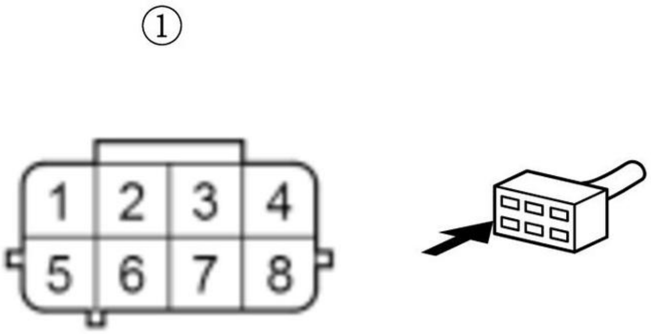
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 3.

NO

Repair an open in the GND wire between the EVAP leak check module and G503.

3. Open wire check (ELCMP line)

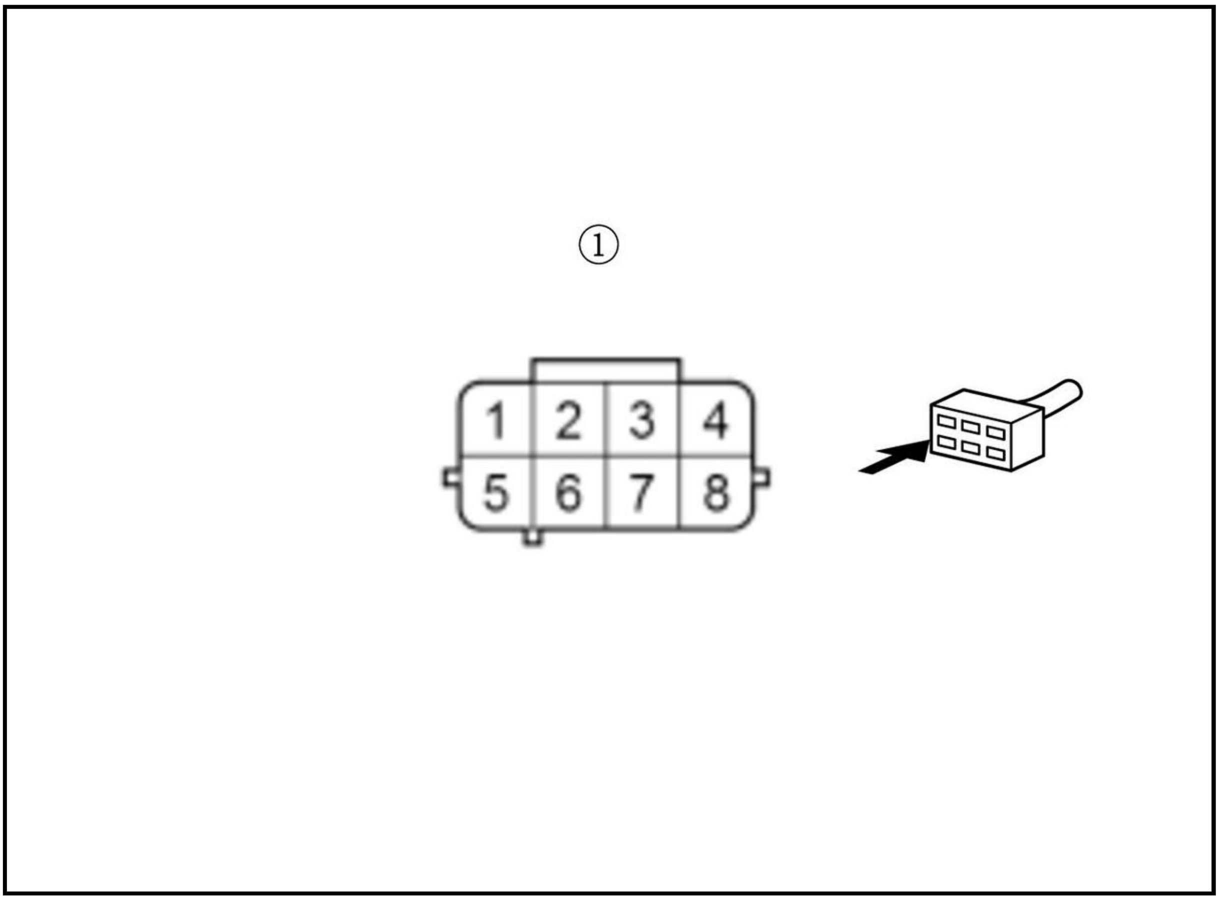
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 3: ①
Terminal B	Body ground



-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	EVAP leak check module 8P connector: disconnected
	EVAP leak check module 8P connector No. 3: jumped to body ground
Test point 1	**PCM connector A (50P) No. 19**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Replace the EVAP leak check module .

NO

Repair an open in the ELCMP wire between the PCM (A19) and the EVAP leak check module.

DTC P2413

DTC P2413 : EGR System Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2413 EGR System Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Select the EGR TEST in the Function Test Menu with the HDS.

   EGR Test

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EGR valve and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   The failure is duplicated. Go to step 2.

2. Determine possible failure area (EGR valve position sensor, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current DTC	
	Values	Unit	Values	Unit
EGR Valve Position Sensor (EGR	about 0	V	B	B

Signal	Threshold		Current DTC	
	Values	Unit	Values	Unit
Vls)				

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Go to step 7.

3. Determine possible failure area (VCC2 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

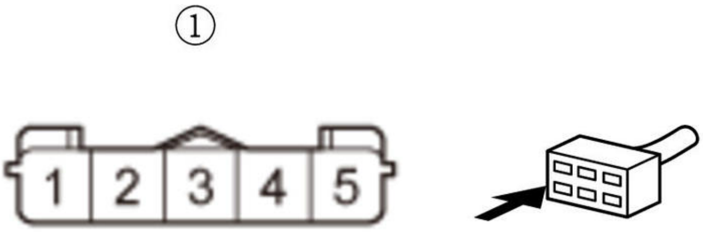
-2. Disconnect the following connector.

EGR valve 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EGR valve 5P connector: disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 4.

4. Open wire check (VCC2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

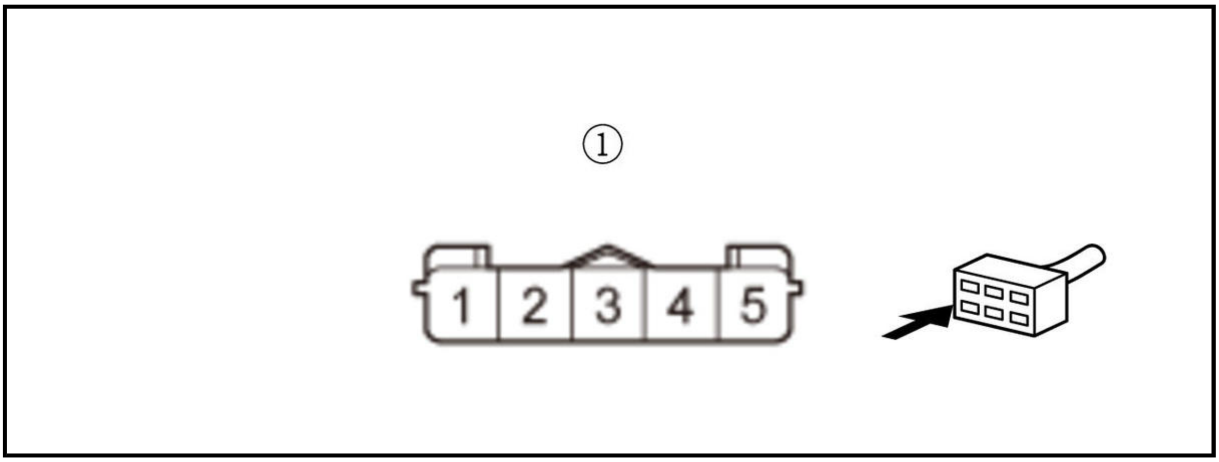
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 77**



Is there 1.0 Ω or less?

YES

The VCC2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC2 wire between the PCM (E77) and the EGR valve.

5. Shorted wire check (EGRL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

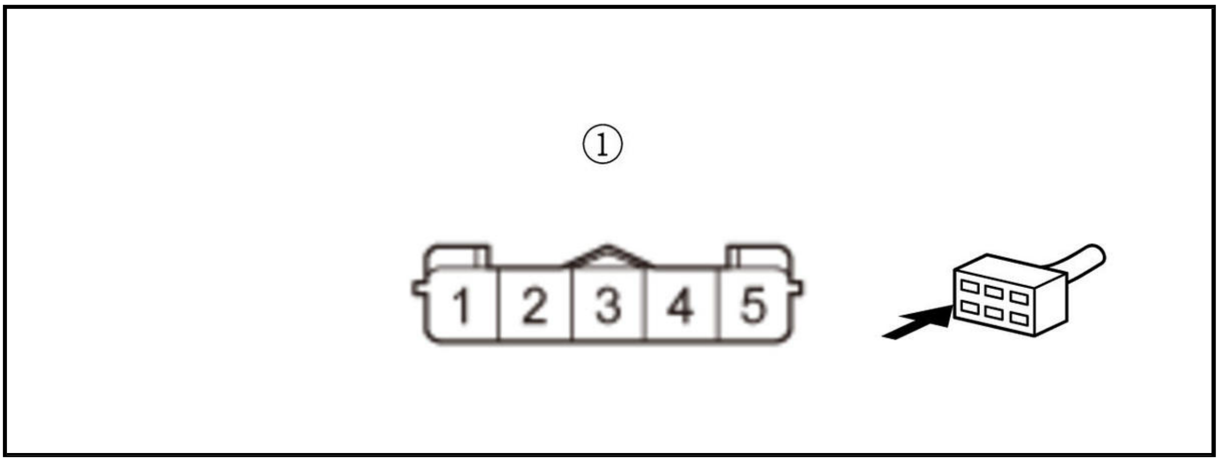
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The EGRL wire is not shorted. Go to step 6.

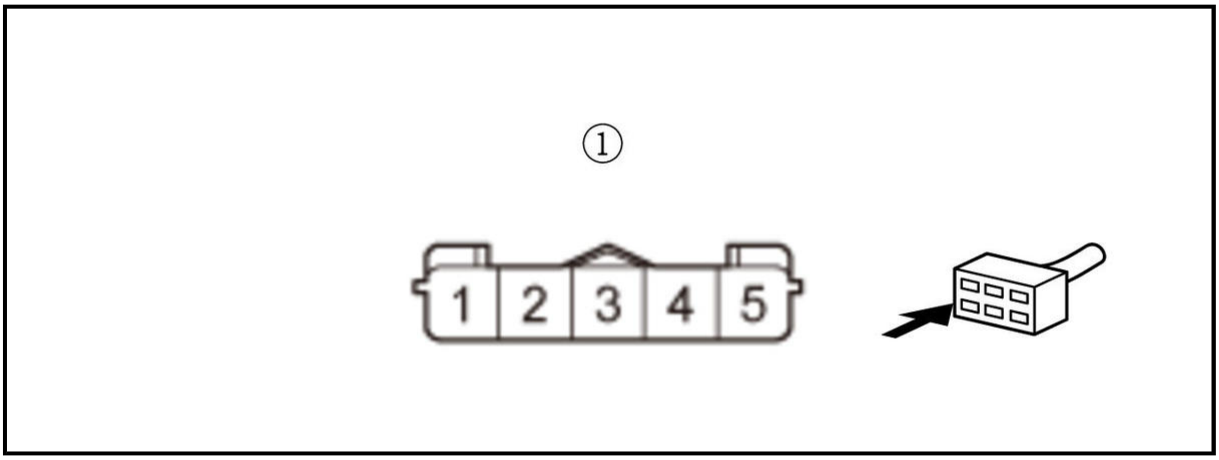
NO

Repair a short in the EGRL wire between the PCM (E69) and the EGR valve.

6. Open wire check (EGRL line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 69**



Is there 1.0 Ω or less?

YES

The EGRL wire is OK. Go to step 7.

NO

Repair an open in the EGRL wire between the PCM (E69) and the EGR valve.

7. EGR valve position sensor internal circuit check 1

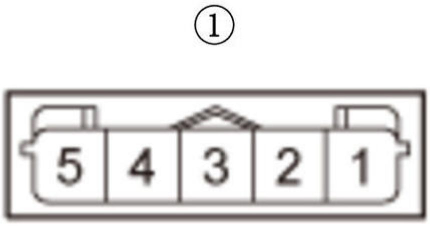
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. If not already done, disconnect the following connector.

EGR valve 5P connector

-3. At the EGR valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
Test point 1	EGR valve 5P connector (male terminals) No. 3 (valve side): ①
Test point 2	EGR valve 5P connector (male terminals) No. 4 (valve side): ①



Is there 100 kΩ or more?

YES

Replace the EGR valve .

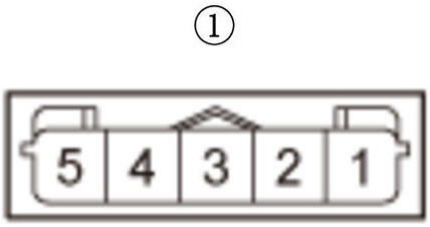
NO

Go to step 8.

8. EGR valve position sensor internal circuit check 2

-1. At the EGR valve side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
Test point 1	EGR valve 5P connector (male terminals) No. 2 (valve side): ①
Test point 2	EGR valve 5P connector (male terminals) No. 4 (valve side): ①



Is there 100 kΩ or more?

YES

Replace the EGR valve .

NO

Go to step 9.

9. Shorted wire check (EEGR line)

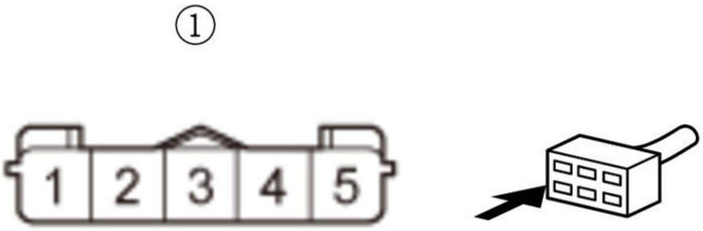
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. If not already done, disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The EEGR wire is not shorted. Go to step 10.

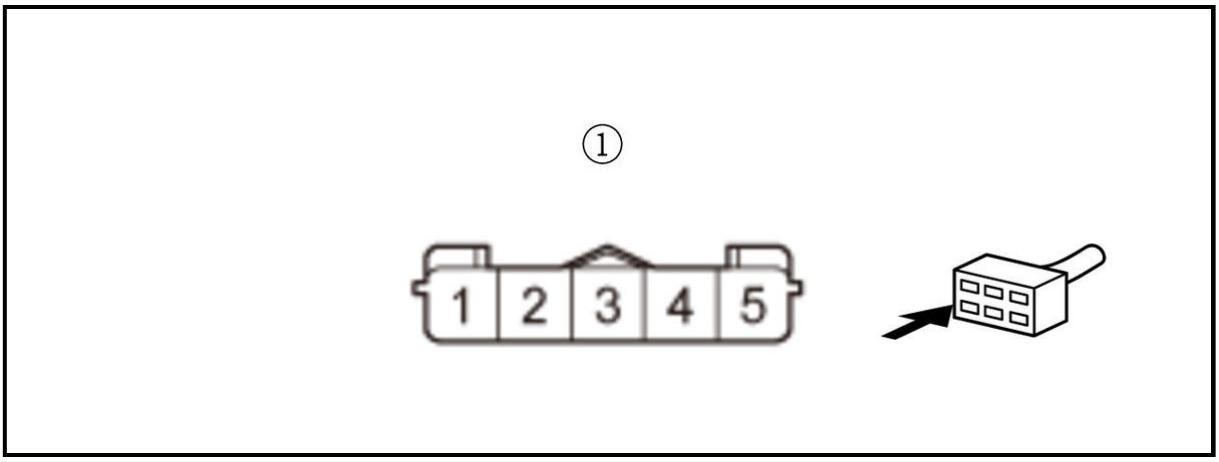
NO

Repair a short in the EEGR wire between the PCM (E10) and the EGR valve.

10. Open wire check (EEGR line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 5: ①
Test point 2	**PCM connector E (80P) No. 10**



Is there 1.0 Ω or less?

YES

The EEGR wire is OK. Go to step 11.

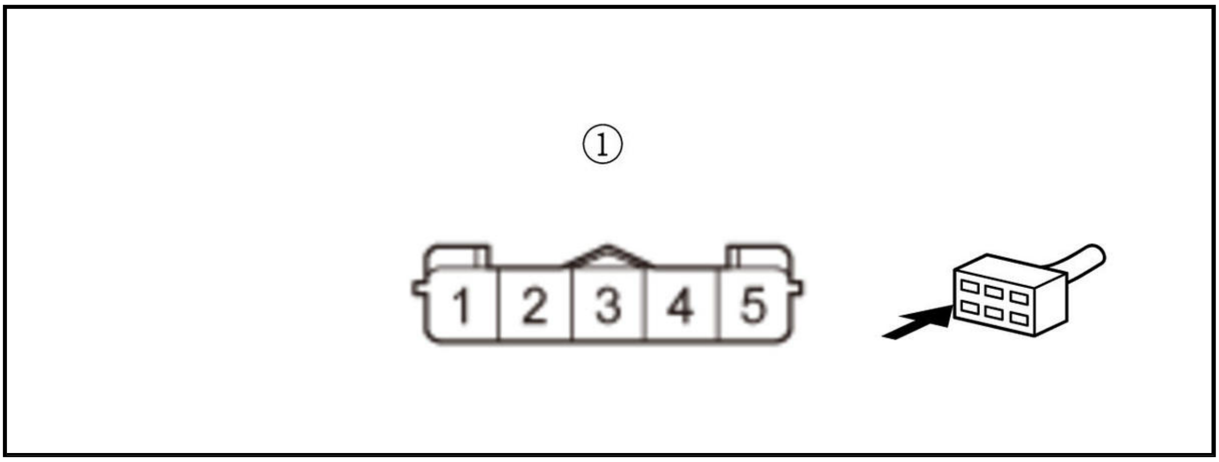
NO

Repair an open in the EEGR wire between the PCM (E10) and the EGR valve.

11. Open wire check (PG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EGR valve 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	EGR valve 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The PG wire is OK. Go to step 12.

NO

Repair an open in the PG wire between the EGR valve and G101.

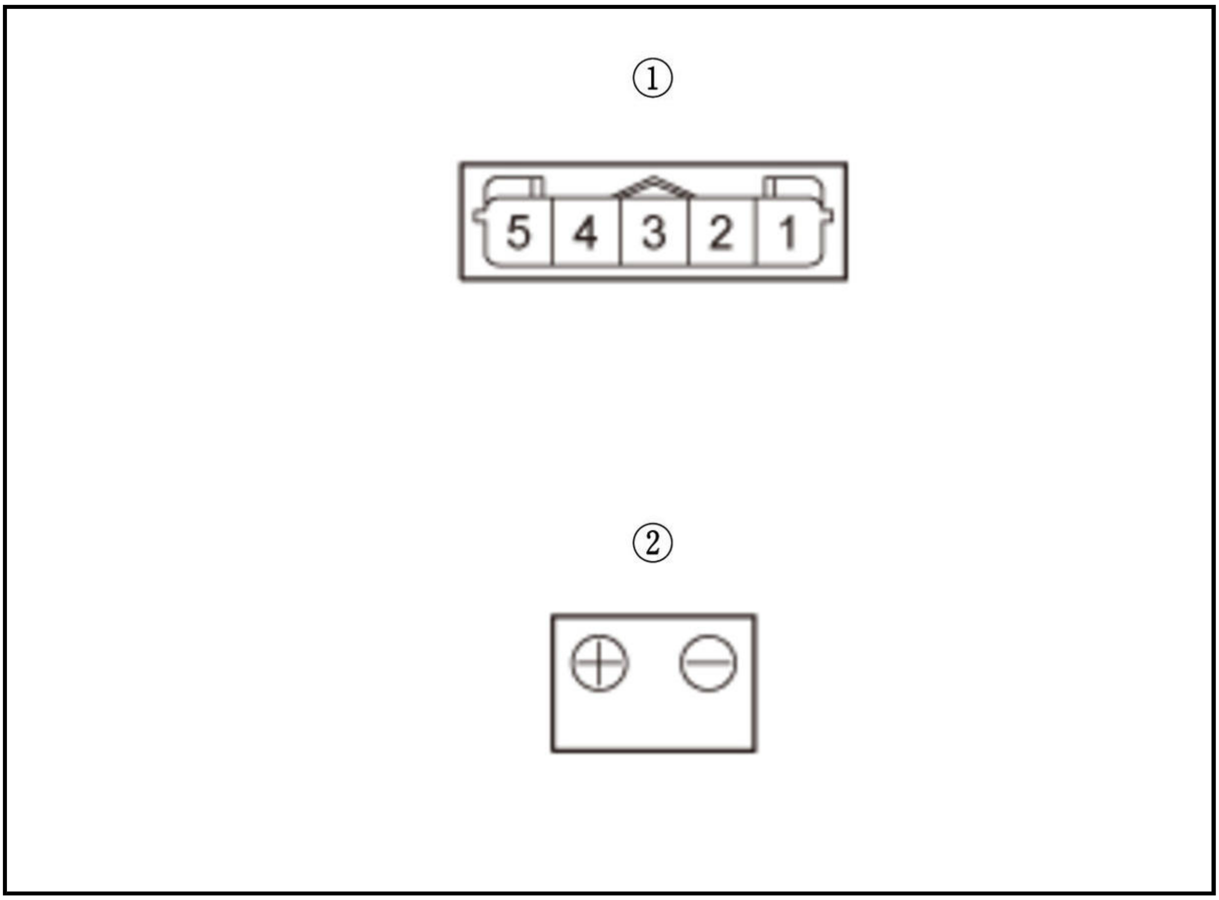
12. EGR valve operation check

-1. Reconnect the following connector.

PCM connector E (80P)

-2. At the EGR valve side, connect terminals A and B with a jumper wire.

Terminal A	EGR valve 5P connector (male terminals) No. 5 (valve side): ①
Terminal B	12 volt battery positive terminal: ②

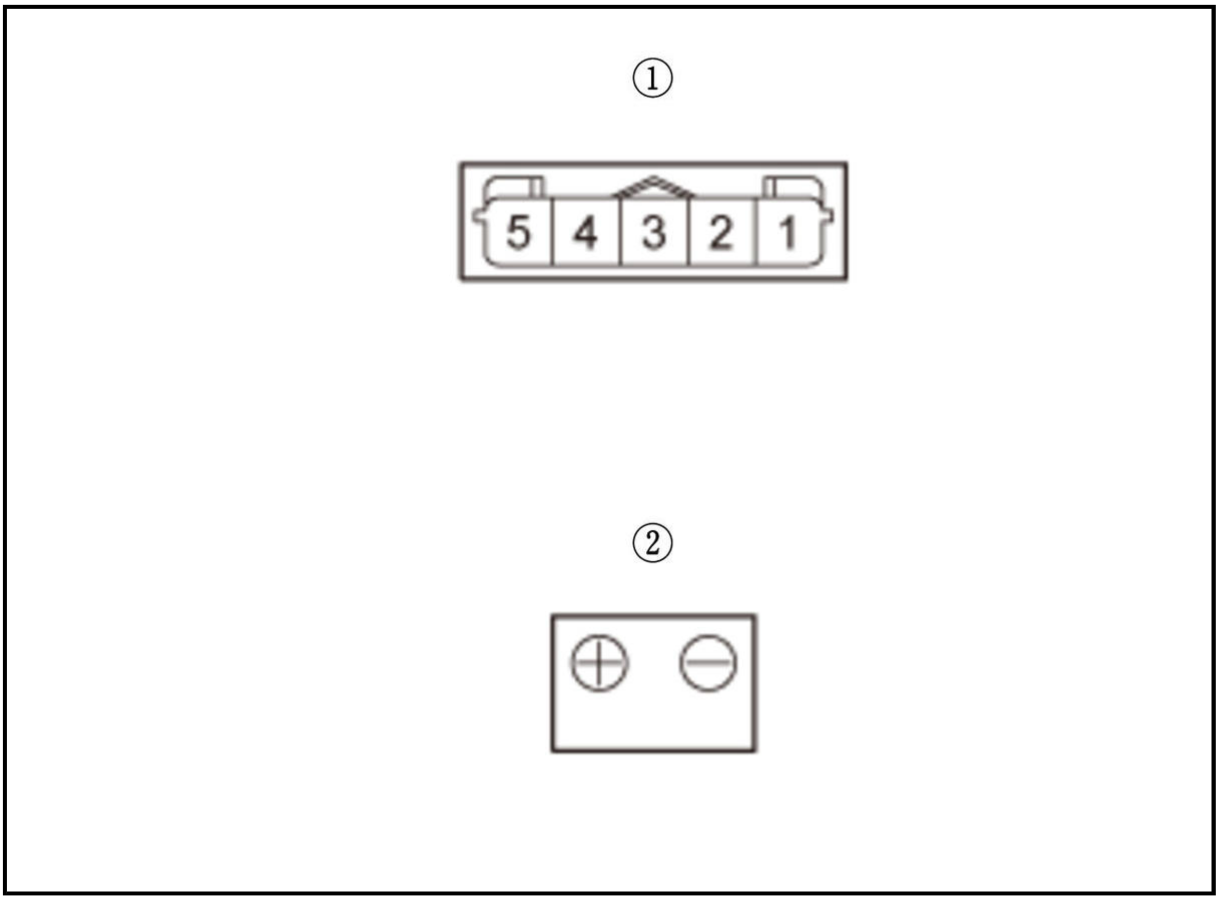


-3. Exit the SCS mode with the HDS.

-4. **Enter the maintenance mode, then start the engine** , and let it idle.

-5. At the EGR valve side, connect terminals A and B with a jumper wire.

Terminal A	EGR valve 5P connector (male terminals) No. 1 (valve side): ①
Terminal B	12 volt battery negative terminal: ②



Does the engine stall or run roughly?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Go to step 13.

13. EGR port and passage cleaning

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the EGR valve** .

-3. Clean the intake manifold EGR port and the passage inside the EGR valve with throttle plate cleaner.

-4. **Install the EGR valve** .

-5. Reconnect all connectors.

-6. Turn the vehicle to the ON mode.

-7. **Reset the PCM with the HDS** .

Reset PCM

-8. Select the EGR TEST in the Function Test Menu with the HDS.

EGR Test

Is the result OK?

YES

The troubleshooting is complete.

NO

Replace the EGR valve .

DTC P24B8

DTC P24B8 : EVAP Leak Check Module Absolute Pressure Sensor Out of Range

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P24BA and/or P24BB are stored at the same time as DTC P24B8, troubleshoot those DTCs first, then recheck for DTC P24B8.

DTC Description	Confirmed DTC	Pending DTC
P24B8 EVAP Leak Check Module Absolute Pressure Sensor Out of Range	B	B

DTC (PGM-FI)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	More than 857	mmHg	B	B

   Do the current condition(s) match the malfunction threshold?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification 2

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24B8 EVAP Leak Check Module Absolute Pressure Sensor Out of Range	B	B

Is DTC P24B8 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (VCC6 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

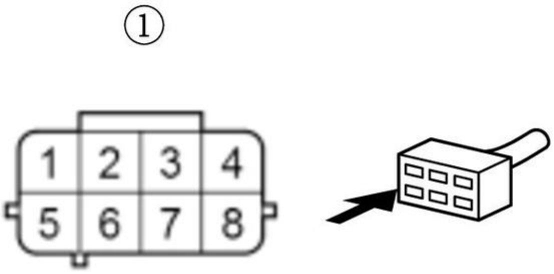
-2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	EVAP leak check module 8P connector (female terminals) No. 8: ①



Is there about 5.0 V?

YES

Go to step 4.

NO

Go to step 6.

4. Determine possible failure area (ELCMPA line, others)

    -1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	Less than 331	mmHg	B	B

Do the current condition(s) match the malfunction threshold?

YES

Go to step 8.

NO

Go to step 5.

5. Determine possible failure area (EVAP leak check module, others)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	EVAP leak check module 8P connector (female terminals) No. 8: ①

    -3. Turn the vehicle to the ON mode.

    -4. Check the parameter(s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
Absolute Pressure of ELCM Pressure Sensor	More than 857	mmHg	B	B

Do the current condition(s) match the malfunction threshold?

YES

Go to step 9.

NO

Replace the EVAP leak check module .

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

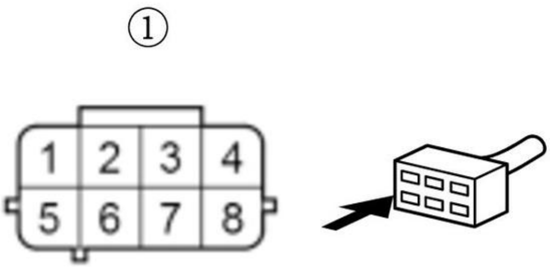
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector: disconnected
Test point 1	**PCM connector E (80P) No. 63**
Test point 2	EVAP leak check module 8P connector (female terminals) No. 6: ①



Is there 1.0 Ω or less?

YES

Go to step 7.

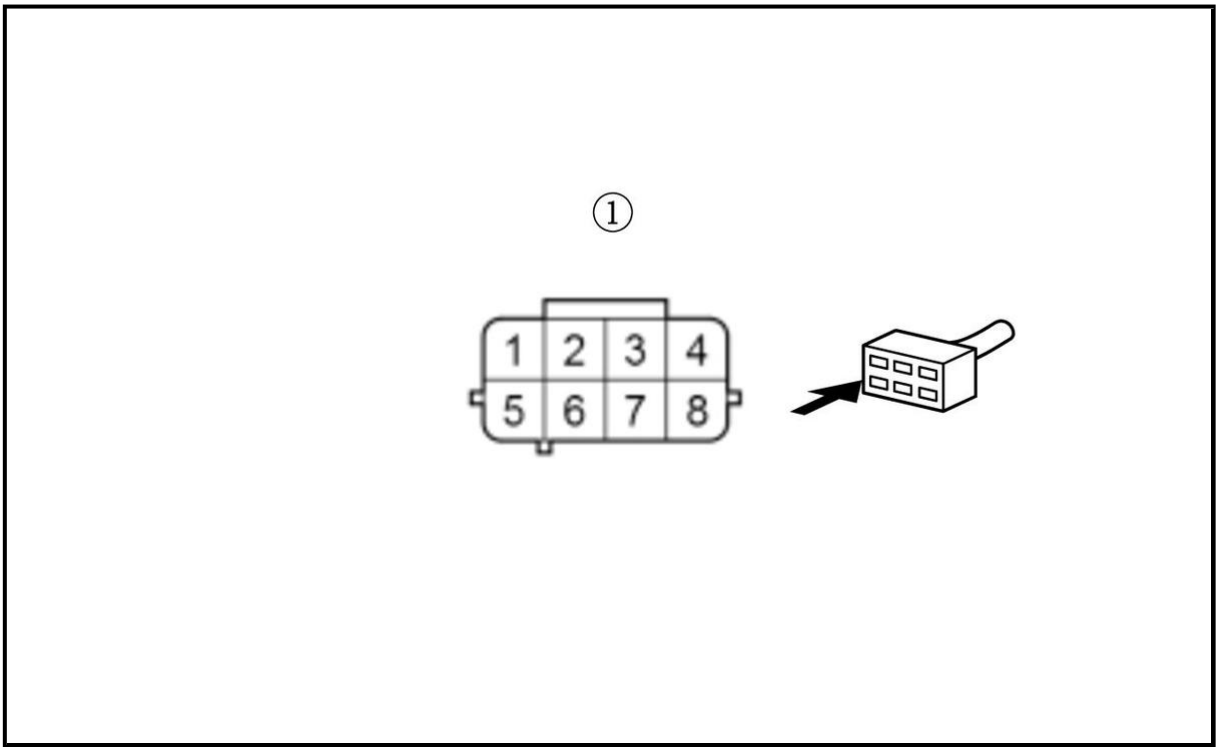
NO

Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

7. Open wire check (SG6 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 45**
Test point 2	EVAP leak check module 8P connector (female terminals) No. 8: ①



Is there 1.0 Ω or less?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and the EVAP leak check module.

8. Shorted wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

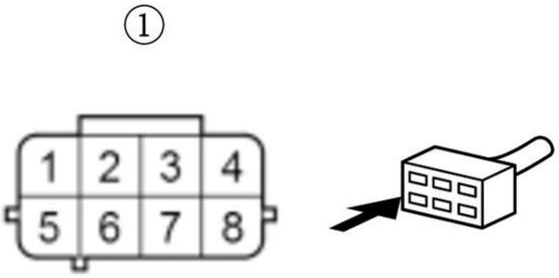
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

9. Open wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the EVAP leak check module 8P connector.

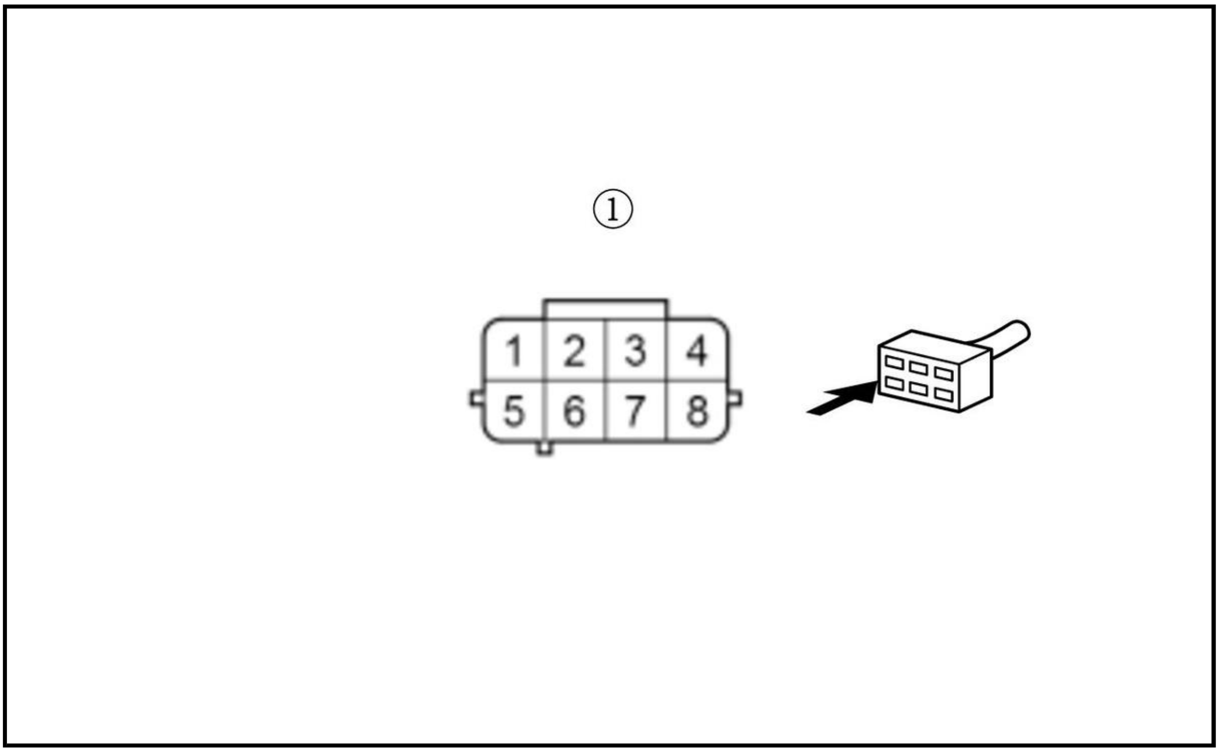
-3. Jump the SCS line with the HDS, and wait more than 1 minute.

-4. Disconnect the following connector.

PCM connector A (50P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode EVAP leak check module 8P connector: disconnected PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 42**
Test point 2	EVAP leak check module 8P connector (female terminals) No. 7: ①



Is there 1.0 Ω or less?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

DTC P24B9

DTC P24B9 : EVAP Leak Check Module Pressure Sensor Range/Performance Problem

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P24BA and/or P24BB is stored at the same time as DTC P24B9, troubleshoot those DTCs first, then recheck for DTC P24B9.

DTC Description	Confirmed DTC	Pending DTC
P24B9 EVAP Leak Check Module Pressure Sensor Range/Performance Problem	B	B

DTC (PGM-FI)

1. EVAP leak check module drain hose check

-1. **Remove the EVAP leak check module** and the **EVAP canister filter** , then check the blockage in the hoses and the EVAP canister filter.

Are the parts OK?

YES

Go to step 2.

NO

Remove the blockage from them, or replace the part(s) if needed.

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24B9 EVAP Leak Check Module Pressure Sensor Range/Performance Problem	B	B

Is DTC P24B9 indicated?

YES

The failure is duplicated. **Replace the EVAP leak check module** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P24BA

DTC P24BA : EVAP Leak Check Module Pressure Sensor Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P24BA EVAP Leak Check Module Pressure Sensor Circuit Low Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for 3 seconds.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	Less than 331	mmHg	B	B

Do the current condition(s) match the malfunction threshold?

YES

Go to step 3.

NO

Go to step 2.

2. Problem verification

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24BA EVAP Leak Check Module Pressure Sensor Circuit Low Voltage	B	B

Is DTC P24BA indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (ELCMPA line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	Less than 331	mmHg	B	B

Do the current condition(s) match the malfunction threshold?

YES

Go to step 4.

NO

Go to step 5.

4. Shorted wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

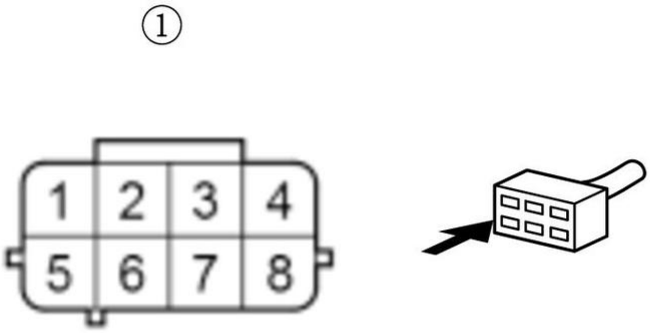
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

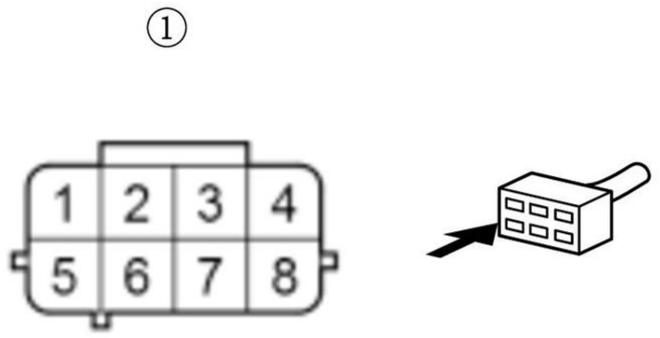
NO

Repair a short in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

5. Determine possible failure area (EVAP leak check module pressure sensor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there about 5.0 V?

YES

Replace the EVAP leak check module .

NO

Go to step 6.

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

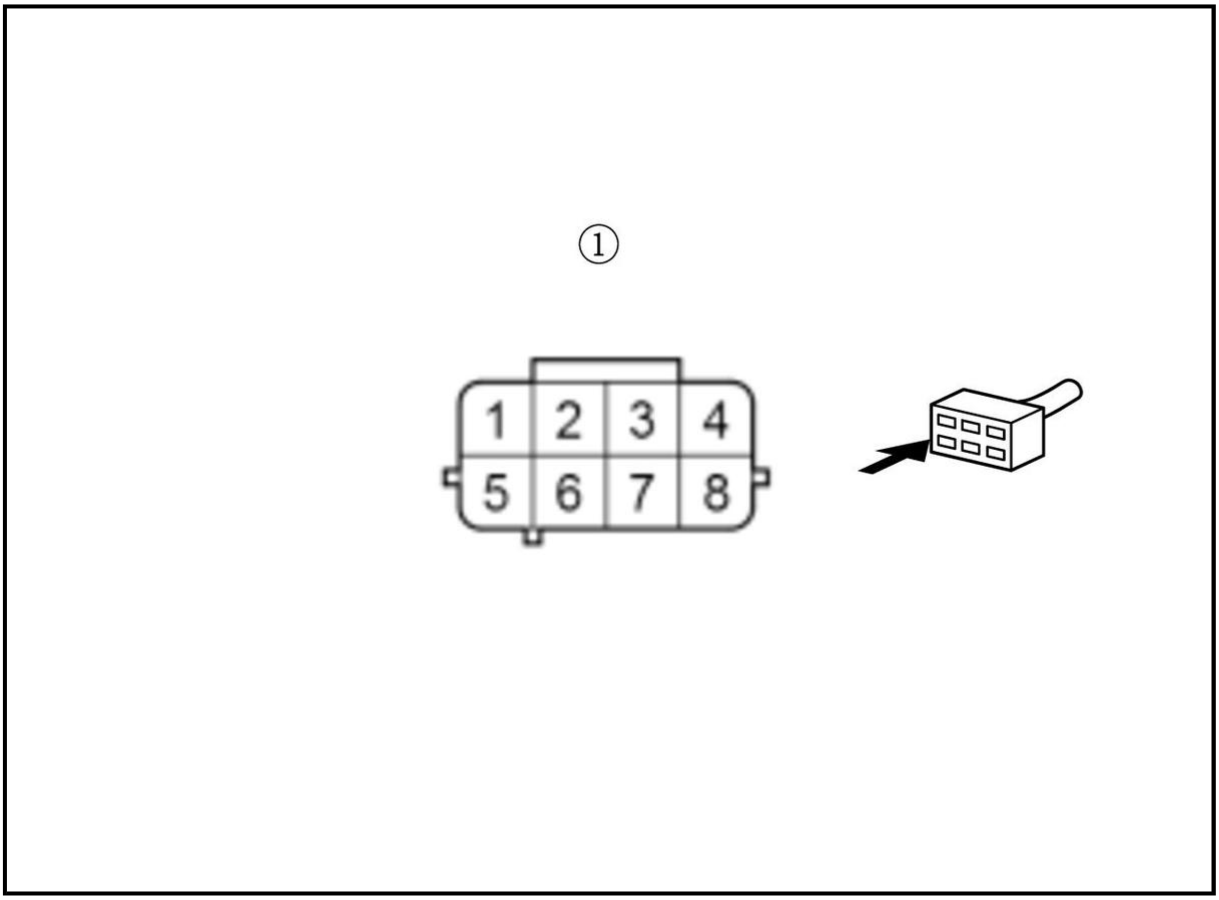
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 6: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector E (80P): disconnected
B	EVAP leak check module 8P connector No. 6: jumped to body ground
Test point 1	**PCM connector E (80P) No. 63**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The VCC6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

DTC P24BB

DTC P24BB : EVAP Leak Check Module Pressure Sensor Circuit High Voltage

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .

- This DTC is stored if there is a blockage in the drain hose of the EVAP leak check module. Check the EVAP canister filter and the drain hoses before troubleshooting.

DTC Description	Confirmed DTC	Pending DTC
P24BB EVAP Leak Check Module Pressure Sensor Circuit High Voltage	B	B

DTC (PGM-FI)

1. EVAP system check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	More than 893	mmHg	B	B

   Do the current condition(s) match the malfunction threshold?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Problem verification

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P24BB EVAP Leak Check Module Pressure Sensor Circuit High Voltage	B	B

   Is DTC P24BB indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Determine possible failure area (EVAP leak check module pressure sensor, others)

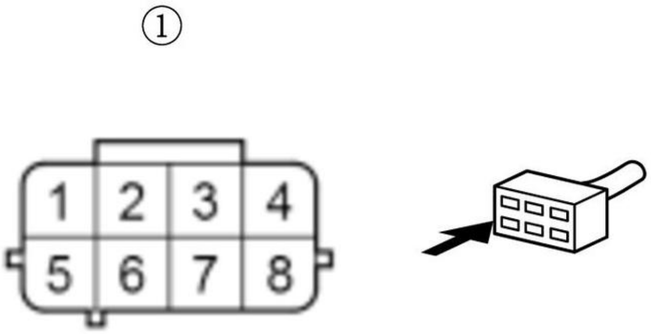
   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EVAP leak check module 8P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	EVAP leak check module 8P connector (female terminals) No. 8: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Absolute Pressure of ELCM Pressure Sensor	More than 893	mmHg	B	B

Do the current condition(s) match the malfunction threshold?

YES

Go to step 4.

NO

Replace the EVAP leak check module .

4. Determine possible failure area (ELCMPA line, others)

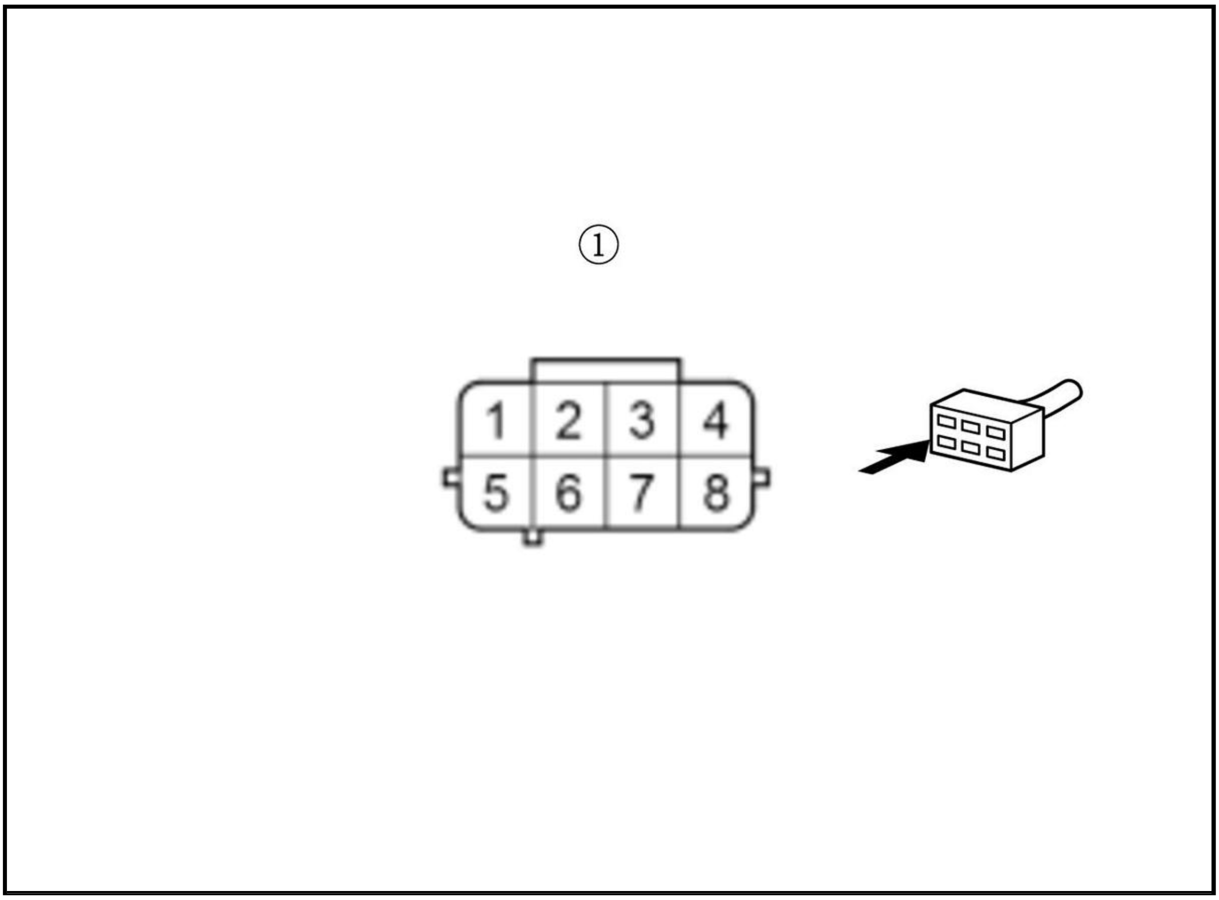
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the EVAP leak check module 8P connector.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 6: ①
Test point 2	EVAP leak check module 8P connector (female terminals) No. 8: ①



Is there about 5.0 V?

YES

Go to step 5.

NO

Go to step 6.

5. Open wire check (ELCMPA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

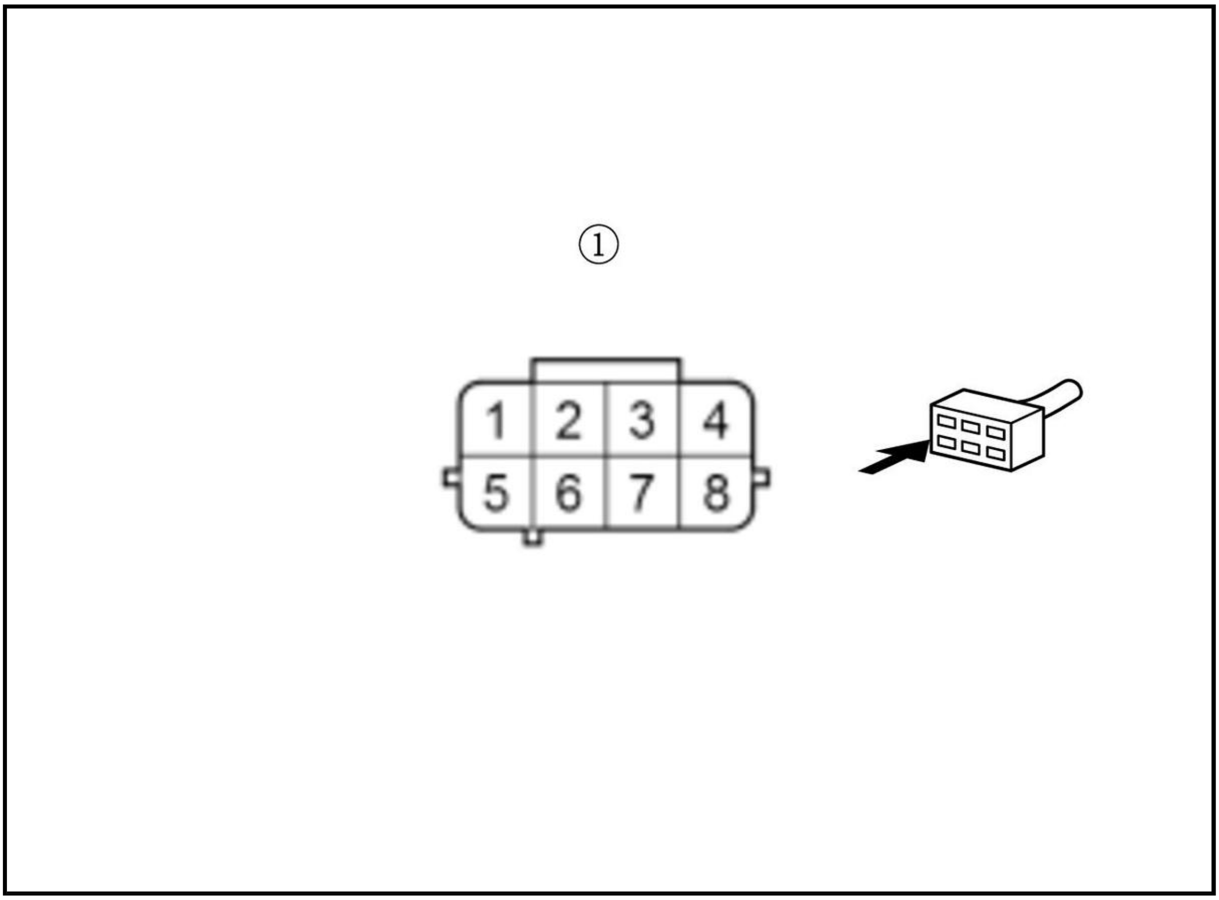
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 7: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector A (50P): disconnected
B	EVAP leak check module 8P connector No. 7: jumped to body ground
Test point 1	**PCM connector A (50P) No. 42**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The ELCMPA wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the ELCMPA wire between the PCM (A42) and the EVAP leak check module.

6. Open wire check (VCC6 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

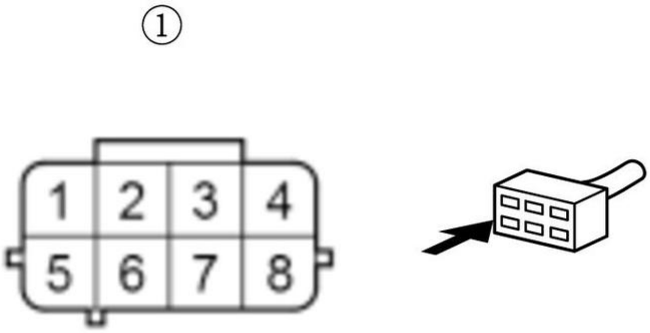
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector E (80P)

-4. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 6: ①
Terminal B	Body ground



-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EVAP leak check module 8P connector: disconnected
B	PCM connector E (80P): disconnected
B	EVAP leak check module 8P connector No. 6: jumped to body ground
Test point 1	**PCM connector E (80P) No. 63**
Test point 2	body ground

Is there 1.0 Ω or less?

YES

Go to step 7.

NO

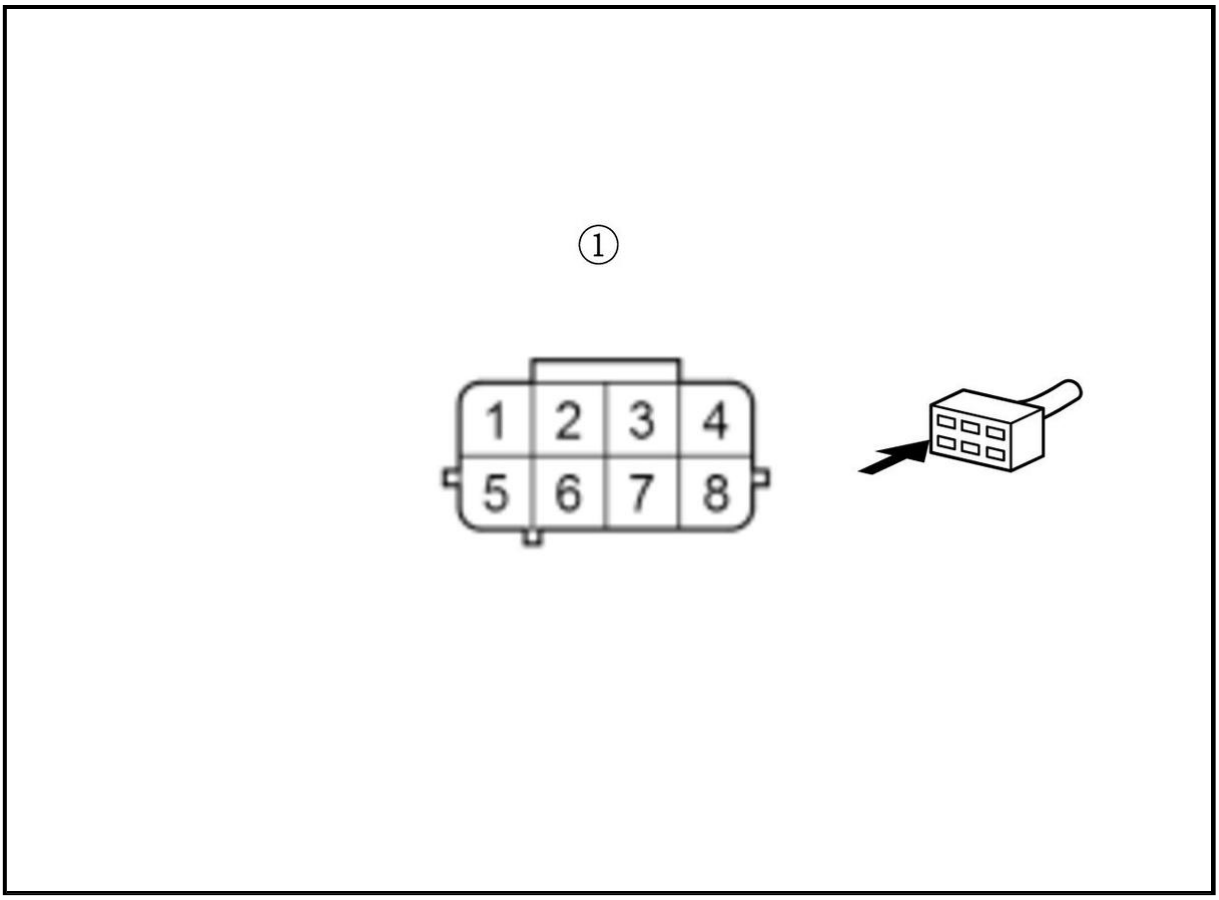
Repair an open in the VCC6 wire between the PCM (E63) and the EVAP leak check module.

7. Open wire check (SG6 line)

-1. Remove the jumper wire from the EVAP leak check module 8P connector.

-2. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 8: ①
Terminal B	Body ground



-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector E (80P): disconnected
	EVAP leak check module 8P connector No. 8: jumped to body ground
Test point 1	**PCM connector E (80P) No. 45**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SG6 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the SG6 wire between the PCM (E45) and the EVAP leak check module.

DTC P24BE

DTC P24BE : Canister Change Over Valve Control Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P24BE Canister Change Over Valve Control Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   The failure is duplicated. Go to step 2.

2. Open wire check (IGPS(LAF) line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

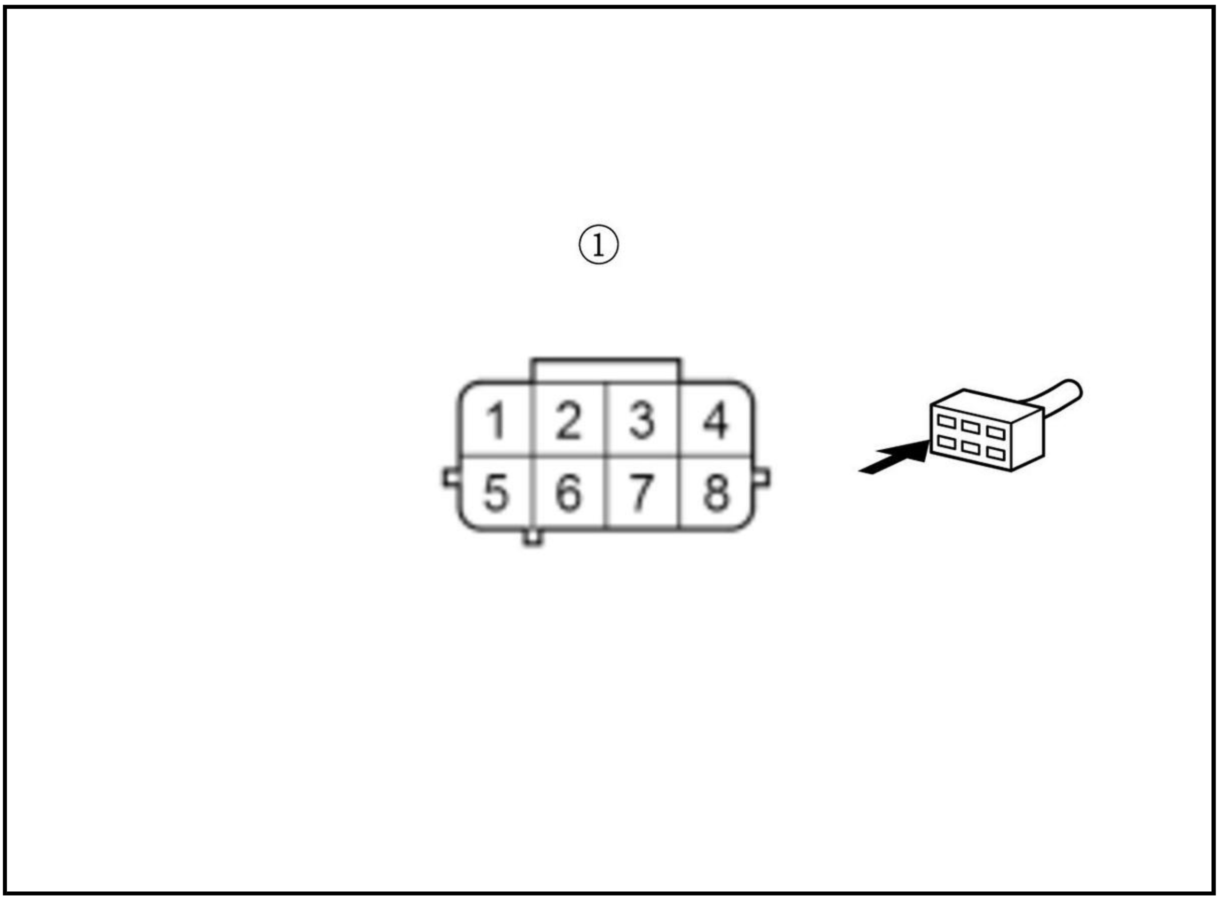
   -2. Disconnect the following connector.

EVAP leak check module 8P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EVAP leak check module 8P connector: disconnected
Test point 1	EVAP leak check module 8P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IGPS(LAF) wire is OK. Go to step 5.

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A11**

Is the fuse OK?

YES

Go to step 4.

NO

Check for a short in IGPS(LAF) wire between the No. A11 fuse and the EVAP leak check module. If the wire is OK, **replace the under-hood fuse/relay box** . Also replace the No. A11 fuse.

4. Relay circuit board check

-1. **Remove and test the relay circuit board** .

Is the relay circuit board OK?

YES

Repair an open in the IGPS(LAF) wire between the **No. A11 fuse** and the EVAP leak check module, or the FI_SUB_RLY_OUT wire between the No. A11 fuse and the relay circuit board (PGM-FI subrelay circuit).

NO

Replace the relay circuit board .

5. Shorted wire check (CCV line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 6**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The CCV wire is not shorted. Go to step 6.

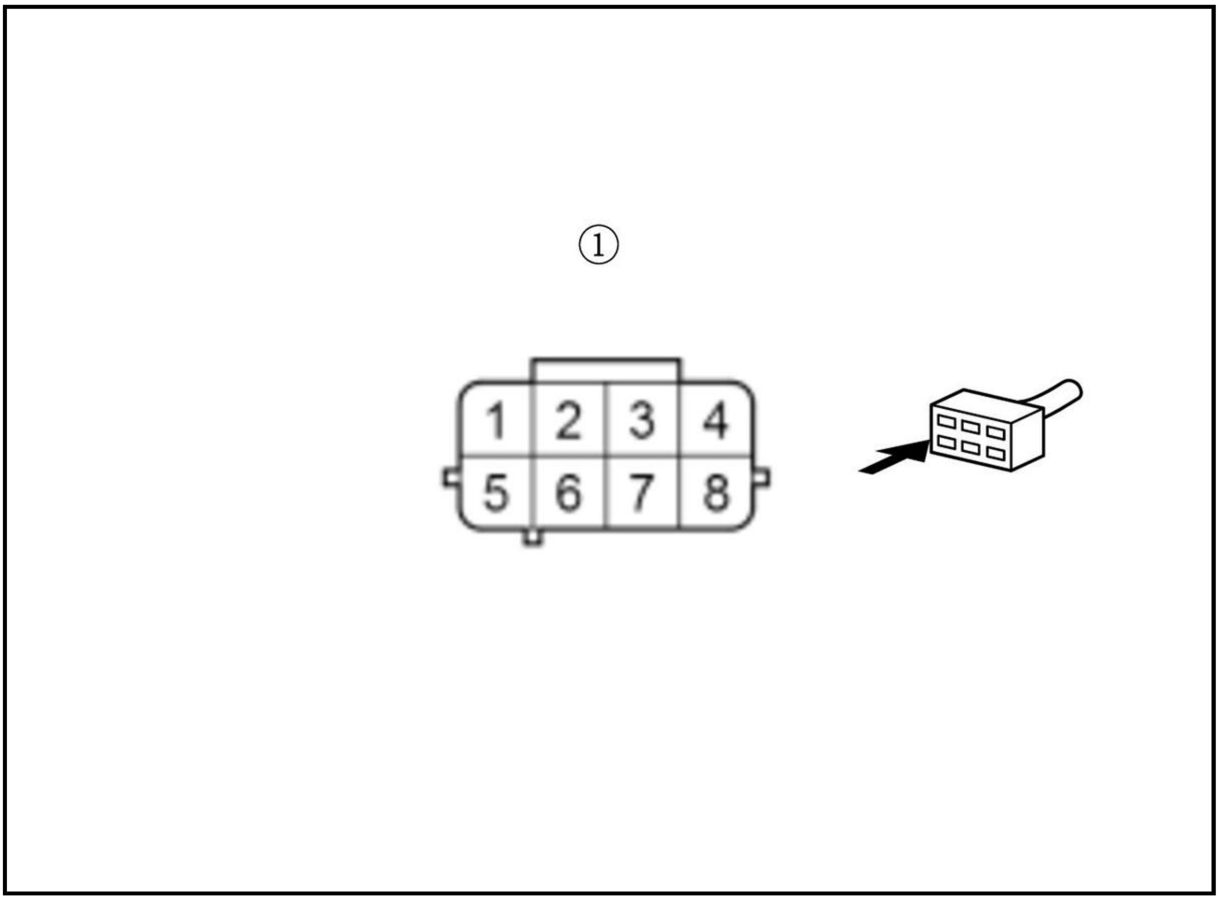
NO

Repair a short in the CCV wire between the PCM (A6) and the EVAP leak check module.

6. Open wire check (CCV line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	EVAP leak check module 8P connector (female terminals) No. 1: ①
Terminal B	Body ground



-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	EVAP leak check module 8P connector: disconnected
	PCM connector A (50P): disconnected
	EVAP leak check module 8P connector No. 1: jumped to body ground
Test point 1	**PCM connector A (50P) No. 6**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The CCV wire is OK. Go to step 7.

NO

Repair an open in the CCV wire between the PCM (A6) and the EVAP leak check module.

7. EVAP leak check module check

-1. **Substitute a known-good EVAP leak check module** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. **Reset the PCM with the HDS** .

Reset PCM

-6. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST

Is the result Failed?

YES

The EVAP leak check module is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original EVAP leak check module .

DTC P24BF

DTC P24BF : Canister Change Over Valve Control Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P24BF Canister Change Over Valve Control Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

   EVAP TEST

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

   The failure is duplicated. Go to step 2.

2. Shorted wire check (CCV line to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

PCM connector A (50P)
EVAP leak check module 8P connector

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PCM connector A (50P): disconnected
	EVAP leak check module 8P connector: disconnected
Test point 1	**PCM connector A (50P) No. 6**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the CCV wire between the PCM (A6) and the EVAP leak check module.

NO

Go to step 3.

3. EVAP leak check module check

-1. **Substitute a known-good EVAP leak check module** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. **Reset the PCM with the HDS** .

Reset PCM

-6. Select the EVAP TEST in the Function Test Menu, then select EVAP Leak Check Module Test with the HDS.

EVAP TEST

Is the result Failed?

YES

The EVAP leak check module is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original EVAP leak check module .

DTC P24C0

DTC P24C0 : Canister Change Over Valve Close Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P24C0 Canister Change Over Valve Close Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** , and let it idle without load (in P or N) until the radiator fan comes on.

   -4. Monitor the EVAP PC Duty in the DATA LIST with the HDS, while holding the engine speed at 3, 000 rpm with the EVAP PC Duty at 20 % or more.

Signal	Current conditions	
	Values	Unit
EVAP PC Duty	B	B

   -5. Monitor the OBD STATUS for DTC P24C0 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P24C0 Canister Change Over Valve Close Malfunction	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, and the system is OK at this time. Check for poor connections or loose terminals at the EVAP leak check module and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. EVAP leak check module drain hose check

   -1. **Remove the EVAP leak check module** and the **EVAP canister filter** , then check the blockage in the hoses and the EVAP canister filter.

   Are the parts OK?

   YES

   Replace the EVAP leak check module .

   NO

   Remove the blockage from them, or replace the part(s) if needed.

DTC P2601

DTC P2601 : Electric Engine Coolant Pump Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2601 Electric Engine Coolant Pump Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Enter the maintenance mode, then start the engine .

   -4. Select the Electric Water Pump TEST in the Function Test Menu with the HDS.

   Electric Water Pump TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2601 Electric Engine Coolant Pump Range/Performance Problem	B	B

   Is DTC P2601 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the electric engine coolant pump and the PCM. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

2. Engine coolant level check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the engine coolant level .

   Is the coolant level appropriate?

   YES

   Replace the electric engine coolant pump .

   NO

   Check the engine coolant leaks .

DTC P2602

DTC P2602 : Electric Engine Coolant Pump Circuit Low Voltage

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	Confirmed DTC	Pending DTC
P2602 Electric Engine Coolant Pump Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Select the Electric Water Pump TEST in the Function Test Menu with the HDS.

   Electric Water Pump TEST

   Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2602 Electric Engine Coolant Pump Circuit Low Voltage	B	B

   Is DTC P2602 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the electric engine coolant pump and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. C1-6**

   Is the fuse OK?

   YES

   Go to step 6.

   NO

   Go to step 3.

3. Relay check

   -1. **Remove the engine EWP relay** .

   -2. **Test the engine EWP relay** .

   Is the relay OK?

YES

Go to step 4.

NO

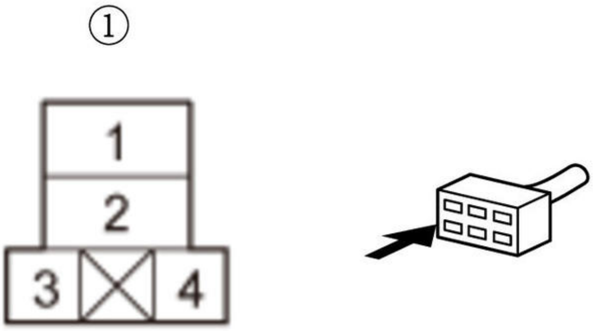
Replace the engine EWP relay. Also replace the **No. C1-6 fuse** .

4. Shorted wire check (+B_ENG_WATER_PUMP line)

-1. Remove the blown **No. C1-6 fuse** .

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected
Test point 1	Engine EWP relay 4P socket (female terminals) No. 1 and No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Go to step 5.

NO

Repair a short in the +B_ENG_WATER_PUMP wire between the No. C1-6 fuse and the engine EWP relay. Also replace the No. C1-6 fuse.

5. Shorted wire check (IG1(EWP)/ENG W/PUMP RLY OUT line)

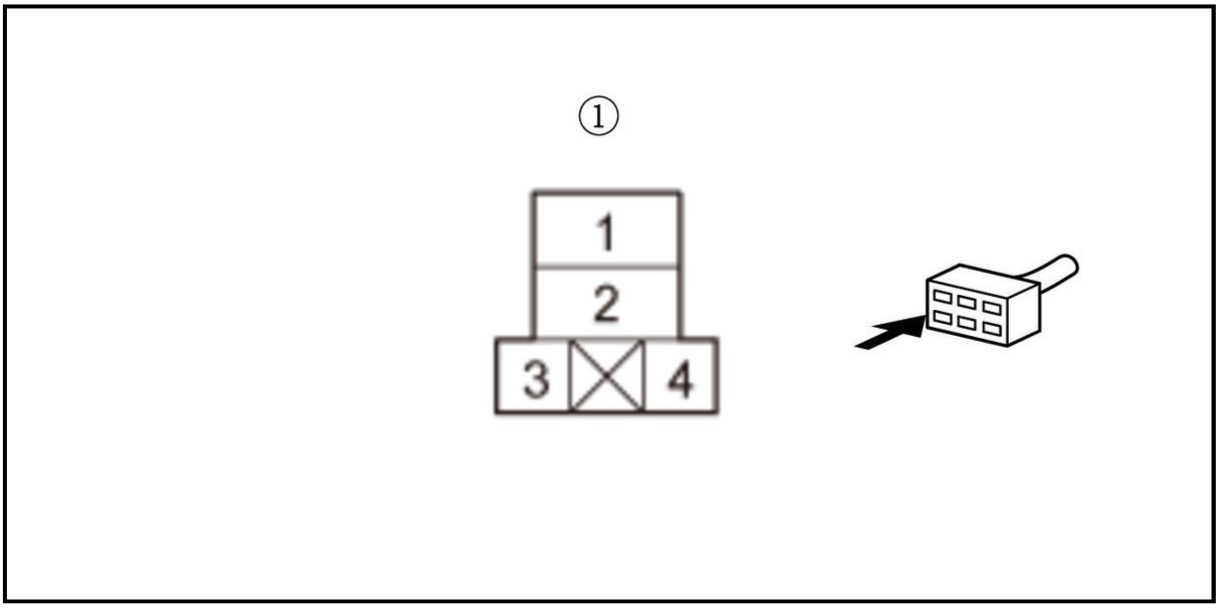
-1. Disconnect the following connector.

Electric engine coolant pump 5P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected

B	Electric engine coolant pump 5P connector: disconnected
Test point 1	Engine EWP relay 4P socket (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Replace the electric engine coolant pump . Also replace the **No. C1-6 fuse** .

NO

Repair a short in the IG1(EWP)/ENG W/PUMP RLY OUT wire between the engine EWP relay and the electric engine coolant pump. Also replace the No. C1-6 fuse.

6. Relay check

-1. **Remove the engine EWP relay** .

-2. **Test the engine EWP relay** .

Is the relay OK?

YES

Go to step 7.

NO

Replace the engine EWP relay.

7. Open wire check (ENG W/PUMP RLY CL- line)

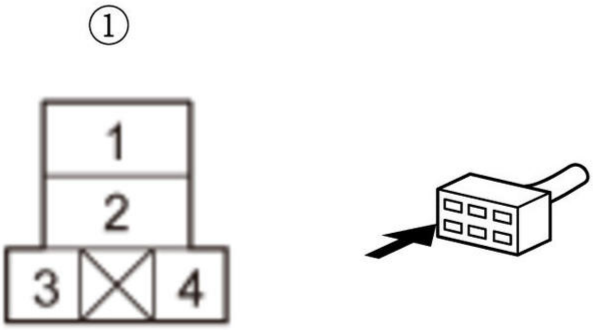
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector A (50P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Engine EWP relay 4P socket (female terminals) No. 4: ①
Test point 2	**PCM connector A (50P) No. 24**



Is there 1.0 Ω or less?

YES

Go to step 8.

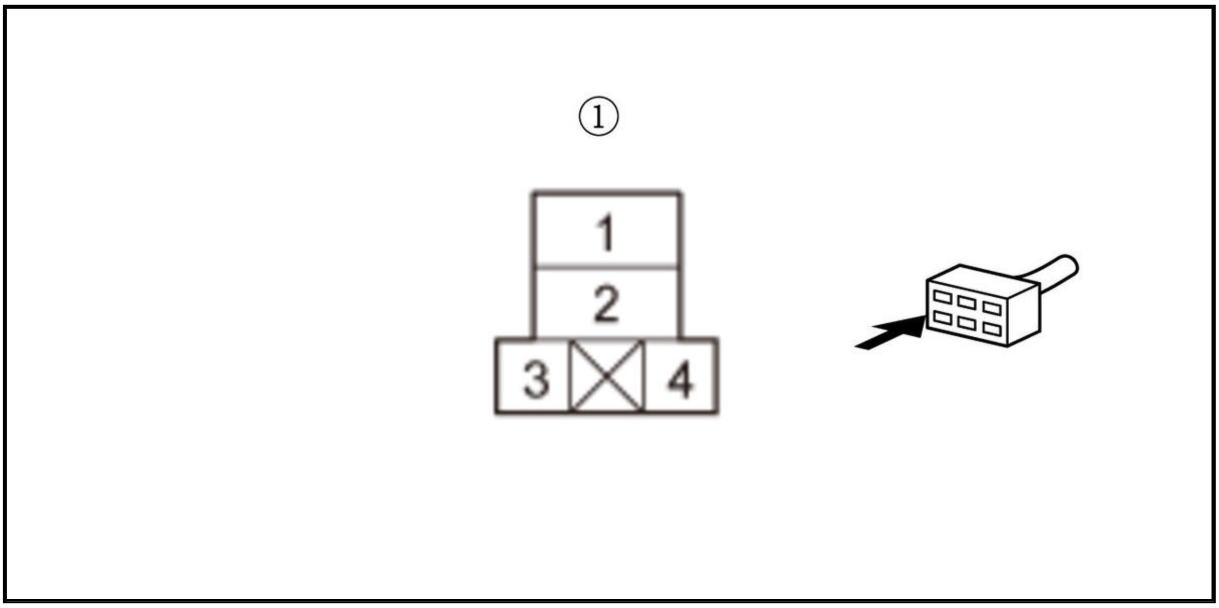
NO

Repair an open in the ENG W/PUMP RLY CL- wire between the PCM (A24) and the engine EWP relay.

8. Open wire check (+B_ENG_WATER_PUMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Engine EWP relay 4P socket (female terminals) No. 1 and No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 9.

NO

Repair an open in the +B_ENG_WATER_PUMP wire between the **No. C1-6 fuse** and the engine EWP relay.

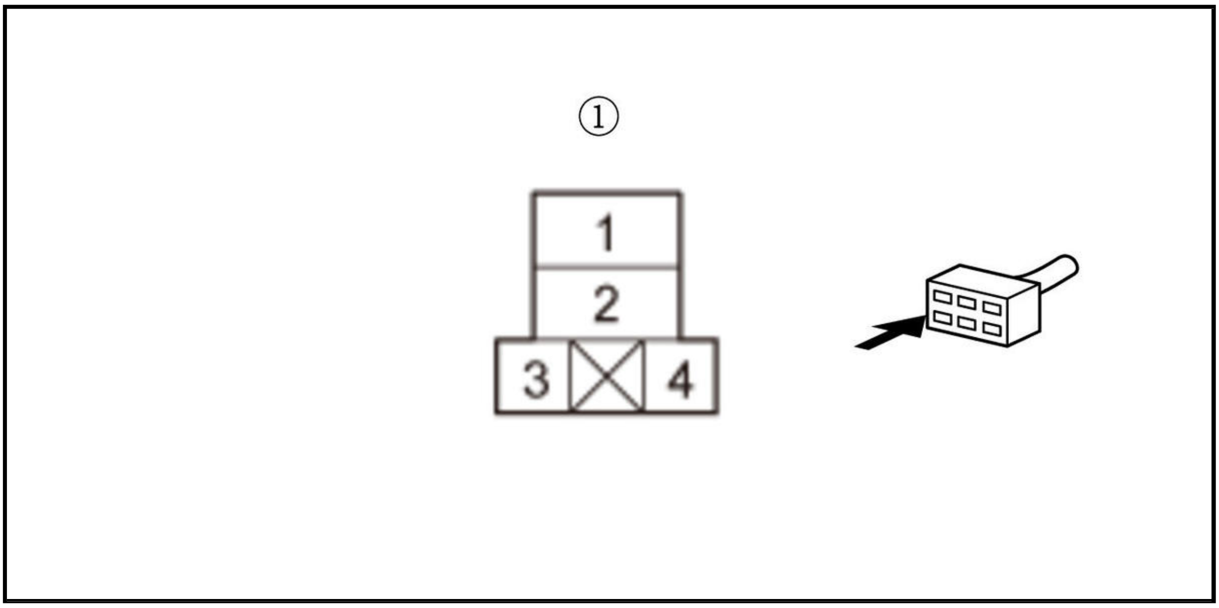
9. Open wire check (IG1(EWP)/ENG W/PUMP RLY OUT line)

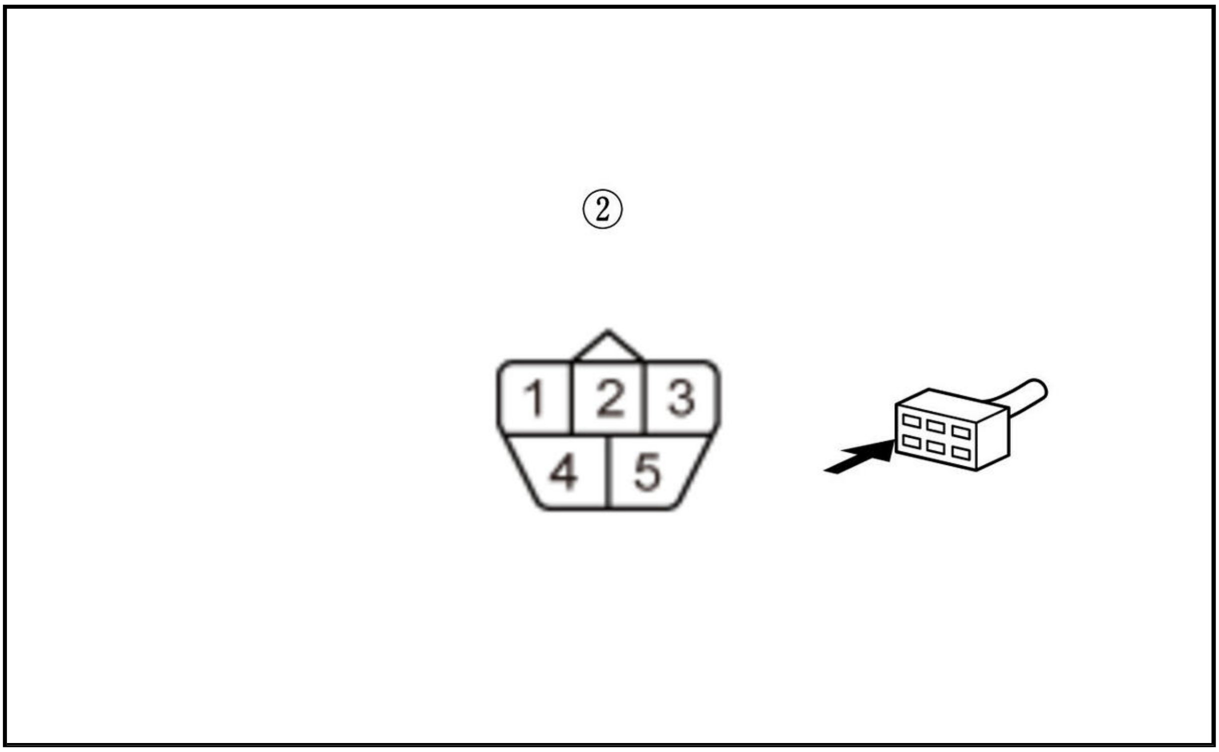
-1. Disconnect the following connector.

Electric engine coolant pump 5P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected
B	PCM connector A (50P): disconnected
B	Electric engine coolant pump 5P connector: disconnected
Test point 1	Engine EWP relay 4P socket (female terminals) No. 2: ①
Test point 2	Electric engine coolant pump 5P connector (female terminals) No. 1: ②





Is there 1.0 Ω or less?

YES

Go to step 10.

NO

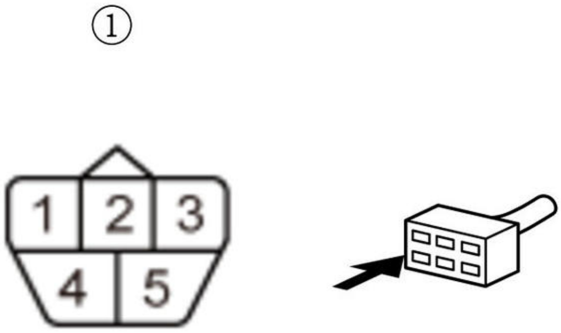
Repair an open in the IG1(EWP)/ENG W/PUMP RLY OUT wire between the engine EWP relay and the electric engine coolant pump.

10. Open wire check (EWP_PG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected
B	PCM connector A (50P): disconnected
B	Electric engine coolant pump 5P connector: disconnected

Test point 1	Electric engine coolant pump 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 11.

NO

Repair an open in the EWP_PG wire between the electric engine coolant pump and G102.

11. Shorted wire check (EWP_C(SWP) line)

-1. Disconnect the following connector.

PCM connector E (80P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected
B	PCM connector A (50P): disconnected
B	Electric engine coolant pump 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 29**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 12.

NO

Repair a short in the EWP_C(SWP) wire between the PCM (E29) and the electric engine coolant pump.

12. Shorted wire check (EWP_REV(NWP) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected
B	PCM connector A (50P): disconnected
B	Electric engine coolant pump 5P connector: disconnected
B	PCM connector E (80P): disconnected

Test point 1	**PCM connector E (80P) No. 60**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The EWP_REV(NWP) wire is not shorted, go to step 13.

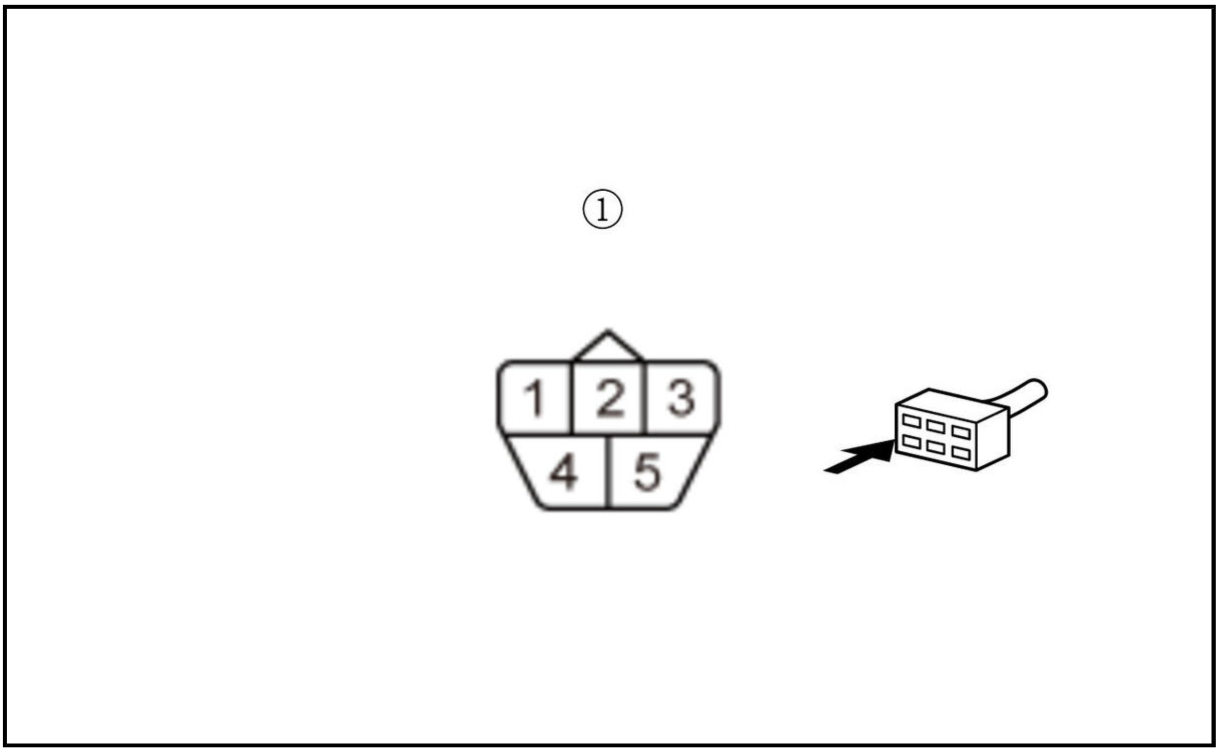
NO

Repair a short in the EWP_REV(NWP) wire between the PCM (E60) and the electric engine coolant pump.

13. Open wire check (EWP_REV(NWP) line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Engine EWP relay: disconnected
B	PCM connector A (50P): disconnected
B	Electric engine coolant pump 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric engine coolant pump 5P connector (female terminals) No. 2: ①
Test point 2	**PCM connector E (80P) No. 60**



Is there 1.0 Ω or less?

YES

The EWP_REV(NWP) wire is OK. Go to step 14.

NO

Repair an open in the EWP_REV(NWP) wire between the PCM (E60) and the electric engine coolant pump.

14. Electric engine coolant pump check

-1. **Substitute a known-good electric engine coolant pump** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. **Enter the maintenance mode, then start the engine** .

-7. Select the Electric Water Pump TEST in the Function Test Menu with the HDS.

Electric Water Pump TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2602 Electric Engine Coolant Pump Circuit Low Voltage	B	B

Is DTC P2602 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original electric engine coolant pump .

DTC P2603

DTC P2603 : Electric Engine Coolant Pump Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2603 Electric Engine Coolant Pump Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Select the Electric Water Pump TEST in the Function Test Menu with the HDS.

Electric Water Pump TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2603 Electric Engine Coolant Pump Circuit High Voltage	B	B

Is DTC P2603 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the electric engine coolant pump and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Open wire check (EWP_C(SWP) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

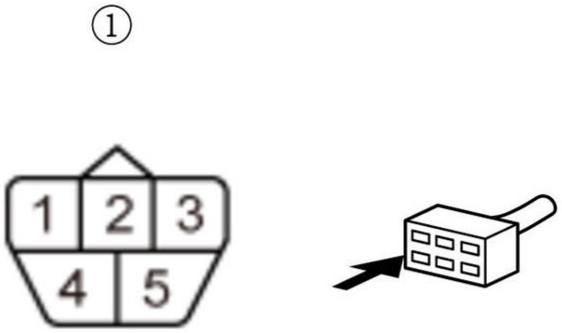
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

Electric engine coolant pump 5P connector
PCM connector E (80P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric engine coolant pump 5P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Electric water pump 5P connector (female terminals) No. 4: ①
Test point 2	**PCM connector E (80P) No. 29**



Is there 1.0 Ω or less?

YES

Go to step 3.

NO

Repair an open in the EWP_C(SWP) wire between the PCM (E29) and the electric engine coolant pump.

3. Electric engine coolant pump check

-1. **Substitute a known-good electric engine coolant pump** .

-2. Reconnect all connectors.

-3. Exit the SCS mode with the HDS.

-4. Turn the vehicle to the ON mode.

-5. Clear the DTC with the HDS.

-6. **Enter the maintenance mode, then start the engine** .

-7. Select the Electric Water Pump TEST in the Function Test Menu with the HDS.

Electric Water Pump TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2603 Electric Engine Coolant Pump Circuit High Voltage	B	B

Is DTC P2603 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Replace the original electric engine coolant pump .

DTC P2610

DTC P2610 : PCM Ignition Off Internal Timer Malfunction

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2610 PCM Ignition Off Internal Timer Malfunction	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, and wait more than 10 seconds.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2610 PCM Ignition Off Internal Timer Malfunction	B	B

Is DTC P2610 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Intermittent failure, the system is OK at this time. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC P2646

DTC P2646 : Rocker Arm Oil Pressure Stuck Off

Special Tools Required

Pressure Gauge Adapter 07NAJ-P07010A

A/T Low Pressure Gauge w/Panel 07406-0070301

A/T Pressure Test Hose 07AAJ-PY4A100

A/T Pressure Adapter 07MAJ-PY40120

Oil Pressure Hose 07ZAJ-S5AA200

NOTE:

- **How to read the torque specifications** .
- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P055C, P2648, and/or P2649 are stored at the same time as DTC P2646, troubleshoot those DTCs first, then recheck for DTC P2646.

DTC Description	Confirmed DTC	Pending DTC
P2646 Rocker Arm Oil Pressure Stuck Off	B	B

DTC (PGM-FI)

1. Oil level check

   -1. **Check the engine oil level** .

   Is the level OK?

   YES

   Go to step 2.

   NO

   Adjust the engine oil to the proper level .

2. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Select the VTEC TEST in the Function Test Menu with the HDS.

   VTEC TEST

   Is the result OK?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

   NO

The failure is duplicated. Go to step 3.

3. DTC check

   -1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P055C Rocker Arm Oil Pressure Sensor Low Voltage	B	B
P2648 Rocker Arm Oil Control Solenoid Circuit Low Voltage	B	B

   Is DTC P055C and/or P2648 indicated?

   YES

   Go to the indicated DTC's troubleshooting.

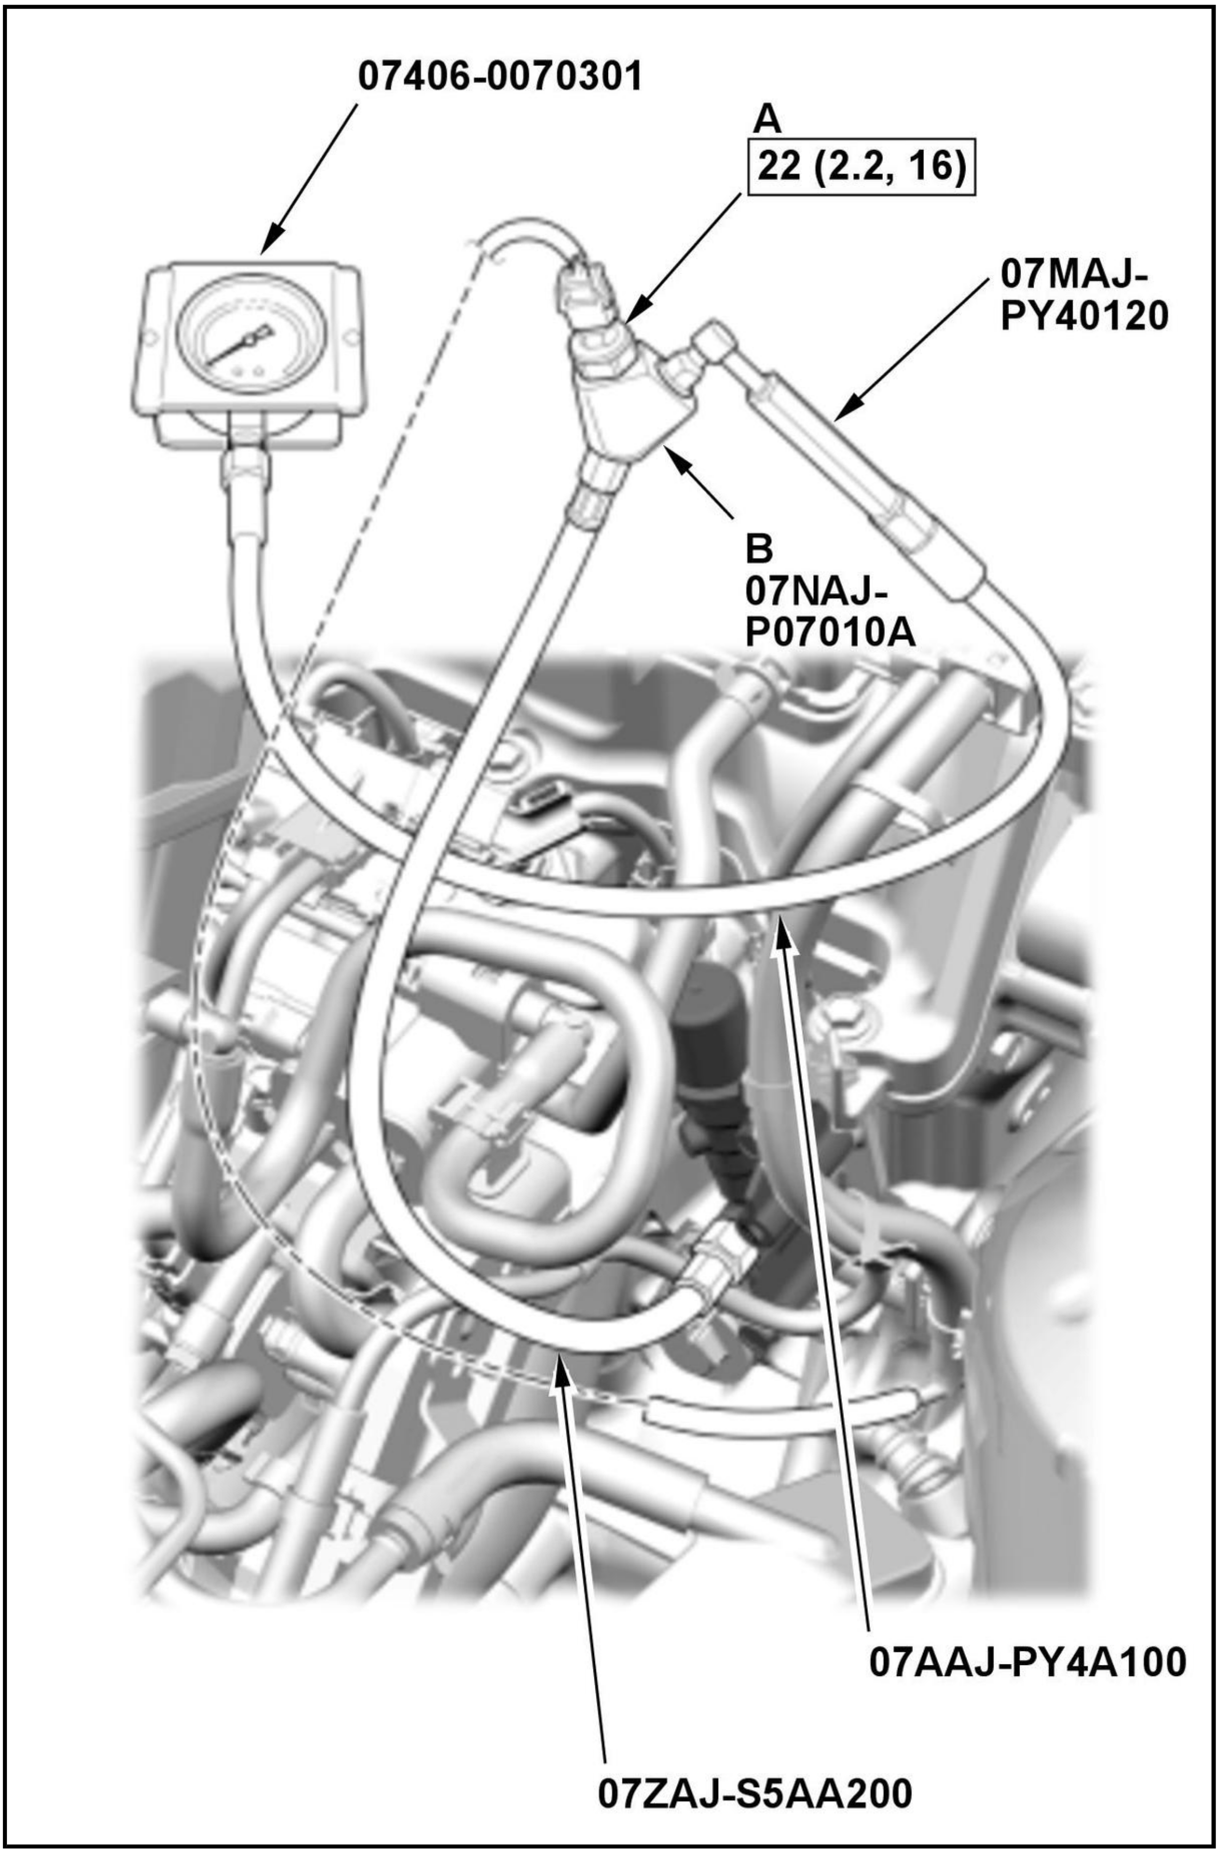
   NO

   Go to step 4.

4. VTEC system oil pressure check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the rocker arm oil pressure sensor (A), and attach the special tools as shown, then attach the rocker arm oil pressure sensor to the oil pressure gauge adapter (B).



07406-0070301

-3. Reconnect the following connector.

Rocker arm oil pressure sensor 3P connector

-4. **Enter the maintenance mode, then start the engine** .

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Select the VTEC TEST in the Function Test Menu with the HDS.

VTEC TEST

Check the oil pressure while the status of VTEC solenoid valve on the HDS display is ON.

Is the oil pressure 49 kPa (0.50 kgf/cm 2, 7.1 psi) or more?

YES

Replace the rocker arm oil pressure sensor .

NO

Inspect the VTEC system oil passage. If it is OK, **replace the rocker arm oil control valve** .

DTC P2647

DTC P2647 : Rocker Arm Oil Pressure Stuck On

Special Tools Required

Pressure Gauge Adapter 07NAJ-P07010A

A/T Low Pressure Gauge w/Panel 07406-0070301

A/T Pressure Test Hose 07AAJ-PY4A100

NOTE:

- **How to read the torque specifications** .
- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P055D, P2648, and/or P2649 are stored at the same time as DTC P2647, troubleshoot those DTCs first, then recheck for DTC P2647.

DTC Description	Confirmed DTC	Pending DTC
P2647 Rocker Arm Oil Pressure Stuck On	B	B

DTC (PGM-FI)

1. Oil level check

-1. **Check the engine oil level** .

Is the level OK?

YES

Go to step 2.

NO

Adjust the engine oil to the proper level .

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Select the VTEC TEST in the Function Test Menu with the HDS.

VTEC TEST

Is the result OK?

YES

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

NO

The failure is duplicated. Go to step 3.

3. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P055D Rocker Arm Oil Pressure Sensor High Voltage	B	B
P2649 Rocker Arm Oil Control Solenoid Circuit High Voltage	B	B

Is DTC P055D and/or P2649 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 4.

4. VTEC system oil pressure check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the rocker arm oil pressure sensor (A), and attach the special tools as shown, then attach the rocker arm oil pressure sensor to the oil pressure gauge adapter (B).

-3. Reconnect the following connector.

Rocker arm oil pressure sensor 3P connector

-4. **Enter the maintenance mode, then start the engine** .

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Select the VTEC TEST in the Function Test Menu with the HDS.

VTEC TEST

Check the oil pressure while the status of VTEC solenoid valve on the HDS display is OFF.

Is the oil pressure 49 kPa (0.50 kgf/cm 2, 7.1 psi) or more?

YES

Inspect the VTEC system oil passage. If it is OK, **replace the rocker arm oil control valve** .

NO

Replace the rocker arm oil pressure sensor .

DTC P2648

DTC P2648 : Rocker Arm Oil Control Solenoid Circuit Low Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2648 Rocker Arm Oil Control Solenoid Circuit Low Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Select the VTEC TEST in the Function Test Menu with the HDS.

VTEC TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2648 Rocker Arm Oil Control Solenoid Circuit Low Voltage	B	B

Is DTC P2648 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Rocker arm oil control solenoid internal resistance check

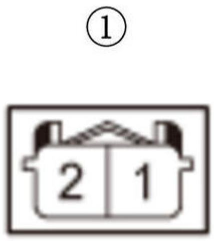
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rocker arm oil control solenoid 2P connector

-3. At the rocker arm oil control solenoid side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
Test point 1	Rocker arm oil control solenoid 2P connector (male terminals) No. 1 (solenoid side): ①
Test point 2	Rocker arm oil control solenoid 2P connector (male terminals) No. 2 (solenoid side): ①



Is there 14.6-16.2 Ω at room temperature?

YES

Go to step 3.

NO

Replace the rocker arm oil control valve .

3. Shorted wire check (VTS line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected

B	PCM connector E (80P): disconnected
Test point 1	**PCM connector E (80P) No. 65**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The VTS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair a short in the VTS wire between the PCM (E65) and the rocker arm oil control solenoid.

DTC P2649

DTC P2649 : Rocker Arm Oil Control Solenoid Circuit High Voltage

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2649 Rocker Arm Oil Control Solenoid Circuit High Voltage	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Enter the maintenance mode, then start the engine** .

-4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-5. Select the VTEC TEST in the Function Test Menu with the HDS.

VTEC TEST

Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2649 Rocker Arm Oil Control Solenoid Circuit High Voltage	B	B

Is DTC P2649 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil control solenoid and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Rocker arm oil control solenoid internal resistance check

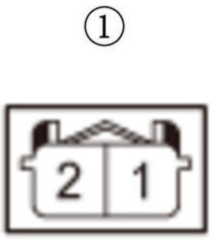
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Rocker arm oil control solenoid 2P connector

-3. At the rocker arm oil control solenoid side, measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
Test point 1	Rocker arm oil control solenoid 2P connector (male terminals) No. 1 (solenoid side): ①
Test point 2	Rocker arm oil control solenoid 2P connector (male terminals) No. 2 (solenoid side): ①



Is there 14.6-16.2 Ω at room temperature?

YES

Go to step 3.

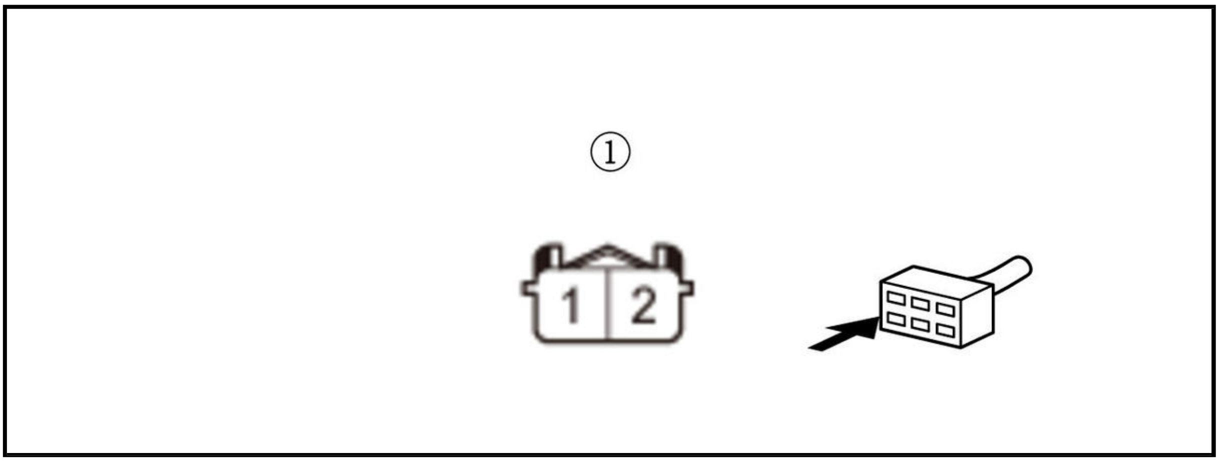
NO

Replace the rocker arm oil control valve .

3. Open wire check (PG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
Test point 1	Rocker arm oil control solenoid 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Go to step 4.

NO

Repair an open in the PG wire between the rocker arm oil control solenoid and the G101.

4. Open wire check (VTS line)

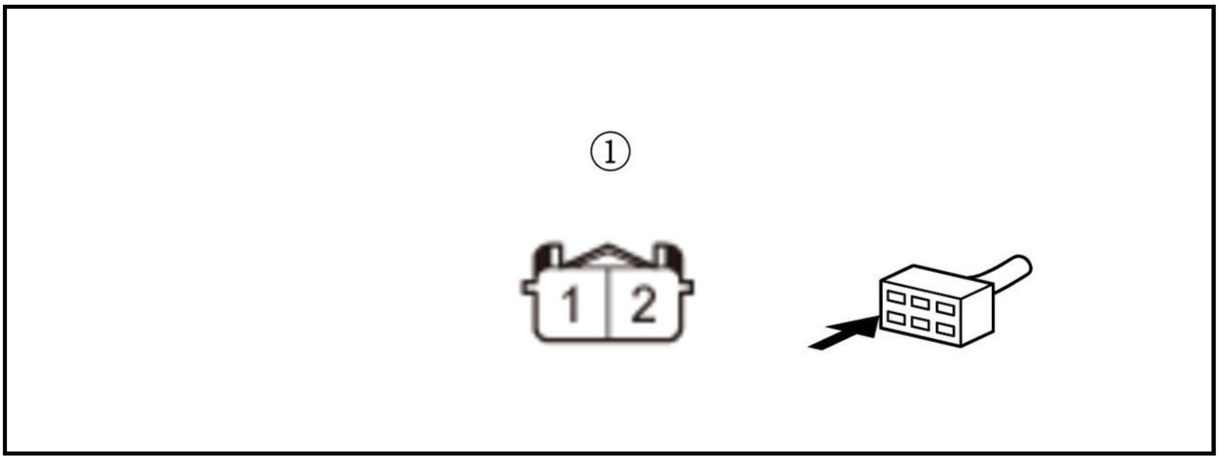
-1. Jump the SCS line with the HDS, and wait more than 1 minute.

-2. Disconnect the following connector.

PCM connector E (80P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Rocker arm oil control solenoid 2P connector: disconnected
B	PCM connector E (80P): disconnected
Test point 1	Rocker arm oil control solenoid 2P connector (female terminals) No. 1: ①
Test point 2	**PCM connector E (80P) No. 65**



Is there 1.0 Ω or less?

YES

The VTS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the VTS wire between the PCM (E65) and the rocker arm oil control solenoid.

DTC P26C3

DTC P26C3 : Internal Control Module Transmission Range Sensor Performance

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P26C3 Internal Control Module Transmission Range Sensor Performance	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. While depressing the brake pedal, test the electronic gear selector switches as follows:

- Shift the transmission position/mode to other than R, and wait for at least 1 minute.
- Switch position/mode back and forth between other than R and R at least 10 times.
- Shift the transmission position/mode to other than N, and wait for at least 1 minute.
- Switch position/mode back and forth between other than N and N at least 10 times.
- Shift the transmission position/mode to other than D, and wait for at least 1 minute.
- Switch position/mode back and forth between other than D and D at least 10 times.

-4. Monitor the OBD STATUS for P26C3 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P26C3 Internal Control Module Transmission Range Sensor Performance	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Faulty SBW shifter control module. **Replace the SBW shifter assembly** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot. If the HDS indicates NOT COMPLETED, go to step 1

DTC P271A

DTC P271A : Park Pawl Position Sensor A Circuit Low

Special Tools Required

SPLINE HOLDER, DETENT SHAFT 070AB-5M50100

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P271A Park Pawl Position Sensor A Circuit Low	B	B	B

DTC (Gear)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

   -5. With the brake pedal pressed and the accelerator released, shift the transmission to N position/mode, then shift back to P position/mode, and wait for at least 5 seconds.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P271A Park Pawl Position Sensor A Circuit Low	B	B	B

   Is DTC P271A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park pawl actuator and the park pawl actuator driver unit. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (RA line, RB line to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

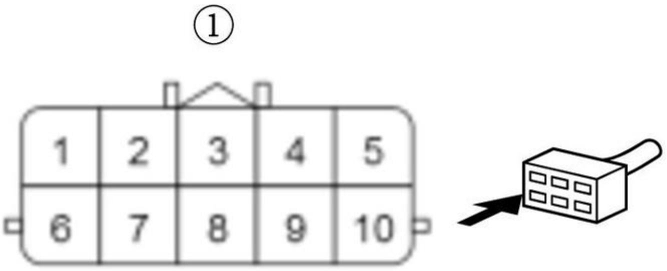
Park pawl actuator 10P connector
Park pawl actuator driver unit 26P connector

   -3. Measure the voltage between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected

Connector	Terminal
Park pawl actuator 10P connector (female terminals): ①	No. 3

Connector	Terminal
	No. 5



Is there voltage?

YES

Repair a short to power in the RA wire and/or the RB wire between the park pawl actuator and the park pawl actuator driver unit.

NO

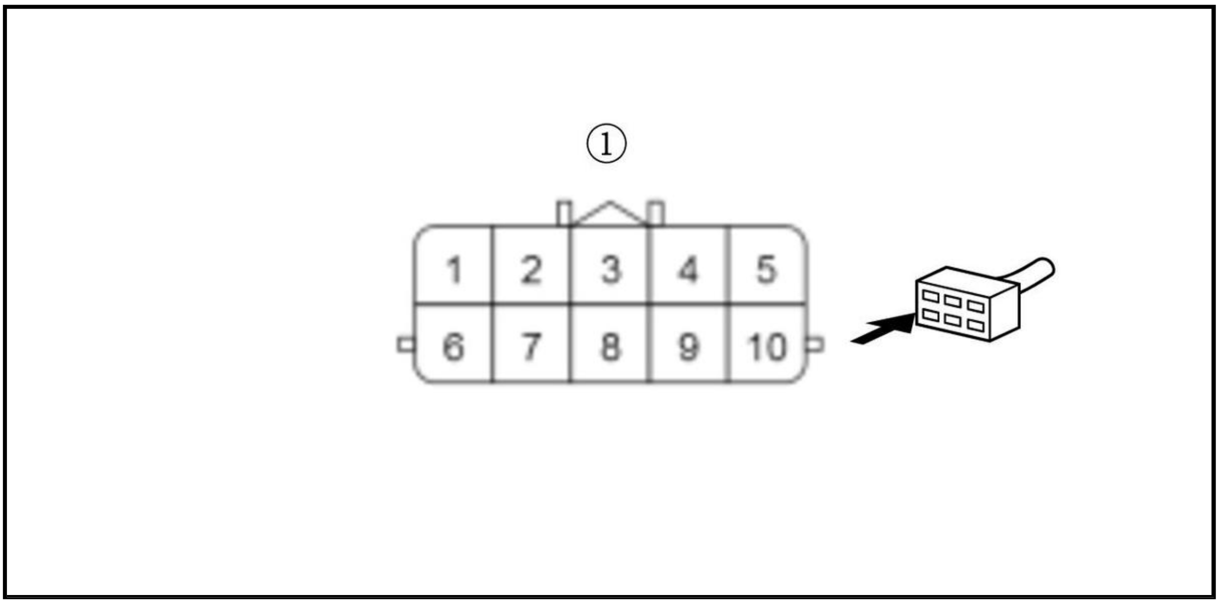
The RA wire and/or the RB wire are not shorted to power. Go to step 3.

3. Shorted wire check (RA line, RB line to ground)

-1. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected

Connector	Terminal
Park pawl actuator 10P connector (female terminals): ①	No. 3
	No. 5



Is there 1 MΩ or more?

YES

The RA wire and/or the RB wire are not shorted to ground. Go to step 4.

NO

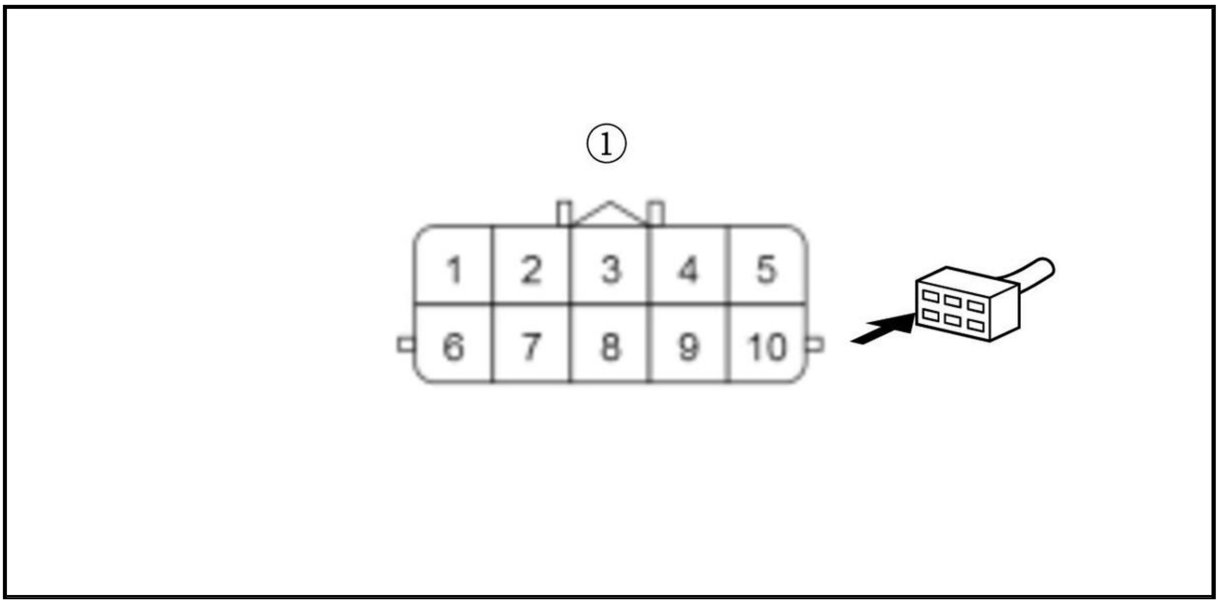
Repair a short to ground in the RA wire and/or the RB wire between the park pawl actuator and the park pawl actuator driver unit.

4. Open wire check (RA/P-ACT_RA line, RB/P-ACT_RB line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	Park pawl actuator 10P connector (female terminals) No. 3: ①
Test point 2	**Park pawl actuator driver unit 26P connector No. 22**

Test point 1	Park pawl actuator 10P connector (female terminals) No. 5: ①
Test point 2	**Park pawl actuator driver unit 26P connector No. 21**



Is there 1.0 Ω or less?

YES

The RA/P-ACT_RA wire and the RB/P-ACT_RB wire are OK. Go to step 5.

NO

Repair an open in the RA/P-ACT_RA wire and/or the RB/P-ACT_RB wire between the park pawl actuator and the park pawl actuator driver unit.

5. Shorted wire check (EENC/P-ACT EENC line to power)

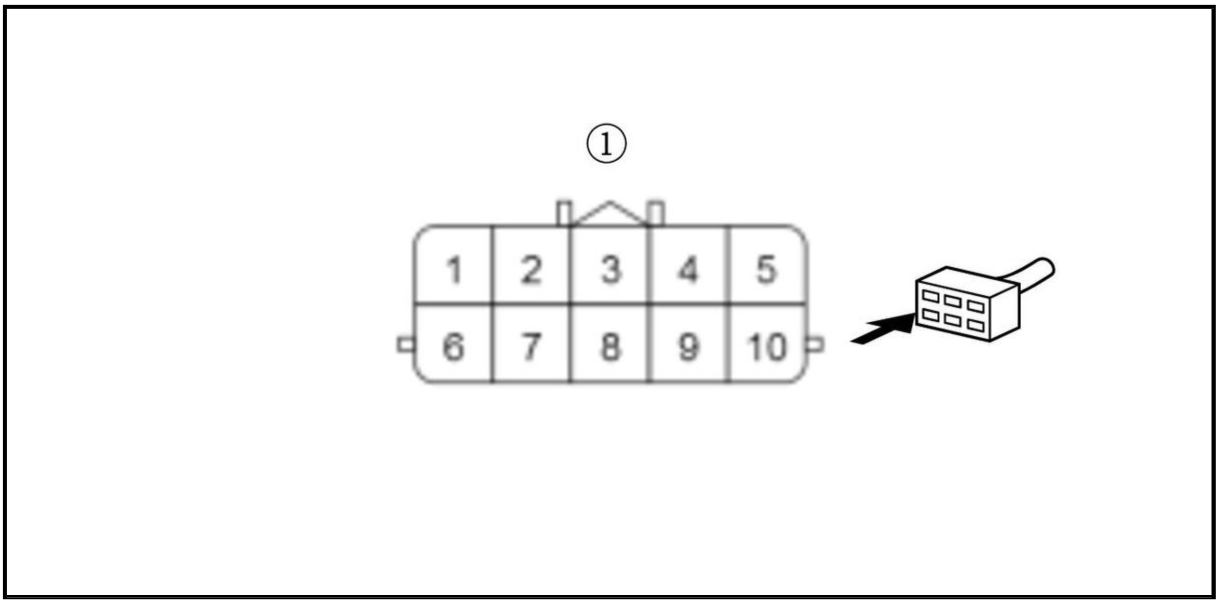
-1. Connect the following connector.

Park pawl actuator driver unit 26P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Park pawl actuator 10P connector: disconnected
Test point 1	Park pawl actuator 10P connector (female terminals) No. 8: ①
Test point 2	Body ground



Is there voltage?

YES

Repair a short to power in the EENC/P-ACT EENC wire between the park pawl actuator and the park pawl actuator driver unit.

NO

The EENC/P-ACT EENC wire is not shorted to power. Go to step 6.

6. Open wire check (EENC/P-ACT_EENC line, VENC/P-ACT_VENC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

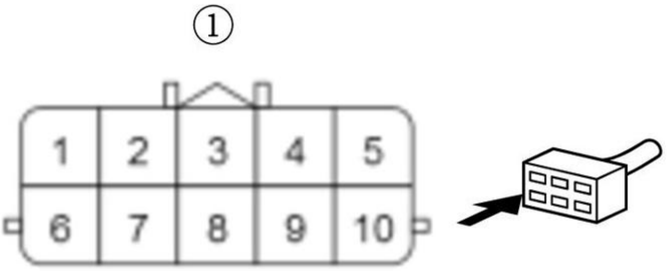
Park pawl actuator driver unit 26P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	Park pawl actuator 10P connector (female terminals) No. 8: ①

Test point 2	**Park pawl actuator driver unit 26P connector No. 19**

Test point 1	Park pawl actuator 10P connector (female terminals) No. 9: ①
Test point 2	**Park pawl actuator driver unit 26P connector No. 20**



Is there 1.0 Ω or less?

YES

The EENC/P-ACT_EENC wire and the VENC/P-ACT_VENC wire are not open. Go to step 7.

NO

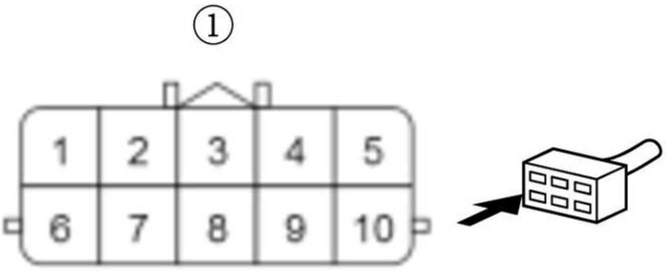
Repair an open in the EENC/P-ACT_EENC wire and/or the VENC/P-ACT_VENC wire between the park pawl actuator and the park pawl actuator driver unit.

7. Shorted wire check (EENC line, VENC line)

-1. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected

Connector	Terminal
Park pawl actuator 10P connector (female terminals): ①	No. 8
	No. 9



Is there 1 MΩ or more?

YES

The EENC wire and the VENC wire are OK. Go to step 8.

NO

Repair a short to ground in the EENC wire and/or the VENC wire between the park pawl actuator and the park pawl actuator driver unit.

8. Park pawl actuator driver unit check

-1. **Substitute a known-good park pawl actuator driver unit** .

-2. Connect the following connectors.

Park pawl actuator 10P connector
Park pawl actuator driver unit 26P connector

-3. Turn the vehicle to the ON mode.

-4. **Update the park pawl actuator driver unit** .

WARNING: **Do not turn the vehicle to the OFF (LOCK) mode. Turing the vehicle to the OFF (LOCK) mode during an update can damage the park pawl actuator driver unit.**

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait for at least 5 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P271A Park Pawl Position Sensor A Circuit Low	B	B	B

Is DTC P271A indicated?

YES

The park pawl actuator driver unit is OK. Go to step 9.

NO

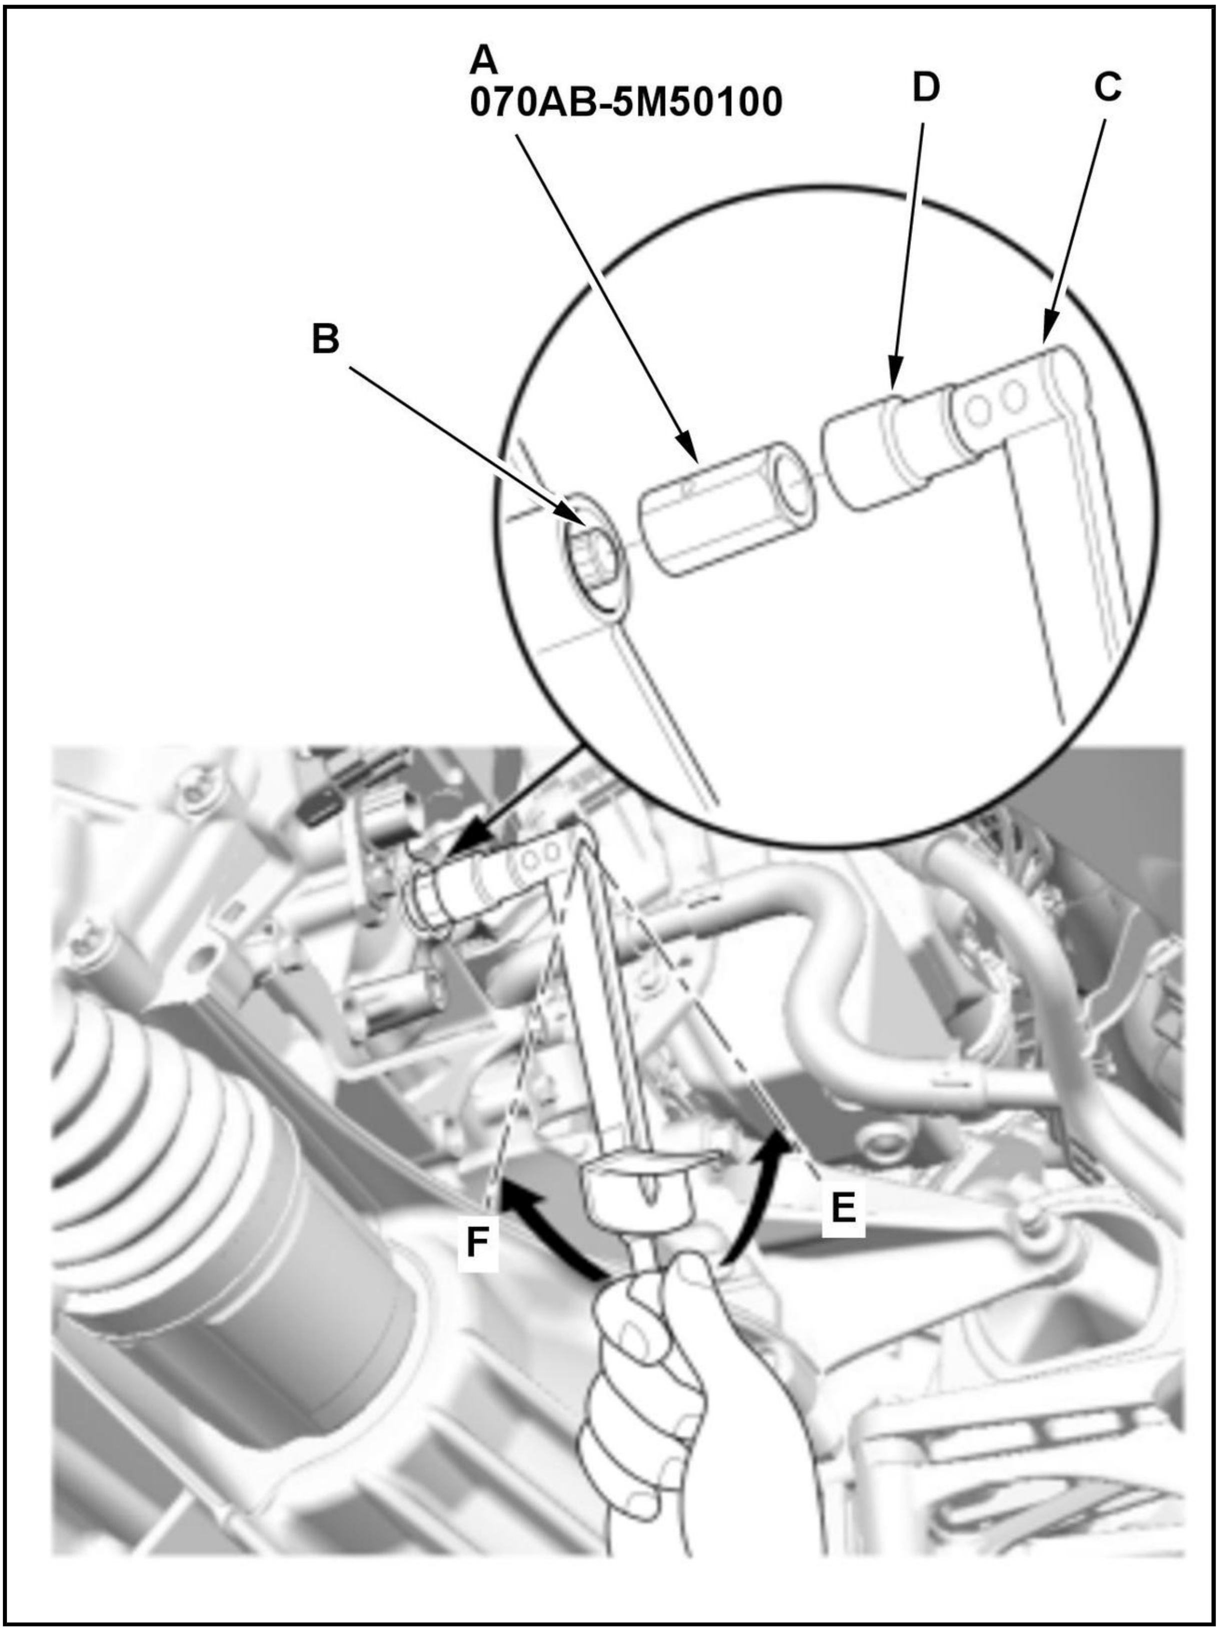
Replace the original park pawl actuator driver unit .

9. Transmission park mechanism check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the park pawl actuator** .

-3. Set the detent shaft spline holder (A) to the detent shaft (B).



-4. Use a torque wrench (C) and the socket (D) to rotate the detent shaft, and check that the detent shaft moves smoothly. Move it back and forth between the P position (E) and the P released position (F) several times.

- -

  Operation angle: approx. 21 deg.

- -

  Operation torque: approx. 4.0 N.m (0.41 kgf.m, 3.0 lbf.ft)

-5. Check that the wheels are locked when putting the detent shaft in the P position. Additionally, check that the wheels rotate when putting the detent shaft in the P released position.

Is the transmission park mechanism OK?

YES

The transmission park mechanism is OK. Put the detent shaft in the P position, and **replace the park pawl actuator** .

NO

Faulty transmission park mechanism. **Replace the transmission (e-CVT)** .

DTC P272C

DTC P272C : Park Pawl Motor Control Circuit

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P272C Park Pawl Motor Control Circuit	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P272C Park Pawl Motor Control Circuit	B	B	B

Is DTC P272C indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park pawl actuator and the park pawl actuator driver unit. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (MAU/P-ACT MTR U line, MAV/P-ACT MTR V line, MAW/P-ACT MTR W line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

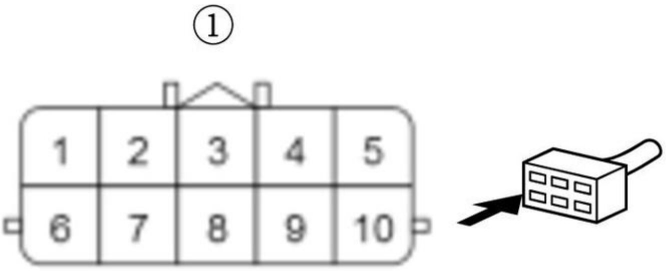
-2. Disconnect the following connectors.

Park pawl actuator 10P connector
Park pawl actuator driver unit 26P connector

-3. Measure the voltage between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected

Connector	Terminal
Park pawl actuator 10P connector (female terminals): ①	No. 1
	No. 6
	No. 7



Is there voltage?

YES

Repair a short to power in the MAU/P-ACT MTR U wire, the MAV/P-ACT MTR V wire, and/or the MAW/P-ACT MTR W wire between the park pawl actuator and the park pawl actuator driver unit.

NO

The MAU/P-ACT MTR U wire, MAV/P-ACT MTR V wire, and/or MAW/P-ACT MTR W wire are not shorted to power. Go to step 3.

3. Park pawl actuator driver unit check

-1. **Substitute a known-good park pawl actuator driver unit** .

-2. Connect the following connectors.

Park pawl actuator 10P connector
Park pawl actuator driver unit 26P connector

-3. Turn the vehicle to the ON mode.

-4. **Update the park pawl actuator driver unit** .

WARNING: **Do not turn the vehicle to the OFF (LOCK) mode. Turing the vehicle to the OFF (LOCK) mode during an update can damage the park pawl actuator driver unit.**

-5. Clear the DTC with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode.

-7. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-8. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P272C Park Pawl Motor Control Circuit	B	B	B

Is DTC P272C indicated?

YES

The park pawl actuator driver unit is OK. Replace the park pawl actuator .

NO

Replace the original park pawl actuator driver unit .

DTC P272D

DTC P272D : Park Pawl Motor Control Circuit Current Too High

NOTE: Before you troubleshoot, review the General Troubleshooting Information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P272D Park Pawl Motor Control Circuit Current Too High	B	B	B

DTC (Gear)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 10 seconds.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P272D Park Pawl Motor Control Circuit Current Too High	B	B	B

Is DTC P272D indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the park pawl actuator and the park pawl actuator driver unit. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A2-6

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short to ground in the fuse circuit.

3. Determine possible failure area (park pawl actuator relay circuit, others)

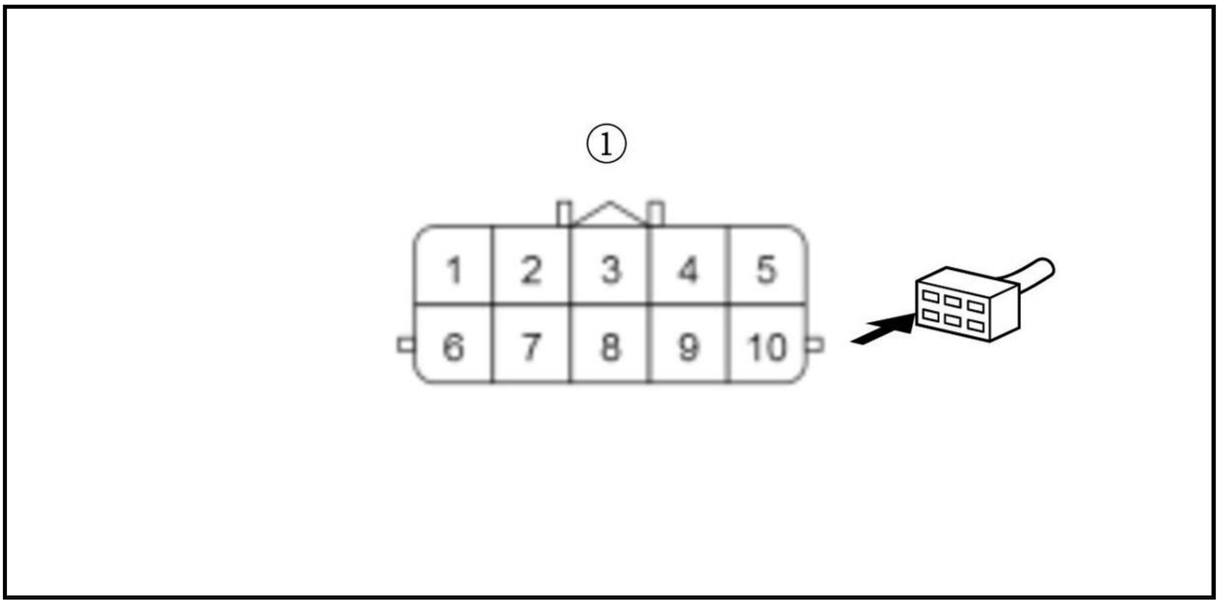
-1. Disconnect the following connector.

Park pawl actuator 10P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Park pawl actuator 10P connector: disconnected
Test point 1	Park pawl actuator 10P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (MAU/P-ACT MTR U line, MAV/P-ACT MTR V line, MAW/P-ACT MTR W line)

-1. Turn the vehicle to the OFF (LOCK) mode.

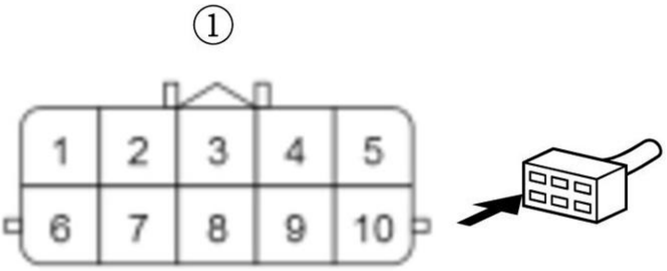
-2. Disconnect the following connector.

Park pawl actuator driver unit 26P connector

-3. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected

Connector	Terminal
Park pawl actuator 10P connector (female terminals): ①	No. 1
	No. 6
	No. 7



Is there 1 MΩ or more?

YES

The MAU/P-ACT MTR U wire, MAV/P-ACT MTR V wire, and/or MAW/P-ACT MTR W wire are not shorted to ground. Go to step 5.

NO

Repair a short to ground in the MAU wire, the MAV wire, and/or the MAW wire between the park pawl actuator and the park pawl actuator driver unit.

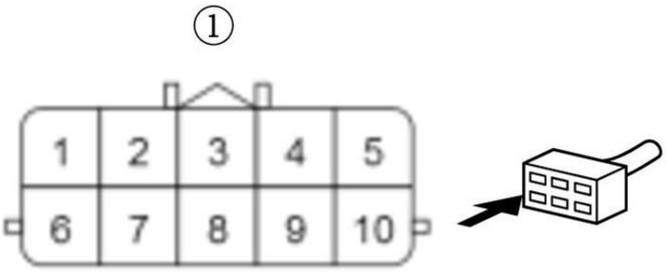
5. Open wire check (MAU/P-ACT_MTR_U line, MAV/P-ACT_MTR_V line, MAW/P-ACT_MTR_W line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	Park pawl actuator 10P connector (female terminals) No. 1: ①
Test point 2	**Park pawl actuator driver unit 26P connector No. 6**

Test point 1	Park pawl actuator 10P connector (female terminals) No. 6: ①
Test point 2	**Park pawl actuator driver unit 26P connector No. 5**

Test point 1	Park pawl actuator 10P connector (female terminals) No. 7: ①
Test point 2	**Park pawl actuator driver unit 26P connector No. 4**



Is there 1.0 Ω or less?

YES

The MAU/P-ACT_MTR_U wire, the MAV/P-ACT_MTR_V wire, and the MAW/P-ACT_MTR_W wire are OK. Go to step 6.

NO

Repair an open in the MAU/P-ACT_MTR_U wire, the MAV/P-ACT_MTR_V wire, and/or the MAW/P-ACT_MTR_W wire between the park pawl actuator and the park pawl actuator driver unit.

6. Park pawl actuator check

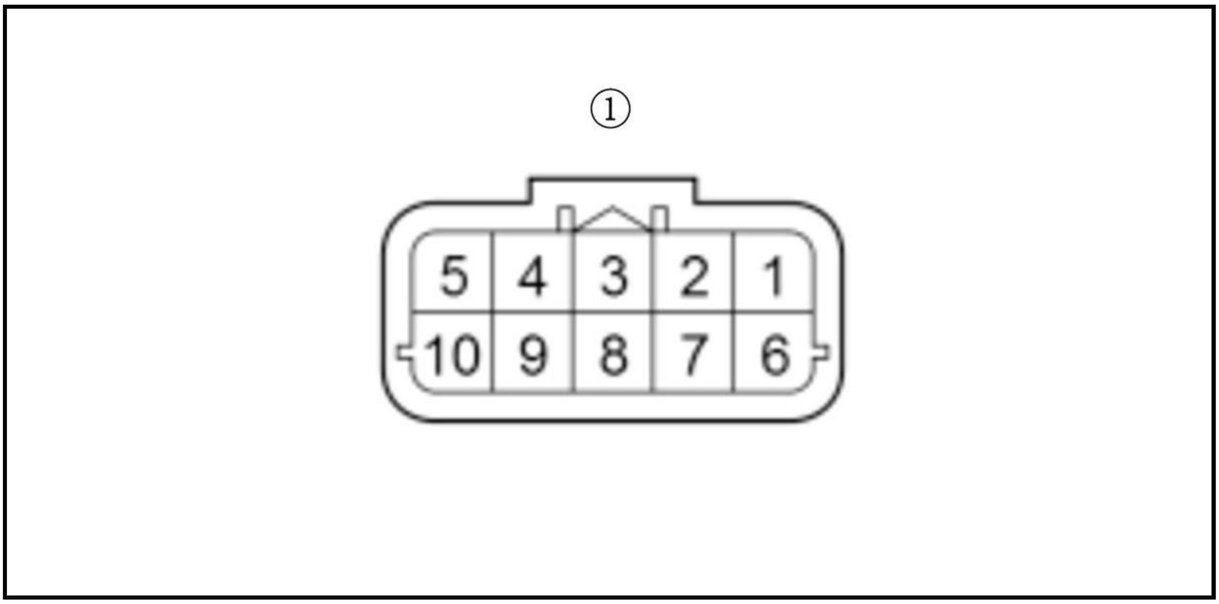
-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected

Test point 1	Park pawl actuator 10P connector (male terminals) No. 2: ①
Test point 2	Park pawl actuator 10P connector (male terminals) No. 1: ①

Test point 1	Park pawl actuator 10P connector (male terminals) No. 2: ①
Test point 2	Park pawl actuator 10P connector (male terminals) No. 6: ①

Test point 1	Park pawl actuator 10P connector (male terminals) No. 2: ①
Test point 2	Park pawl actuator 10P connector (male terminals) No. 7: ①



Is there 10 kΩ or more?

YES

Replace the park pawl actuator .

NO

The park pawl actuator is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the park pawl actuator driver unit** .

7. Park pawl actuator relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the park pawl actuator relay** .

-3. **Test the park pawl actuator relay** .

Is the relay OK?

YES

The park pawl actuator relay is OK. Keep the relay removed, and go to step 8.

NO

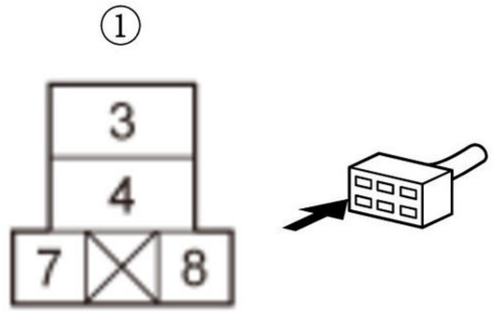
Replace the park pawl actuator relay.

8. Open wire check (+B_P-ACT line)

-1. Measure the voltage between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator relay: disconnected
B	Park pawl actuator 10P connector: disconnected

Connector	**Terminal**
Park pawl actuator relay 4P socket (female terminals): ①	No. 3
	No. 7



Is there battery voltage?

YES

The +B_P-ACT wire is OK. Go to step 9.

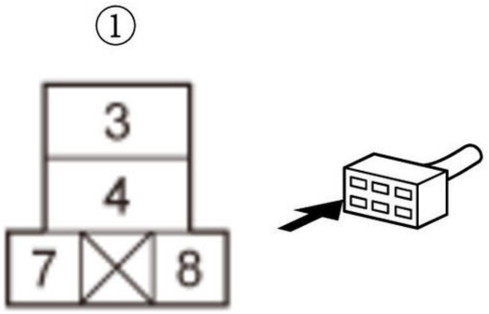
NO

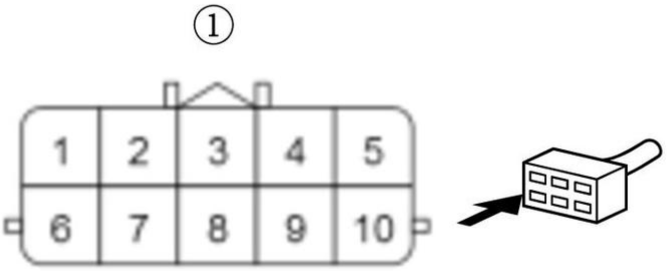
Repair an open in the +B_P-ACT wire between the park pawl actuator relay and the under-hood fuse/relay box.

9. Open wire check (P-ACT_RLY_OUT/BMA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator relay: disconnected
B	Park pawl actuator 10P connector: disconnected
Test point 1	Park pawl actuator relay 4P socket (female terminals) No. 4: ①
Test point 2	Park pawl actuator 10P connector (female terminals) No. 2: ②





Is there 1.0 Ω or less?

YES

The P-ACT_RLY_OUT/BMA wire is OK. Go to step 10.

NO

Repair an open in the P-ACT_RLY OUT/BMA wire between the park pawl actuator relay and the park pawl actuator.

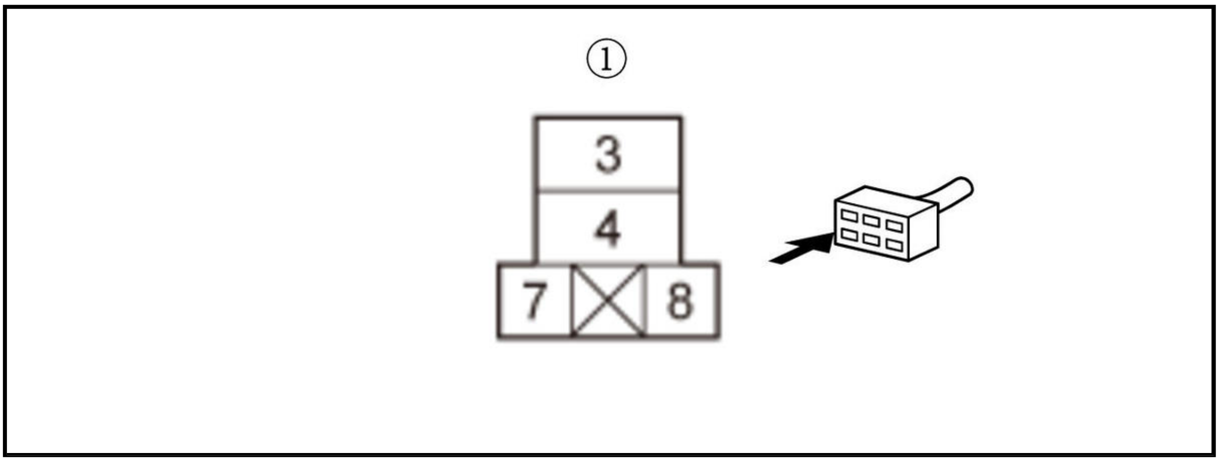
10. Open wire check (P-ACT_RLY_CL- line)

-1. Disconnect the following connector.

Park pawl actuator driver unit 26P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator relay: disconnected
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected
Test point 1	Park pawl actuator relay 4P socket (female terminals) No. 8: ①
Test point 2	**Park pawl actuator driver unit 26P connector No. 23**



Is there 1.0 Ω or less?

YES

The P-ACT_RLY_CL- wire is not open. Go to step 11.

NO

Repair an open in the P-ACT_RLY_CL- wire between the park pawl actuator relay and the park pawl actuator driver unit.

11. Shorted wire check (P-ACT_RLY_CL- line to power)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Park pawl actuator relay: disconnected
B	Park pawl actuator 10P connector: disconnected
B	Park pawl actuator driver unit 26P connector: disconnected

Test point 1	**Park pawl actuator driver unit 26P connector No. 23**
Test point 2	Body ground

Is there battery voltage?

YES

Repair a short to power in the P-ACT_RLY_CL- wire between the park pawl actuator relay and the park pawl actuator driver unit.

NO

The P-ACT_RLY_CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the park pawl actuator driver unit** .

DTC P2A00

DTC P2A00 : A/F Sensor (Sensor 1) Circuit Range/Performance Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2A00 A/F Sensor (Sensor 1) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2A00 A/F Sensor (Sensor 1) Circuit Range/Performance Problem	B	B

Is Confirmed DTC P2A00 indicated?

YES (Confirmed DTC is indicated)

Replace the A/F sensor (Sensor 1) .

NO (Pending DTC is indicated)

Check for poor connections or loose terminals at the A/F sensor (Sensor 1) and the PCM, and the installation of the A/F sensor (Sensor 1), then recheck.

DTC P2A01

DTC P2A01 : Secondary HO2S (Sensor 2) Circuit Range/Performance Problem

Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2A01 Secondary HO2S (Sensor 2) Circuit Range/Performance Problem	B	B

DTC (PGM-FI)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Enter the maintenance mode, then start the engine** .

   -4. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	More than 1.51	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the secondary HO2S (Sensor 2) and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

2. Determine possible failure area (secondary HO2S (Sensor 2), others)

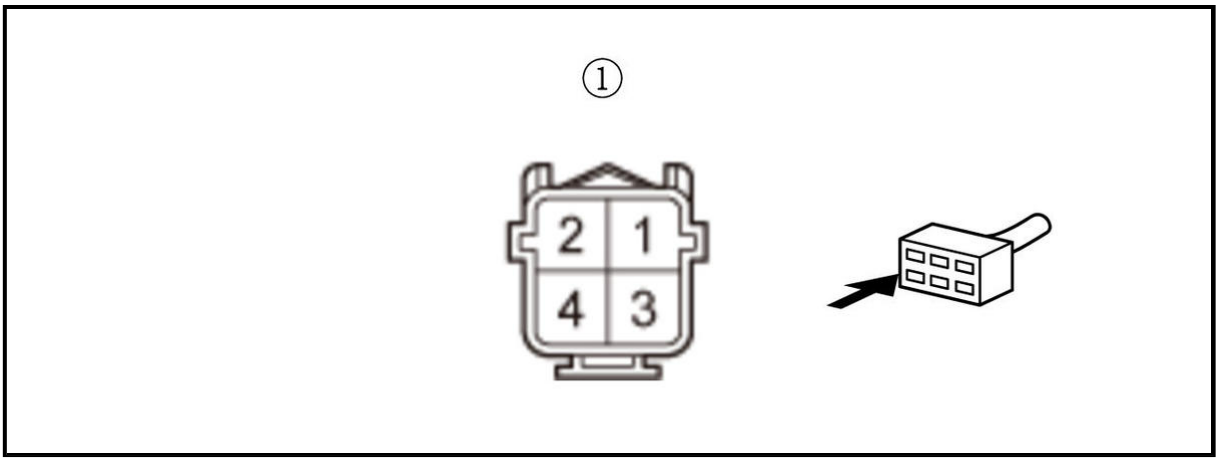
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Secondary HO2S (Sensor 2) 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
HO2S S2	More than 1.51	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Replace the secondary HO2S (Sensor 2) .

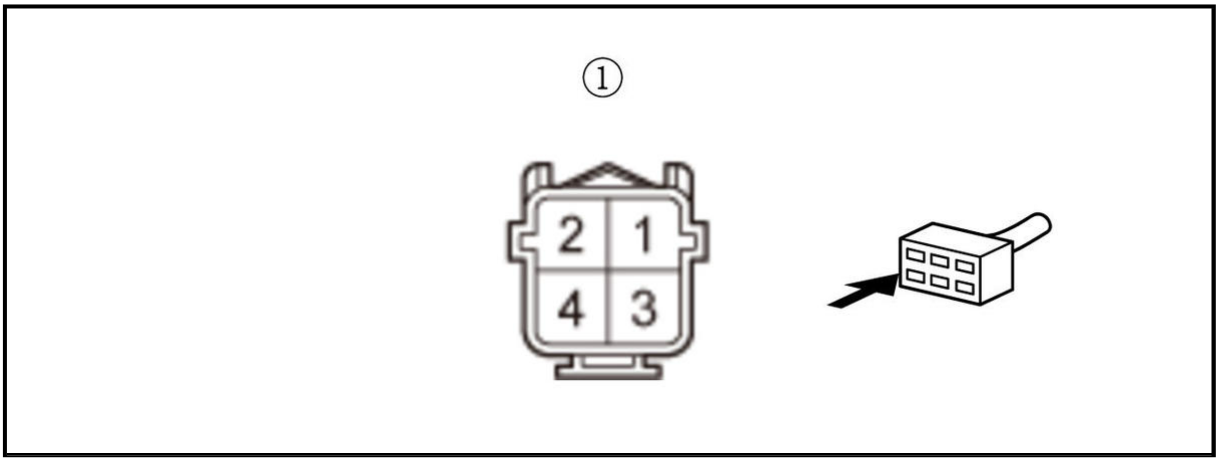
3. Open wire check (SO2SG/SO2_SG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the secondary HO2S (Sensor 2) 4P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Secondary HO2S (Sensor 2) 4P connector (male terminals) No. 1: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
HO2S S2	More than 1.51	V	B	B

Do the current condition(s) match the threshold?

YES

The SO2SG/SO2_SG wire is OK. Go to step 4.

NO

Repair an open in the SO2SG/SO2_SG wire between the PCM (A48) and the secondary HO2S (Sensor 2).

4. Open wire check (SO2 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Secondary HO2S (Sensor 2) 4P connector: disconnected
B	PCM connector A (50P): disconnected
B	Secondary HO2S (Sensor 2) 4P connector No. 1: jumped to body ground
Test point 1	**PCM connector A (50P) No. 47**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SO2 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM .

NO

Repair an open in the SO2 wire between the PCM (A47) and the secondary HO2S (Sensor 2).

DTC P2DE0 (2021)

DTC P2DE0 : Cold Start Air Fuel Ratio Control System Lean

NOTE:

- Before you troubleshoot, review the general troubleshooting information .
- If DTC P2DE0 is indicated alone, do the troubleshooting for DTC P0171 using the on-board snapshot for P2DE0.

DTC Description	Confirmed DTC	Pending DTC
P2DE0 Cold Start Air Fuel Ratio Control System Lean	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Leave the vehicle to cool the engine.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Enter the maintenance mode, then start the engine , and let it idle for 10 seconds or more.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2DE0 Cold Start Air Fuel Ratio Control System Lean	B	B

Is DTC P2DE0 indicated?

YES

The failure is duplicated. Do the troubleshooting for DTC P0171 using the on-board snapshot for P2DE0.

NO

Intermittent failure, the system is OK at this time. If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot .

DTC P2DE1 (2021)

DTC P2DE1 : Cold Start Air Fuel Ratio Control System Rich

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P2DE1 is indicated alone, do the troubleshooting for DTC P0172 using the on-board snapshot for P2DE1.

DTC Description	Confirmed DTC	Pending DTC
P2DE1 Cold Start Air Fuel Ratio Control System Rich	B	B

DTC (PGM-FI)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Leave the vehicle to cool the engine.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2DE1 Cold Start Air Fuel Ratio Control System Rich	B	B

Is DTC P2DE1 indicated?

YES

The failure is duplicated. Do the troubleshooting for **DTC P0172** using the on-board snapshot for P2DE1.

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC P2EA4 (2021)

DTC P2EA4 : Cold Start Ignition Timing Problem

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
P2EA4 Cold Start Ignition Timing Problem	B	B

DTC (PGM-FI)

1. PGM-FI system check

-1. Turn the vehicle to the ON mode.

-2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

DTC (PGM-FI)

Are any Pending or Confirmed DTCs other than P2EA4 indicated?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to step 2.

2. Intake air duct visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check for poor connection or blockage at the intake air duct** .

Is it OK?

YES

Go to step 3.

NO

Reconnect or repair the intake air duct, or **replace it if needed** .

3. Air cleaner housing visual check

-1. **Check for poor connection or blockage at the air cleaner housing** .

Is it OK?

YES

Go to step 4.

NO

Replace the air cleaner housing .

4. Air cleaner element visual check

-1. **Check for dirt or debris on the air cleaner element** .

Is it dirty?

YES

Replace the air cleaner element .

NO

Go to step 5.

5. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT Sensor 1 is 122 deg.F (50 deg.C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-6. Monitor the OBD STATUS for DTC P2EA4 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P2EA4 Cold Start Ignition Timing Problem	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 6.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CKP sensor, the throttle body, MAF/IAT sensor 1, ECT sensor 1, ECT sensor 2, and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** . If the HDS indicates EXECUTING, keep idling until a result comes on. If the HDS indicates OUT OF CONDITION, go to step 5-2 and recheck.

6. MAF sensor performance check

-1. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-2. While holding the engine speed at 2, 500 rpm for 30 seconds, check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
MAF Sensor	7.5-10.5	g/s	B	B

Do the current condition(s) match the malfunction threshold?

YES

The MAF sensor is OK. Go to step 7.

NO

Replace MAF sensor/IAT sensor 1 .

7. IAT sensor 1 performance check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Allow the engine to cool to ambient temperature.

-3. Note the ambient temperature.

-4. Turn the vehicle to the ON mode.

-5. Quickly note the value of IAT SENSOR (1) in the DATA LIST with the HDS.

Signal	Current conditions	
	Values	Unit
IAT Sensor (1)	B	B

-6. Compare the value of the IAT SENSOR with the ambient temperature.

Does the value of the IAT SENSOR (1) differ 5.4 deg.F (3 deg.C) or more from the ambient temperature?

YES

Replace MAF sensor/IAT sensor 1 .

NO

The IAT sensor 1 is OK. Check for dirt, carbon, or damage in the throttle bore. If there is dirt or carbon, **clean the throttle body** . If there is damage in the throttle bore, **replace the throttle body** .

DTC P2EC7 (2021)

DTC P2EC7 : Cold Start Rocker Arm Oil Control System Problem

Special Tools Required

Pressure Gauge Adapter 07NAJ-P07010A

A/T Low Pressure Gauge w/Panel 07406-0070301

A/T Pressure Test Hose 07AAJ-PY4A100

A/T Pressure Adapter 07MAJ-PY40120

Oil Pressure Hose 07ZAJ-S5AA200

NOTE:

- **How to read the torque specifications** .
- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC P055D, P2648, and/or P2649 are stored at the same time as DTC P2EC7, troubleshoot those DTCs first, then recheck for DTC P2EC7.

DTC Description	Confirmed DTC	Pending DTC
P2EC7 Cold Start Rocker Arm Oil Control System Problem	B	B

DTC (PGM-FI)

1. Oil level check

-1. **Check the engine oil level** .

Is the level OK?

YES

Go to step 2.

NO

Adjust the engine oil to the proper level .

2. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Let the engine cool until the value of ECT Sensor 1 is 77 deg.F (25 deg.C) or less.

Signal	Current conditions	
	Values	Unit
ECT Sensor 1	B	B

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. **Enter the maintenance mode, then start the engine** , and let it idle for 10 seconds or more.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P2EC7 Cold Start Rocker Arm Oil Control System Problem	B	B

Is DTC P2EC7 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the rocker arm oil pressure sensor and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P055D Rocker Arm Oil Pressure Sensor High Voltage	B	B
P2649 Rocker Arm Oil Control Solenoid Circuit High Voltage	B	B

Is DTC P055D and/or P2649 indicated?

YES

Go to the indicated DTC's troubleshooting .

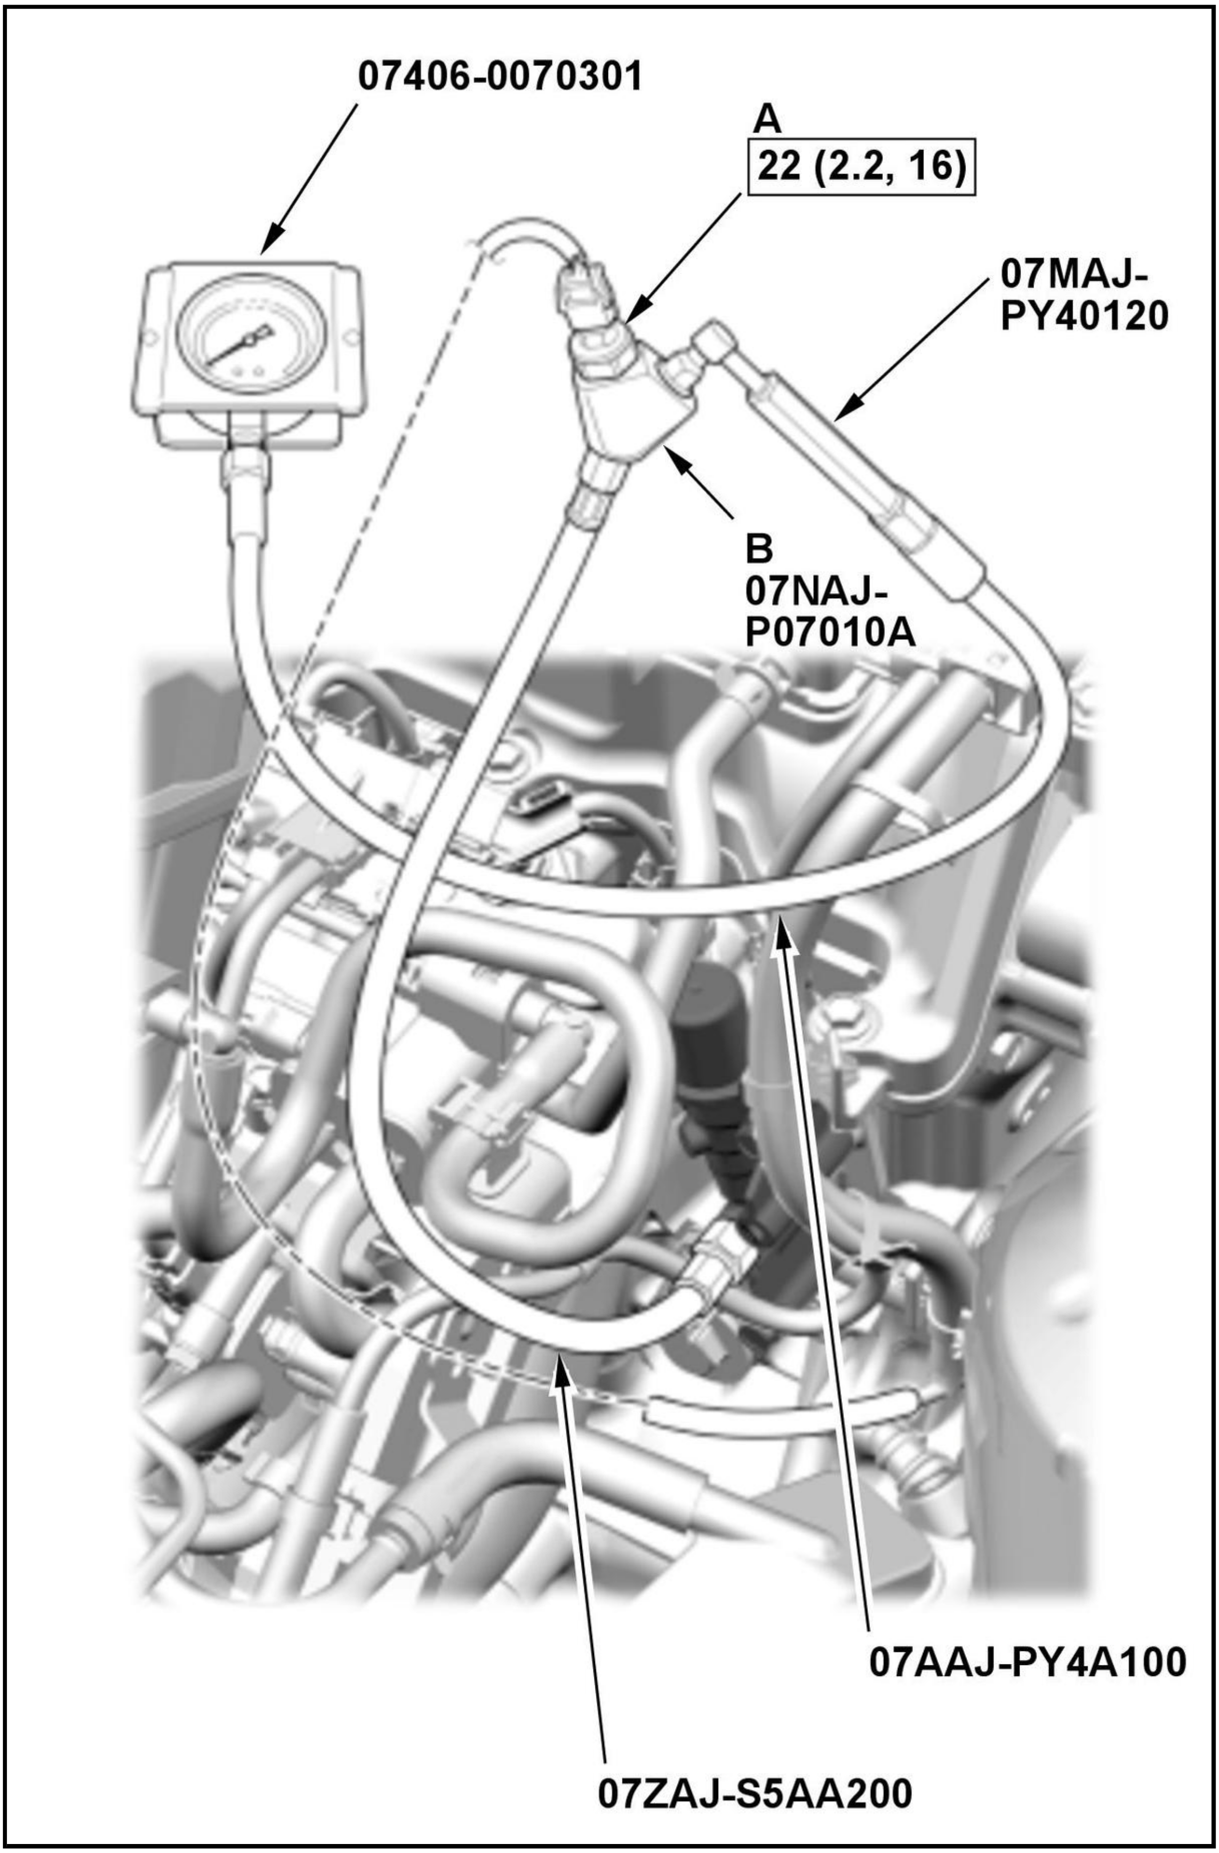
NO

Go to step 4.

4. VTEC system oil pressure check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the rocker arm oil pressure sensor (A), and attach the special tools as shown, then attach the rocker arm oil pressure sensor to the oil pressure gauge adapter (B).



07406-0070301
A
22 (2.2, 16)
07MAJ-PY40120
B
07NAJ-P07010A
07AAJ-PY4A100
07ZAJ-S5AA200

-3. Reconnect the following connector.

Rocker arm oil pressure sensor 3P connector

-4. **Enter the maintenance mode, then start the engine** .

-5. Hold the engine speed at 3, 000 rpm without load (in P or N) until the radiator fan comes on, then let it idle.

-6. Select the VTEC TEST in the Function Test Menu with the HDS.

VTEC TEST

Check the oil pressure while the status of VTEC solenoid valve on the HDS display is OFF.

Is the oil pressure 49 kPa (0.50 kgf/cm 2, 7.1 psi) or more?

YES

Inspect the VTEC system oil passage. If it is OK, **replace the rocker arm oil control valve** .

NO

Replace the rocker arm oil pressure sensor .

DTC U0029 (PGM-FI SYSTEM)

DTC U0029 : F-CAN Malfunction (BUS-OFF (PCM))

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
U0029 F-CAN Malfunction (BUS-OFF (PCM))	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

The failure is duplicated. **Go to the troubleshooting for CAN gateway system DTC(s)** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC U0038 (PGM-FI SYSTEM)

DTC U0038 : EP-CAN Malfunction (BUS-OFF(PCM))

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
U0038 EP-CAN Malfunction (BUS-OFF(PCM))	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   The failure is duplicated. **Go to the troubleshooting for CAN gateway system DTC(s)** .

   NO

   Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC U0047 (PGM-FI SYSTEM)

DTC U0047 : F-CAN Malfunction for The Second Channel (BUS-OFF (PCM))

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
U0047 F-CAN Malfunction for The Second Channel (BUS-OFF (PCM))	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

The failure is duplicated. **Go to the troubleshooting for CAN gateway system DTC(s)** .

NO

Intermittent failure, the system is OK at this time. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

DTC U0103, U0104, U0114, U0122, U0129, U0151, U0155, U1207, U129E, U1603, U1604, U1605 (PGM-FI SYSTEM)

DTC U0103 : F-CAN Malfunction (PCM-SBW Shifter)

DTC U0104 : F-CAN Malfunction (PCM-Driving Support System Control Unit)

DTC U0114 : F-CAN Malfunction (PCM-AWD Control Unit)

DTC U0122 : F-CAN Malfunction (PCM-VSA Modulator-Control Unit)

DTC U0129 : F-CAN Malfunction (PCM-Electric Servo Brake Control Unit)

DTC U0151 : F-CAN Malfunction (PCM-SRS Unit)

DTC U0155 : F-CAN Malfunction (PCM-Gauge Control Module)

DTC U1207 : F-CAN Malfunction (PCM-A/C Compressor Driver)

DTC U129E : F-CAN Malfunction (PCM-Power Control Unit (PCU))

DTC U1603 : F-CAN Malfunction (PCM-Battery Condition Monitor Module)

DTC U1604 : F-CAN Malfunction (PCM-Motor Control Module)

DTC U1605 : F-CAN Malfunction (PCM-Motor Control Module)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the power system indicator flashes, **go to the electric powertrain system general troubleshooting information** .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the PCM.

DTC Description	Confirmed DTC	Pending DTC
U0103 F-CAN Malfunction (PCM- SBW Shifter)	B	B
U0104 F-CAN Malfunction (PCM-Driving Support System Control Unit)	B	B
U0114 F-CAN Malfunction (PCM-AWD Control Unit)	B	B
U0122 F-CAN Malfunction (PCM-VSA Modulator-Control Unit)	B	B
U0129 F-CAN Malfunction (PCM-Electric Servo Brake Control Unit)	B	B
U0151 F-CAN Malfunction (PCM-SRS Unit)	B	B

DTC Description	Confirmed DTC	Pending DTC
U1207 F-CAN Malfunction (PCM-A/C Compressor Driver)	B	B
U129E F-CAN Malfunction (PCM-Power Control Unit (PCU))	B	B
U1603 F-CAN Malfunction (PCM-Battery Condition Monitor Module)	B	B
U1604 F-CAN Malfunction (PCM-Motor Control Module)	B	B
U1605 F-CAN Malfunction (PCM-Motor Control Module)	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC(s) .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Which result is indicated?

   Bus A is Not Available

   Go to step 3.

   Bus B is Not Available

   Go to step 4.

   Bus A and B are Available

   Go to step 5.

3. Open wire check (F-CAN A_H line, F-CAN A_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

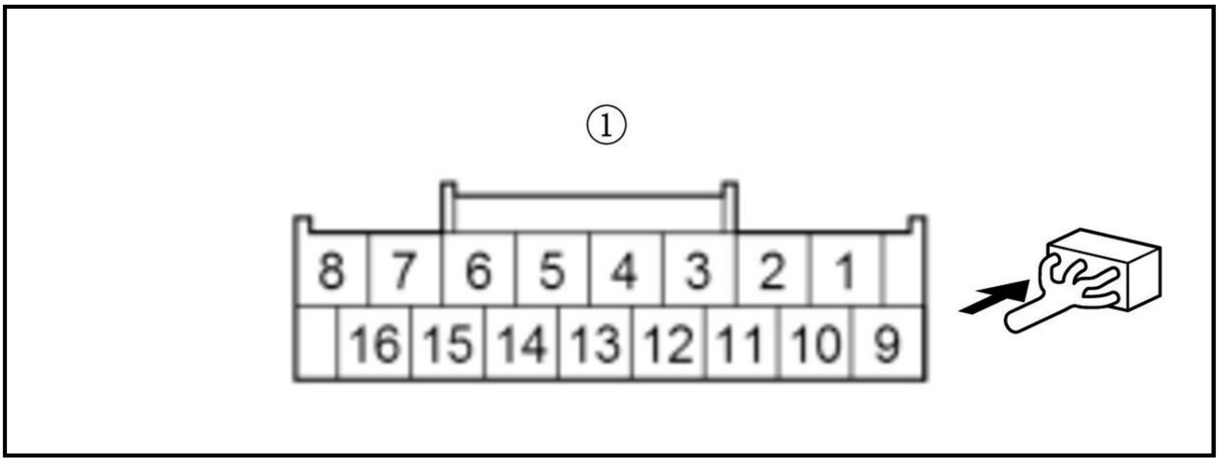
   -3. Disconnect the following connectors.

CAN gateway 16P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	**PCM connector A (50P) No. 37**

Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	**PCM connector A (50P) No. 36**



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the PCM (A36, A37) and the CAN gateway.

4. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

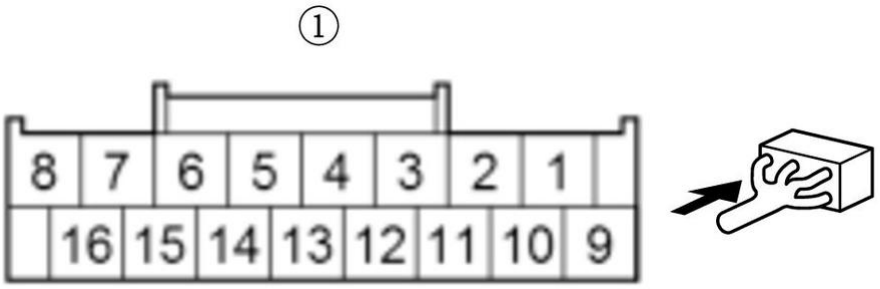
CAN gateway 16P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected

B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**PCM connector A (50P) No. 39**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**PCM connector A (50P) No. 38**



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the PCM (A38, A39) and the CAN gateway.

5. F-CAN circuit communication check (Transmitting control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0103	SBW shifter control module	A
U0104	Millimeter wave radar	C
U0114	Real time AWD control unit	D
U0122	VSA modulator-control unit	B, C
U0129	Electric servo brake control unit	B, C
U0151	SRS unit	C
U0155	Gauge control module	D

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U1207	Electric A/C compressor	D
U129E	Body control module	B
U1603	Battery condition monitor module	A
U1604	PCU (motor control module)	A
U1605	PCU (motor control module)	A

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0103: SBW shifter control module is Not Available for Bus A

Go to step 6.

U0104: Millimeter wave radar is Not Available for Bus C

Go to step 8.

U0114: Real time AWD control unit is Not Available for Bus D

Go to step 9.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 7.

U0122: VSA modulator-control unit is Not Available for Bus C

Go to step 8.

U0129: Electric servo brake control unit is Not Available for Bus B

Go to step 7.

U0129: Electric servo brake control unit is Not Available for Bus C

Go to step 8.

U0151: SRS unit is Not Available for Bus C

Go to step 8.

U0155: Gauge control module is Not Available for Bus D

Go to step 9.

U1207: Electric A/C compressor is Not Available for Bus D

Go to step 9.

U129E: Body control module is Not Available for Bus B

Go to step 7.

U1603: Battery condition monitor module is Not Available for Bus A

Go to step 6.

U1604: Motor control module is Not Available for Bus A

Go to step 6.

U1605: Motor control module is Not Available for Bus A

Go to step 6.

6. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

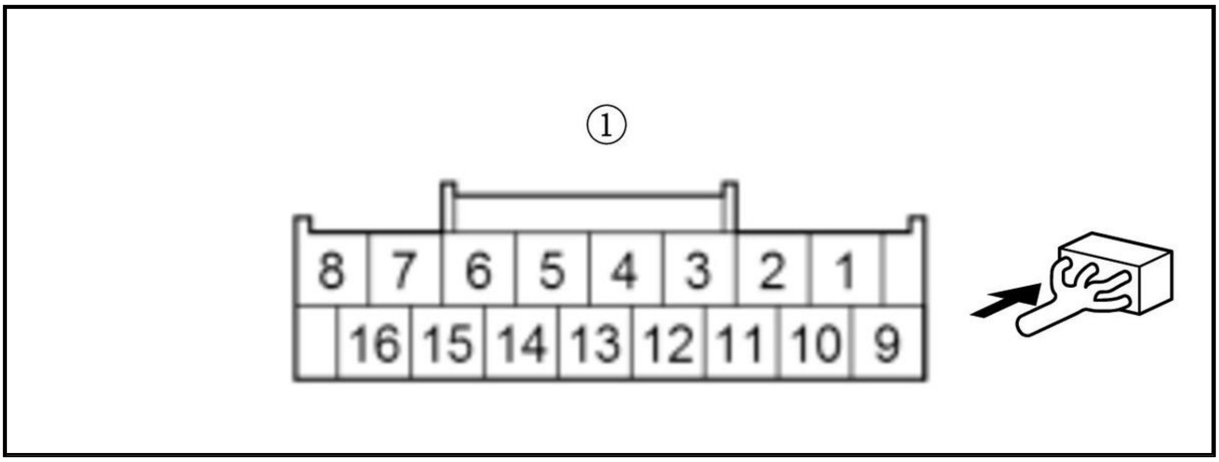
NOTE: Before disconnecting the PCU connector and/or the battery condition monitor module connector, **do the 12 volt battery terminal disconnection procedure** , and **turn off the service plug** .

DTC	Connector
-	CAN gateway 16P connector
U0103	SBW shifter control module 20P connector
U1603	Battery condition monitor module connector E (32P)
U1604	PCU 33P connector
U1605	PCU 33P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0103	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**SBW shifter control module 20P connector**	No. 5
	F-CAN A_L		No. 11		No. 6
U1603	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**Battery condition monitor module connector E (32P)**	No. 9
	F-CAN A_L		No. 11		No. 8
U1604	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCU 33P connector**	No. 5
	F-CAN A_L		No. 11		No. 6
U1605	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	**PCU 33P connector**	No. 5
	F-CAN A_L		No. 11		No. 6



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0103	Check for poor connections or loose terminals at the CAN gateway and the SBW shifter control module. **Substitute a known-good SBW shifter control module** .
U1603	Check for poor connections or loose terminals at the CAN gateway and the battery condition monitor module. **Substitute a known-good battery condition monitor module** .
U1604	Check for poor connections or loose terminals at the CAN gateway and the PCU. **Substitute a known-good PCU** .
U1605	Check for poor connections or loose terminals at the CAN gateway and the PCU. **Substitute a known-good PCU** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

7. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

NOTE: Before disconnecting the electric servo brake control unit connector, open the driver's door and wait for at least 3 minutes.

DTC	Connector
-	CAN gateway 16P connector
U0122	VSA modulator-control unit 46P connector
U0129	Electric servo brake control unit 22P connector
U129E	Body control module connector B (36P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected

B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)

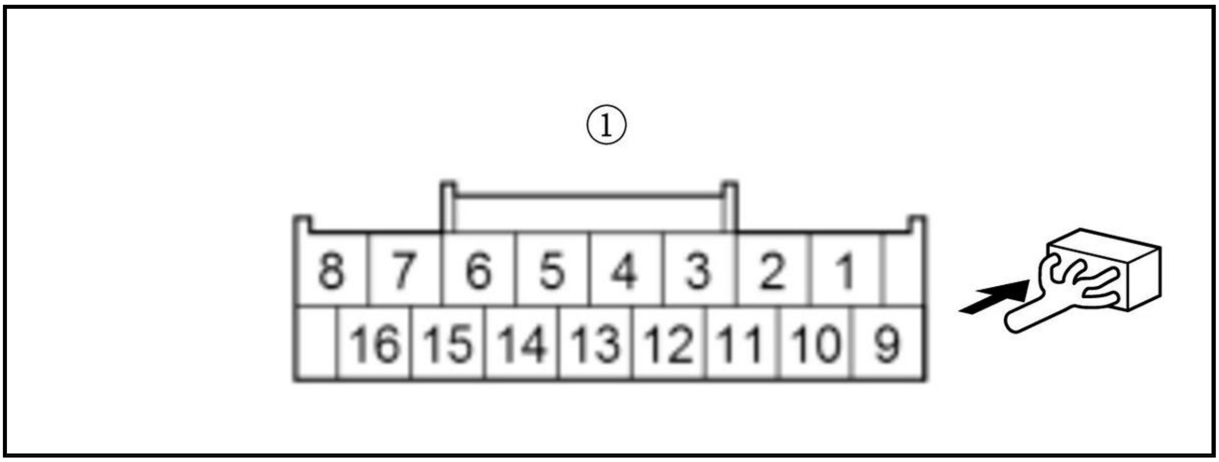
U129E	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**Body control module connector B (36P)**	No. 22
	F-CAN B_L		No. 14		No. 23



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0122	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0129	Check for poor connections or loose terminals at the CAN gateway and the electric servo brake control unit. **Replace the electric servo brake control unit** .
U129E	Check for poor connections or loose terminals at the CAN gateway and the body control module. **Substitute a known-good body control module** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

8. Open wire check (F-CAN C_H line, F-CAN C_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

NOTE: Before disconnecting the SRS unit connector, do the 12 volt battery terminal disconnection procedure , and wait for at least 3 minutes.

DTC	Connector
-	CAN gateway 16P connector
U0104	Millimeter wave radar 8P connector
U0122	VSA modulator-control unit 46P connector
U0129	Electric servo brake control unit 22P connector
U0151	SRS unit connector A (39P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected

B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	**Circuit name**	**Test point 1 (Receiving control unit)**		**Test point 2 (Transmitting control unit)**

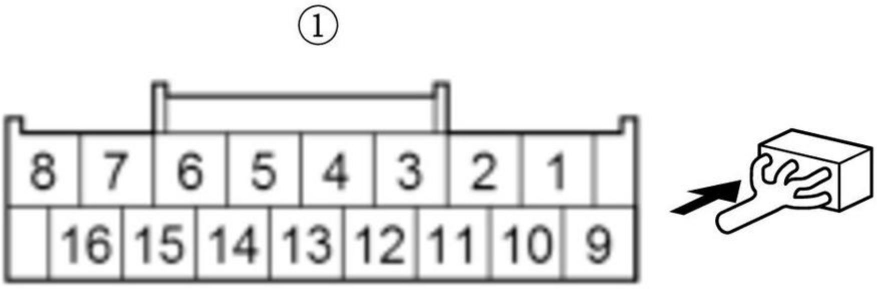
	F-CAN C_L		No. 13		No. 35



Is there 1.0 Ω or less?

YES

The F-CAN C_H wire and the F-CAN C_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0104	Check for poor connections or loose terminals at the CAN gateway and the millimeter wave radar. **Substitute a known-good millimeter wave radar** .
U0122	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0129	Check for poor connections or loose terminals at the CAN gateway and the electric servo brake control unit. **Replace the electric servo brake control unit** .
U0151	Check for poor connections or loose terminals at the CAN gateway and the SRS unit. **Substitute a known-good SRS unit** .

NO

Repair an open in the F-CAN C_H wire or the F-CAN C_L wire between the transmitting control unit and the CAN gateway.

9. Open wire check (F-CAN D_H line, F-CAN D_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

NOTE: Before disconnecting the A/C compressor connector, **do the 12 volt battery terminal disconnection procedure** , and **turn off the service plug** .

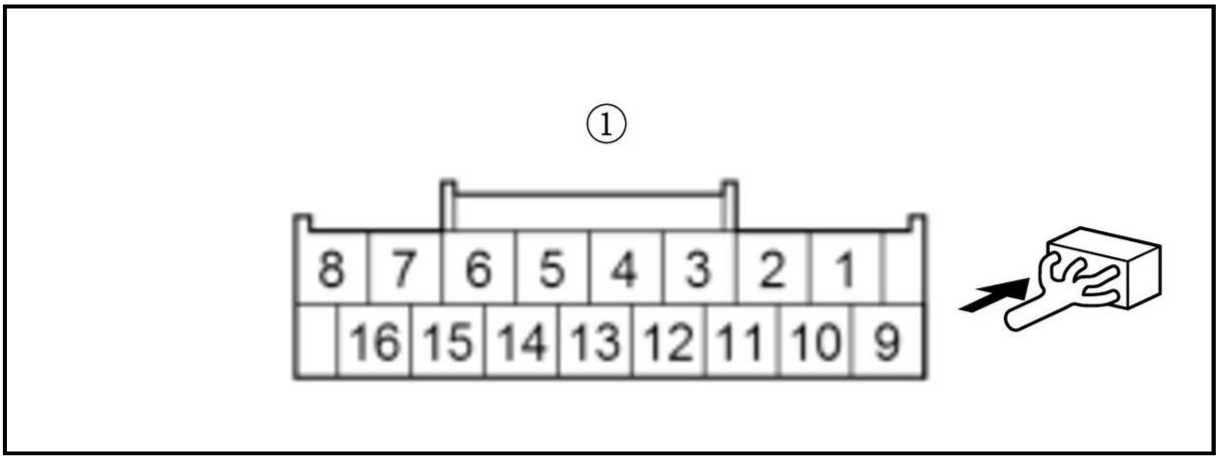
DTC	Connector
-	CAN gateway 16P connector
U0114	Real time AWD control unit 24P connector
U0155	Gauge control module connector A (32P)
U1207	Electric A/C compressor 4P connector

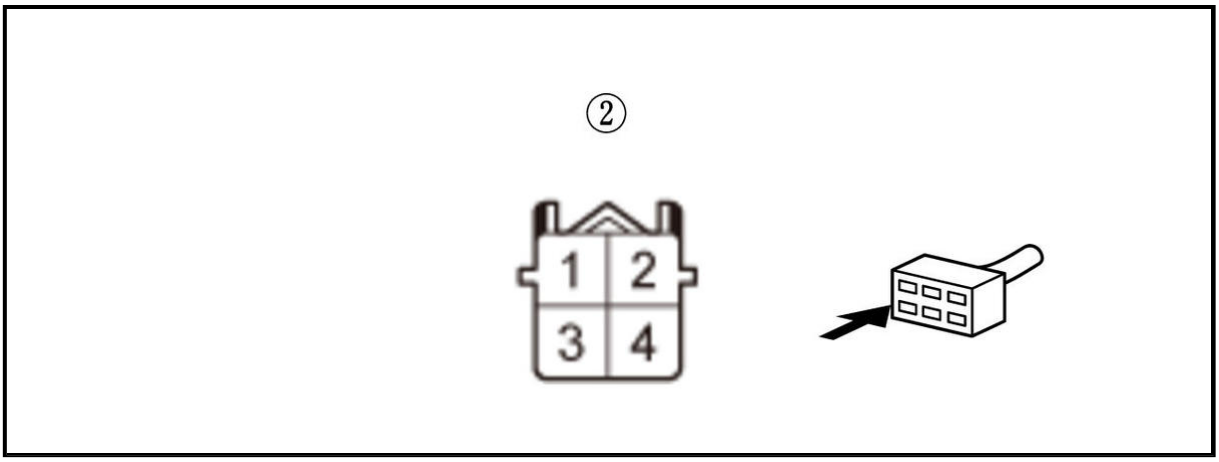
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0114	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	**Real time AWD control unit 24P connector**	No. 14
	F-CAN D_L		No. 15		No. 24
U0155	F-CAN D_H	CAN gateway 16P connector (female terminals): ①	No. 7	**Gauge control module connector A (32P)**	No. 19
	F-CAN D_L		No. 15		No. 20
U1207	F-CAN D_H	CAN gateway 16P connector (female	No. 7	A/C compressor 4P connector (female	No. 4

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
	F-CAN D_L	terminals): ①	No. 15	terminals): ②	No. 3





Is there 1.0 Ω or less?

YES

The F-CAN D_H wire and the F-CAN D_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0114	Check for poor connections or loose terminals at the CAN gateway and the real time AWD control unit. **Substitute a known-good real time AWD control unit** .
U0155	Check for poor connections or loose terminals at the CAN gateway and the gauge control module. **Substitute a known-good gauge control module** .
U1207	Check for poor connections or loose terminals at the CAN gateway and the electric A/C compressor. **Substitute a known-good A/C compressor** .

NO

Repair an open in the F-CAN D_H wire or the F-CAN D_L wire between the transmitting control unit and the CAN gateway.

DTC U0110 (PGM-FI SYSTEM)

DTC U0110 : EP-CAN Malfunction (PCM-Motor Control Module)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC U0110 is indicated alone, do the troubleshooting for DTC U1205 using the on-board snapshot for U0110.
- If any of the DTCs listed below are indicated at the same time as DTC U0110, troubleshoot those DTCs first, then recheck for U0110.
-
    - -

      U1205: Motor control module

DTC Description	Confirmed DTC	Pending DTC
U0110 EP-CAN Malfunction (PCM-Motor Control Module)	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0110 EP-CAN Malfunction (PCM-Motor Control Module)	B	B
U1205 EP-CAN Malfunction (PCM-Motor Control Module)	B	B

   Are DTC U1205 and U0110 indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC U1205** using the on-board snapshot for DTC U0110.

DTC U0111 (PGM-FI SYSTEM)

DTC U0111 : EP-CAN Malfunction (PCM-Battery Condition Monitor Module)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC U0111 is indicated alone, do the troubleshooting for DTC U1206 using the on-board snapshot for U0111.
- If any of the DTCs listed below are indicated at the same time as DTC U0111, troubleshoot those DTCs first, then recheck for U0111.
-
    - -

      U1206: Battery condition monitor module

DTC Description	Confirmed DTC	Pending DTC
U0111 EP-CAN Malfunction (PCM-Battery Condition Monitor Module)	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0111 EP-CAN Malfunction (PCM-Battery Condition Monitor Module)	B	B
U1206 EP-CAN Malfunction (PCM-Battery Condition Monitor Module)	B	B

   Are DTC U1206 and U0111 indicated at the same time?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to the troubleshooting for **DTC U1206** using the on-board snapshot for DTC U0111.

DTC U012D (PGM-FI SYSTEM)

DTC U012D : EP-CAN Malfunction (PCM-Motor Control Module)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If DTC U012D is indicated alone, do the troubleshooting for DTC U12A5 using the on-board snapshot for U012D.
- If any of the DTCs listed below are indicated at the same time as DTC U012D, troubleshoot those DTCs first, then recheck for U012D.
-
    - -

      U12A5: Motor control module

DTC Description	Confirmed DTC	Pending DTC
U012D EP-CAN Malfunction (PCM-Motor Control Module)	B	B

DTC (PGM-FI)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U012D EP-CAN Malfunction (PCM-Motor Control Module)	B	B
U12A5 EP-CAN Malfunction (Motor Control Module-PCM)	B	B

Are DTC U12A5 and U012D indicated at the same time?

YES

Go to the indicated DTC's troubleshooting.

NO

Go to the troubleshooting for **DTC U12A5** using the on-board snapshot for DTC U012D.

DTC U0146 (PGM-FI SYSTEM)

DTC U0146 : F-CAN Malfunction (PCM-CAN Gateway)

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
U0146 F-CAN Malfunction (ECM/PCM-CAN Gateway)	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC(s) .

   NO

   Go to step 2.

2. F-CAN circuit communication check

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Which result is indicated?

   PCM (Bus A) is Not Available

   Go to step 3.

PCM (Bus B) is Not Available

Go to step 4.

PCM is Detected

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the CAN gateway and the PCM. **If the on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the on-board snapshot** .

3. Open wire check (F-CAN A_H line, F-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

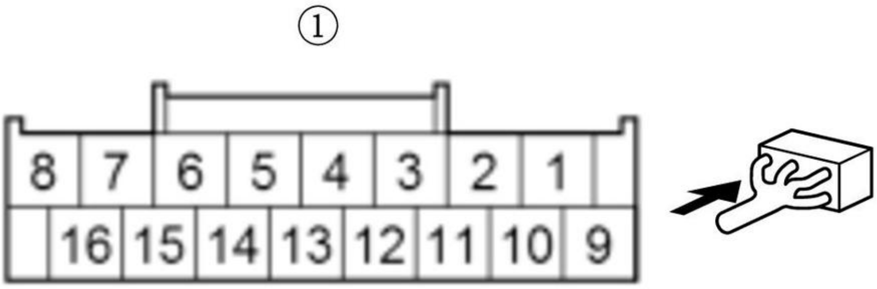
-3. Disconnect the following connectors.

CAN gateway 16P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	**PCM connector A (50P) No. 37**

Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	**PCM connector A (50P) No. 36**



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN A_H wire and/or the F-CAN A_L wire between the PCM (A36, A37) and the CAN gateway.

4. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

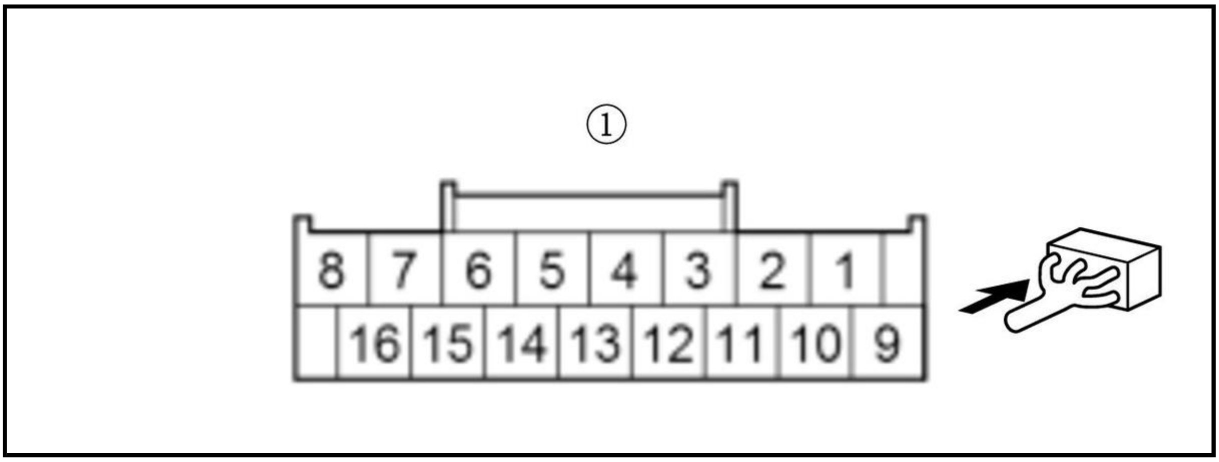
-3. Disconnect the following connectors.

CAN gateway 16P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**PCM connector A (50P) No. 39**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**PCM connector A (50P) No. 38**



Is there 1.0 Ω or less?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the F-CAN B_H wire and/or the F-CAN B_L wire between the PCM (A38, A39) and the CAN gateway.

DTC U0301(PGM-FI SYSTEM)

DTC U0301 : PGM-FI System and Transmission System Program Version Mismatch

NOTE: Before you troubleshoot, **review the general troubleshooting information** .

DTC Description	Confirmed DTC	Pending DTC
U0301 PGM-FI System and Transmission System Program Version Mismatch	B	B

DTC (PGM-FI)

1. Problem verification (update)

   -1. **Update the PCM** .

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
U0301 PGM-FI System and Transmission System Program Version Mismatch	B	B

   Is DTC U0301 indicated?

   YES

   Replace the PCM .

   NO

   Update is complete. If any other Pending or Confirmed DTCs are indicated, go to the indicated DTC's troubleshooting.

DTC U1205, U1206, U12A5, U12AA, U12B4 (PGM-FI SYSTEM)

DTC U1205 : EP-CAN Malfunction (PCM-Motor Control Module)

DTC U1206 : EP-CAN Malfunction (PCM-Battery Condition Monitor Module)

DTC U12A5 : EP-CAN Malfunction (PCM-Motor Control Module)

DTC U12AA : EP-CAN Malfunction (PCM-SBW Shifter)

DTC U12B4 : EP-CAN Malfunction (PCM-Park Pawl Actuator Driver Unit)

NOTE:

- Before you troubleshoot, **review the general troubleshooting information** .
- If the power system indicator flashes, **go to the electric powertrain system general troubleshooting information** .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the PCM.

DTC Description	Confirmed DTC	Pending DTC
U1205 EP-CAN Malfunction (PCM-Motor Control Module)	B	B
U1206 EP-CAN Malfunction (PCM-Battery Condition Monitor Module)	B	B
U12A5 EP-CAN Malfunction (PCM-Motor Control Module)	B	B

DTC Description	Confirmed DTC	Pending DTC
U12AA EP-CAN Malfunction (PCM- SBW Shifter)	B	B

DTC Description	Confirmed DTC	Pending DTC
U12B4 EP-CAN Malfunction (PCM-Park Pawl Actuator Driver Unit)	B	B

DTC (PGM-FI)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC(s) .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Which result is indicated?

   Bus E is Not Available

   Go to step 3.

   Bus E is Available

   Go to step 4.

3. Open wire check (EP-CAN A_H line, EP-CAN A_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connectors.

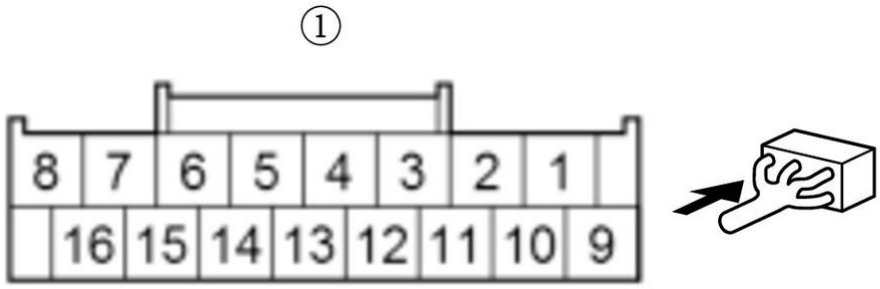
CAN gateway 16P connector
PCM connector A (50P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	PCM connector A (50P): disconnected

Test point 1	CAN gateway 16P connector (female terminals) No. 16: ①
Test point 2	**PCM connector A (50P) No. 21**

Test point 1	CAN gateway 16P connector (female terminals) No. 8: ①
Test point 2	**PCM connector A (50P) No. 20**



Is there 1.0 Ω or less?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK. Check for poor connections or loose terminals at the CAN gateway and the PCM. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** .

NO

Repair an open in the EP-CAN A_H wire or the EP-CAN A_L wire between the PCM (A20, A21) and the CAN gateway.

4. Open wire check (EP-CAN A_H line, EP-CAN A_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector(s).

NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector(s).

PCM connector A (50P)

-3. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

NOTE: Before disconnecting the PCU connector and/or the battery condition monitor module connector, **do the 12 volt battery terminal disconnection procedure** , and **turn off the service plug** .

DTC	Connector
-	CAN gateway 16P connector
U1205	PCU 33P connector
U1206	Battery condition monitor module connector E (32P)
U12A5	PCU 33P connector
U12AA	SBW shifter control module 20P connector

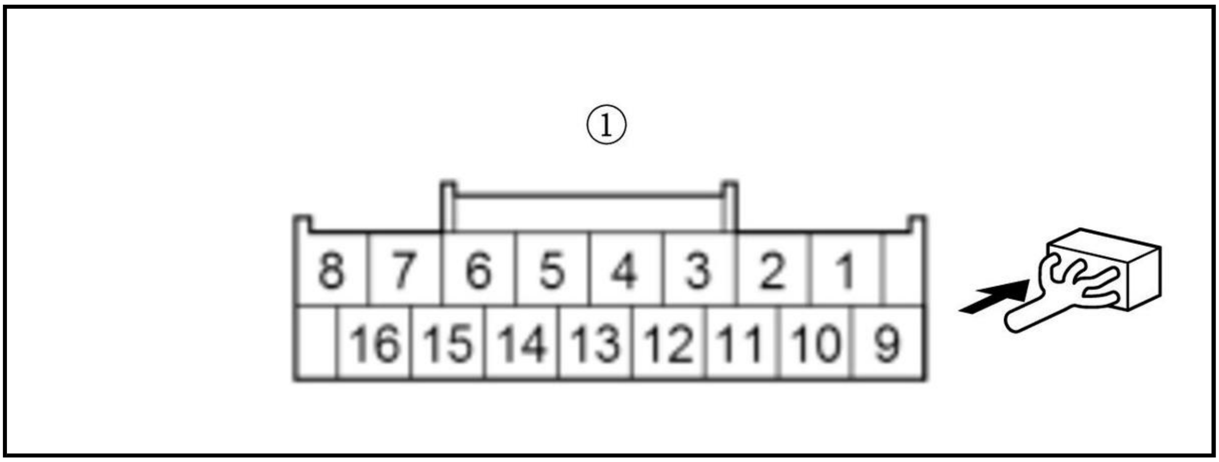
DTC	Connector
U12B4	Park pawl actuator driver unit 26P connector

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the EP-CAN A_H circuit and the EP-CAN A_L circuit.

Test condition	Vehicle OFF (LOCK) mode
B	Receiving control unit connector(s): disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1205	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	**PCU 33P connector**	No. 27
	EP-CAN A_L		No. 8		No. 28
U1206	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	**Battery condition monitor module connector E (32P)**	No. 11
	EP-CAN A_L		No. 8		No. 10
U12A5	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	**PCU 33P connector**	No. 27
	EP-CAN A_L		No. 8		No. 28

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U12AA	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	**SBW shifter control module 20P connector**	No. 9
	EP-CAN A_L		No. 8		No. 10
U12B4	EP-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 16	**Park pawl actuator driver unit 26P connector**	No. 8
	EP-CAN A_L		No. 8		No. 7



Is there 1.0 Ω or less?

YES

The EP-CAN A_H wire and the EP-CAN A_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U1205	Check for poor connections or loose terminals at the CAN gateway and the PCU. **Substitute a known-good PCU** .
U1206	Check for poor connections or loose terminals at the CAN gateway and the battery condition monitor module. **Substitute a known-good battery condition monitor module** .
U12A5	Check for poor connections or loose terminals at the CAN gateway and the PCU. **Substitute a known-good PCU** .
U12AA	Check for poor connections or loose terminals at the CAN gateway and the SBW shifter control module. **Substitute a known-good SBW shifter control module** .
U12B4	Check for poor connections or loose terminals at the CAN gateway and the park pawl actuator driver unit. **Substitute a known-good park pawl actuator driver unit** .

NO

Repair an open in the EP-CAN A_H wire and/or the EP-CAN A_L wire between the receiving control unit and the transmitting control unit.

FIRING ORDER & CYLINDER IDENTIFICATION

NOTE: **This information is intended as a quick reference for firing order and cylinder identification only. The information provided covers many vehicles and may include some information that does not apply to the vehicle you have currently selected.**

3 CYLINDER ENGINE

Engine Configuation	Firing Order	Cylinder Identification
In-Line 3	1-3-2	
4 CYLINDER ENGINE

Engine Configuation	Firing Order	Cylinder Identification
In-Line 4	1-3-4-2	
V6 ENGINE

3.0L & 3.5L V6 Engines

Engine Configuation	Firing Order	Cylinder Identification
3.0L & 3.5L	1-4-2-5-3-6	 FRONT 4 5 6 1 2 3 G00016204

3.2L V6 Engine

Engine Configuation	Firing Order	Cylinder Identification
3.2L	1-2-3-4-5-6	 FRONT 2 4 6 1 3 5 G00016203

REMOVAL & INSTALLATION TEST

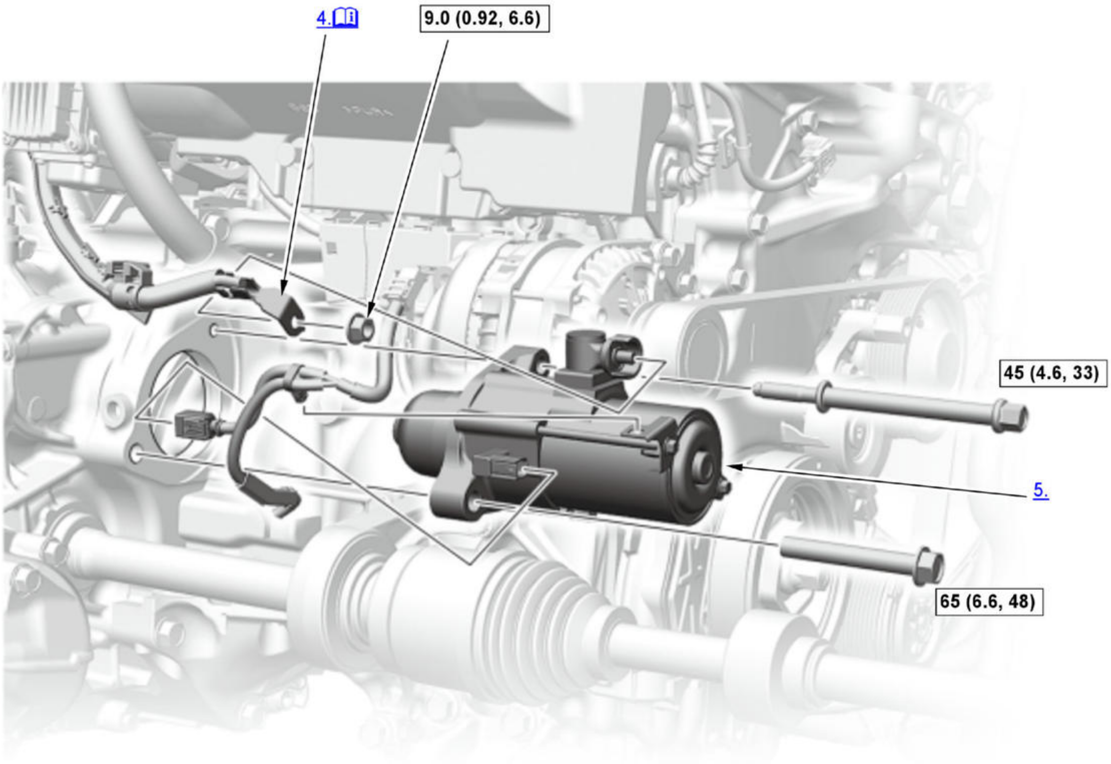
STARTER REMOVAL, INSTALLATION, AND PERFORMANCE TEST (1.5 L ENGINE)

Removal and Installation

NOTE:

- ℹ Where icon is shown, further information shown below.
- With auto idle stop system: If the starter is replaced, replace the oil pressure switch and the relay circuit board at the same time.

1



ℹ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)

1. 12 Volt Battery Terminal - Disconnect
2. Engine Undercover - Remove
3. Exhaust Pipe A - Remove
4. Positive Starter Cable - Disconnect

Note for installation

Make sure the crimped side of the ring terminal faces away from the starter when you connect the positive starter cable.

5. Starter - Remove
6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

7. Starter Counter - Clear (When the Starter Replaced) (With Auto Idle Stop System)

Starter Counter Clear Procedure

NOTE:

- If the starter is replaced, do this procedure.
- Make sure the HDS is loaded with the latest software version.

1. If the starter is replaced, you must replace the **the relay circuit board** and **the oil pressure switch** .

2. **Connect the HDS to the DLC** .

3. Select IDLE STOP STARTER COUNTER CLEAR in Adjustment.

Test

1. Starter Performance - Test

 B S Ω BODY (GROUND) STARTER ⊕ ⊖ 12 VOLT BATTERY	1. Clamp the starter firmly in a vise. 2. Make the connections for this test using the thickest (gauge) wire possible (preferably the same gauge as used on the vehicle). **NOTE:** **To avoid damaging the starter, never leave the 12 volt battery connected for more than 5 seconds.** 3. Connect the 12 volt battery as shown, and check for continuity between the B terminal and the starter body. If there is continuity, it is working properly.

 B S Ω BODY (GROUND) STARTER 12 VOLT BATTERY	4. Disconnect the 12 volt battery from the starter body, and check for continuity between the B terminal and the starter body. If there is no continuity, it is working properly.

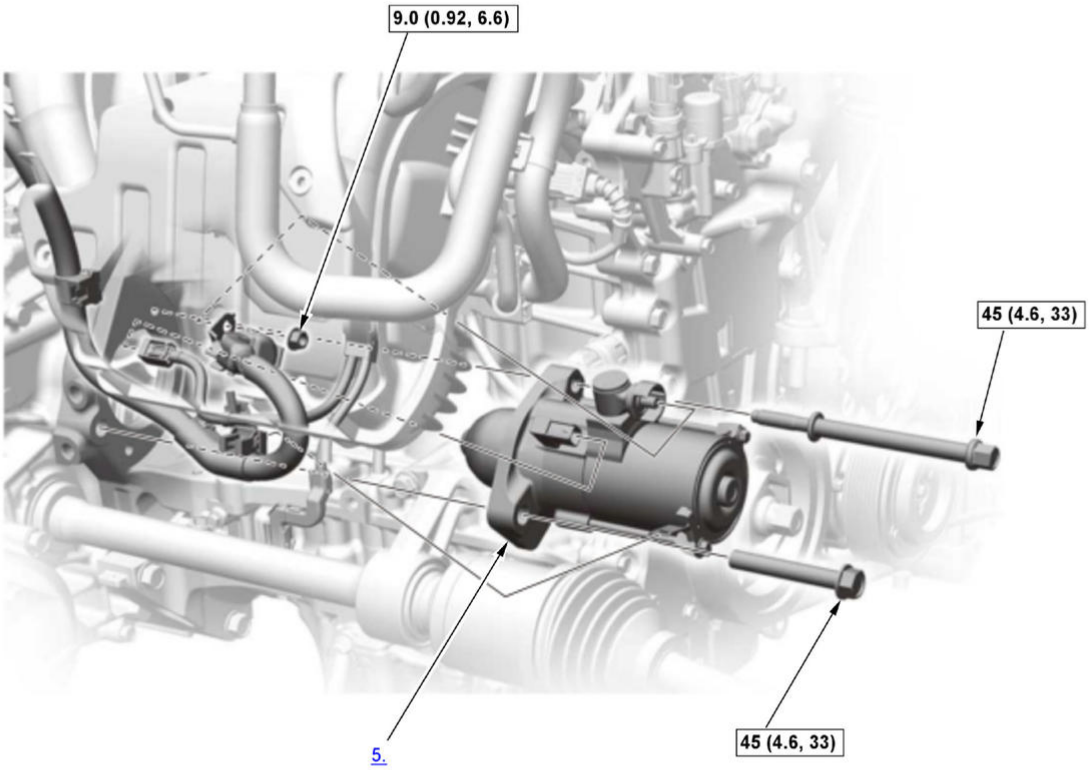
 A B S STARTER BODY (GROUND) 12 VOLT BATTERY	5. Connect the starter to the 12 volt battery as shown, and confirm that the motor runs. 6. If the electric current meets the specification when the 12 volt battery voltage is at 11.5 V, the starter is working properly.

Specification
Electric Current: 80 A or less

STARTER REMOVAL, INSTALLATION, AND PERFORMANCE TEST (2.4 L ENGINE) (2017 2018 2019)

Removal and Installation

1



9.0 (0.92, 6.6)
45 (4.6, 33)
5.

[Fig. 1: Starter Bolts With Torque Specifications]

Courtesy of HONDA, U.S.A., INC.

▭	Torque: N.m (kgf.m, lbf.ft)

1. 12 Volt Battery Terminal - Disconnect
2. Engine Undercover - Remove
3. Exhaust Pipe A - Remove
4. Intake Manifold Bracket - Remove
5. Starter - Remove
6. All Removed Parts - Install

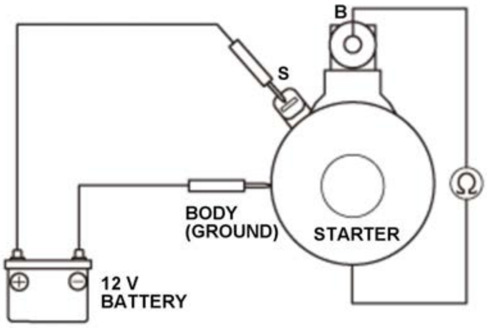
1. Install the parts in the reverse order of removal.

NOTE:

Make sure the crimped side of the ring terminal faces away from the starter when you connect the positive starter cable.

Test

1. Starter Performance - Test



1. Clamp the starter firmly in a vise.

2. Make the connections for this test using the thickest (gauge) wire possible (preferably the same gauge as used on the vehicle).

NOTE:

To avoid damaging the starter, never leave the 12 volt battery connected for more than 5 seconds.

3. Connect the 12 volt battery as shown, and check for continuity between the B terminal and the starter body. If there is continuity, it is working properly.

 B S BODY (GROUND) STARTER Ω 12 V BATTERY	4. Disconnect the 12 volt battery from the starter body as shown, and check for continuity between the B terminal and the starter body. If there is no continuity, it is working properly.

 A B S STARTER BODY (GROUND) 12 V BATTERY	5. Connect the starter to the 12 volt battery as shown, and confirm that the motor runs. 6. If the electric current meets the specification when the 12 volt battery voltage is at 11.5 V, the starter is working properly.

Specification
Electric Current: 80 A or less

OVERHAUL

Fig. 2: Starter Overhaul Bolts With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

ℹ	Detailed information, notes, and precautions
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	Do not wipe off the special grease applied to the area of the starter when you disassemble or assemble it.
*2	These parts have inspection items.

1. Gear Plunger - Install
2. Switch Plunger - Install
3. Switch Shaft - Install
4. Internal Gear - Install
5. Drive Plate - Install
6. Planetary Gear - Install
7. Brush Holder Assembly - Install
8. Moving Contact - Install
9. Contact Spring - Install
10. Push Nut - Install
11. Switch Cover - Install
12. Terminal - Install
13. Terminal Cap - Install
14. Armature - Install

    NOTE: To seat the new brushes, slip a strip of #500 or #600 sandpaper, with the grit side up, between the commutator and each brush, and smoothly turn the armature. The contact surface of the brushes will be sanded to the same contour as the commutator.

15. Brush Spring - Install

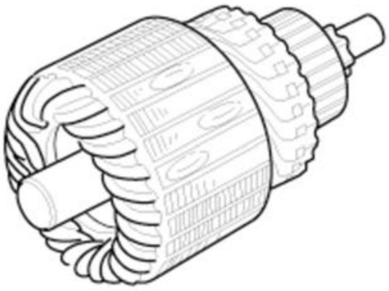
	1. While squeezing a spring (A), insert it in the hole on the brush holder, and push it until it bottoms. Repeat this for the other three springs (B, C, and D).

16. Armature Housing - Install
17. End Cover - Install

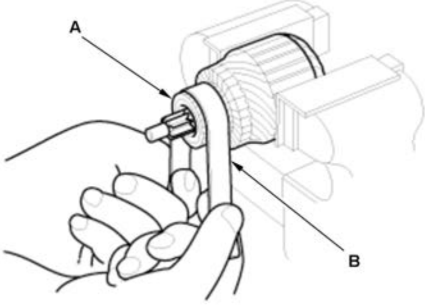
Inspection

Armature

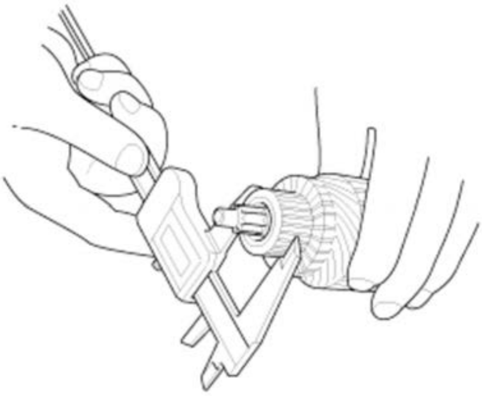
1. Armature - Inspect



1. Inspect the armature for wear or damage from contact with the permanent magnet. If there is wear or damage, replace the armature.

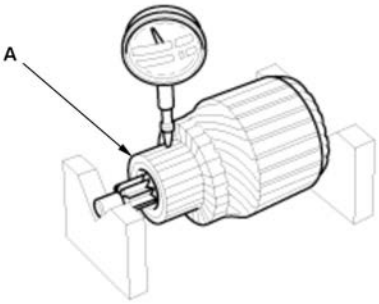


2. Check the commutator (A) surface. If the surface is dirty or burnt, resurface it with an emery cloth or a lathe to the specifications in step 3, or recondition with #500 or #600 sandpaper (B).



3. Check the commutator diameter with a digital caliper or dial type caliper. If the diameter is below the service limit, replace the armature.

Commutator Diameter	
Standard (New):	**28.0-28.1 mm (1.102-1.106 in)**
Service Limit:	**27.5 mm (1.083 in)**



4. Measure the commutator (A) runout:
- If the commutator runout is within the service limit, check the commutator for carbon dust or brass chips between the segments.
- If the commutator runout is not within the service limit, replace the armature.

Commutator Runout	
Standard (New):	**0.02 mm (0.0008 in) max.**

Service Limit:	**0.05 mm (0.0020 in)**

	5. Use a digital caliper or dial type caliper to check the mica depth (A). If the mica depth is below the service limit, replace the armature.

Standard (New):	**0.40-0.50 mm (0.0157-0.0197 in)**
Service Limit:	**0.15 mm (0.0059 in)**

Commutator Mica Depth

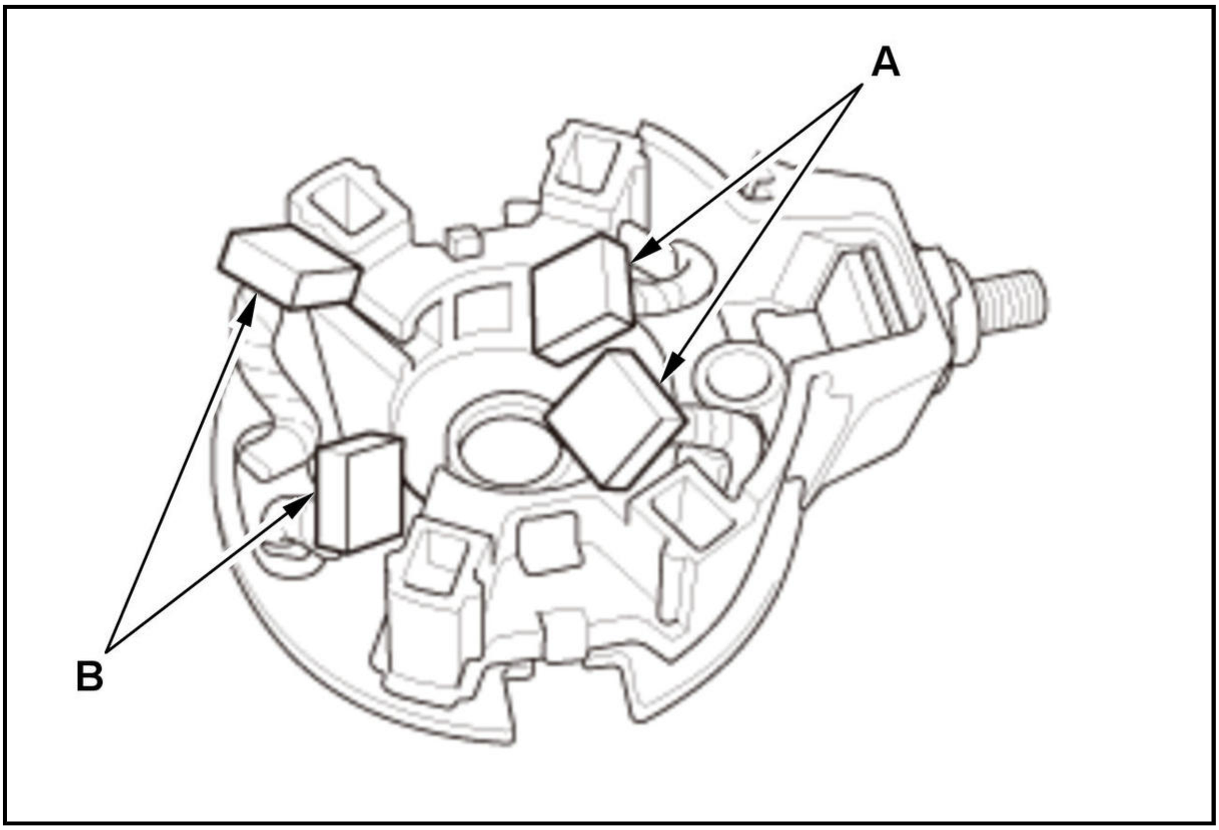
	6. Use an ohmmeter to check for continuity between the segments of the commutator. If there is an open circuit between any of the segments, replace the armature.

	7. Place the armature (A) on an armature tester (B). Hold a hacksaw blade (C) on the armature core. If the blade is attracted to the core while the core is turned, the armature is shorted. Replace the armature.

	8. Use an ohmmeter to check for continuity between the commutator (A) and the armature coil core (B), and between the commutator and the armature shaft (C). If there is continuity, replace the armature.

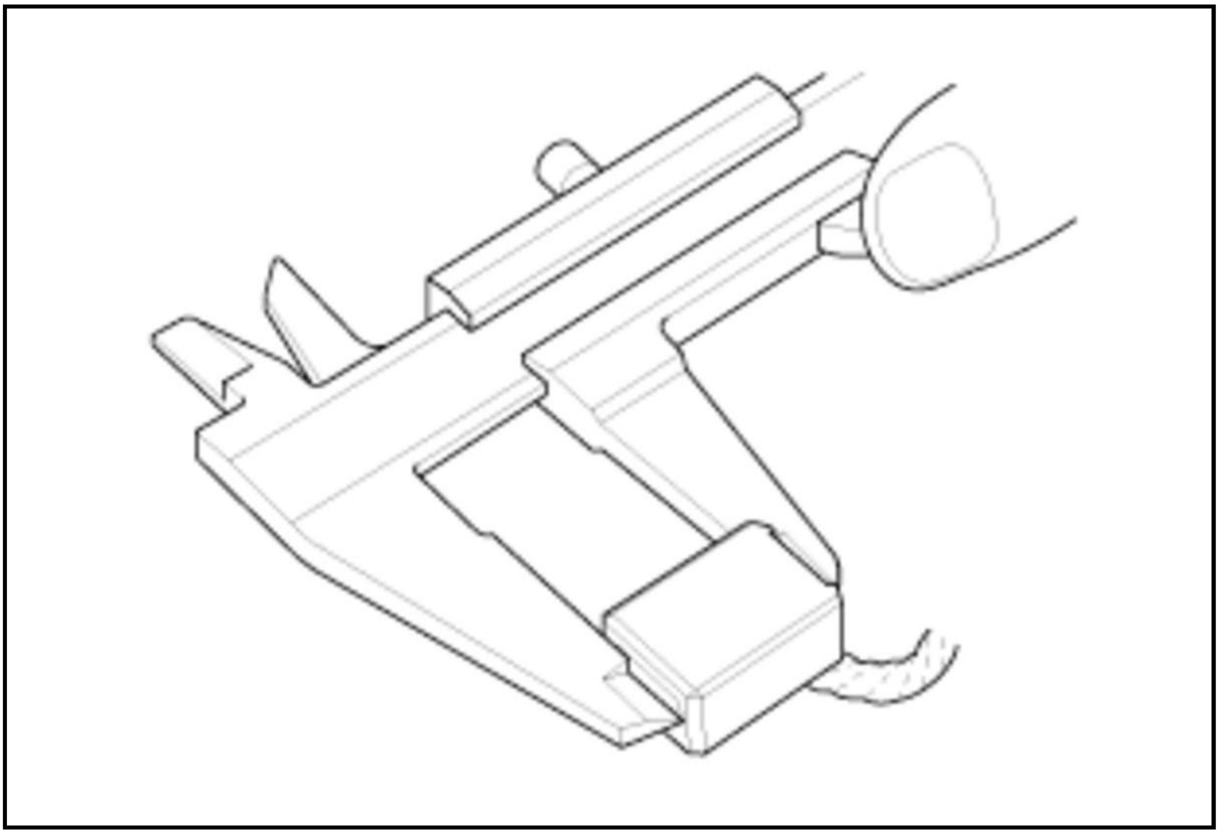
Brush Holder

2. Brush Holder Assembly - Inspect



Brush Holder Test

1. Check for continuity between the (+) brushes (A) and the (-) brushes (B). If there is continuity, replace the brush holder assembly.



Brush Inspect

1. Measure the brush length. If it is shorter than the service limit, replace the brush holder assembly.

Brush Length

Standard (New):	**11.1-11.5 mm (0.437-0.453 in)**
Service Limit:	**4.3 mm (0.169 in)**

Internal Gear Unit

3. Planetary Gear - Inspect

	1. Check the planetary gears (A), the gear shaft (B), and the internal ring gear (C). Replace them if they are worn or damaged.

Gear Cover Set

4. Overrunning Clutch - Inspect

	1. Hold the drive gear (A), turn the gear shaft (B) counterclockwise. Check that the drive gear comes out to the other end. If the drive gear does not move smoothly, replace the gear cover set. 2. Hold the drive gear, turn the gear shaft clockwise. The gear shaft should turn freely. If the gear shaft does not turn freely, replace the gear cover set. 3. If the drive gear is worn or damaged, replace the overrunning clutch assembly; the gear is not available separately.

TROUBLESHOOTING

STARTER SYSTEM CIRCUIT TROUBLESHOOTING (WITH KEYLESS ACCESS SYSTEM)

Special Tools Required

Alternator, Regulator, Battery, and Starter Tester OTC3131*

*: Available through the Honda Tool and Equipment Program 888-424-6857

NOTE:

- Air temperature must be between 59-100B°F (15-38B°C) during this procedure.
- After the inspection, you must **reset the PCM** . Otherwise, the PCM will continue to stop the fuel injectors from operating.
- The 12 volt battery must be in good condition and fully charged.

1. PGM-FI, CVT, and Keyless Access system DTC check

   -1. **Connect the HDS to the DLC** .

   -2. Check for PGM-FI, CVT, and Keyless Access system DTCs with the HDS. If you fail to enter the SYSTEM SELECTION MENU with the HDS, go to the keyless access system symptom troubleshooting **"Cannot select ON mode with keyless access and with the keyless remote touching the engine start/stop switch"** .

   PGM-FI system

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   CVT system

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   Keyless Access system

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Starting system check 1

   -1. Select All INJECTORS STOP in the PGM-FI INSPECTION menu with the HDS.

ALL INJECTORS

With the transmission in P or N position/mode, and with the brake pedal pressed, turn the vehicle to the START mode to crank the engine.

Did the starter crank the engine?

YES

Do the PCM reset in the PGM-FI MODE menu to cancel All INJECTORS STOP with the HDS.

NO

Go to step 3.

3. Starting system check 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check the 12 volt battery condition** . Check the electrical connections at the 12 volt battery, the 12 volt battery negative cable to the body, the engine ground cables, and the starter for looseness and corrosion. Then try starting the engine again.

   Did the starter crank the engine?

   Starter cranks normally

   Repairing the loose connection corrected the problem. **Do the PCM reset** in the PGM-FI MODE menu to All INJECTORS STOP with the HDS.

   Starter does not crank engine at all

   If the starter does not crank the engine at all, go to step 4.

   Starter cranks abnormally

   If the starter cranks the engine erratically or too slowly, go to step 6.

   Starter overruns

   If the starter does not disengage from the torque converter ring gear when you release the button, **remove the starter** , and check for the following:

   - Dirty drive gear or damaged overrunning clutch
   - Damaged torque converter ring gear

4. Fuse check

   -1. Check the following fuses.

Fuse	Location
No. A9 (10 A)	Under-hood fuse/relay box
No. A3-5 (30 A)	
No. D20 (10 A)	Under-dash fuse/relay box

Are the fuses OK?

YES

Reinstall the fuses, then go to step 5.

NO

Replace the fuse(s), and recheck. If the fuse(s) blows again, repair the short to ground on the No. A9 (10 A) fuse, the No. A3-5 (30 A) fuse, and/or the No. D20 (10 A) fuse circuit(s).

5. Determine possible failure area (starter, others)

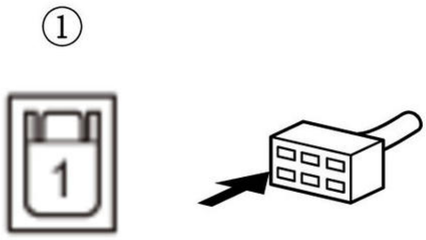
-1. Make sure the transmission is in P or N position/mode.

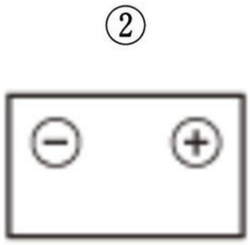
-2. Disconnect the following connector.

Starter S terminal 1P connector (A)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Starter S terminal 1P connector (male terminals) No. 1: ①
Terminal B	12 volt battery positive terminal: ②





Did the starter crank the engine?

YES

Check the following items in the order listed until you find the problem in the circuit:

- Check for an open or short in the wire and connectors between the under-hood fuse/relay box and the relay circuit board.
- Check for an open or short in the wire and connectors between the under-dash fuse/relay box and the relay circuit board.

- Check for an open or short in the wire and connectors between the relay circuit board and the PCM.
- Check for an open or short in the wire and connectors between the relay circuit board and the starter.
- Check for an open or short in the wire and connectors between the body control module and the PCM (STS line).
- Check for an open or short in the wire and connectors between the under-hood fuse/relay box and the brake pedal position switch.
- Check for an open or short in the wire and connectors between the brake pedal position switch, the body control module, and the PCM.
- Check for an open or short in the wire and connectors between the transmission range switch, the body control module, and the TCM.
- Check for an open or short in the wire and connectors between the transmission range switch and the TCM.
- Check for poor connections or loose terminals at the transmission range switch and body ground G151.
- **Check for a faulty relay circuit board** .
- **Check for a faulty engine start/stop switch** .
- **Check for faulty transmission range switch** .
- **Check for a faulty brake pedal position switch** .

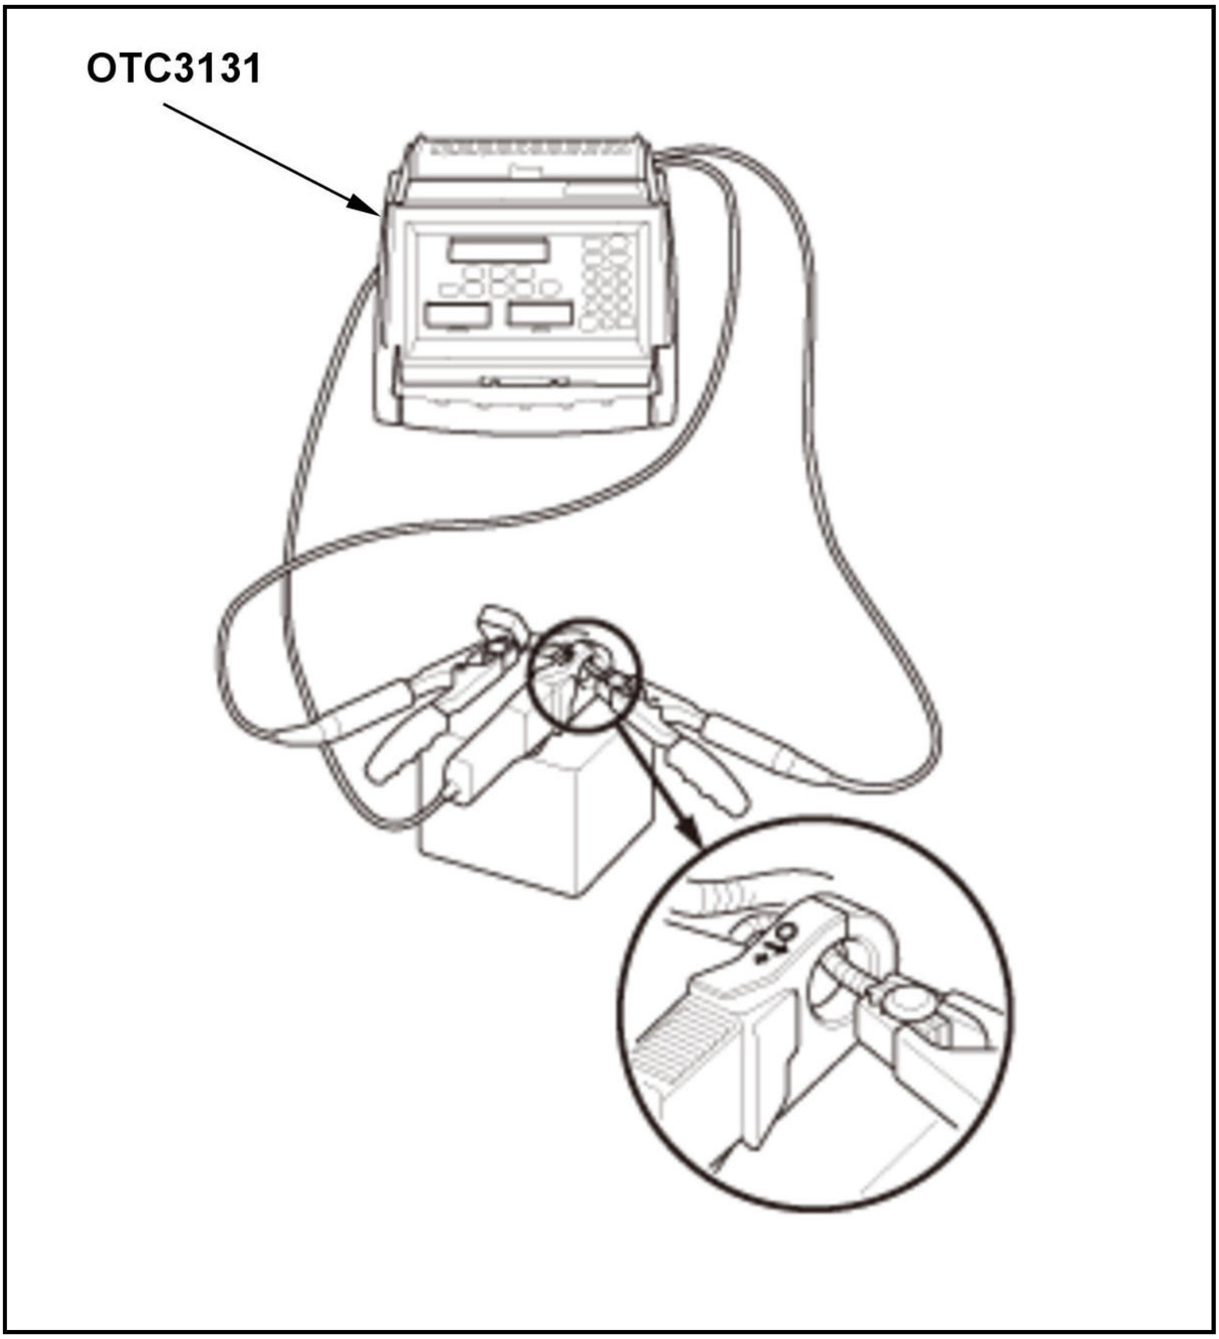
NO

Check for an open or short in the wire and connectors between the 12 volt battery and the starter. **Test or replace the starter** .

NOTE: **Do not inspect the component parts inside the starter if disassembly is prohibited.**

6. Starter test

-1. Connect the alternator, regulator, battery, and starter tester to the battery.



-2. Do the STARTING TEST, check the cranking voltage and the current draw from the following service limit table.

Voltage (V)	Current (A)
8.5 or more	380 or less

Are the cranking voltage and the current draw within the service limits?

YES

Remove the starter , and inspect its drive gear and torque converter ring gear for damage. Replace any damaged parts.

NO

Check the starter and if there is no problem, check the engine rotational load:

- Drag in the starter armature
- Shorted armature winding
- Open circuit in the starter armature commutator segments

- Excessively worn starter brushes
- Open circuit in the starter brushes
- Dirty or damaged helical splines or drive gear
- Faulty overrunning clutch

STARTER SYSTEM CIRCUIT TROUBLESHOOTING (WITHOUT KEYLESS ACCESS SYSTEM)

Special Tools Required

Alternator, Regulator, Battery, and Starter Tester OTC3131*

*: Available through the Honda Tool and Equipment Program 888-424-6857

NOTE:

- Air temperature must be between 59-100B°F (15-38B°C) during this procedure.
- After the inspection, you must **reset the PCM** . Otherwise, the PCM will continue to stop the fuel injectors from operating.
- The 12 volt battery must be in good condition and fully charged.

1. PGM-FI and CVT system DTC check

   -1. **Connect the HDS to the DLC** .

   -2. Check for PGM-FI and CVT system DTCs with the HDS.

   PGM-FI system

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   CVT system

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

   Are any DTCs indicated?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Starting system check 1

   -1. Select All INJECTORS STOP in the PGM-FI INSPECTION menu with the HDS.

   ALL INJECTORS

   With the transmission in P or N position/mode, and with the brake pedal pressed, turn the vehicle to the START mode to crank the engine.

   Did the starter crank the engine?

   YES

Do the PCM reset in the PGM-FI mode menu to cancel All INJECTORS STOP with the HDS.

NO

Go to step 3.

3. Starting system check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the 12 volt battery condition** . Check the electrical connections at the 12 volt battery, the 12 volt battery negative cable to the body, the engine ground cables, and the starter for looseness and corrosion. Then try starting the engine again.

Did the starter crank the engine?

Starter cranks normally

Repairing the loose connection corrected the problem. **Do the PCM reset** in the PGM-FI MODE menu to All INJECTORS STOP with the HDS.

Starter does not crank engine at all

If the starter does not crank the engine at all, go to step 4.

Starter cranks abnormally

If the starter cranks the engine erratically or too slowly, go to step 6.

Starter overruns

If the starter does not disengage from the torque converter ring gear when you release the key, **remove the starter** , and check for the following:

- Dirty drive gear or damaged overrunning clutch
- Damaged torque converter ring gear

4. Fuse check

-1. Check the following fuses.

Fuse	**No. A3-5**

B	**No. D20**
B	**No. D30**

Are the fuses OK?

YES

Reinstall the fuses, then go to step 5.

NO

Replace the fuse(s), and recheck. If the fuse(s) blows again, repair the short to ground on the No. A3-5 fuse, the No. D20 fuse, and/or the No. D30 fuse circuit(s).

5. Determine possible failure area (starter, others)

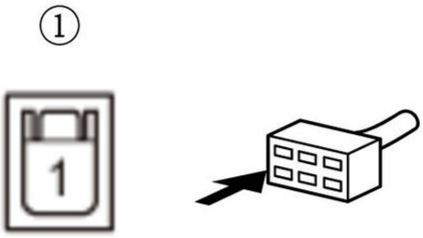
-1. Make sure the transmission is in P or N position/mode.

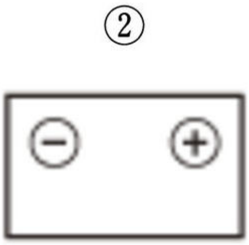
-2. Disconnect the following connector.

Starter S terminal 1P connector (A)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Starter S terminal 1P connector (male terminals) No. 1: ①
Terminal B	12 volt battery positive terminal: ②





Did the starter crank the engine?

YES

Check the following items in the order listed until you find the problem in the circuit:

- Check for an open or short in the wire and connectors between the under-hood fuse/relay box and the relay circuit board.
- Check for an open or short in the wire and connectors between the under-dash fuse/relay box and the relay circuit board.
- Check for an open or short in the wire and connectors between the relay circuit board and the PCM.
- Check for an open or short in the wire and connectors between the relay circuit board and the starter.
- Check for an open or short in the wire and connectors between the under-dash fuse/relay box and the PCM (STS line).
- Check for an open or short in the wire and connectors between the transmission range switch and the PCM.

- Check for poor connections or loose terminals at the transmission range switch and body ground G101 or G151.
- Check for a faulty relay circuit board .
- Check for a faulty ignition switch .
- Check for faulty transmission range switch .

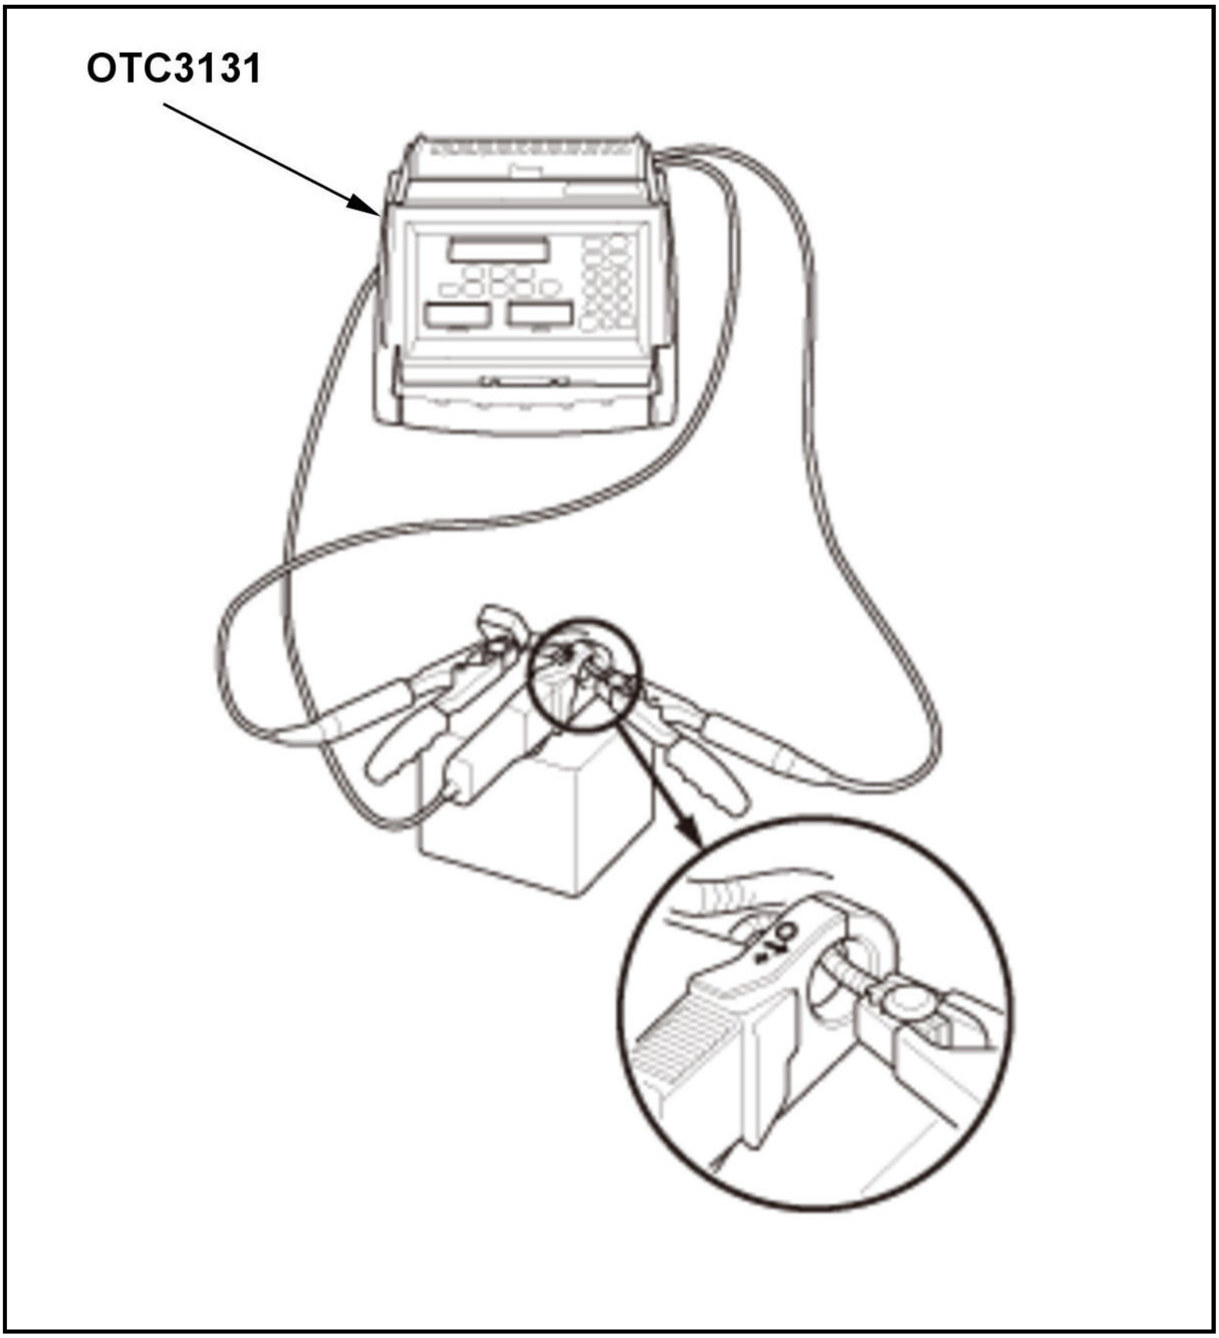
NO

Check for an open or short in the wire and connectors between the 12 volt battery and the starter. Test or replace the starter .

NOTE: **Do not inspect the component parts inside the starter if disassembly is prohibited.**

6. Starter test

-1. Connect the alternator, regulator, battery, and starter tester to the battery.



-2. Do the STARTING TEST, check the cranking voltage and the current draw from the following service limit table.

Voltage (V)	Current (A)
8.5 or more	380 or less

Are the cranking voltage and the current draw within the service limits?

YES

Remove the starter , and inspect its drive gear and the torque converter ring gear for damage. Replace any damaged parts.

NO

Check the starter and if there is no problem, check the engine rotational load:

NOTE: **The following are assumed as abnormalities of the starter.**

- **Drag in the starter armature**
- **Shorted armature winding**
- **Open circuit in the starter armature commutator segments**
- **Excessively worn starter brushes**
- **Open circuit in the starter brushes**
- **Dirty or damaged helical splines or drive gear**
- **Faulty overrunning clutch**

SYMPTOM TROUBLESHOOTING INDEX

STARTING SYSTEM SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
Engine does not crank	Check the starter system circuit troubleshooting.	Seized engine
Engine cranks, but does not start	• Check for PGM-FI DTCs . • Check the relay circuit board and PGM-FI main relay 2. • Without keyless access system: Check for IMMOBI status and function . • With keyless access system: Check for keyless access system symptom troubleshooting information . • Check the fuel pressure . • Check for a plugged or damaged fuel line .	• Fuel level in tank • Weak or fouled spark plugs

Symptom	Diagnostic procedure	Also check for
	- **Check for a plugged fuel filter** . - **Check the throttle body** . - **Check for low engine compression** . - **Check the camshaft timing** . - **Do the PCM reset** in the PGM-FI System to cancel ALL INJECTORS STOP with the HDS.	
Engine is hard to start	**Do the symptom troubleshooting for Engine will not start, engine starts but stalls immediately, or engine is hard to start** .	Weak or fouled spark plugs
Engine cranks slowly	- Check for loose 12 volt battery terminals or connections. - **Test the 12 volt battery for a low state of charge** . - **Check the starter for binding** . - Check for excessive drag in the engine.	B

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

ENGINE CRANKS SLOWLY

Diagnostic procedure

- Check for loose 12 volt battery terminals or connections.
- **Test the 12 volt battery for a low state of charge** .
- **Check the starter for binding** .
- Check for excessive drag in the engine.

ENGINE CRANKS, BUT DOES NOT START

Diagnostic procedure

- **Check for PGM-FI DTCs** .
- Check **the relay circuit board** and **PGM-FI main relay 2.**
- Without keyless access system: **Check for IMMOBI status and function** .
- With keyless access system: **Check for keyless access system symptom troubleshooting information** .
- **Check the fuel pressure** .
- **Check for a plugged or damaged fuel line** .
- **Check for a plugged fuel filter** .
- **Check the throttle body** .
- **Check for low engine compression** .
- **Check the camshaft timing** .
- **Do the PCM reset** in the PGM-FI System to cancel ALL INJECTORS STOP with the HDS.

Also check for

- Fuel level in tank
- Weak or fouled spark plugs

ENGINE DOES NOT CRANK

Diagnostic procedure

- Check the starter system circuit troubleshooting.

Also check for

Seized engine

ENGINE IS HARD TO START

Diagnostic procedure

- Do the symptom troubleshooting for Engine will not start, engine starts but stalls immediately, or engine is hard to start .

Also check for

Weak or fouled spark plugs

GENERAL INFORMATION

Anti-Lock Brake Safety Precautions

* PLEASE READ THIS FIRST *

This article is intended for general information purposes only. This information may not apply to all makes and models. If vehicle is equipped with Anti-Lock Brake System (ABS), refer to appropriate ANTI-LOCK BRAKE SYSTEM article in the BRAKES section for description, operation, depressurizing, testing, system bleeding, trouble shooting and servicing of specific system.

ANTI-LOCK BRAKE SAFETY PRECAUTIONS

WARNING: **Failure to depressurize ABS could lead to physical injury.**

- NEVER open a bleeder valve or loosen a hydraulic line while ABS is pressurized.
- NEVER disconnect or reconnect any electrical connectors while ignition is on. Damage to ABS control unit may result.
- **DO NOT** attempt to bleed hydraulic system without first referring to the appropriate ANTI-LOCK BRAKE SYSTEM article in the BRAKES section.
- Only use specially designed brake hoses/lines on ABS equipped vehicles.
- **DO NOT** tap on speed sensor components (sensor, sensor rings). Sensor rings must be pressed into hubs, NOT hammered into hubs. Striking these components can cause demagnetization or a loss of polarization, affecting the accuracy of the speed signal returning to the ABS control unit.
- **DO NOT** mix tire sizes. Increasing the width, as long as tires remain close to the original diameter, is acceptable. Rolling diameter must be identical for all 4 tires. Some manufacturers recommend tires of the same brand, style and type. Failure to follow this precaution may cause inaccurate wheel speed readings.
- **DO NOT** contaminate speed sensor components with grease. Only use recommended coating, when system calls for an anti-corrosion coating.
- When speed sensor components have been removed, ALWAYS check sensor-to-ring air gaps when applicable. These specifications can be found in each appropriate article.
- ONLY use recommended brake fluids. **DO NOT** use silicone brake fluids in an ABS equipped vehicle.
- When installing transmission devices (CB's, telephones, etc.) on ABS equipped vehicles, **DO NOT** locate the antenna near the ABS control unit (or any control unit).
- Disconnect all on-board computers, when using electric welding equipment.
- **DO NOT** expose the ABS control unit to prolonged periods of high heat (185 B°F/85B°C for 2 hours is generally considered a maximum limit).

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

ALL MODELS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

CLUTCH TROUBLE SHOOTING

Problem & Possible Cause	Action
Clutch Chatters/Grabs	
Incorrect Pedal Adjustment	Adjust Free Play
Worn Input Shaft Spline	Replace Input Shaft
Binding Pressure Plate	Replace Pressure Plate
Binding Throw-Out Lever	Check Throw-Out Lever, Check Throw-Out Bearing, Check Bearing Retainer

GENERAL INFORMATION

Drive Axle Noise Diagnosis

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

UNRELATED NOISES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Some driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires and other parts of the vehicle. Make sure that cause of trouble actually is in the drive axle before adjusting, repairing, or replacing any parts.

NON-DRIVE AXLE NOISES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

A few conditions can sound just like drive axle noise and have to be considered in pre-diagnosis. The 4 most common noises are exhaust, tires, CV/universal joints and trim moldings.

In certain conditions, the pitch of exhaust gases may sound like gear whine. At other times, it may be mistaken for a wheel bearing rumble.

Tires, especially radial and snow tires, can have a high-pitched tread whine or roar, similar to gear noise. Also, some non-standard tires with an unusual tread construction may emit a roar or whine.

Defective CV/universal joints may cause clicking noises or excessive driveline play that can be improperly diagnosed as drive axle problems.

Trim and moldings can also cause a whistling or whining noise. Ensure that none of these components are causing the noise before disassembling the drive axle.

GEAR NOISE

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

A "howling" or "whining" noise from the ring and pinion gear can be caused by an improper gear pattern, gear damage, or improper bearing preload. It can occur at various speeds and driving conditions, or it can be continuous.

Before disassembling axle to diagnose and correct gear noise, make sure that tires, exhaust, and vehicle trim have been checked as possible causes.

CHUCKLE

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

This is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It occurs while decelerating from 40 MPH and usually can be heard until vehicle comes to a complete stop. The frequency varies with the speed of the vehicle.

A chuckle that occurs on the driving phase is usually caused by excessive clearance due to differential gear wear, or by a damaged tooth on the coast side of the pinion or ring gear. Even a very small tooth nick or a ridge on the edge of a gear tooth is enough to cause the noise.

This condition can be corrected simply by cleaning the gear tooth nick or ridge with a small grinding wheel. If either gear is damaged or scored badly, the gear set must be replaced. If metal has broken loose, the carrier and housing must be cleaned to remove particles that could cause damage.

KNOCK

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

This is very similar to a chuckle, though it may be louder, and occur on acceleration of deceleration. Knock can be caused by a gear tooth that is damaged on the drive side of the ring and pinion gears. Ring gear bolts that are hitting the carrier casting can cause knock. Knock can also be due to excessive end play in the axle shafts.

CLUNK

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Clunk is a metallic noise heard when an automatic transmission is engaged in Reverse or Drive, or when throttle is applied or released. It is caused by backlash somewhere in the driveline, but not necessarily in the axle. To determine whether driveline clunk is caused by the axle, check the total axle backlash as follows:

1. Raise vehicle on a frame or twinpost hoist so that drive wheels are free. Clamp a bar between axle companion flange and a part of the frame or body so that flange cannot move.
2. On conventional drive axles, lock the left wheel to keep it from turning. On all models, turn the right wheel slowly until it is felt to be in drive condition. Hold a chalk marker on side of tire about 12" from center of wheel. Turn wheel in the opposite direction until it is again felt to be in drive condition.
3. Measure the length of the chalk mark, which is the total axle backlash. If backlash is one inch or less, clunk will not be eliminated by overhauling drive axle.

BEARING WHINE

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by malfunctioning pinion bearings. Pinion bearings operate at driveshaft speed. Roller wheel bearings may whine in a similar manner if they run completely dry of lubricant. Bearing noise will occur at all driving speeds. This distinguishes it from gear whine, which usually comes and goes as speed changes.

BEARING RUMBLE

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Bearing rumble sounds like marbles being tumbled. It is usually caused by a malfunctioning wheel bearing. The lower pitch is because the wheel bearing turns at only about 1/3 of driveshaft speed.

CHATTER ON TURNS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

This is a condition where the whole front or rear vibrates when vehicle is moving. The vibration is easily felt and heard. Extra differential thrust washers installed during axle repair can cause a condition of partial lock-up that creates the chatter.

AXLE SHAFT NOISE

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Axle shaft noise is similar to gear noise and pinion bearing whine. Axle shaft bearing noise will normally distinguish itself from gear noise by occurring in all driving modes. Noise will persist with transmission in neutral while vehicle is moving at problem speed.

If vehicle displays this noise condition, remove suspect axle shafts and replace axle bearings. Re-evaluate vehicle for noise before removing any internal components.

VIBRATION

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Vibration is a high-frequency trembling, shaking or grinding condition (felt or heard) that may be constant or variable in level and con occur during the total operating speed range of the vehicle.

The types of vibrations that can be felt in the vehicle can be divided into 3 main groups:

- Vibrations of various unbalanced rotating parts of the vehicle.
- Resonance vibrations of the body and frame structures caused by rotating of unbalance parts.
- Tip-in moans of resonance vibrations from stressed engine or exhaust system mounts or driveline flexing modes.

Electrostatic Discharge (ESD) Warning - Basic Information

* PLEASE READ THIS FIRST *

NOTE: **This article is intended for general information purposes only. Contents are generic in nature and all information may or may not apply to all vehicles.**

INTRODUCTION

NOTE: **This article is intended for general information purposes only. Contents are generic in nature and all information may or may not apply to all vehicles.**

All Electrostatic Discharge (ESD) sensitive components contain solid state circuits (transistors, diodes, semiconductors) that may become damaged when contacted with an electrostatic charge. The following information applies to all ESD sensitive devices. The ESD symbol shown in Fig. **Fig. 1** may be used on schematics to indicate which components are ESD sensitive. See **Fig. 1**. Although different manufactures may display different symbols to represent ESD sensitive devices, the handling and measuring precautions and procedures are the same.

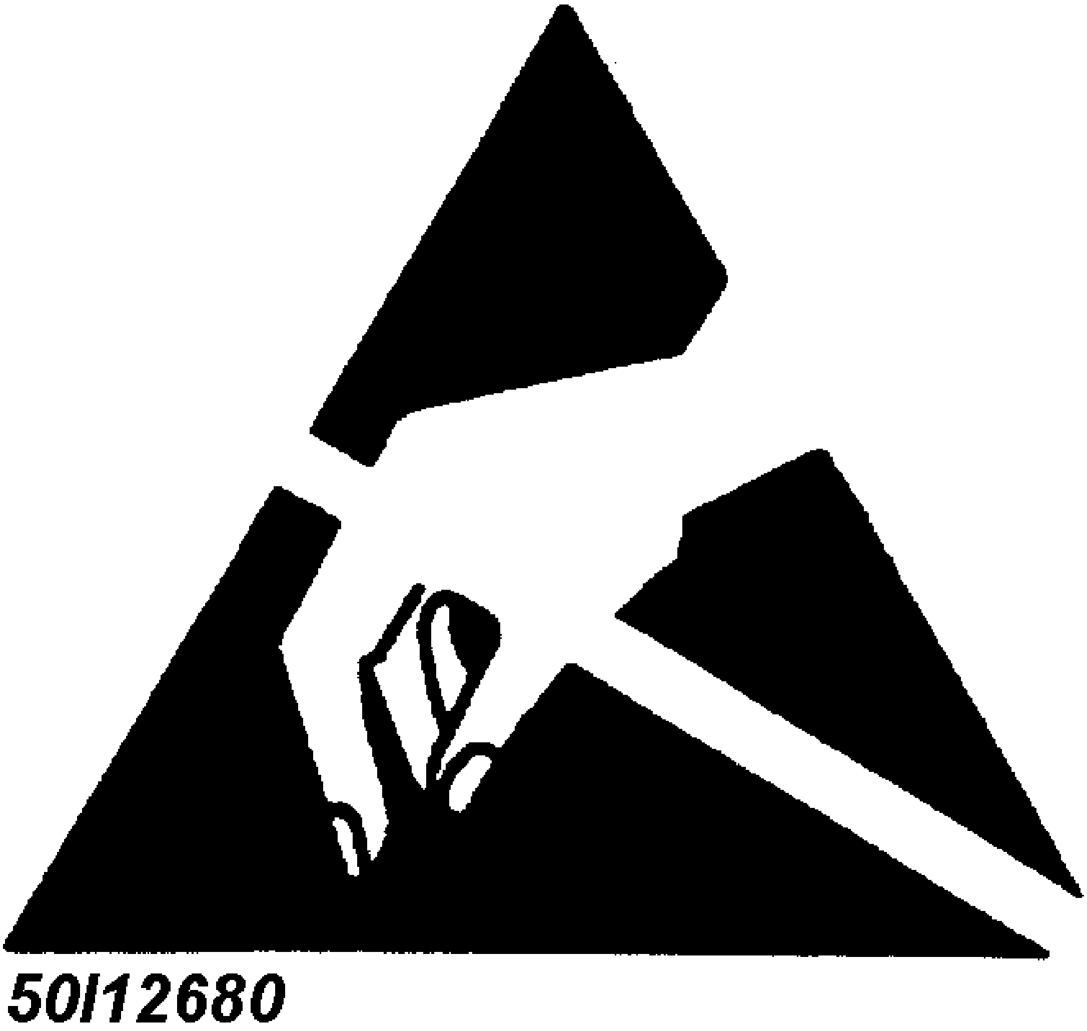

Fig. 1: Sample ESD Symbol

HANDLING STATIC-SENSITIVE CIRCUITS/DEVICES

NOTE: **This article is intended for general information purposes only. Contents are generic in nature and all information may or may not apply to all vehicles.**

When handling an electronic part that is ESD sensitive, the technician should follow these guidelines to reduce any possible electrostatic charge build-up on the technician's body and the electronic part.

1. Always touch a known good ground source before handling the part. This should be repeated while handling the part and more frequently after sitting down from a standing position, sliding across the seat or walking a distance.
2. Avoid touching electrical terminals of the part, unless instructed by a diagnostic procedure.
3. DO NOT open the package of a new part until it is time to install the part.
4. Before removing the part from its package, ground the package to a known good ground source.

CHECKING STATIC-SENSITIVE CIRCUITS/DEVICES

NOTE: **This article is intended for general information purposes only. Contents are generic in nature and all information may or may not apply to all vehicles.**

1. Solid State circuits in electronic devices are shown greatly simplified in schematics. See Fig. 2. Due to the simplification of the electronic devices on the schematic, resistance measurements could be misleading or could lead to an electrostatic discharge. Always follow the recommended diagnostic procedure.

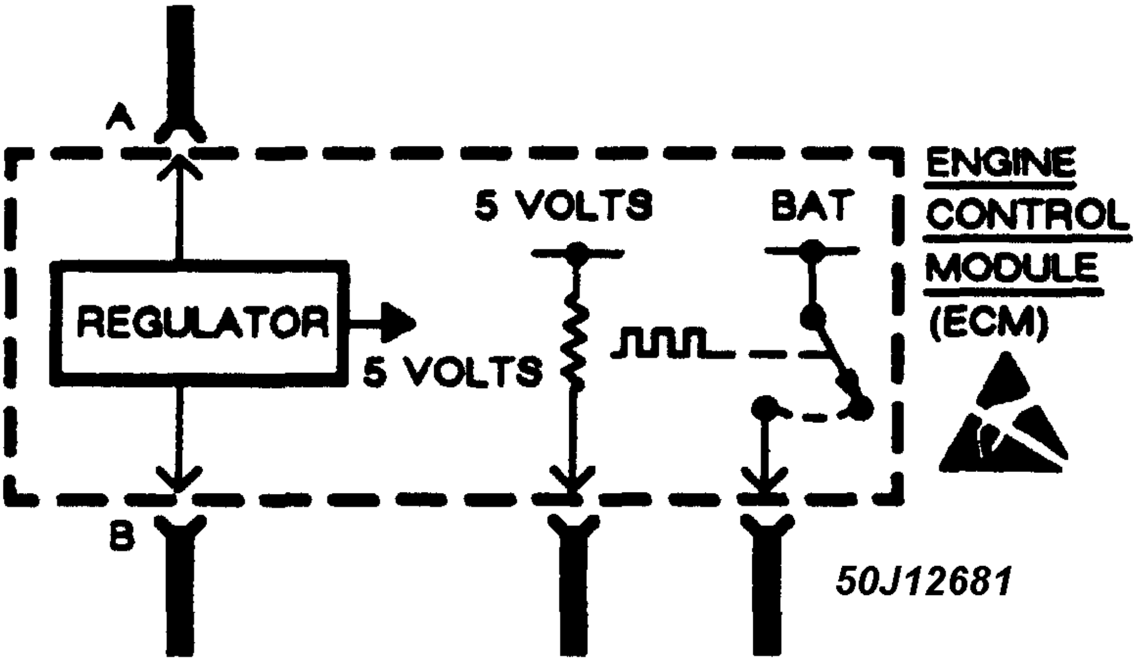

Fig. 2: Sample Schematic Showing Typical ESD Sensitive Device

2. Only measure resistance at the terminals of the devices when instructed by the recommended diagnostic procedure.
3. When using a voltmeter, be sure to connect the ground lead first.

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

DESCRIPTION

Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of cleaning, inspection, and assembly processes are included.

ENGINE IDENTIFICATION

Engine may be identified from Vehicle Identification Number (VIN) stamped on a metal tab. Metal tab may be located in different locations depending on manufacturer. Engine identification number or serial number is located on cylinder block. Location varies with each manufacturer.

INSPECTION PROCEDURES

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

GENERAL

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Engine components must be inspected to meet manufacturer's specifications and tolerances during overhaul. Proper dimensions and tolerances must be met to obtain proper performance and maximum engine life.

Micrometers, depth gauges and dial indicator are used for checking tolerances during engine overhaul. Magnaflux, Magnaglo, dye-check, ultrasonic and x-ray inspection procedures are used for parts inspection.

MAGNETIC PARTICLE INSPECTION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Magnaflux & Magnaglo

Magnaflux is an inspection technique used to locate material flaws and stress cracks. Component is subjected to a strong magnetic field. Entire component or a localized area can be magnetized. Component is coated with either a wet or dry material that contains fine magnetic particles.

Cracks which are outlined by the particles cause an interruption of magnetic field. Dry powder method of Magnaflux can be used in normal lighting and crack appears as a bright line.

Fluorescent liquid is used along with a Black light in the Magnaglo Magnaflux system. Darkened room is required for this procedure. The crack will appear as a glowing line. Complete demagnetizing of component upon completion is required on both procedures. Magnetic particle inspection applies to ferrous materials only.

PENETRANT INSPECTION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Zyglo

The Zyglo process coats material with a fluorescent dye penetrant. Component is often warmed to expand cracks that will be penetrated by the dye. Using darkened room and Black light, component is inspected for cracks. Crack will glow brightly.

Developing solution is often used to enhance results. Parts made of any material, such as aluminum cylinder heads or plastics, may be tested using this process.

Dye Check

Penetrating dye is sprayed on the previously cleaned component. Dye is left on component for 5-45 minutes, depending upon material density. Component is then wiped clean and sprayed with a developing solution. Surface cracks will show up as a bright line.

ULTRASONIC INSPECTION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen**

to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

If an expensive part is suspected of internal cracking, ultrasonic testing is used. Sound waves are used for component inspection.

X-RAY INSPECTION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

This form of inspection is used on highly stressed components. X-ray inspection may be used to detect internal and external flaws in any material.

PRESSURE TESTING

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Cylinder heads can be tested for cracks using a pressure tester. Pressure testing is performed by plugging all but one of the holes of cylinder head and injecting air or water into the open passage.

Leaks are indicated by the appearance of wet or damp areas when using water. When air is used, it is necessary to spray the head surface with a soap solution. Bubbles will indicate a leak. Cylinder head may also be submerged in water heated to specified temperature to check for cracks created during heat expansion.

CLEANING PROCEDURES

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

GENERAL

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

All components of an engine do not have the same cleaning requirements. Physical methods include bead blasting and manual removal. Chemical methods include solvent blast, solvent tank, hot tank, cold tank and steam cleaning of components.

BEAD BLASTING

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Manual removal of deposits may be required prior to bead blasting, followed by some other cleaning method. Carbon, paint and rust may be removed using bead blasting method. Components must be free of oil and grease prior to bead blasting. Beads will stick to grease or oil soaked areas causing area not to be cleaned.

Use air pressure to remove all trapped residual beads from component after cleaning. After cleaning internal engine parts made of aluminum, wash thoroughly with hot soapy water. Component must be thoroughly cleaned as glass beads will enter engine oil resulting in bearing damage.

CHEMICAL CLEANING

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Solvent tank is used for cleaning oily residue from components. Solvent blasting sprays solvent through a siphon gun using compressed air.

The hot tank, using heated caustic solvents, is used for cleaning ferrous materials only. DO NOT clean aluminum parts such as cylinder heads, bearings or other soft metals using the hot tank. After cleaning, flush parts with hot water.

A non-ferrous part will be ruined and caustic solution will be diluted if placed in the hot tank. Always use eye protection and gloves when using the hot tank.

Use of a cold tank is for cleaning aluminum cylinder heads, carburetors and other soft metals. A less caustic and unheated solution is used. Parts may be left in the tank for several hours without damage. After cleaning, flush parts with hot water.

Steam cleaning, with boiling hot water sprayed at high pressure, is recommended as the final cleaning process when using either hot or cold tank cleaning.

COMPONENT CLEANING

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

SHEET METAL PARTS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Examples of sheet metal parts are rocker covers, front and side covers, oil pan and bellhousing dust cover. Glass bead blasting or hot tank may be used for cleaning.

Ensure all mating surfaces are flat. Deformed surfaces should be straightened. Check all sheet metal parts for cracks and dents.

INTAKE & EXHAUST MANIFOLDS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Using solvent cleaning or bead blasting, clean manifolds for inspection. If intake manifold has an exhaust crossover, all carbon deposits must be removed. Inspect manifolds for cracks, burned or eroded areas, corrosion and damage to fasteners.

Exhaust heat and products of combustion cause threads of fasteners to corrode. Replace studs and bolts as necessary. On "V" type intake manifolds, sheet metal oil shield must be removed for proper cleaning and inspection. Ensure all manifold parting surfaces are flat and free of burrs.

CYLINDER HEAD REPLACEMENT

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

REMOVAL

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Remove intake and exhaust manifolds and valve cover. Cylinder head and camshaft carrier bolts (if equipped) should be removed only when engine is cold. On many aluminum cylinder heads, removal while hot will cause cylinder head warpage. Mark rocker arm or overhead cam components for location.

Remove rocker arm components or overhead cam components. Components must be installed in original location. Individual design rocker arms may utilize shafts, ball-type pedestal mounts or no rocker arms. For all design types, wire components together and identify according to corresponding valve. Remove cylinder head bolts. Note length and location. Some applications require cylinder head bolts be removed in proper sequence to prevent cylinder head damage. See **Fig. 1**. Remove cylinder head.

INSTALLATION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure all surfaces and head bolts are clean. Check that head bolt holes of cylinder block are clean and dry to prevent block damage when bolts are tightened. Clean threads with tap to ensure accurate bolt torque.

Install head gasket on cylinder block. Some manufacturers may recommend sealant be applied to head gasket prior to installation. Note that all holes are aligned. Some gasket applications may be marked so that certain area faces upward. Install cylinder head using care not to damage head gasket. Ensure cylinder head is fully seated on cylinder block.

Some applications require head bolts be coated with sealant prior to installation. This is done if head bolts are exposed to coolant passages. Some applications require head bolts be coated with light coat of engine oil.

Install head bolts. Head bolts should be tightened in proper steps and sequence to specification. See Fig. 1. Install remaining components. Tighten all bolts to specification. Adjust valves if required. See VALVE ADJUSTMENT.

NOTE: **Some manufacturers require that head bolts be retightened after specified amount of operation. This must be done to prevent head gasket failure.**

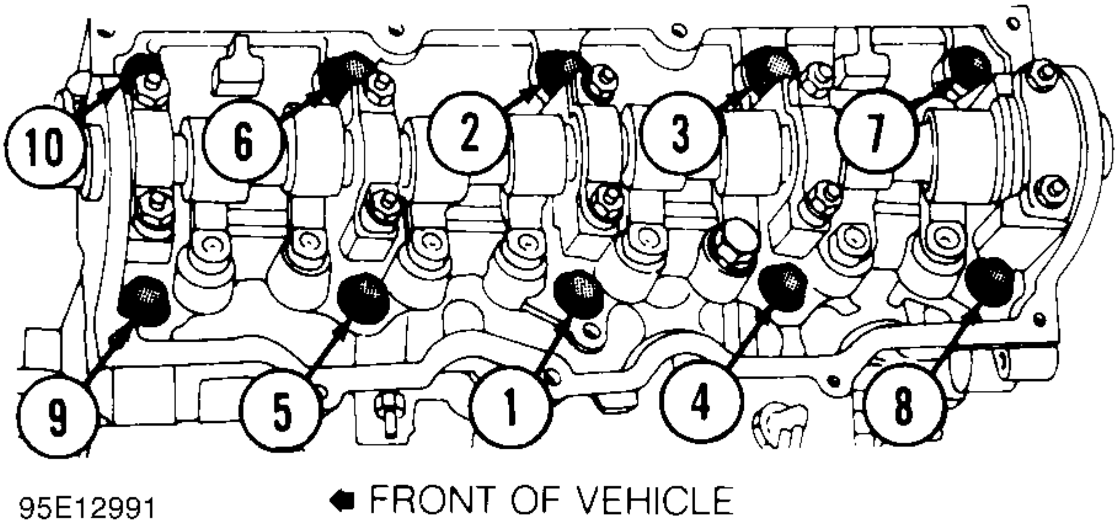

Fig. 1: Typical Cylinder Head Tightening or Loosening Sequence

VALVE ADJUSTMENT

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Engine specifications will indicate valve train clearance and temperature at which adjustment is to be made on most models. In most cases, adjustment will be made with a cold engine. In some cases, both a cold and a hot clearance will be given for maintenance convenience.

On some models, adjustment is not required. Rocker arms are tightened to specification and valve lash is automatically set. On some models with push rod actuated valve train, adjustment is made at push rod end of rocker arm while other models do not require adjustment.

Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge. Adjustment is made by rotating adjusting screw until proper clearance is obtained. Lock nut is then tightened. Engine will be rotated to obtain all valve adjustments to manufacturer's specifications.

Some models require hydraulic lifter to be bled down and clearance measured. Push rods of different length can be used to obtain proper clearance. Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge.

Overhead cam engines designed without rocker arms actuate valves directly on a cam follower. A hardened, removable disc is installed between the cam lobe and lifter. Clearance will be checked between cam heel and adjusting disc in proper sequence using a feeler gauge. Engine will be rotated to obtain all valve adjustments.

On overhead cam engines designed with rocker arms, adjustment is made at valve end of rocker arm. Ensure valve to be adjusted is riding on heel of cam on all engines. Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge. Adjustment is made by rotating adjusting screw until proper clearance is obtained. Lock nut is then tightened. Engine will be rotated to obtain all valve adjustments to manufacturer's specifications.

CYLINDER HEAD OVERHAUL

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

CYLINDER HEAD DISASSEMBLY

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Mark valves for location. Using valve spring compressor, compress valve springs. Remove valve locks. Carefully release spring compressor. Remove retainer or rotator, valve spring, spring seat and valve. See **Fig. 2**.

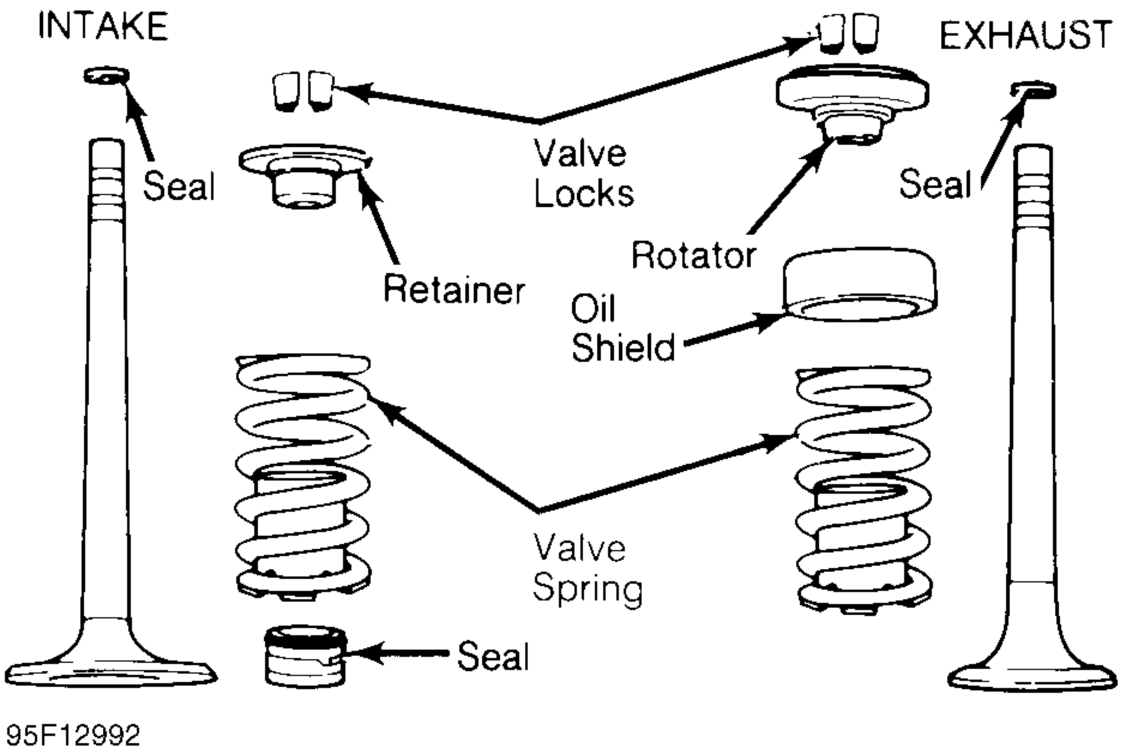

Fig. 2: Exploded View of Valve Assemblies

CYLINDER HEAD CLEANING & INSPECTION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Clean cylinder head and valve components using approved cleaning methods. Inspect cylinder head for cracks, damage or warped gasket surface. Place straightedge across gasket surface. Determine clearance at center of straightedge. Measure across both diagonals, longitudinal center line and across cylinder head at several points. See Fig. 3.

On cast iron cylinder heads, if warpage exceeds .003" (.08 mm) in a 6" span, or .006" (.15 mm) over total length, cylinder head must be resurfaced. On most aluminum cylinder heads, if warpage exceeds .002" (.05 mm) in any area, cylinder head must be resurfaced. Warpage specification may vary by manufacturer. If warpage exceeds specification on some cylinder heads, cylinder head must be replaced.

Cylinder head thickness should be measured to determine amount of material which can be removed before replacement is required. Cylinder head thickness must not be less than the manufacturer's specification.

If cylinder head required resurfacing, it may not align properly with intake manifold. On "V" type engines, misalignment is corrected by machining intake manifold surface that contacts cylinder head. Cylinder head may be machined on surface that contacts intake manifold. Using oil stone, remove burrs or scratches from all sealing surfaces.

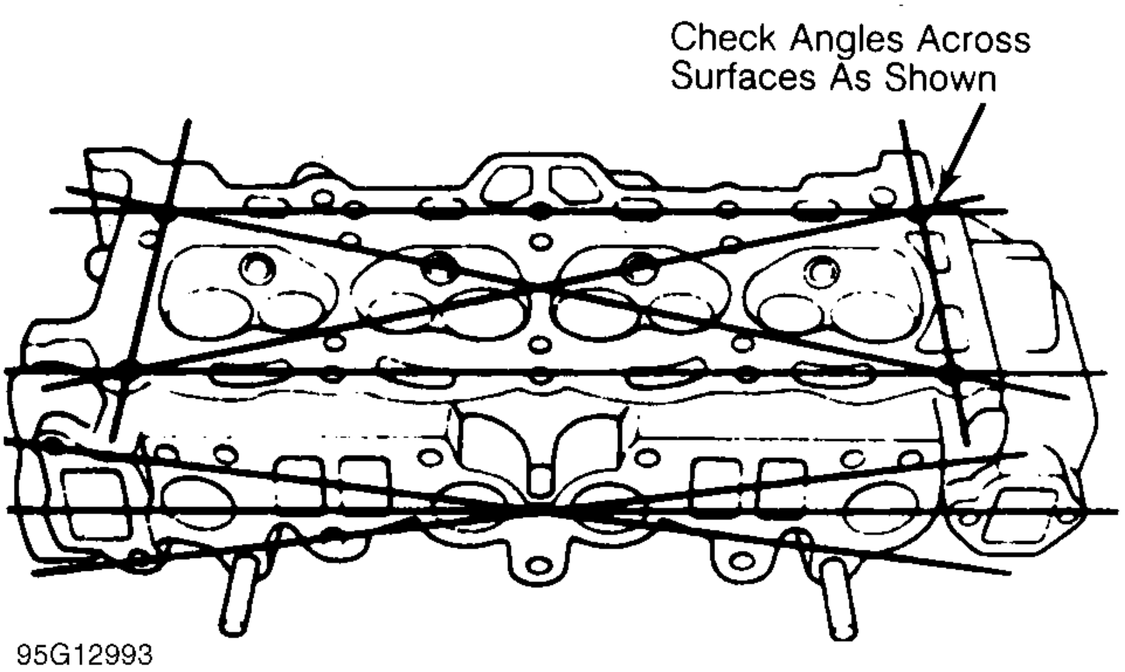

Fig. 3: Checking Cylinder Head for Warpage

VALVE SPRINGS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Inspect valve springs for corroded or pitted valve spring surfaces which may lead to breakage. Polished spring ends caused by a rotating spring indicate that spring surge has occurred. Replace springs showing evidence of these conditions.

Inspect valve springs for squareness using a 90-degree straightedge. See Fig. 4. Replace valve spring if out-of-square exceeds manufacturer's specification.

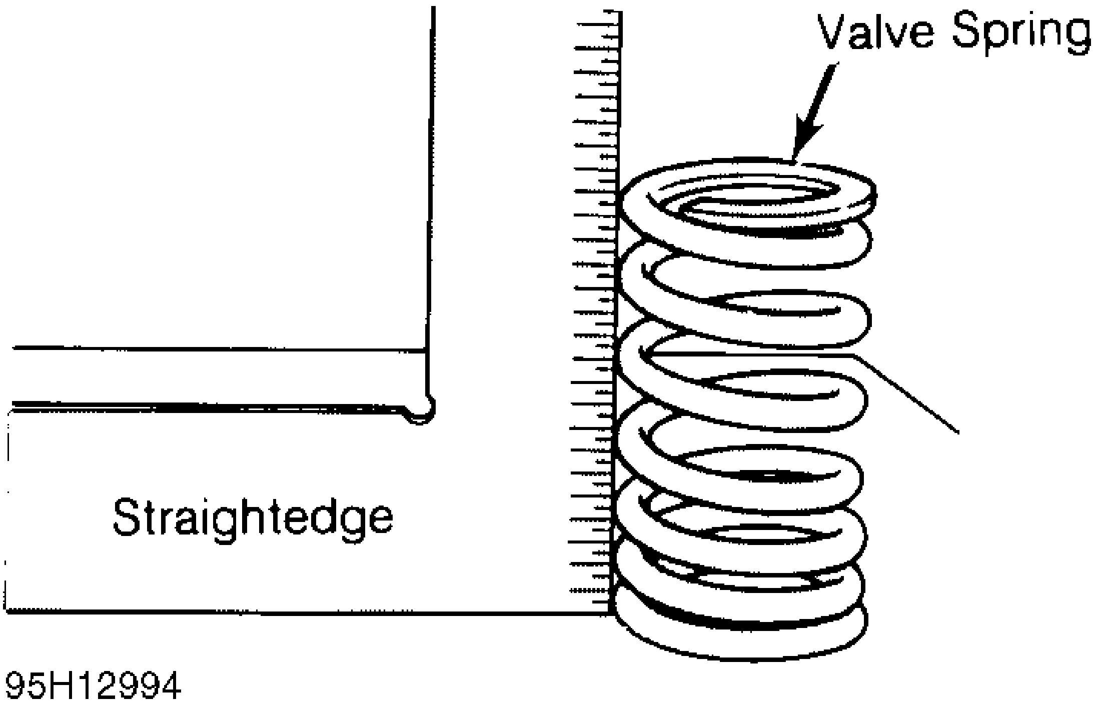

Fig. 4: Checking Valve Spring Squareness

Using vernier caliper, measure free length of all valve springs. Replace springs if not within specification. Using valve spring tester, test valve spring pressure at installed and compressed heights. See **Fig. 5**.

Usually compressed height is installed height minus valve lift. Replace valve spring if not within specification. It is recommended to replace all valve springs when overhauling cylinder head. Valve springs may need to be installed with color coded end or small coils at specified area according to manufacturer.

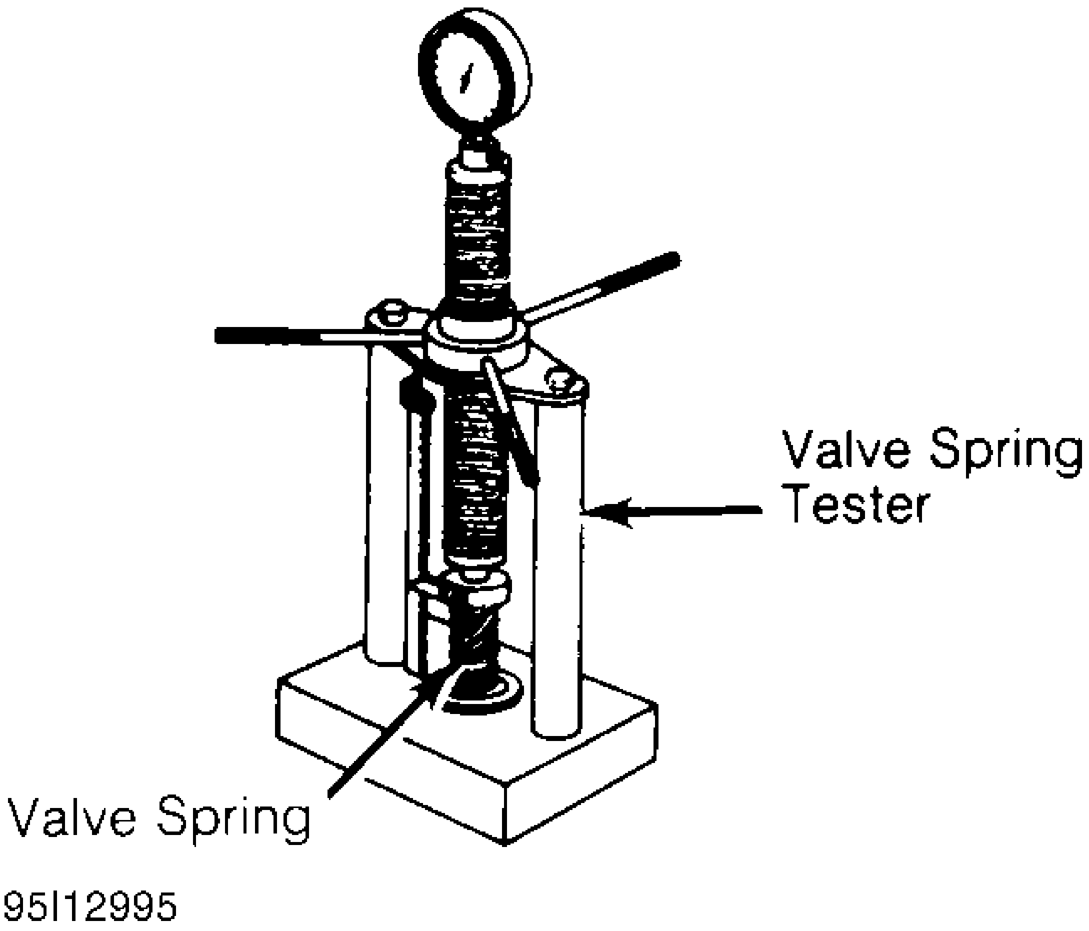

Fig. 5: Checking Valve Spring Pressure

VALVE GUIDE

NOTE:	**Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.** **Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Measuring Valve Guide Clearance

Check valve stem-to-guide clearance. Ensure valve stem diameter is within specification. Install valve in valve guide. Install dial indicator assembly on cylinder head with tip resting against valve stem just above valve guide. See Fig. 6.

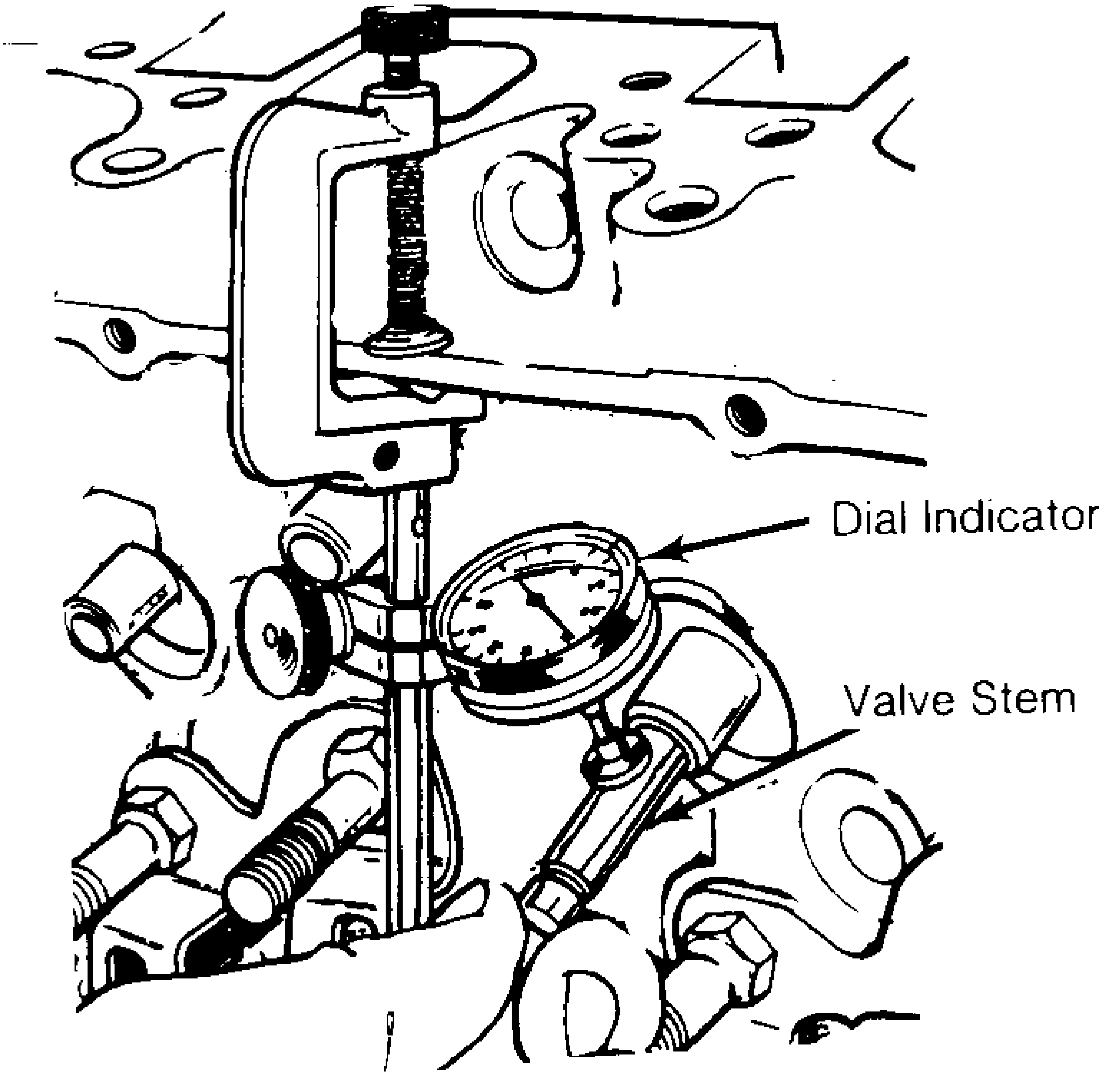

Fig. 6: Measuring Valve Stem-to-Guide Clearance

Lower valve approximately 1/16" below valve seat. Push valve stem against valve guide as far as possible. Adjust dial indicator to zero. Push valve stem in opposite direction and note reading. Clearance must be within specification.

If valve guide clearance exceeds specification, valves with oversize stems may be used and valve guides are reamed to larger size or valve guide must be replaced. On some applications, a false guide is installed, then reamed to proper specification. Valve guide reamer set is used to ream valve guide to obtain proper clearance for new valve.

Reaming Valve Guide

Select proper reamer for size of valve stem. Reamer must be of proper length to provide clean cut through entire length of valve guide. Install reamer in valve guide and rotate to cut valve guide. See Fig. 7.

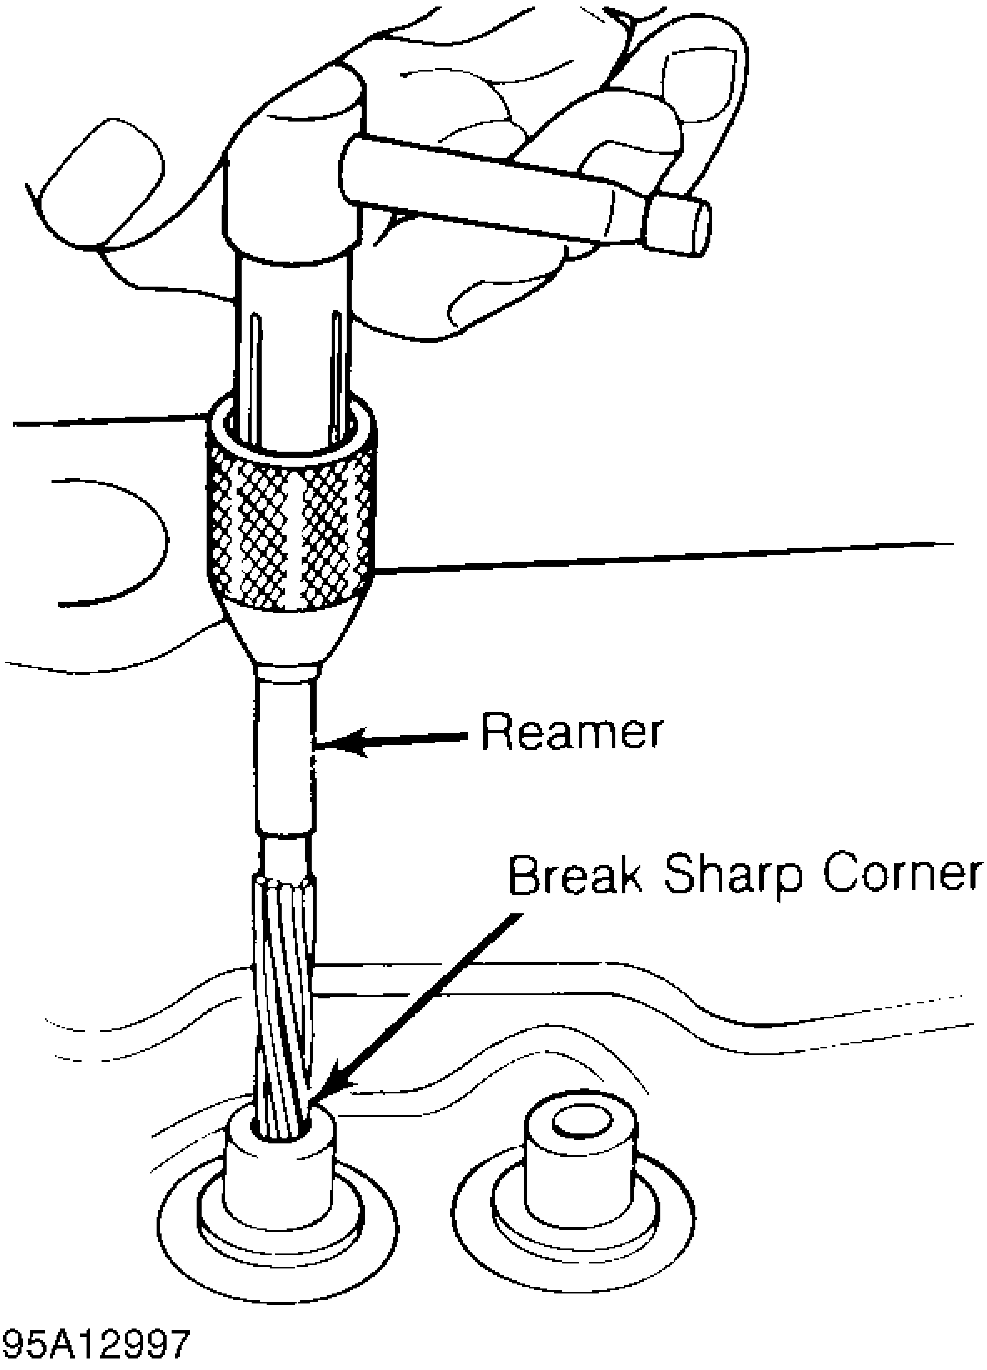

Fig. 7: Reaming Valve Guides

Replacing Valve Guide

Replace valve guide if clearance exceeds specification. Valve guides are either pressed, hammered or shrunk in place, depending upon cylinder head design and type of metal used.

Remove valve guide from cylinder head by pressing or tapping on a stepped drift. See **Fig. 8**. Once valve guide is installed, distance from cylinder head to top of valve guide must be checked. This distance must be within specification.

Aluminum heads are often heated before installing valve guide. Valve guide is sometimes cooled in dry ice prior to installation. Combination of a heated cylinder head and cooled valve guide ensures a tight guide fit upon assembly. The new guide must be reamed to specification.

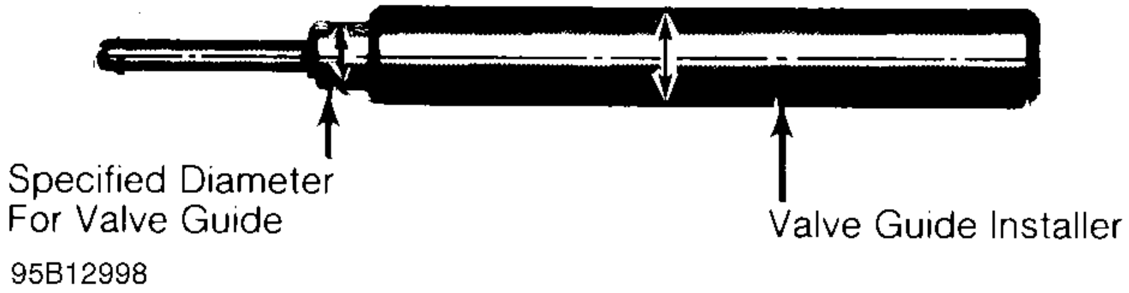

Fig. 8: Typical Valve Guide Remover & Installer

VALVES & VALVE SEATS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve Grinding

Valve stem O.D. should be measured in several areas to indicate amount of wear. Replace valve if not within specification. Valve margin area should be measured to ensure that valve can be ground. See Fig. 9.

If valve margin is less than specification, the valves will be burned. Valve must be replaced. Due to minimum margin dimensions during manufacture, some new type valves cannot be reground. Some manufacturers use stellite coated valves that must NOT be machined. Valves can only be lapped into valve seat.

CAUTION: **Some valves are sodium filled. Extreme care must be used when disposing of damaged or worn sodium-filled valves.**

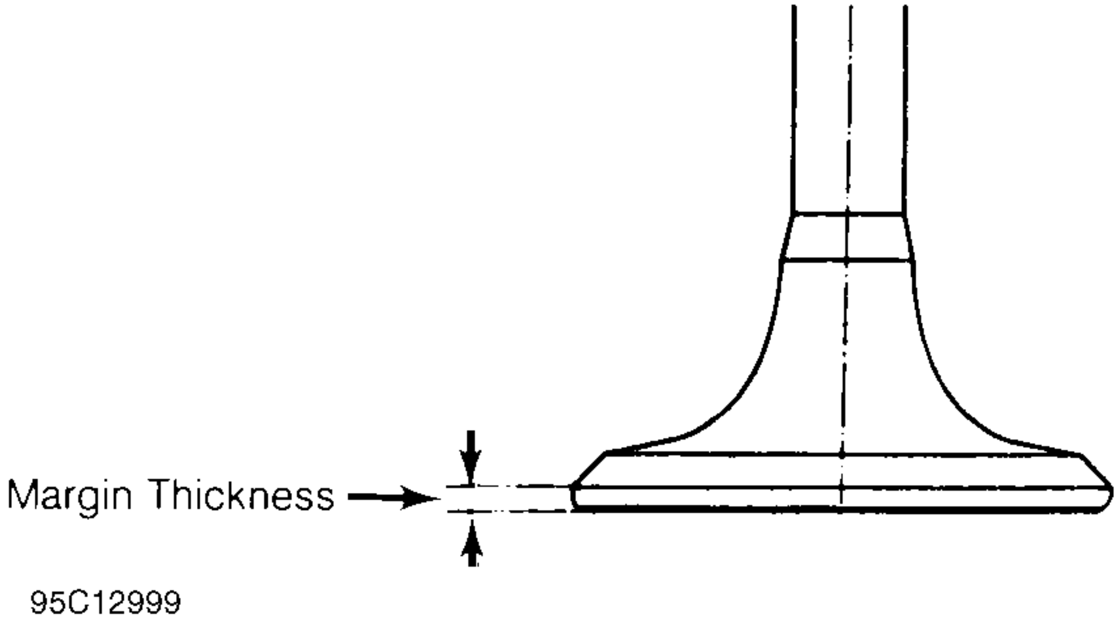

Fig. 9: Measuring Valve Head Margin

Resurface valve to proper angle specification using valve grinding machine. Follow manufacturer's instructions for valve grinding machine. Specifications may indicate a different valve face angle than seat angle. Measure valve margin after grinding. Replace valve if not within specification. Valve stem tip can be refinished using valve grinding machine.

Valve Lapping

During valve lapping of recently designed valves, be sure to follow manufacturer's recommendations. Surface hardening and materials used with some valves do not permit lapping. Lapping process will remove excessive amounts of the hardened surface.

Valve lapping is done to ensure adequate sealing between valve face and seat. Use either a hand drill or lapping stick with suction cup attached.

Moisten and attach suction cup to valve. Lubricate valve stem and guide. Apply a thin coat of fine valve grinding compound between valve and seat. Rotate lapping tool between the palms or with hand drill.

Lift valve upward off the seat and change position often. This is done to prevent grooving of valve seat. Lap valve until a smooth polished seat is obtained. Thoroughly clean grinding compound from components. Valve-to-valve seat concentricity should be checked. See VALVE SEAT CONCENTRICITY.

CAUTION: **Valve guides must be in good condition and free of carbon deposits prior to valve seat grinding. Some engines contain an induction hardened valve seat. Excessive material removal will damage valve seats.**

Valve Seat Grinding

Select coarse stone of correct size and angle for seat to be ground. Ensure stone is true and has a smooth surface. Select correct size pilot for valve guide dimension. Install pilot in valve guide. Lightly lubricate pilot shaft. Install stone on pilot. Move stone off and on the seat approximately 2 times per second during grinding operation.

Select a fine stone to finish grinding operation. Various angle grinding stones are used to center and narrow the valve seat as required. See Fig. 10.

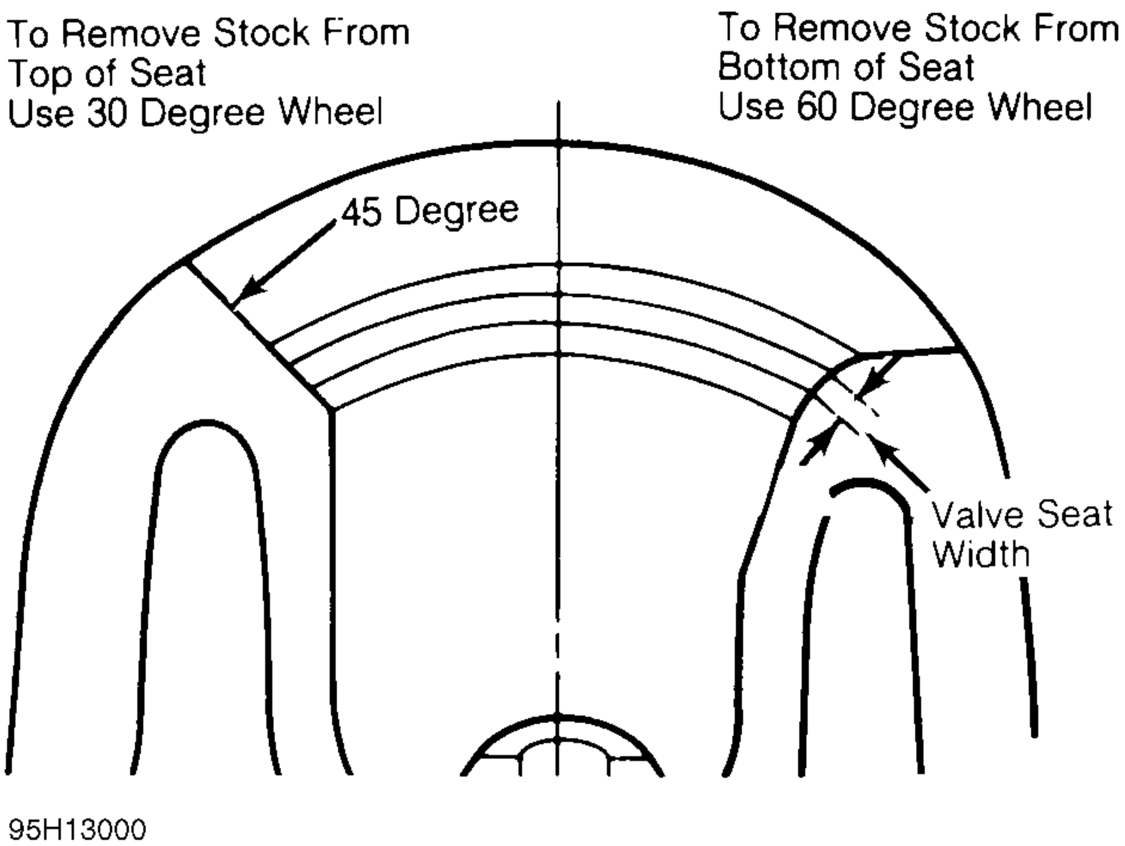

Fig. 10: Adjusting Valve Seat Width

Valve Seat Replacement

Replacement of valve seat inserts is done by cutting out the old insert and machining an oversize insert bore. Replacement oversize insert is usually cooled and the cylinder head is sometimes warmed. Valve seat is pressed into the head. This operation requires specialized machine shop equipment.

Valve Seat Concentricity

Using dial gauge, install gauge pilot in valve guide. Position gauge arm on the valve seat. Adjust dial indicator to zero. Rotate arm 360 degrees and note reading. Runout should not exceed specification.

To check valve-to-valve seat concentricity, coat valve face lightly with Prussian Blue dye. Install valve and rotate it on valve seat. If pattern is even and entire seat is coated at valve contact point, valve is concentric with the valve seat.

CYLINDER HEAD REASSEMBLY

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle

being repaired.

Valve Stem Installed Height

Valve stem installed height must be checked when new valves are installed or when valves or valve seats have been ground. Install valve in valve guide. Measure distance from tip of valve stem to spring seat. See **Fig. 11**. Distance must be within specification to allow sufficient clearance for valve operation.

Remove valve and grind valve stem tip if height exceeds specification. Valve tips are surface hardened. DO NOT remove more than .010" (.25 mm) from tip. Chamfer sharp edge of reground valve tip. Recheck valve stem installed height.

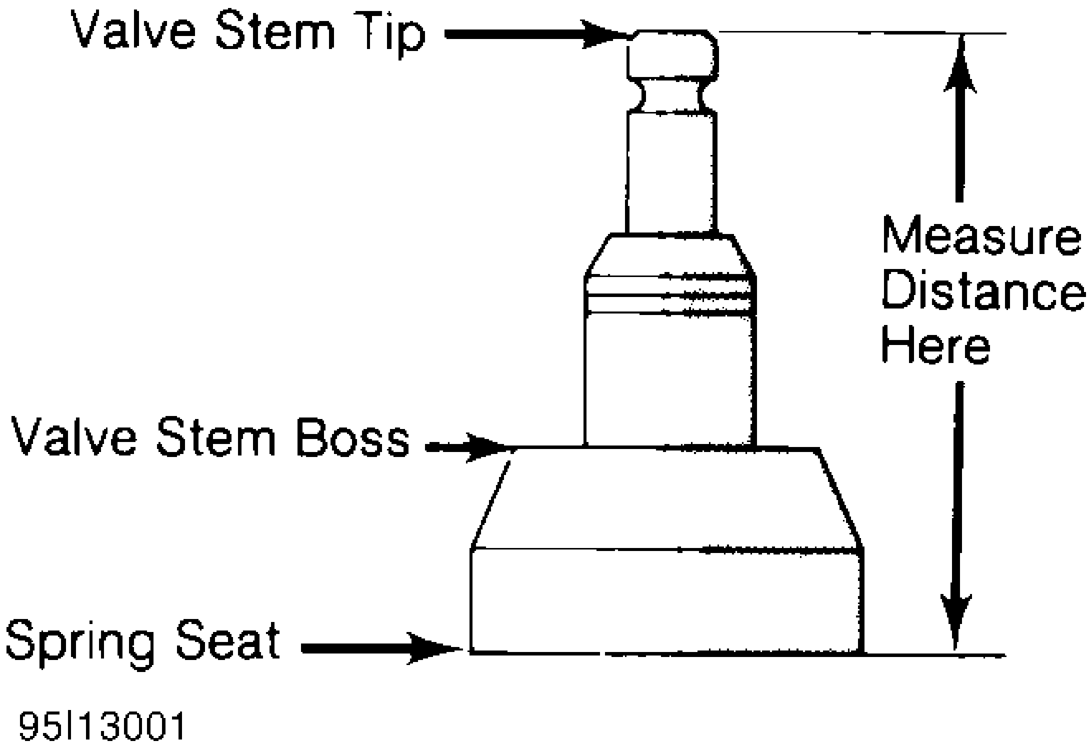

Fig. 11: Measuring Valve Stem Installed Height

VALVE STEM OIL SEALS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve stem oil seals must be installed on valve stem. See **Fig. 2**. Seals are needed due to pressure differential at the ends of valve guides. Atmospheric pressure above intake guide, combined with manifold vacuum below guide, causes oil to be drawn into the cylinder.

Exhaust guides also have pressure differential created by exhaust gas flowing past the guide, creating a low pressure area. This low pressure area draws oil into the exhaust system.

Some manufacturers require that special color code or specified height valve stem oil seal be installed in designated area.

Replacement (On-Vehicle)

Mark rocker arm or overhead cam components for location. Remove rocker arm components or overhead cam components. Components must be installed in original location. Remove spark plugs. Valve stem oil seals may be replaced by holding valves against seats using air pressure.

Air pressure must be installed in cylinder using an adapter for spark plug hole. An adapter can be constructed by welding air hose connection to spark plug body with porcelain removed.

Rotate engine until piston is at top of stroke. Install adapter in spark plug hole. Apply a minimum of 140 psi (9.8 kg/cm^2) line pressure to adapter. Air pressure should hold valve closed. If air pressure does not hold valve closed, check for damaged or bent valve. Cylinder head must be removed for service.

Using valve spring compressor, compress valve springs. Remove valve locks. Carefully release spring compressor. Remove retainer or rotator and valve spring. Remove valve stem oil seal.

If oversize valves have been installed, oversize oil seals must be used. Coat valve stem with engine oil. Install protective sleeve over end of valve stem. Install new oil seal over valve stem and seat on valve guide. Remove protective sleeve. Install spring seat, valve spring and retainer or rotator. Compress spring and install valve locks. Remove spring compressor. Ensure valve locks are fully seated.

Install rocker arms or overhead cam components. Tighten all bolts to specification. Adjust valves if required. Remove adapter. Install spark plugs, valve cover and gasket.

VALVE SPRING INSTALLED HEIGHT

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve spring installed height should be checked during reassembly. Measure height from lower edge of valve spring to the upper edge. DO NOT include valve spring seat or retainer. Distance must be within specification. If valves and/or seats have been ground, a valve spring shim may be required to correct spring height. See **Fig. 12**.

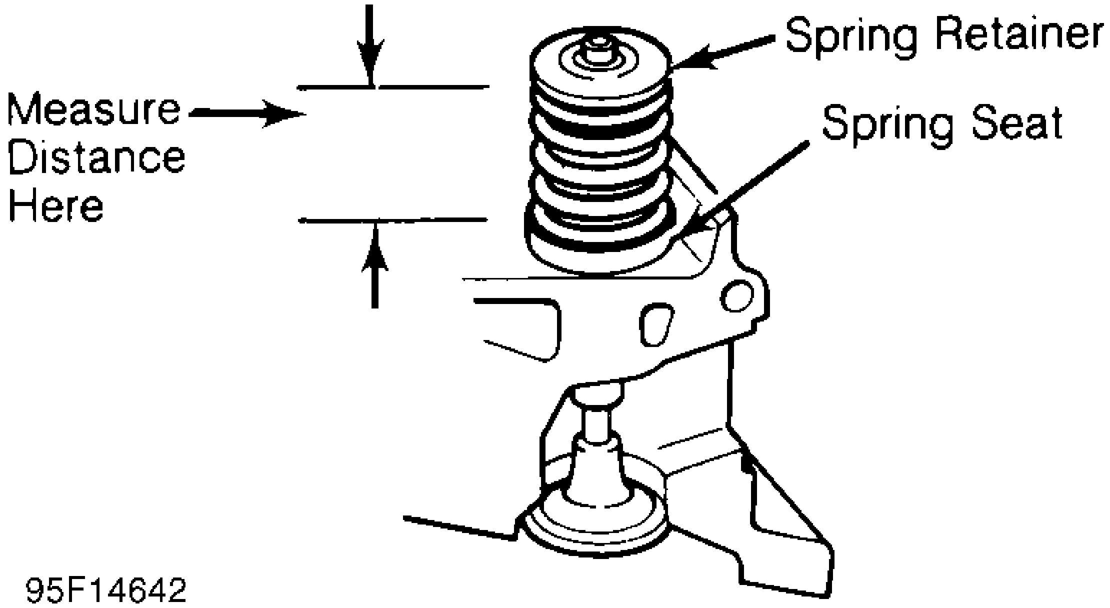

Fig. 12: Measuring Valve Spring Installed Height

ROCKER ARMS & ASSEMBLIES

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Rocker Studs

Rocker studs are either threaded or pressed in place. Threaded studs are removed by locking 2 nuts on the stud. Unscrew the stud by turning the jam nut. Coat new stud threads with Loctite and install. Tighten to specification.

Pressed-in stud can be removed using a stud puller. Ream stud bore to proper specification and press in a new oversize stud. Pressed-in studs are often replaced by cutting threads in the stud bore to accept a threaded stud.

Rocker Arms & Shafts

Mark rocker arms for location. Remove rocker arm retaining bolts. Remove rocker arms. Inspect rocker arms, shafts, bushings and pivot balls (if equipped) for excessive wear. Inspect rocker arms for wear in valve stem contact area. Measure rocker arm bushing I.D. Replace bushings if excessively worn.

The rocker arm valve stem contact point may be reground, using special fixture for valve grinding machine. Remove minimum amount of material as possible. Ensure all oil passages are clear. Install rocker arm components in original location. Ensure rocker arm is properly seated in push rod. Tighten bolts to specification. Adjust valves if required. See VALVE ADJUSTMENT.

PUSH RODS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Remove rocker arms. Mark push rods for location. Remove push rods. Push rods can be steel or aluminum, solid or hollow. Hollow push rods must be internally cleaned to ensure oil passage to rocker arms is cleaned. Check push rods for damage, such as loose ends on steel tipped aluminum types.

Check push rod for straightness. Roll push rod on a flat surface. Using feeler gauge, check clearance at center. Replace push rod if bent. The push rod can also be supported at each end and rotated. A dial indicator is used to detect a bent area in the push rod.

Lubricate ends of push rod and install push rod in original location. Ensure push rod is properly seated in lifter. Install rocker arm. Tighten bolts to specification. Adjust valves if required. See **VALVE ADJUSTMENT**.

LIFTERS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Hydraulic Lifters

Before replacing a hydraulic lifter for noisy operation, ensure noise is not caused by worn rocker arms or valve tips. Also ensure sufficient oil pressure exists. Hydraulic lifters must be installed in original location. Remove rocker arm assembly and push rod. Mark components for location. Some applications require intake manifold, cylinder head or lifter cover removal. Remove lifter retainer plate (if used). To remove lifters, use a hydraulic lifter remover or magnet. Different type lifters are used. See **Fig. 13**.

On sticking lifters, disassemble and clean lifter. DO NOT mix lifter components or positions. Parts are select-fitted and are not interchangeable. Inspect all components for wear. Note amount of wear in lifter body-to-camshaft contact area. Surface must have smooth and convex contact face. If wear is apparent, carefully inspect cam lobe.

Inspect push rod contact area and lifter body for scoring or signs of wear. If body is scored, inspect lifter bore for damage and lack of lubrication. On roller type lifters, inspect roller for flaking, pitting, loss of needle bearings and roughness during rotation.

Measure lifter body O.D. in several areas. Measure lifter bore I.D. Ensure components or oil clearance is within specification. Some models offer oversize lifters. Replace lifter if damaged.

If lifter check valve is not operating, obstructions may be preventing it from closing or valve spring may be broken. Clean or replace components as necessary.

Check plunger operation. Plunger should drop to bottom of the body by its own weight when assembled dry. If plunger is not free, soak lifter in solvent to dissolve deposits.

Lifter leak-down test can be performed on lifter. Lifter must be filled with special test oil. New lifters contain special test oil. Using lifter leak-down tester, perform leak-down test following manufacturer's instructions. If leak-down time is not within specifications, replace lifter assembly.

Lifters should be soaked in clean engine oil several hours prior to installation. Coat lifter base, roller (if equipped) and lifter body with ample amount of Molykote or camshaft lubricant. See Fig. 13. Install lifter in original location. Install remaining components. Valve lash adjustment is not required on most hydraulic lifters. Preload of hydraulic lifter is automatic. Some models may require adjustment.

NOTE: **Some manufacturers require that a crankcase conditioner be added to engine oil and engine operated for specified amount of time to aid in lifter break-in procedure if new lifters or camshaft are installed.**

Fig. 13: Typical Hydraulic Valve Lifter Assemblies

Mechanical Lifters

Lifter assemblies must be installed in original locations. Remove rocker arm assembly and push rod. Mark components for location. Some applications require intake manifold or lifter cover removal. Remove lifter retainer plate (if used). To remove lifters, use lifter remover or magnet.

Inspect push rod contact area and lifter body for scoring or signs of wear. If body is scored, inspect lifter bore for damage and lack of lubrication. Note amount of wear in lifter body-to-camshaft contact area. Surface must have smooth and convex contact face. If wear is apparent, carefully inspect cam lobe.

Coat lifter base, roller (if equipped) and lifter body with ample amount of Molykote or camshaft lubricant. Install lifter in original location. Install remaining components. Tighten bolts to specification. Adjust valves. See VALVE ADJUSTMENT.

PISTONS, CONNECTING RODS & BEARINGS

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

RIDGE REMOVAL

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Ridge in cylinder wall must be removed prior to piston removal. Failure to remove ridge prior to removing pistons will cause piston damage in piston ring lands or grooves.

With piston at bottom dead center, place rag in bore to trap metal chips. Install ridge reamer in cylinder bore. Adjust ridge reamer using manufacturer's instructions. Remove ridge using ridge reamer. DO NOT remove an excessive amount of material. Ensure ridge is completely removed.

PISTON & CONNECTING ROD REMOVAL

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Note top of piston. Some pistons may contain a notch, arrow or be marked FRONT. Piston must be installed in proper direction to prevent damage with valve operation.

Check that connecting rod and cap are numbered for cylinder location and which side of cylinder block the number faces. Proper cap and connecting rod must be installed together. Connecting rod cap must be installed on connecting rod in proper direction to ensure bearing lock procedure. Mark connecting rod and cap if necessary. Pistons must be installed in original location.

Remove cap retaining nuts or bolts. Remove bearing cap. Install tubing protectors on connecting rod bolts. This protects cylinder walls from scoring during removal. Ensure proper removal of ridge. Push piston and connecting rod from cylinder. Connecting rod boss can be tapped with a wooden dowel or hammer handle to aid in removal.

PISTON & CONNECTING ROD

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Disassembly

Using ring expander, remove piston rings. Remove piston pin retaining rings (if equipped). Note direction of piston installation on connecting rod. On pressed type piston pins, special fixtures and procedures according to manufacturer must be used to remove piston pins. Follow manufacturer's recommendations to avoid piston distortion or breakage.

Cleaning

Remove all carbon and varnish from piston. Pistons and connecting rods may be cleaned in cold type chemical tank. Using ring groove cleaner, clean all deposits from ring grooves. Ensure all deposits are cleaned from ring grooves to prevent ring breakage or sticking. DO NOT attempt to clean pistons with wire brush.

Inspection

Inspect pistons for nicks, scoring, cracks or damage in ring areas. Connecting rod should be checked for cracks using Magnaflux procedure. Piston diameter must be measured in manufacturer's specified area.

Using telescopic gauge and micrometer, measure piston pin bore of piston in 2 areas, 90 degrees apart. This is done to check diameter and out-of-round.

Install proper bearing cap on connecting rod. Ensure bearing cap is installed in proper location. Tighten bolts or nuts to specification. Using inside micrometer, measure inside diameter in 2 areas, 90 degrees apart.

Connecting rod I.D. and out-of-round must be within specification. Measure piston pin bore I.D. and piston pin O.D. All components must be within specification. Subtract piston pin diameter from piston pin bore in piston and connecting rod to determine proper fit.

Connecting rod length must be measured from center of crankshaft journal inside diameter to center of piston pin bushing using proper caliper. Connecting rods must be the same length. Connecting rods should be checked on an alignment fixture for bent or twisted condition. Replace all components which are damaged or not within specification.

PISTON & CYLINDER BORE FIT

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure cylinder is checked for taper, out-of-round and properly honed prior to checking piston and cylinder bore fit. See CYLINDER BLOCK. Using dial bore gauge, measure cylinder bore.

Measure piston skirt diameter at 90 degree angle to piston pin at specified area by manufacturer. Subtract piston diameter from cylinder bore diameter to determine piston-to-cylinder clearance. Clearance must be within specification. Mark piston for proper cylinder location.

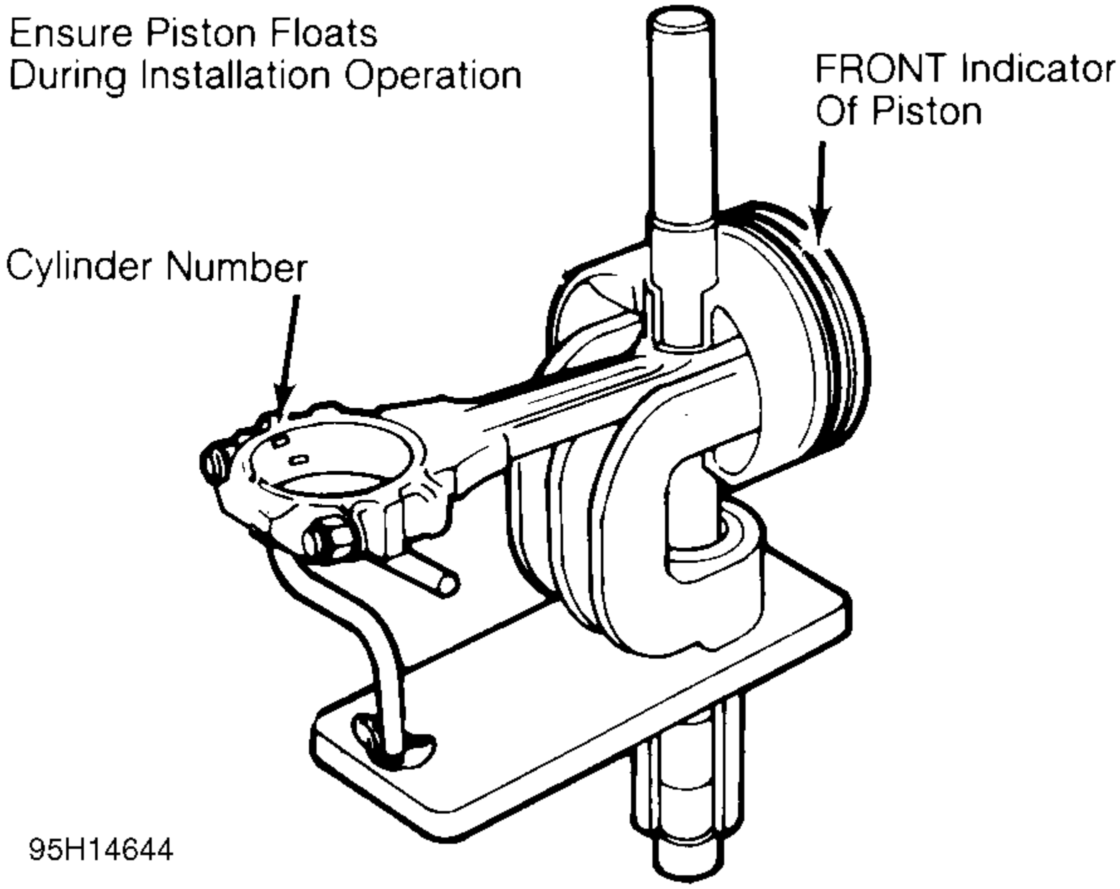
ASSEMBLING PISTON & CONNECTING ROD

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Install piston on connecting rod for corresponding cylinder. Ensure reference marking on top of piston corresponds with connecting rod and cap number. See Fig. 14.

Lubricate piston pin and install in connecting rod. Ensure piston pin retainers are fully seated (if equipped). On pressed type piston pins, follow manufacturer's recommended procedure to avoid distortion or breakage.



Ensure Piston Floats During Installation Operation
FRONT Indicator Of Piston
Cylinder Number

CHECKING PISTON RING CLEARANCES

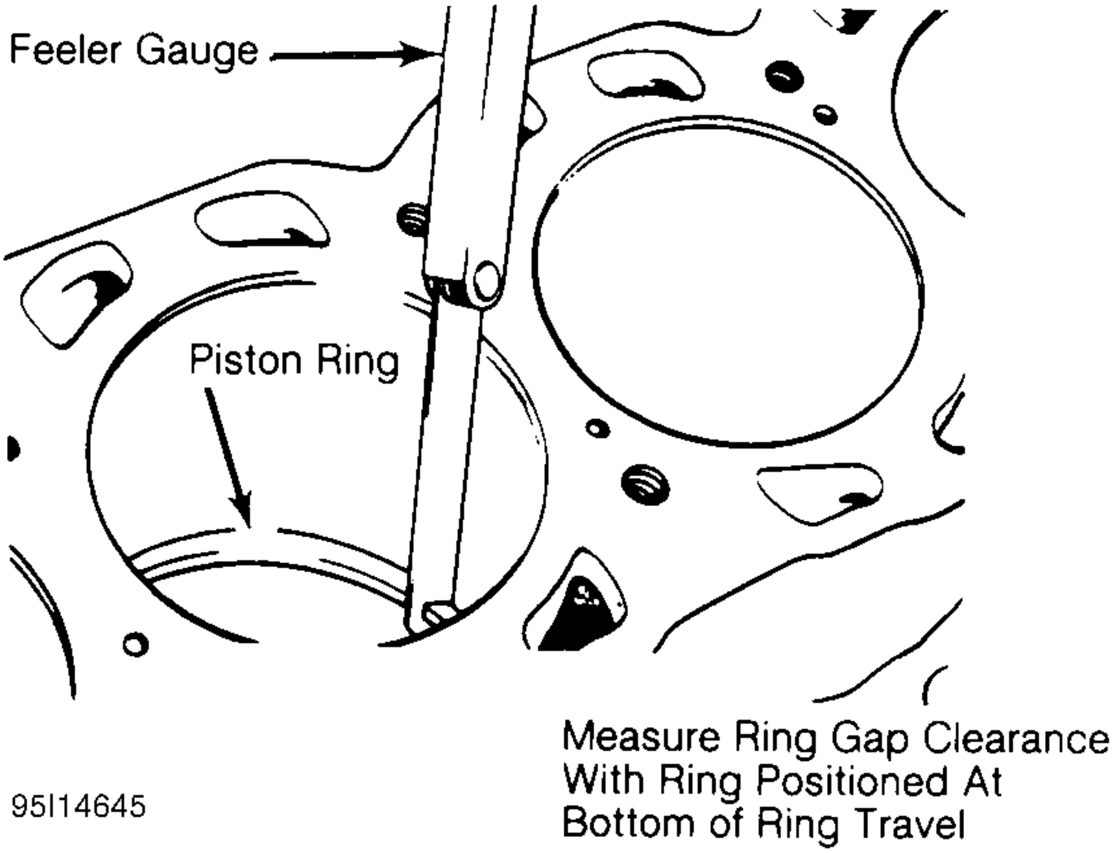
NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Piston rings must be checked for side clearance and end gap. To check end gap, install piston ring in cylinder in which it is to be installed. Using an inverted piston, push ring to bottom of cylinder in smallest cylinder diameter.

Using feeler gauge, check ring end gap. See Fig. 15. Piston ring end gap must be within specification. Ring breakage will occur if insufficient ring end gap exists.

Some manufacturers permit correcting insufficient ring end gap by using a fine file while other manufacturers recommend using another ring set. Mark rings for proper cylinder installation after checking end gap.



Feeler Gauge
Piston Ring
Measure Ring Gap Clearance With Ring Positioned At Bottom of Ring Travel
95I14645

Fig. 15: Checking Piston Ring End Gap

For checking side clearance, install rings on piston. Using feeler gauge, measure clearance between piston ring and piston ring land. Check side clearance in several areas around piston. Side clearance must be within specification.

If side clearance is excessive, piston ring grooves can be machined to accept oversize piston rings (if available). Normal practice is to replace piston.

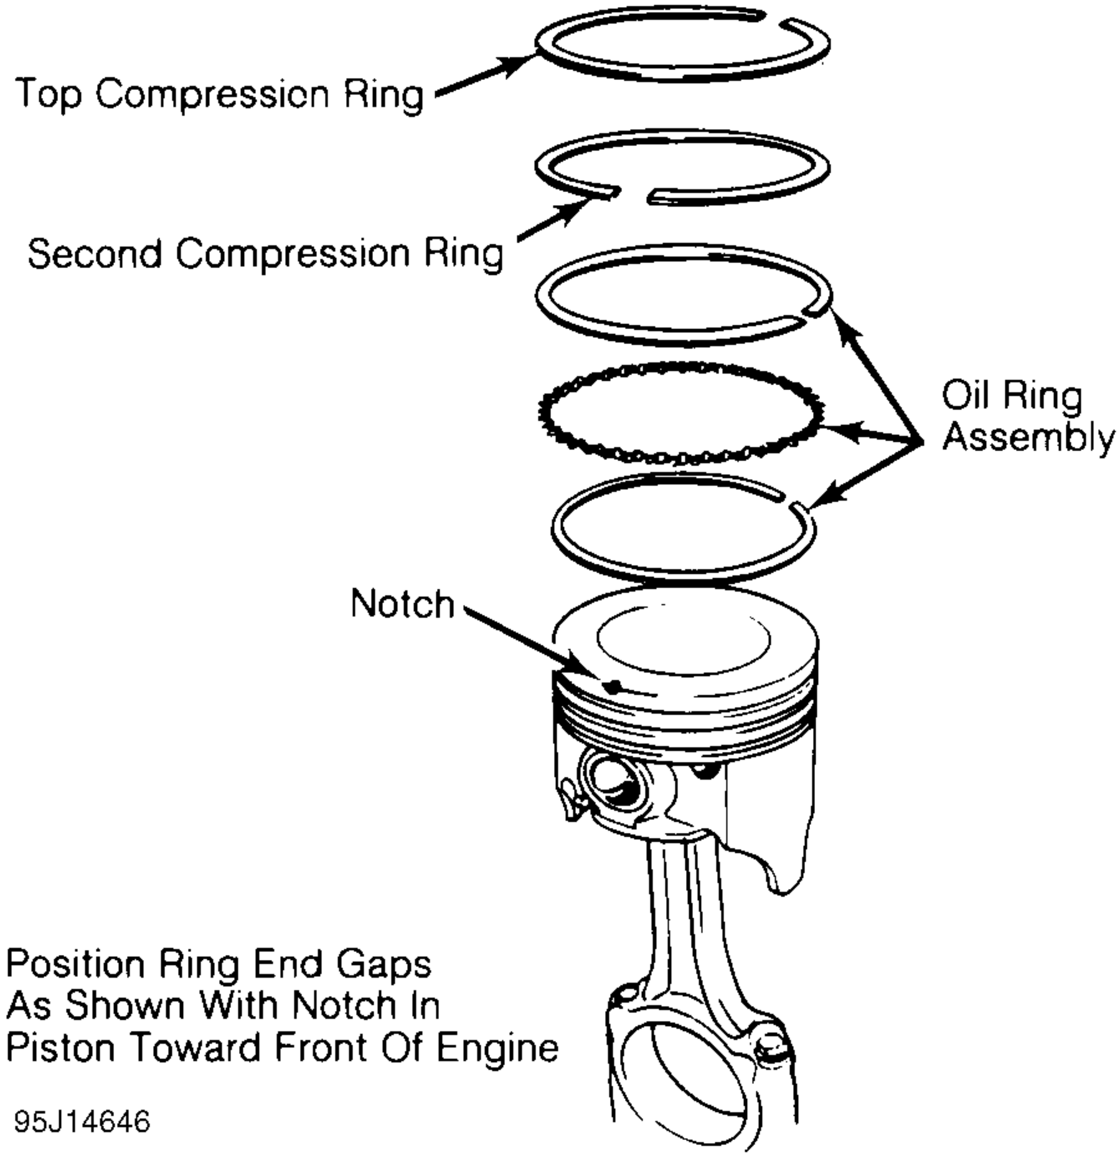
PISTON & CONNECTING ROD INSTALLATION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Cylinders must be honed prior to piston installation. See CYLINDER HONING under CYLINDER BLOCK.

Install upper connecting rod bearings. Lubricate upper bearings with engine oil. Install lower bearings in rod caps. Ensure bearing tabs are properly seated. Position piston ring gaps according to manufacturer's recommendations. See Fig. 16. Lubricate pistons, rings and cylinder walls.



Top Compression Ring
Second Compression Ring
Oil Ring Assembly
Notch
Position Ring End Gaps As Shown With Notch In Piston Toward Front Of Engine
95J14646

Fig. 16: Positioning Typical Piston Ring End Gap

Install ring compressor. Use care not to rotate piston rings. Compress rings with ring compressor. Install plastic tubing protectors over connecting rod bolts. Install piston and connecting rod assembly. Ensure piston notch, arrow or FRONT mark is toward front of engine. See **Fig. 17**.

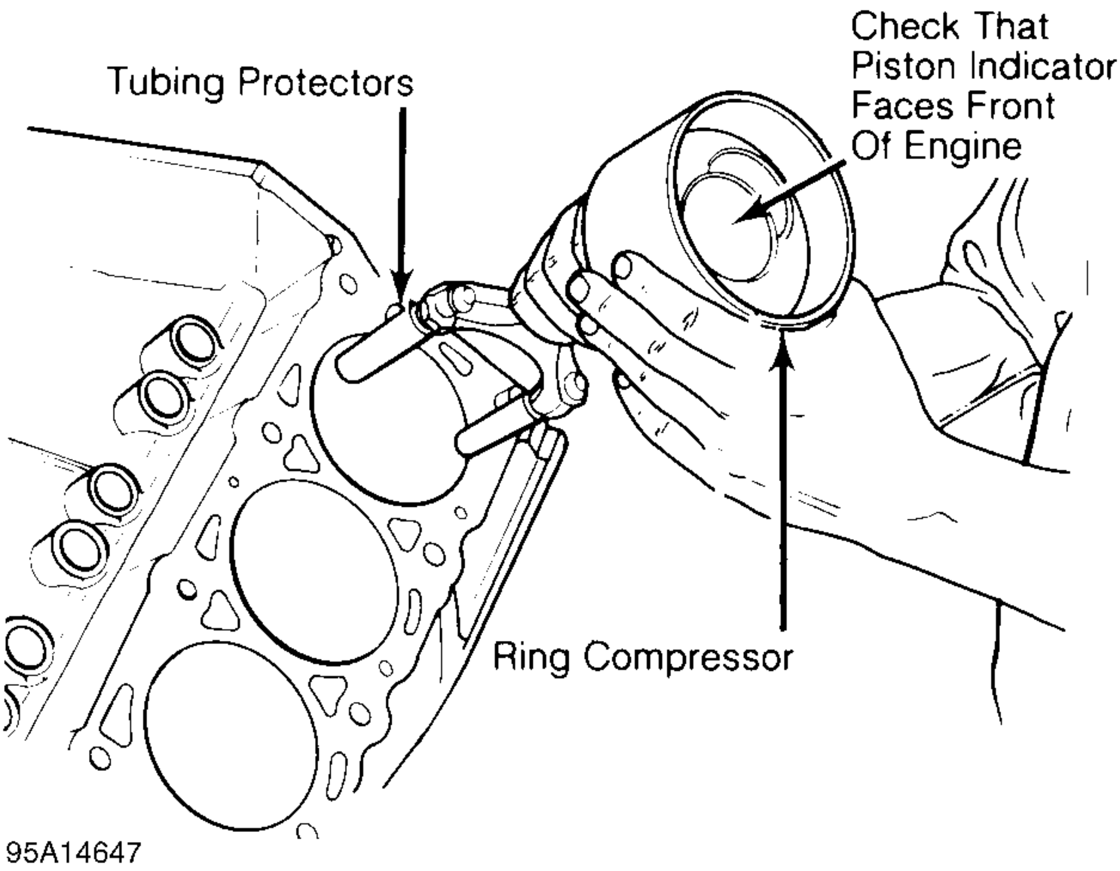


Fig. 17: Installing Piston & Connecting Rod Assembly

Carefully tap piston into cylinder until rod bearing is seated on crankshaft journal. Remove protectors. Install rod cap and bearing. Lightly tighten connecting rod bolts. Repeat procedure for remaining cylinders. Check bearing clearance. See MAIN & CONNECTING ROD BEARING CLEARANCE.

Once clearance is checked, lubricate journals and bearings. Install bearing caps. Ensure marks are aligned on connecting rod and cap. Tighten rod nuts or bolts to specification. Ensure rod moves freely on crankshaft. Check connecting rod side clearance. See CONNECTING ROD SIDE CLEARANCE.

CONNECTING ROD SIDE CLEARANCE

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Position connecting rod toward one side of crankshaft as far as possible. Using feeler gauge, measure clearance between side of connecting rod and crankshaft. See Fig. 18. Clearance must be within specification.

Check for improper bearing installation, wrong bearing cap or insufficient bearing clearance if side clearance is insufficient. Connecting rod may require machining to obtain proper clearance. Excessive clearance usually indicates excessive wear at crankshaft. Crankshaft must be repaired or replaced.

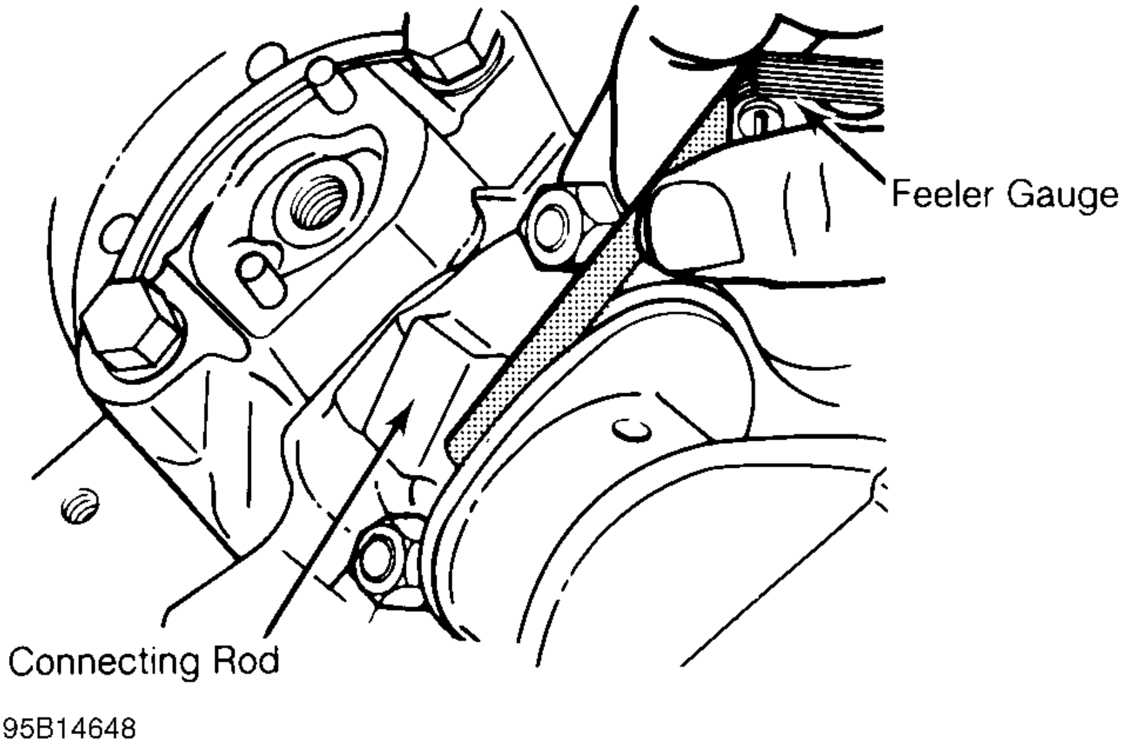

Fig. 18: Measuring Connecting Rod Side Clearance

MAIN & CONNECTING ROD BEARING CLEARANCE

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Plastigage Method

Plastigage method may be used to determine bearing clearance. Plastigage can be used with an engine in service or during reassembly. Plastigage material is oil soluble.

Ensure journals and bearings are free of oil or solvent. Oil or solvent will dissolve material and false reading will be obtained. Install small piece of Plastigage along full length of bearing journal. Install bearing cap in original location. Tighten bolts to specification.

CAUTION: **DO NOT rotate crankshaft while Plastigage is installed. Bearing clearance will not be obtained if crankshaft is rotated.**

Remove bearing cap. Compare Plastigage width with scale on Plastigage container to determine bearing clearance. See Fig. 19. Rotate crankshaft 90 degrees. Repeat procedure. This is done to check journal eccentricity. This procedure can be used to check oil clearance on both connecting rod and main bearings.

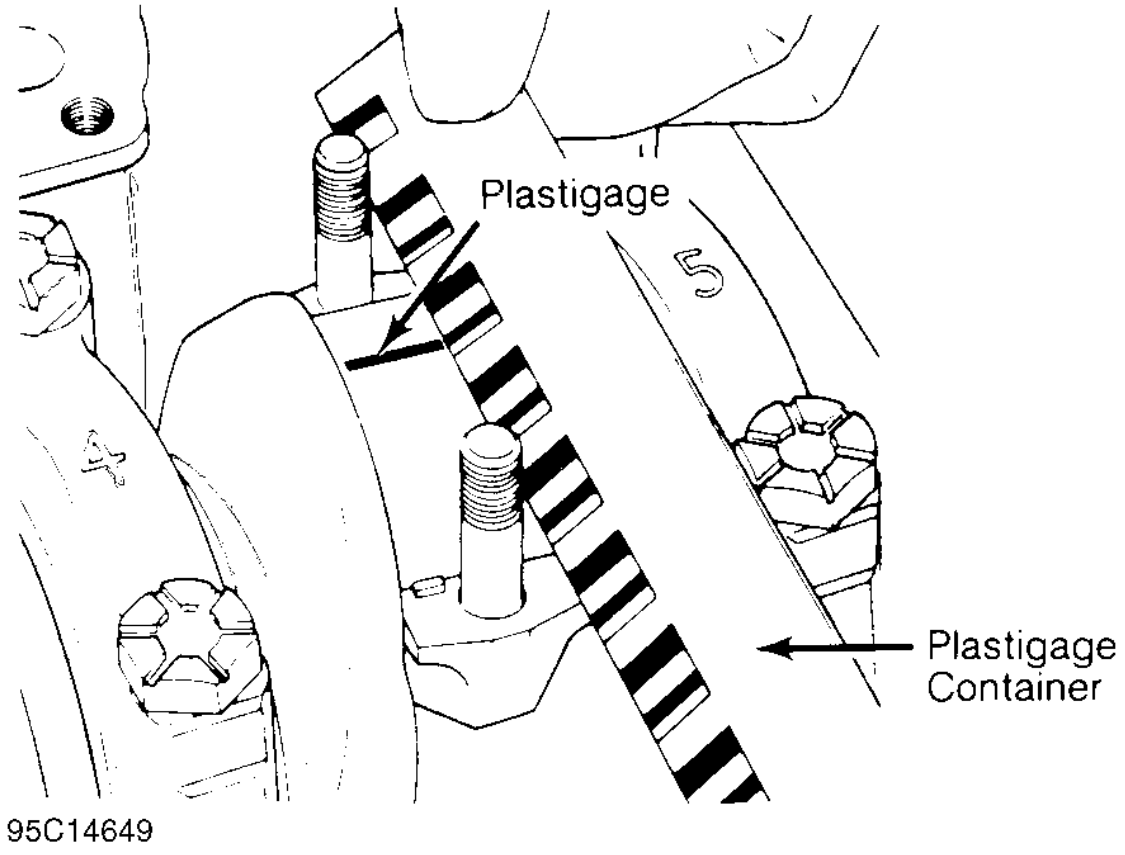

Fig. 19: Measuring Bearing Clearance

Micrometer & Telescopic Gauge Method

A micrometer is used to determine journal diameter, taper and out-of-round dimensions of the crankshaft. See CLEANING & INSPECTION under CRANKSHAFT & MAIN BEARINGS in this article.

With crankshaft removed, install bearings and caps in original location on cylinder block. Tighten bolts to specification. On connecting rods, install bearings and caps on connecting rods. Install proper connecting rod cap on corresponding rod. Ensure bearing cap is installed in original location. Tighten bolts to specification.

Using a telescopic gauge and micrometer or inside micrometer, measure inside diameter of connecting rod and main bearings bores. Subtract each crankshaft journal diameter from the corresponding inside bearing bore diameter. This is the bearing clearance.

CRANKSHAFT & MAIN BEARINGS

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

REMOVAL

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure all main bearing caps are marked for location on cylinder block. Some main bearing caps have an arrow stamped on them. The arrow must face timing belt or timing chain end of engine. Remove main bearing cap bolts. Remove main bearing caps. Carefully remove crankshaft. Use care not to bind crankshaft in cylinder block during removal.

CLEANING & INSPECTION

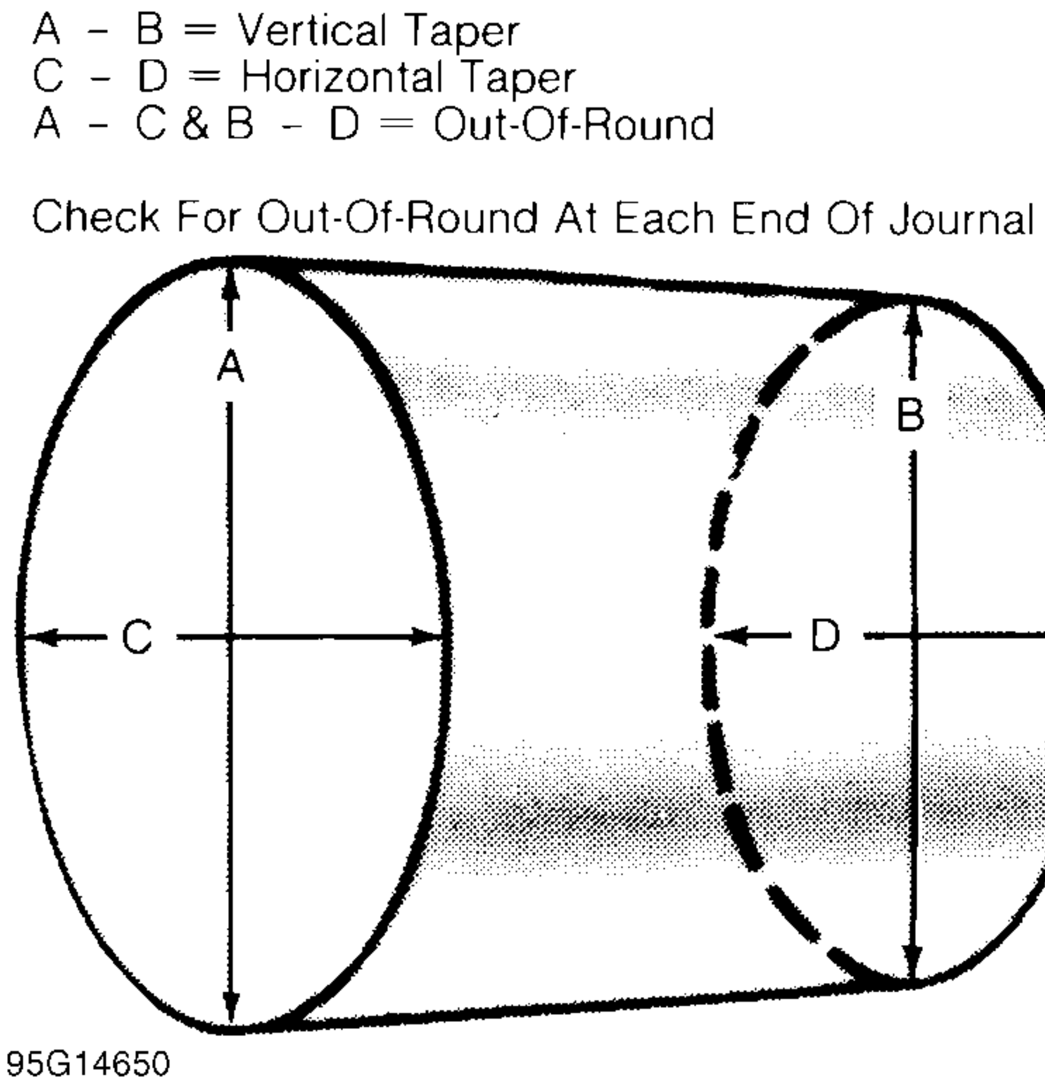
NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Thoroughly clean crankshaft using solvent. Dry with compressed air. Ensure all oil passages are clear and free of sludge, rust, dirt and metal chips.

Inspect crankshaft for scoring and nicks. Inspect crankshaft for cracks using Magnaflux procedure. Inspect rear seal area for grooving or damage. Inspect bolt hole threads for damage. If pilot bearing or bushing is used, check pilot bearing or bushing fit in crankshaft. Inspect crankshaft gear for damaged or cracked teeth. Replace gear if damaged. Ensure oil passage plugs are tight (if equipped).

Using micrometer, measure all journals in 4 areas to determine journal taper, out-of-round and undersize. See **Fig. 20**. Some crankshafts can be reground to the next largest undersize, depending on the amount of wear or damage. Crankshafts with rolled fillet cannot be reground and must be replaced.



A - B = Vertical Taper
C - D = Horizontal Taper
A - C & B - D = Out-Of-Round
Check For Out-Of-Round At Each End Of Journal
A
B
C
D
95G14650

Fig. 20: Measuring Crankshaft Journals

Crankshaft journal runout should be checked. Install crankshaft in "V" blocks or bench center. Position dial indicator with tip resting on the main bearing journal area. See **Fig. 21**. Rotate crankshaft and note reading. Journal runout must not exceed specification. Repeat procedure on all main bearing journals. Crankshaft must be replaced if runout exceeds specification.

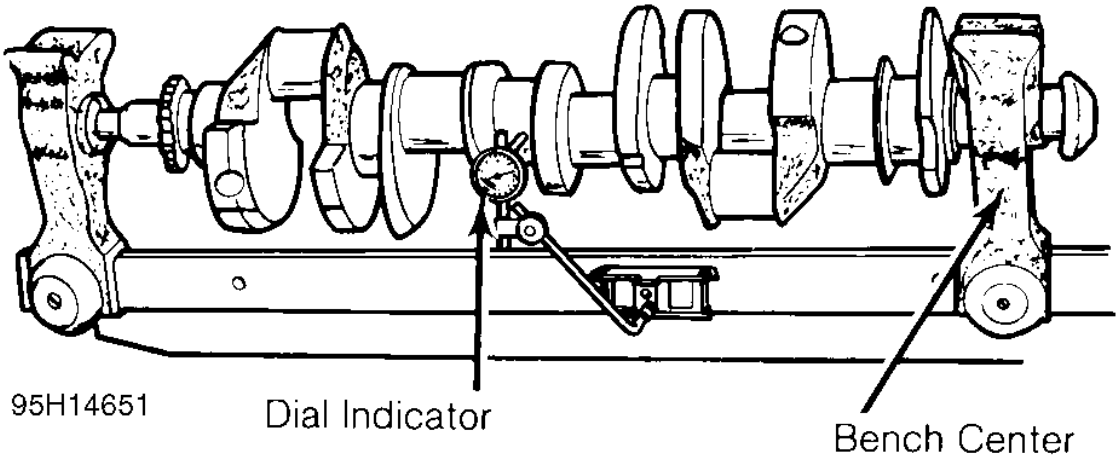


Fig. 21: Measuring Crankshaft Main Bearing Journal Runout

INSTALLATION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Install upper main bearing in cylinder block. Ensure lock tab is properly located in cylinder block. Install bearings in main bearing caps. Ensure all oil passages are aligned. Install rear seal (if removed).

Ensure crankshaft journals are clean. Lubricate upper main bearings with clean engine oil. Carefully install crankshaft. Check each main bearing clearance using Plastigage method. See MAIN & CONNECTING ROD BEARING CLEARANCE.

Once clearance is checked, lubricate lower main bearing and journals. Install main bearing caps in original location. Install rear seal in rear main bearing cap (if removed). Some rear main bearing caps require sealant to be applied in corners to prevent oil leakage.

Install and tighten all bolts except thrust bearing cap to specification. Tighten thrust bearing cap bolts finger tight only. Some models require that thrust bearing be aligned. On most applications, crankshaft must be moved rearward then forward. Procedure may vary with manufacturer. Thrust bearing cap is then tightened to specification. Ensure crankshaft rotates freely. Crankshaft end play should be checked. See CRANKSHAFT END PLAY.

CRANKSHAFT END PLAY

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Dial Indicator Method

Crankshaft end play can be checked using dial indicator. Mount dial indicator on rear of cylinder block. Position dial indicator tip against rear of crankshaft. Ensure tip is resting against flat surface.

Pry crankshaft rearward. Adjust dial indicator to zero. Pry crankshaft forward and note reading. Crankshaft end play must be within specification. If end play is not within specification, check for faulty thrust bearing installation or worn crankshaft. Some applications offer oversize thrust bearings.

Feeler Gauge Method

Crankshaft end play can be checked using feeler gauge. Pry crankshaft rearward. Pry crankshaft forward. Using feeler gauge, measure clearance between crankshaft and thrust bearing surface. See Fig. 22.

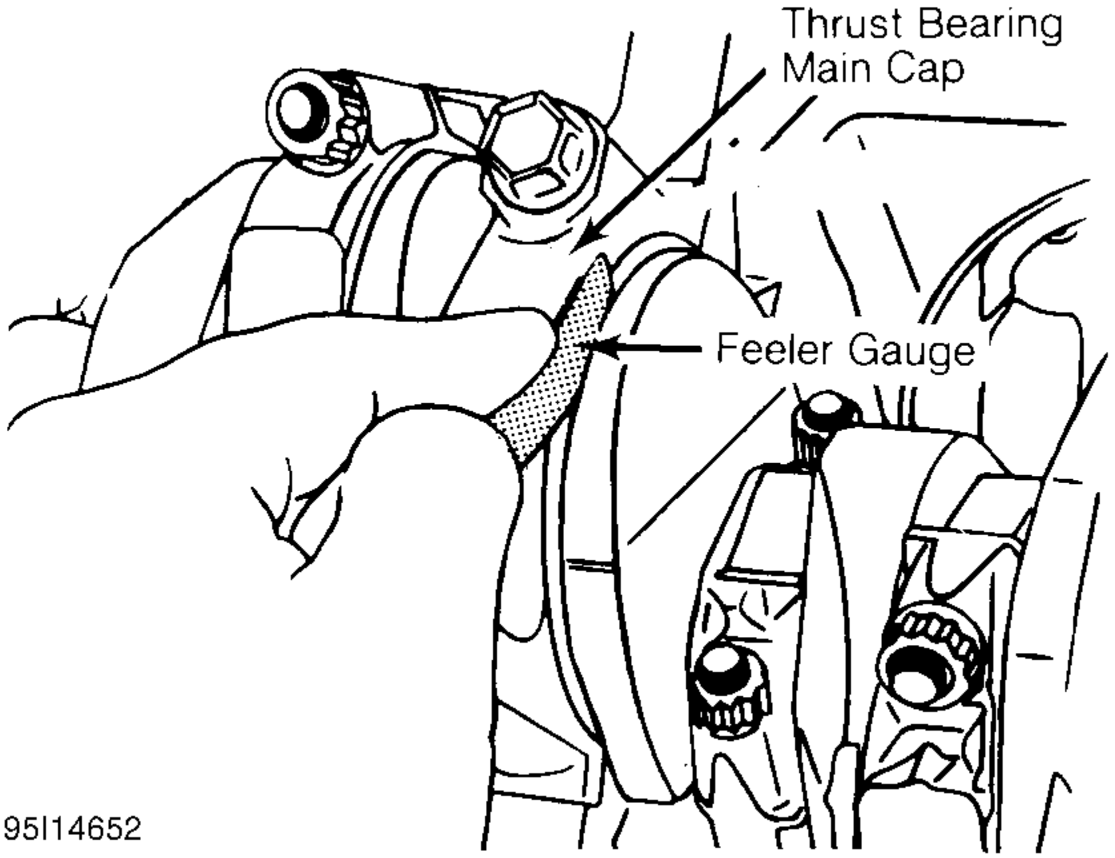

Fig. 22: Checking Crankshaft End Play

Crankshaft end play must be within specification. If end play is not within specification, check for faulty thrust bearing installation or worn crankshaft. Some applications offer oversize thrust bearings.

CYLINDER BLOCK

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of**

processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Block Cleaning

Only cast cylinder blocks should be hot tank cleaned. Aluminum cylinder blocks should be cleaned using cold tank method. Cylinder block is cleaned in order to remove carbon deposits, gasket residue and water jacket scale. Remove oil gallery plugs, freeze plugs and cam bearings before cleaning block.

Block Inspection

Visually inspect the block. Check suspected areas for cracks using the Dye Penetrant inspection method. Block may be checked for cracks using the Magnaflux method.

Cracks are most commonly found at the bottom of cylinders, main bearing saddles, near expansion plugs and between cylinders and water jackets. Inspect lifter bores for damage. Inspect all head bolt holes for damaged threads. Threads should be cleaned using tap to ensure proper head bolt torque. Consult machine shop concerning possible welding and machining (if required).

Cylinder Bore Inspection

Inspect bore for scoring or roughness. Cylinder bore is dimensionally checked for out-of-round and taper using dial bore gauge. For determining out-of-round, measure cylinder parallel and perpendicular to the block center line. Difference in the 2 readings is the bore out-of-round. Cylinder bore must be checked at top, middle and bottom of piston travel area.

Bore taper is obtained by measuring bore at the top and bottom. If wear has exceeded allowable limits, block must be honed or bored to next available oversize piston dimension.

Cylinder Honing

Cylinder must be properly honed to allow new piston rings to properly seat. Cross-hatching at correct angle and depth is critical to lubrication of cylinder walls and pistons.

A flexible drive hone and power drill are commonly used. Drive hone must be lubricated during operation. Mix equal parts of kerosene and SAE 20W engine oil for lubrication.

Apply lubrication to cylinder wall. Operate cylinder hone from top to bottom of cylinder using even strokes to produce 45 degree cross-hatch pattern on the cylinder wall. DO NOT allow cylinder hone to extend below cylinder during operation.

Recheck bore dimension after final honing. Wash cylinder wall with hot soapy water to remove abrasive particles. Blow dry with compressed air. Coat cleaned cylinder walls with lubricating oil.

Deck Warpage

Check deck for damage or warped gasket surface. Place a straightedge across gasket surface of the deck. Using feeler gauge, measure clearance at center of straightedge. Measure across width and length of cylinder block at several points.

If warpage exceeds specifications, deck must be resurfaced. If warpage exceeds manufacturer's maximum tolerance for material removal, replace block.

NOTE: **Some manufacturers recommend that a total amount of material (cylinder head and cylinder block) can only be removed before components must be replaced.**

Deck Height

Distance from crankshaft center line to block deck is called the deck height. Measure and record front and rear main journals of crankshaft. To compute this distance, install crankshaft and retain with center main bearing and cap only. Measure distance from crankshaft journal to block deck, parallel to cylinder center line.

Add one half of main bearing journal diameter to distance from crankshaft journal to block deck. This dimension should be checked at front and rear of cylinder block. Both readings should be the same.

If difference exceeds specification, cylinder block must be repaired or replaced. Deck height and warpage should be corrected at the same time.

Main Bearing Bore & Alignment

For checking main bearing bore, remove all bearings from cylinder block and main bearing caps. Install main bearing caps in original location. Tighten bolts to specification. Using inside micrometer, measure main bearing bore in 2 areas 90 degrees apart. Determine bore size and out-of-round. If diameter is not within specification, block must be align-bored.

For checking alignment, place a straightedge along center line of main bearing saddles. Check for clearance between straightedge and main bearing saddles. Block must be align-bored if clearance exists.

Expansion Plug Removal

Drill hole in center of expansion plug. Remove with screwdriver or punch. Use care not to damage sealing surface.

Expansion Plug Installation

Ensure sealing surface is free of burrs. Coat expansion plug with sealer. Using wooden dowel or pipe of slightly smaller diameter, install expansion plug. Ensure expansion plug is evenly located.

Oil Gallery Plug Removal

Remove threaded oil gallery plugs using appropriate wrench. Soft press-in plugs are removed by drilling into plug and installing a sheet metal screw. Remove plug with slide hammer or pliers.

Oil Gallery Plug Installation

Ensure threads or sealing surface is clean. Coat threaded oil gallery plugs with sealer and install. Replacement soft press-in plugs are installed with a hammer and drift.

CAMSHAFT

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

CLEANING & INSPECTION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen**

to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Clean camshaft with solvent. Ensure all oil passages are clear. Inspect cam lobes and bearing journals for pitting, flaking or scoring. Using micrometer, measure bearing journal O.D.

Support camshaft at each end with "V" blocks. Position dial indicator with tip resting on center bearing journal. Rotate camshaft and note camshaft runout reading. If reading exceeds specification, replace camshaft.

Check cam lobe lift by measuring base circle of camshaft using micrometer. Measure again at 90-degree angle to tip of cam lobe. Cam lift can be determined by subtracting base circle diameter from tip of cam lobe measurement.

Different lift dimensions are given for intake and exhaust cam lobes. Reading must be within specification. Replace camshaft if cam lobes or bearing journals are not within specification.

Inspect camshaft gear for chipped, eroded or damaged teeth. Replace gear if damaged. On camshafts using thrust plate, measure distance between thrust plate and camshaft shoulder. Replace thrust plate if not within specification.

CAMSHAFT BEARINGS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Removal & Installation

Remove camshaft rear plug. Camshaft bearing remover is assembled with shoulder resting against bearing to be removed according to manufacturer's instructions. Tighten puller nut until bearing is removed. Remove remaining bearings, leaving front and rear bearings until last. These bearings act as a guide for camshaft bearing remover.

To install new bearings, puller is rearranged to pull bearings toward the center of block. Ensure all lubrication passages of bearing are aligned with cylinder block. Coat new camshaft rear plug with sealant. Install camshaft rear plug. Ensure plug is even in cylinder block.

CAMSHAFT INSTALLATION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Lubricate bearing surfaces and cam lobes with ample amount of Molykote or camshaft lubricant. Carefully install camshaft. Use care not to damage bearing journals during installation. Install thrust plate retaining bolts (if equipped). Tighten bolts to specification. On overhead camshafts, install bearing caps in original location. Tighten bolts to specification. On all applications, check camshaft end play.

CAMSHAFT END PLAY

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Using dial indicator, check camshaft end play. Position dial indicator on front of engine block or cylinder head. Position indicator tip against camshaft. Push camshaft toward rear of cylinder head or engine and adjust indicator to zero.

Move camshaft forward and note reading. Camshaft end play must be within specification. End play may be adjusted by relocating gear, shimming thrust plate or replacing thrust plate depending on each manufacturer.

TIMING CHAINS & BELTS

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

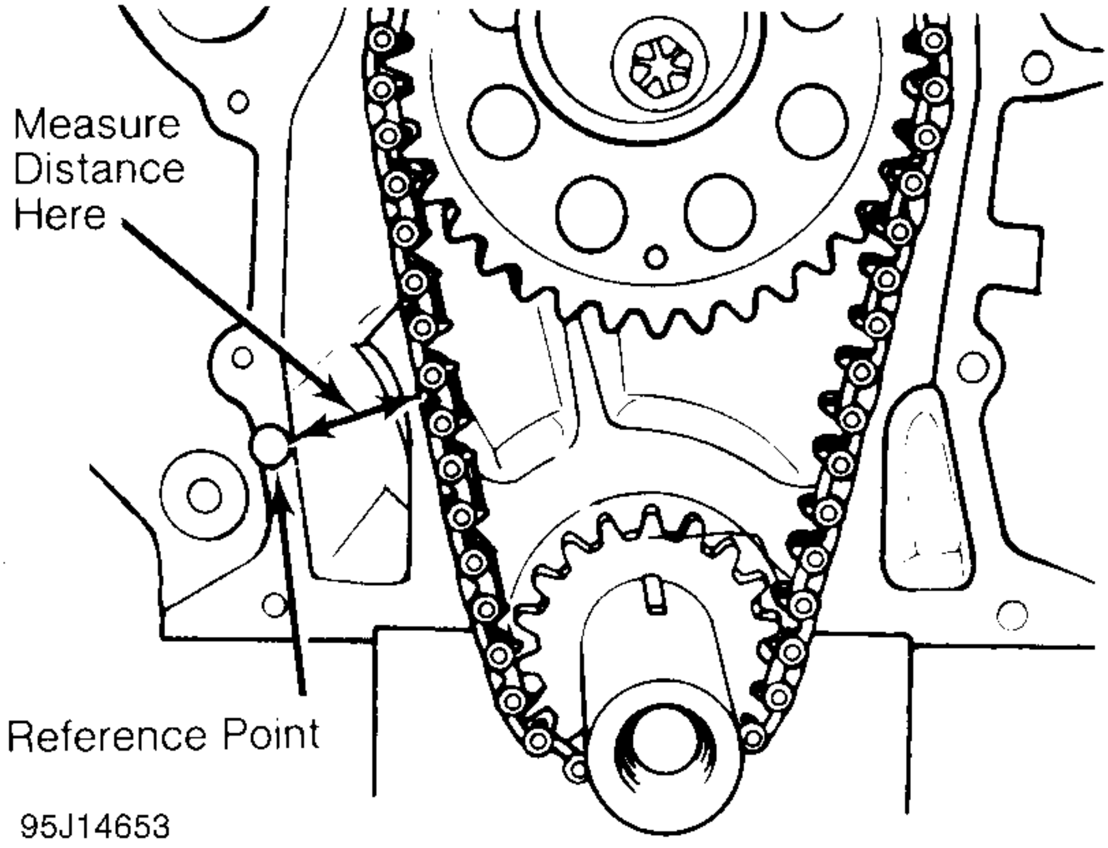
TIMING CHAINS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Timing chains will stretch during operation. Limits are placed upon amount of stretch before replacement is required. Timing chain stretch will alter ignition timing and valve timing.

To check timing chain stretch, rotate crankshaft to eliminate slack from one side of timing chain. Mark reference point on cylinder block. Rotate crankshaft in opposite direction to eliminate slack from remaining side of timing chain. Force other side of chain outward and measure distance between reference point and timing chain. See **Fig. 23**. Replace timing chain and gears if not within specification.



Measure Distance Here
Reference Point
95J14653

Fig. 23: Measuring Timing Chain Stretch

Timing chains must be installed so timing marks on camshaft gear and crankshaft gear are aligned according to manufacturer. See **Fig. 24**.

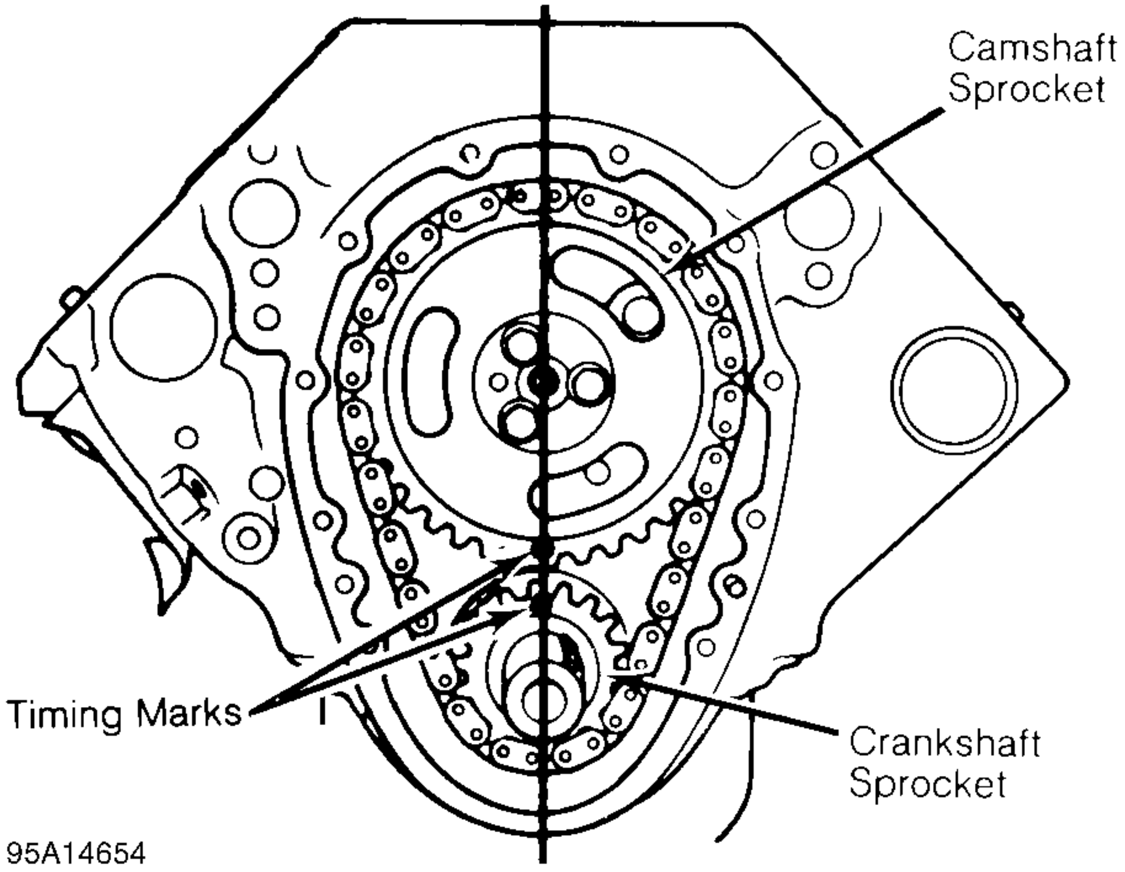


Fig. 24: Typical Gear Timing Mark Alignment

TIMING BELTS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Cogged tooth belts are commonly used on overhead cam engines. Inspect belt teeth for rounded corners or cracking. Replace belt if it is cracked, damaged, missing teeth or oil soaked.

Used timing belt must be installed in original direction of rotation. Inspect all sprocket teeth for wear. Replace all worn sprockets. Sprockets are marked for timing purposes. Engine is positioned so that crankshaft sprocket mark will be upward. Camshaft sprocket is aligned with reference mark on cylinder head or timing belt cover and then timing belt can be installed. See Fig. 25.

TENSION ADJUSTMENT

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

If guide rails are used with spring loaded tensioners, ensure at least half of original rail thickness remains. Spring loaded tensioner should be inspected for damage.

Ensure all timing marks are aligned. Adjust belt tension using manufacturer's recommendations. Belt tension may require checking using tension gauge. See Fig. 26.

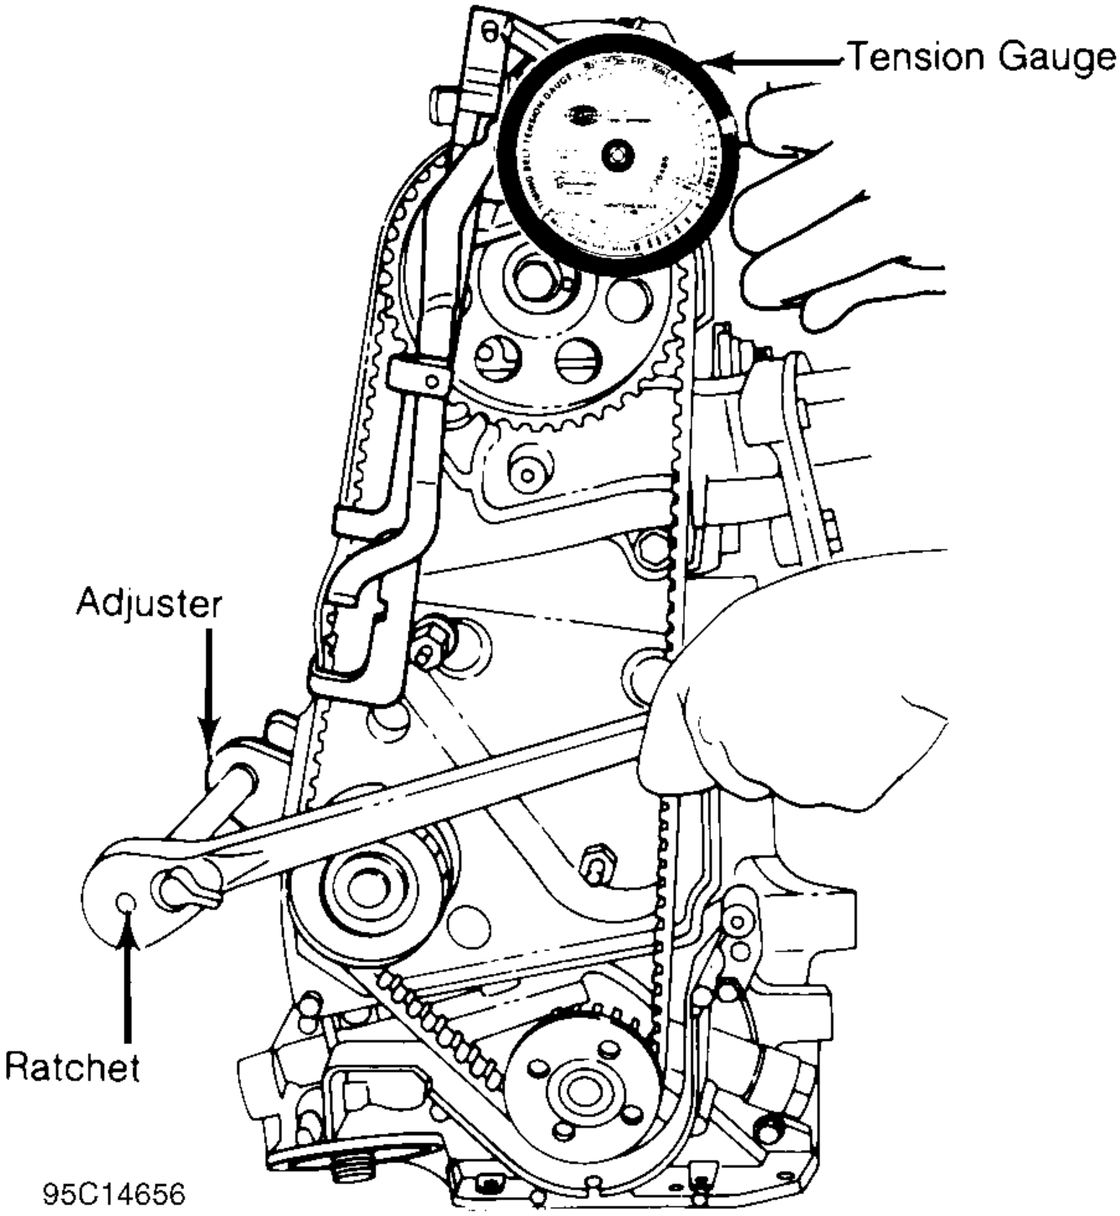

Fig. 26: Adjusting Typical Timing Belt Tension

TIMING GEARS

* PLEASE READ THIS FIRST *

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

TIMING GEAR BACKLASH & RUNOUT

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

On engines where camshaft gear operates directly on crankshaft gear, gear backlash and runout must be checked. To check backlash, install dial indicator with tip resting on tooth of camshaft gear. Rotate camshaft gear as far as possible. Adjust indicator to zero. Rotate camshaft gear in opposite direction as far as possible and note reading.

To determine timing gear runout, mount dial indicator with tip resting on face edge of camshaft gear. Adjust indicator to zero. Rotate camshaft gear 360 degrees and note reading. If backlash or runout exceeds specification, replace camshaft and/or crankshaft gear.

REAR MAIN OIL SEAL INSTALLATION

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

One-Piece Type Seal

For one-piece type oil seal installation, coat block contact surface of seal with sealer if seal is not factory coated. Ensure seal surface is free of burrs. Lubricate seal lip with engine oil and press seal into place using proper oil seal installer. See **Fig. 27**.

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

ROTOR TYPE

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle

being repaired.

Mark oil pump rotor locations before removing. See Fig. 30. Remove outer rotor and measure thickness and diameter. Measure inner rotor thickness. Inspect shaft for scoring or wear. Inspect rotors for pitting or damage. Inspect cover for grooving or wear. Replace worn or damaged components.

Measure outer rotor-to-body clearance. Replace pump assembly if clearance exceeds specification. Measure clearance between rotors. See Fig. 31. Replace shaft and both rotors if clearance exceeds specification.

Install rotors in pump body. Position straightedge across pump body. Using feeler gauge, measure clearance between rotors and straightedge. Pump cover wear is measured using a straightedge and feeler gauge. Replace pump if clearance exceeds specification.

BREAK-IN PROCEDURE

* PLEASE READ THIS FIRST *

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

ENGINE PRE-OILING

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Pre-oil engine prior to operation to prevent engine damage. Lightly oiled oil pump will cavitate unless oil pump cavities are filled with engine oil or petroleum jelly.

Engine pre-oiling can be done using pressure oiler (if available). Connect pressure oiler to cylinder block oil passage such as oil pressure sending unit. Operate pressure oiler long enough to ensure correct amount of oil has filled crankcase. Check oil level while pre-oiling.

If pressure oiler is not available, disconnect ignition system. Remove oil pressure sending unit and replace with oil pressure test gauge. Using starter motor, rotate engine starter until gauge shows normal oil pressure for several seconds. DO NOT crank engine for more than 30 seconds to avoid starter motor damage. Ensure oil pressure has reached the most distant point from the oil pump.

NOTE: **If new lifters or camshaft are installed, some manufacturers require that a crankcase conditioner be added to engine oil. The engine should be operated for specified amount of time to aid in lifter break-in procedure.**

INITIAL START-UP

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Start engine and operate engine at low speed while checking for coolant, fuel and oil leaks. Stop engine. Recheck coolant and oil level. Adjust if necessary.

CAMSHAFT

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Break-in procedure is required when new or reground camshaft has been installed. Operate and maintain engine speed between 1500-2500 RPM for approximately 30 minutes. Procedure may vary due to manufacturer's recommendations.

PISTON RINGS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Piston rings require a break-in procedure to ensure seating of rings to cylinder walls. Serious damage may occur to rings if correct procedures are not followed.

Extremely high piston ring temperatures are obtained during break-in process. If rings are exposed to excessively high RPM or high cylinder pressures, ring damage can occur. Follow piston ring manufacturer's recommended break-in procedure.

FINAL ADJUSTMENTS

NOTE: **Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.**

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Check or adjust ignition timing and dwell (if applicable). Adjust valves (if necessary). Adjust idle speed and mixture. Retighten cylinder heads (if required). If cylinder head or block is aluminum, retighten bolts when engine is cold. Follow the engine manufacturer's recommended break-in procedure and maintenance schedule for new engines.

NOTE: **Some manufacturers require that head bolts be retightened after specified amount of operation. This must be done to prevent head gasket failure.**

Engine Performance Diagnostic Routine Outline

* PLEASE READ THIS FIRST *

NOTE: **This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the ENGINE PERFORMANCE category.**

WHERE DOES DRIVEABILITY DIAGNOSIS START?

PERFORM BASIC INSPECTION

NOTE: **This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the ENGINE PERFORMANCE category.**

1. Verify Customer Complaint
2. Check for Relevant Technical Service Bulletins (TSBs)
3. Perform Visual Inspection **(See Basic Diagnostic Procedures)**
4. Test Engine Sub-Systems **(See Basic Diagnostic Procedures)**
    - Mechanical Condition (Compression)
    - Ignition Output
    - Fuel Delivery
5. Check Air Induction System For Leaks
6. Check & Adjust Basic Engine Settings**(See On-Vehicle Adjustments)**
    - Ignition Timing
    - Idle Speed

CHECK FOR TROUBLE CODES

NOTE: **This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the ENGINE PERFORMANCE category.**

1. Check for Diagnostic Trouble Codes (DTCs).**(See Self-Diagnostics)**
2. Repair cause of DTCs.
3. Clear PCM memory and repeat self-test.

DIAGNOSE SYMPTOM

NOTE: **This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the ENGINE PERFORMANCE category.**

1. If no self-diagnostics available, or no trouble codes present, identify symptom.
2. See trouble shooting procedure to identify problem. **(See Trouble Shooting - No Codes)**

TEST SYSTEM

NOTE: **This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the**

ENGINE PERFORMANCE category.

1. Perform required tests. **(See Systems & Component Testing)**
2. Verify complaint is repaired.

GENERAL INFORMATION

Engine Performance Safety Precautions

- Always refer to Emission Decal in engine compartment before servicing vehicle. If manual and decal differ, always use decal specifications.
- Do not allow or create a condition of misfire in more than one cylinder for an extended period of time. Damage to converter may occur due to loading converter with unburned air/fuel mixture.
- Always turn ignition off and disconnect negative battery cable BEFORE disconnecting or connecting computer or other electrical components.
- DO NOT drop or shock electrical components such as computer, airflow meter, etc.
- DO NOT use fuel system cleaning compounds that are not recommended by the manufacturer. Damage to gaskets, diaphragm materials and catalytic converter may result.
- Before performing a compression test or cranking engine using a remote starter switch, disconnect coil wire from distributor and secure it to a good engine ground, or disable ignition.
- Before disconnecting any fuel system component, ensure fuel system pressure is released.
- Use a shop towel to absorb any spilled fuel to prevent fire.
- DO NOT create sparks or have an open flame near battery.
- If any fuel system components such as hoses or clamps are replaced, ensure they are replaced with components designed for fuel system use.
- Always reassemble throttle body components with new gaskets, "O" rings and seals.
- If equipped with an inertia switch, DO NOT reset switch until fuel system has been inspected for leaks.
- Wear safety goggles when drilling or grinding.
- Wear proper clothing which protects against chemicals and other hazards.

English-Metric Conversion Chart

METRIC CONVERSIONS

Metric conversions are making life more difficult for the mechanic. In addition to increasing the number of tools required, metric-dimensioned nuts and bolts are used alongside English components in many new vehicles. The mechanic has to decide which tool to use, slowing down the job. The tool problem can be solved by trial and error, but some metric conversions aren't so simple.

Converting temperature, lengths or volumes requires a calculator and conversion charts, or else a very nimble mind. Conversion charts are only part of the answer though, because they don't help you "think" metric, or "visualize" what you are converting. The following examples are intended to help you "see" metric sizes:

LENGTH

Meters are the standard unit of length in the metric system. The smaller units are 10ths (decimeter), 100ths (centimeter), and 1000ths (millimeter) of a meter. These common examples might help you to visualize the metric units:

- A meter is slightly longer than a yard (about 40 inches).
- An aspirin tablet is about one centimeter across (.4 inches).
- A millimeter is about the thickness of a dime.

VOLUME

The metric weight system is based on the gram, with the most common unit being the kilogram (1000 grams). Our comparable units are ounces and pounds:

- A kilogram is about 2.2 pounds.
- A kilogram is about 2.2 pounds.

TORQUE

Torque is somewhat complicated. The term describes the amount of effort exerted to turn something. A chosen unit of weight or force is applied to a lever of standard length. The resulting leverage is called torque. In our standard system, we use the weight of one pound applied to a lever a foot long, resulting in the unit called a foot-pound. A smaller unit is the inch-pound (the lever is one inch long). Metric units include the meter kilogram (lever one meter long with a kilogram of weight applied) and the Newton-meter (lever one meter long with force of one Newton applied). Some conversions are:

- A meter kilogram is about 7.2 foot pounds.
- A foot pound is about 1.4 Newton-meters.
- A centimeter kilogram (cmkg) is equal to .9 inch pounds.

PRESSURE

Pressure is another complicated measurement. Pressure is described as a force or weight applied to a given area. Our common unit is pounds per square inch. Metric units can be expressed in several ways. One is the kilogram per square centimeter (kg/cm^2). Another unit of pressure is the Pascal (force of one Newton on an area of one square meter), which equals about 4 ounces on a square yard. Since this is a very small amount of pressure, we usually see the kiloPascal, or kPa (1000 Pascals). Another common automotive term for pressure is the bar (used by German manufacturers), which equals 10 Pascals. Thoroughly confused? Try the examples below:

- Atmospheric pressure at sea level is about 14.7 psi.

- Atmospheric pressure at sea level is about 1 bar.
- Atmospheric pressure at sea level is about 1 kg/cm^2 .
- One pound per square inch is about 7 kPa.

Release January 2023

GENERAL INFORMATION

Gear Tooth Contact Patterns

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

INSPECTION

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Wipe lubricant from internal parts. Rotate gears and inspect for wear or damage. Mount dial indicator to housing and check backlash at several points around ring gear. Backlash must be within specification at all points. If no defects are found, check gear tooth pattern contact.

NOTE: **Drive pattern should be well centered on ring gear teeth. Coast pattern should be centered, but may be slightly toward toe of ring gear teeth.**

GEAR TOOTH CONTACT PATTERN

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

1. Paint ring gear teeth with marking compound. Wrap cloth or rope around drive pinion flange to act as brake. Rotate gear until clear contact pattern is obtained.
2. Contact pattern will indicate whether correct pinion bearing mounting shim has been installed and if drive gear backlash has been set properly. Backlash between drive gear pinion must be maintained within specified limits until correct tooth pattern is obtained.

ADJUSTMENTS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

GEAR BACKLASH & PINION SHIM CHANGES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

1. With no change in backlash, moving pinion further from ring gear moves drive pattern toward heel and top of tooth, and moves coast pattern toward toe and top of tooth.
2. With no change in backlash, moving pinion closer to ring gear moves drive pattern toward toe and bottom of tooth, and moves coast pattern toward heel and bottom of tooth.
3. With no change in pinion shim thickness, an increase in backlash moves ring gear further from pinion. Both drive and coast patterns move toward heel and top of tooth.
4. With no change in pinion shim thickness, a decrease in backlash moves ring gear closer to pinion gear. Both drive and coast patterns move toward toe and bottom of tooth.

General Cooling System Service

* PLEASE READ THIS FIRST *

This article is generic in nature and all information does not apply to all vehicles including those without a liquid cooling system. For vehicle specific information, see the appropriate articles in the ENGINE category.

DESCRIPTION

The liquid cooling system consists of a radiator, water pump, thermostat, electric or belt-driven cooling fan, pressure cap, heater, and various connecting hoses and cooling passages in the engine block and cylinder head.

MAINTENANCE

DRAINING

Remove radiator cap and open heater control valve to maximum heat position. Open drain cocks or remove plugs in bottom of radiator and engine block. In-line engines usually have one plug or drain cock, while "V" type engines have 2, one in each bank of cylinders.

FLUSHING

CAUTION: **Some manufacturers use an aluminum and plastic radiator. Flushing solution must be compatible with aluminum.**

Radiator

Connect flushing gun to water outlet of radiator. Disconnect water inlet hose. To prevent flooding engine, use a hose connected to radiator inlet. Use air in short bursts to prevent damage to radiator. Continue flushing until water runs clear.

Engine Block

To flush engine, remove thermostat. Connect flushing gun to water outlet of radiator. Use air in short bursts to prevent damage to radiator. Continue flushing until water runs clear.

REFILLING

To prevent air from being trapped in engine block, engine should be running when refilling cooling system. After system is full, continue running engine until thermostat is open, then recheck fill level. Do not overfill system.

TESTING

THERMOSTAT

1. Remove and inspect thermostat for corrosion and proper seating of valve. If okay, suspend thermostat and thermometer in a 50/50 mixture of coolant and water. See **Fig. 1**. DO NOT allow thermostat or thermometer to touch bottom or container. Heat water until thermostat begins to open.
2. Read temperature on thermometer. This is the initial opening temperature and should be within specification. Continue heating water until thermostat is fully open and note temperature. This is the fully open temperature. If either reading is not to specification, replace thermostat.

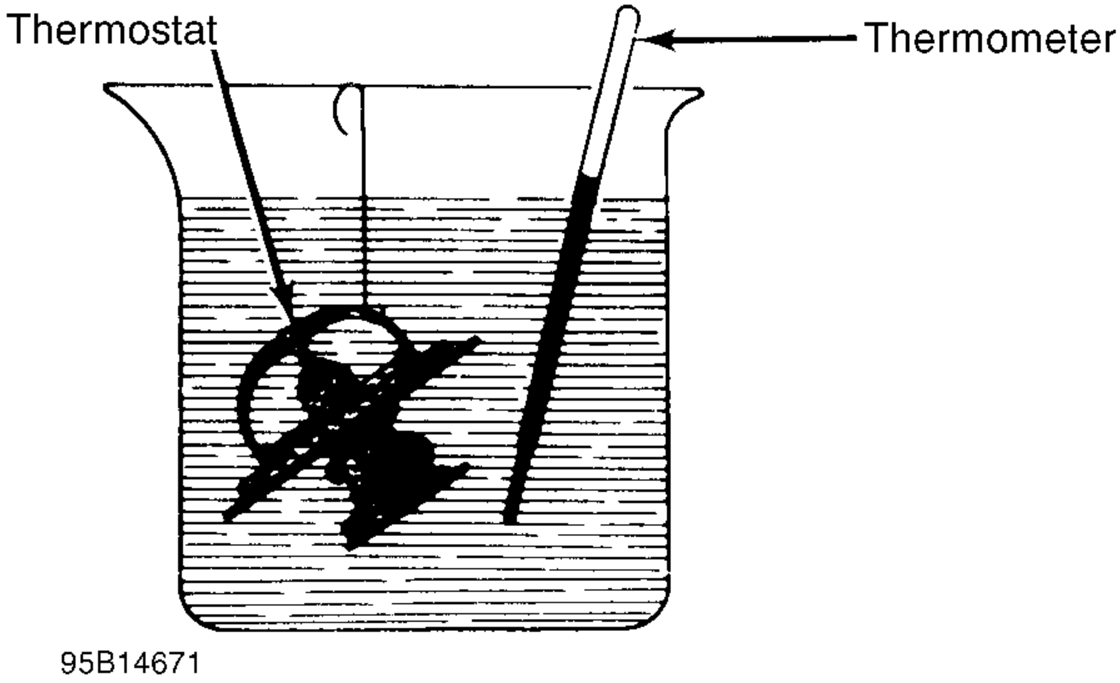

Fig. 1: Testing Thermostat in Coolant/Water Solution

PRESSURE TESTING

A pressure tester is used to check both radiator cap and complete cooling system. Follow pressure tester manufacturer instructions and test components as follows:

Radiator Cap

Visually inspect radiator cap. If cap looks okay, connect pressure tester to cap. See Fig. 2. Pressurize tester to full radiator cap specification. Replace cap if it fails to hold pressure.

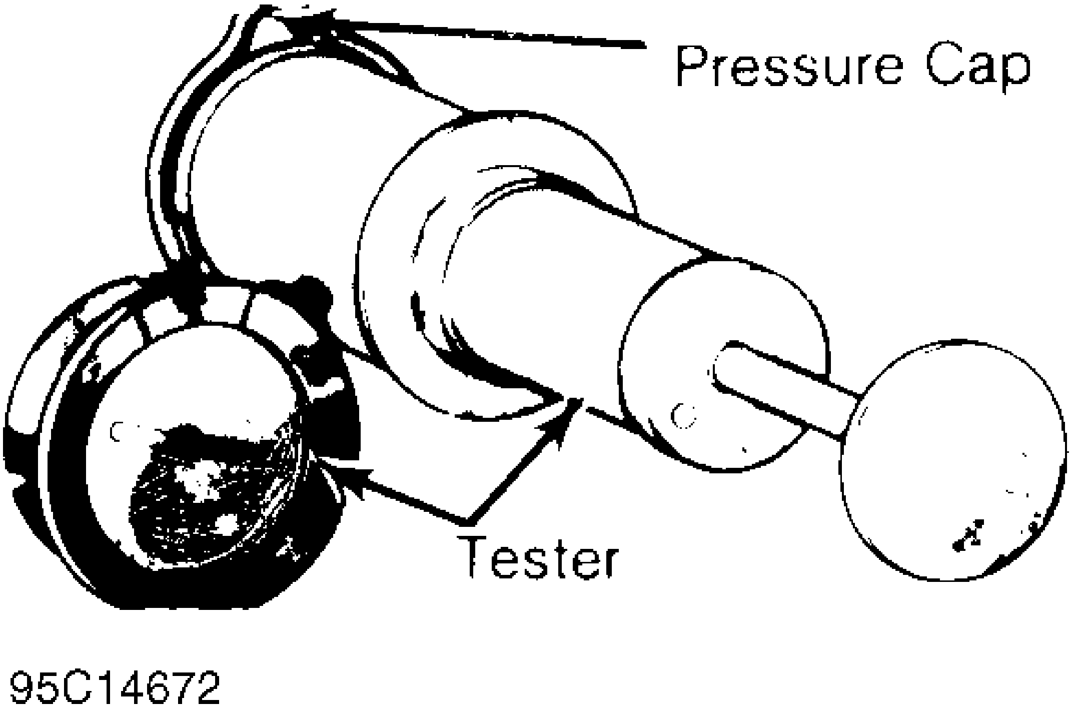

Fig. 2: Pressure Testing Radiator Cap

Cooling System

1. Turn ignition off and allow engine to cool. Ensure radiator if filled to correct level. Remove cap and attach pressure tester to radiator. Pressurize tester to full radiator rating specification.
2. If pressure drops, check for external leaks. If no leaks are found, start engine and allow to idle. If pressure builds up immediately, check cylinder head and block for cracks. If pressure does not build up immediately, go to next step.

CAUTION: **DO NOT allow excess pressure to build in cooling system or damage may result.**

3. Using pressure tester, pump cooling system up to pressure specified on radiator cap. If pump gauge pointer vibrates, compression or combustion leak into cooling system is indicated. Isolate leak by shorting each spark plug wire to cylinder block. Gauge pointer vibration will stop or decrease when leaking cylinder is shorted.

GENERAL INFORMATION

Manual Transmission Trouble Shooting

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

INTRODUCTION

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

There are many times when the transmission is incorrectly blamed for shifting problems or noises that are actually caused by other reasons. Shift difficulties are frequently caused by conditions outside of the transmission or transaxle. Typical conditions include: shift linkage, shift cables, alignment of engine to transmission, worn engine mounts or clutch problems. Drive train noises may come from many sources such as tires, road surfaces, wheel bearings, differentials, engine or exhaust system. Repairing or overhauling transmission will not cure these problems.

No manufacturer makes a perfectly quiet transmission. Gear rollover noise is present in most constant mesh transmissions and will tend to disappear when the clutch is disengaged or transmission is placed in gear. If clutch is properly adjusted, clutch release bearing noise will disappear when release bearing is moved enough to slide release bearing away from pressure plate.

Trouble shooting can be helped by driving vehicle on a smooth level road to help eliminate tire and body noise. Note whether noise occurs on acceleration, coasting, deceleration or steady driving conditions. Some problems may only occur when transmission is either hot or cold. Gear lubricant that is too thick can cause hard shifting on cold mornings before engine is warm and vehicle has been driven.

MANUAL TRANSMISSION/TRANSAXLE TROUBLE SHOOTING

Condition	Possible Cause
Noisy In Forward Gears	Low Gear Oil Level, Loose Bellhousing Bolts, Worn Bearings Or Gears
Clunk On Deceleration (FWD Only)	Loose Engine Mounts, Worn Inboard CV Joints, Worn Differential Pinion Shaft, Oversized Side Gear Hub Counterbore in Case
Gear Clash When Shifting Forward Gears	Clutch Out Of Alignment, Shift Linkage Damaged Or Out Of Adjustment, Gears Or Synchronizers Damaged, Low Gear Oil Level
Transmission Noisy When Moving (RWD Only); Quiet In Neutral With Clutch Engaged	Worn Rear Output Shaft Bearing
Gear Rattle	Worn Bearings, Worn Gear Oil, Low Gear Oil, Worn Gears
Steady Ticking At Idle (Increases With RPM)	Broken Tooth On A Gear
Gear Clash When Shifting Forward Gears	Worn Or Broken Synchronizers, Faulty Clutch
Loud Whine In Reverse	Normal Condition (1)
Noise When Stepping On Clutch	Faulty Release Bearing, Worn Pilot Bearing
Ticking Or Screeching As Clutch Is Engaged	Faulty Release Bearing, Uneven Pressure Plate Fingers
Click Or Snap When Clutch Is Engaged	Worn Clutch Fork, Worn Pivot Ball, Worn Or Broken Front Bearing Retainer

Condition	Possible Cause
Transmission Shifts Hard	Clutch Not Releasing, Incorrect Gear Oil, Shift Mechanism Binding, Clutch Installed Backward
Will Not Shift Into One Gear, Shifts Into All Others	Bent Shift Fork, Worn Detent Balls
Locked Into Gear, Cannot Shift	Clutch Adjustment, Worn Detent Balls
Transmission Jumps Out Of Gear	Pilot Bearing Worn, Bent Shift Fork, Worn Gear Teeth Or Face, Excessive Gear Train End Play, Worn Synchronizers, Missing Detent Ball Spring, Shift Mechanism Worn Or Out Of Adjustment, Engine Or Transmission Mount Bolts Loose, Transmission Not Aligned
Shift Lever Rattle	Worn Detents Or Shift Lever, Worn Shift Fork, Worn Synchronizer Sleeves
Shift Lever Hops Under Acceleration	Worn Engine Or Transmission Mounts

(1) Most units use spur cut gears in Reverse and are naturally noisy.

GENERAL INFORMATION

Parasitic Load Explanation & Test Procedures

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

GENERAL INFORMATION

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

The term Parasitic Load refers to electrical devices that continue to use or draw current after the ignition switch is turned to OFF position. This small amount of continuous battery draw is expressed in milliamps (mA). On Chrysler vehicles, a typical Parasitic Load should be no more than 30 milliamps (0.030 amps). On Ford Motor Co. and General Motors vehicles produced after 1980, a typical Parasitic Load should be no more than 50 milliamps (0.050 amps).

Vehicles produced since 1980 have memory devices that draw current with ignition off for as long as 20 minutes before shutting down the Parasitic Drain. When Parasitic Load exceeds normal specifications, the vehicle may exhibit dead battery and no-start condition.

Follow test procedure for checking Parasitic Loads to completion. A brief overview of a suggested test procedure is included along with some typical Parasitic Load specifications. Refer to GENERAL MOTORS PARASITIC LOAD TABLE chart.

TESTING FOR PARASITIC LOAD

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

CAUTION: **Always turn ignition off when connecting or disconnecting battery cables, battery chargers or jumper cables. DO NOT turn test switch to OFF position (which causes current to run through ammeter or vehicle electrical system).**

NOTE: **Memory functions of various accessories must be reset after the battery is reconnected.**

The battery circuit must be opened to connect test switch (shunt) and ammeter into the circuit. When a battery cable is removed, timer circuits within the vehicle computer are interrupted and immediately begin to discharge. If in doubt about the condition of the ammeter fuse, test it with an ohmmeter prior to beginning test. An open fuse will show the same reading (00.00) as no parasitic drain. Begin test sequence with the meter installed and on the 10-amp scale. Select lower scale to read parasitic draw.

CHRYSLER IGNITION OFF DRAW (IOD) TEST

To test for excessive IOD, verify that all electrical accessories are OFF. Turn off all lights, remove ignition key, and close all doors and decklid. If the vehicle is equipped with electronic accessories (illuminated entry, automatic load leveler, body computer, or high line radio), allow the system to automatically shut off (time out), up to 3 minutes.

1. Raise the hood and disconnect both battery cables, negative first.

CAUTION: **IOD greater than 3 amps may damage millampmeter.**

2. Reconnect the negative cable and connect a typical 12-volt test light (low wattage bulb) between the positive cable clamp and the positive battery post. Remove the engine compartment lamp bulb. If the test light does not light, proceed to step 3. If the test light does light, proceed to step, 4. The test light will indicate IOD greater than 3 amps. After higher amperage IOD has been corrected, proceed to step 3.
3. ith 12-volt test light still connected (not lit), connect an ammeter (milliampere scale) between the positive cable clamp and the positive battery post, disconnect test light, refer to instructions provided with ammeter being used. A reading of 30 milliamperes or less indicates normal electrical draw. If ammeter reads more than 30 milliamperes, excessive IOD must be corrected.
4. Locate the fuse panel and remove fuses or circuit breakers one at a time, and observe ammeter after each fuse or circuit breaker is removed. If test light goes out and the reading drops below 30 milliamperes when a certain fuse or circuit breaker is removed, that circuit may have a defect.
5. If IOD is detected after all fuses and circuit breakers have been removed, disconnect the 60-way connector at the Single Module Engine Control (SMEC), located outboard of the battery.
6. If excessive IOD is detected after all fused circuits and SMEC have been verified, disconnect the B+ terminal from the alternator. If reading drops below 30 milliamperes, reinstall all fuses and circuit breakers, reconnect B+ terminal at alternator, reconnect battery, and perform alternator diagnostics.
7. Install engine compartment lamp bulb.

TEST PROCEDURE USING TEST SWITCH

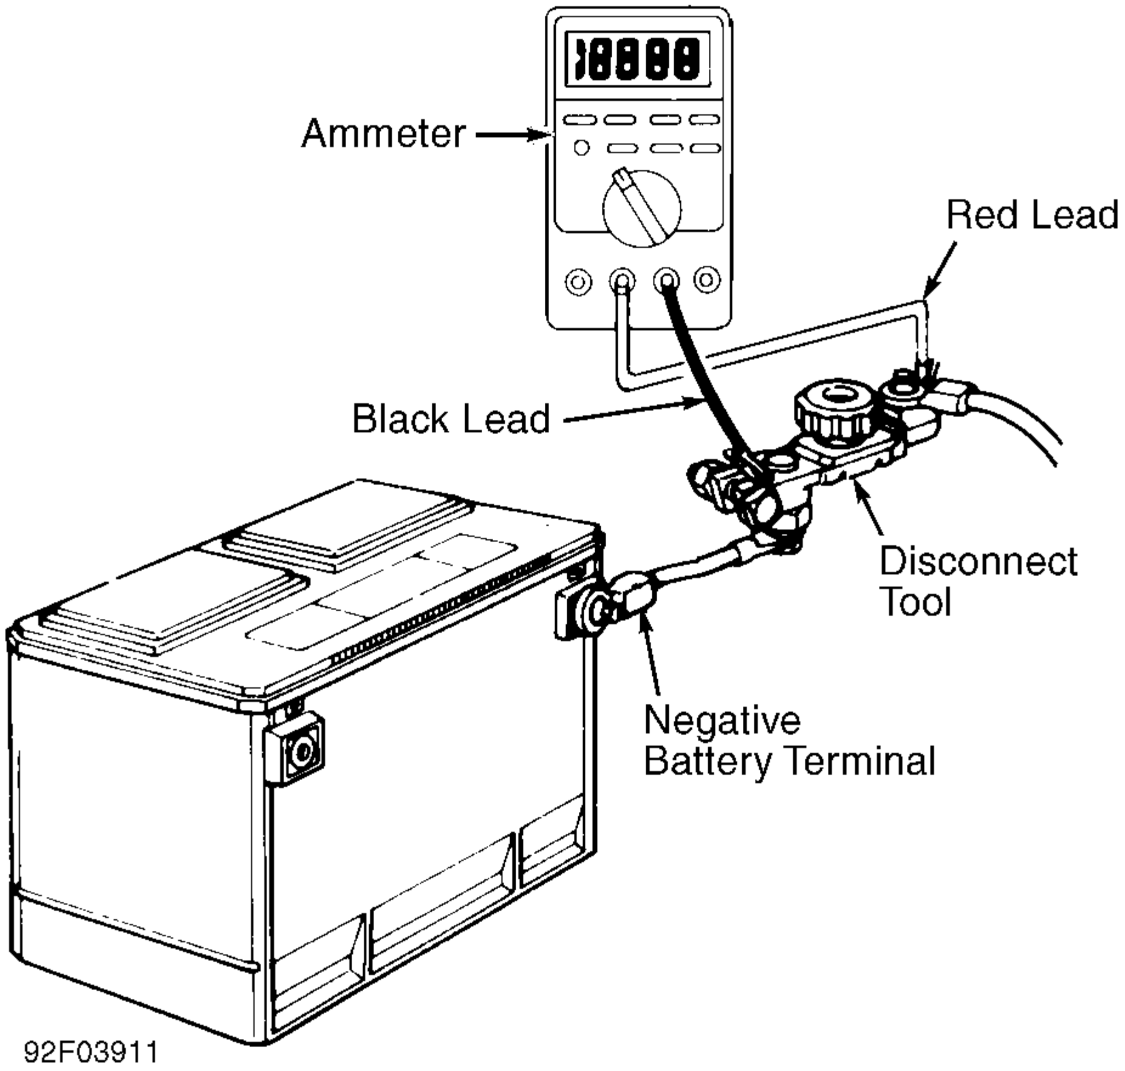
1. Turn ignition off. Remove negative battery terminal cable. Install Disconnect Tool (J-38758) test switch male end to negative battery cable. Turn test switch knob to OFF position (current through meter). Install negative battery cable to the female end of test switch.
2. Turn test switch knob to ON position (current through switch). Road test vehicle with vehicle accessories on (radio, air conditioner, etc). After road test, turn ignition switch to LOCKED position and remove key. Connect ammeter terminals to test switch terminals. See **Fig. 1**. Select 10-amp scale.
3. Turn off all electrical accessories. Turn off interior lights, underhood lamp, trunk light, illuminated entry, etc. To avoid damaging ammeter or obtaining a false meter reading, all accessories must be off before turning test switch knob to OFF position.
4. Turn test switch knob to OFF position to allow current to flow through ammeter. If meter reads wrong polarity, turn test switch to ON position and reverse leads. Turn test switch to OFF position. Observe current reading. If reading is less than 2 amps, turn test switch to ON position to keep electrical circuits powered-up.
5. Select low amp scale. Switch lead to the correct meter position. Turn test switch to OFF position and compare results to normal current draw. See **GENERAL MOTORS PARASITIC LOAD TABLE (MILLIAMPS)**. If current draw is unusually high for the vehicle's overall electrical system, remove system fuses one at a time until current draw returns to normal.
6. Turn test switch to ON position each time door is opened or fuse is removed. Turn switch to OFF position to read current draw value through meter. When the cause of excessive current drain has been located and repaired, remove test switch and reconnect negative battery cable to the negative battery terminal.

INTERMITTENT PARASITIC LOAD PROBLEMS

Intermittent parasitic load can occur because of a memory device that does not power down with ignition off. With an intermittent parasitic load, battery draw can be greater than 1.0 amp.

To find an intermittent problem requires that an ammeter and Disconnect Tool (J-38758) test switch be connected and left in the circuit. See **Fig. 1**. Road test vehicle. After road test, turn ignition off and remove key.

Monitor the milliamps scale for 15-20 minutes after ignition is turned off. This allows monitoring memory devices to determine if they time out and stop drawing memory current. The test switch is needed to protect ammeter when the vehicle is started.



Ammeter

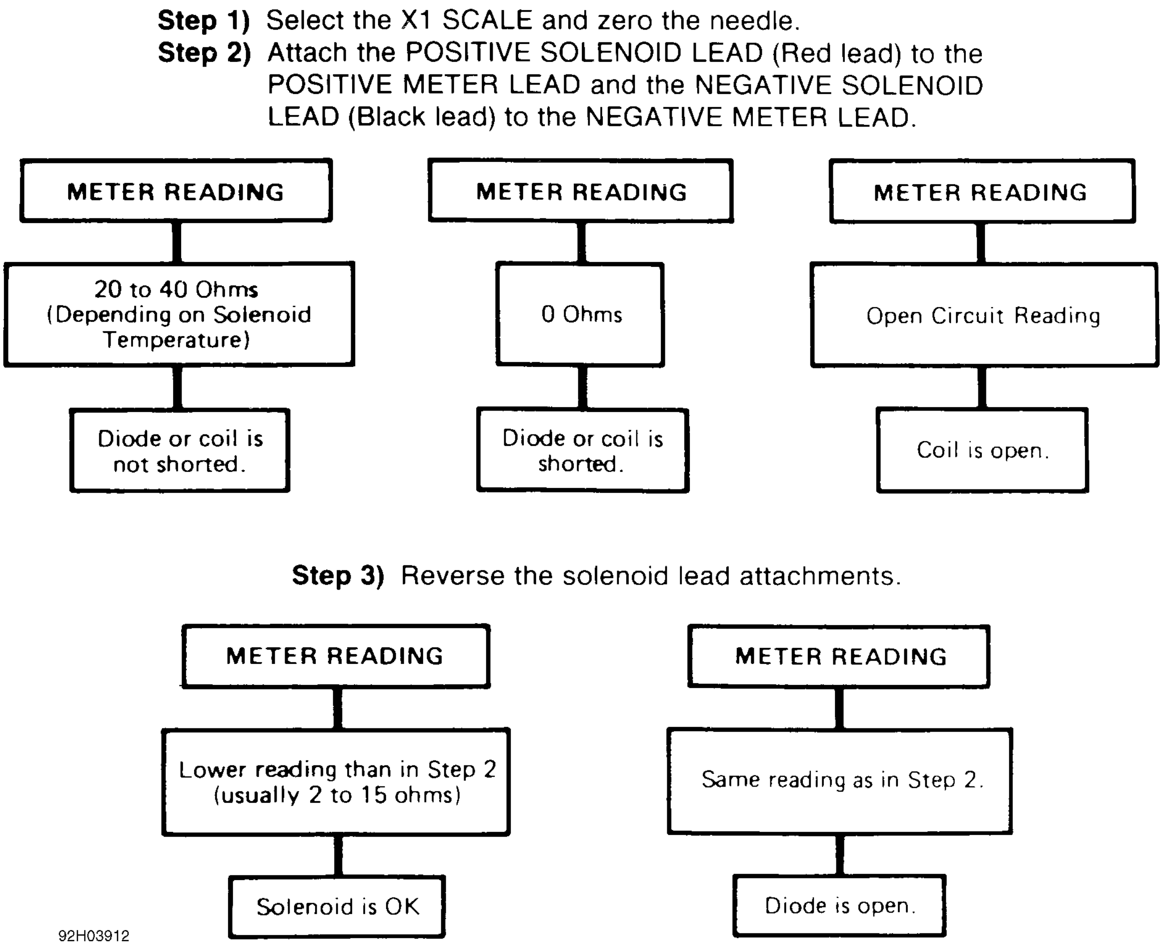
DIODE CHECK & SOLENOID TEST



Step 1) Select the X1 SCALE and zero the needle.

Step 2) Attach the POSITIVE SOLENOID LEAD (Red lead) to the POSITIVE METER LEAD and the NEGATIVE SOLENOID LEAD (Black lead) to the NEGATIVE METER LEAD.

Step 3) Reverse the solenoid lead attachments.

METER READING
20 to 40 Ohms (Depending on Solenoid Temperature)
Diode or coil is not shorted.
METER READING
0 Ohms
Diode or coil is shorted.
METER READING
Open Circuit Reading
Coil is open.
METER READING
Lower reading than in Step 2 (usually 2 to 15 ohms)
Solenoid is OK
METER READING
Same reading as in Step 2.
Diode is open.
92H03912

Fig. 2: Diode Check & Solenoid Test

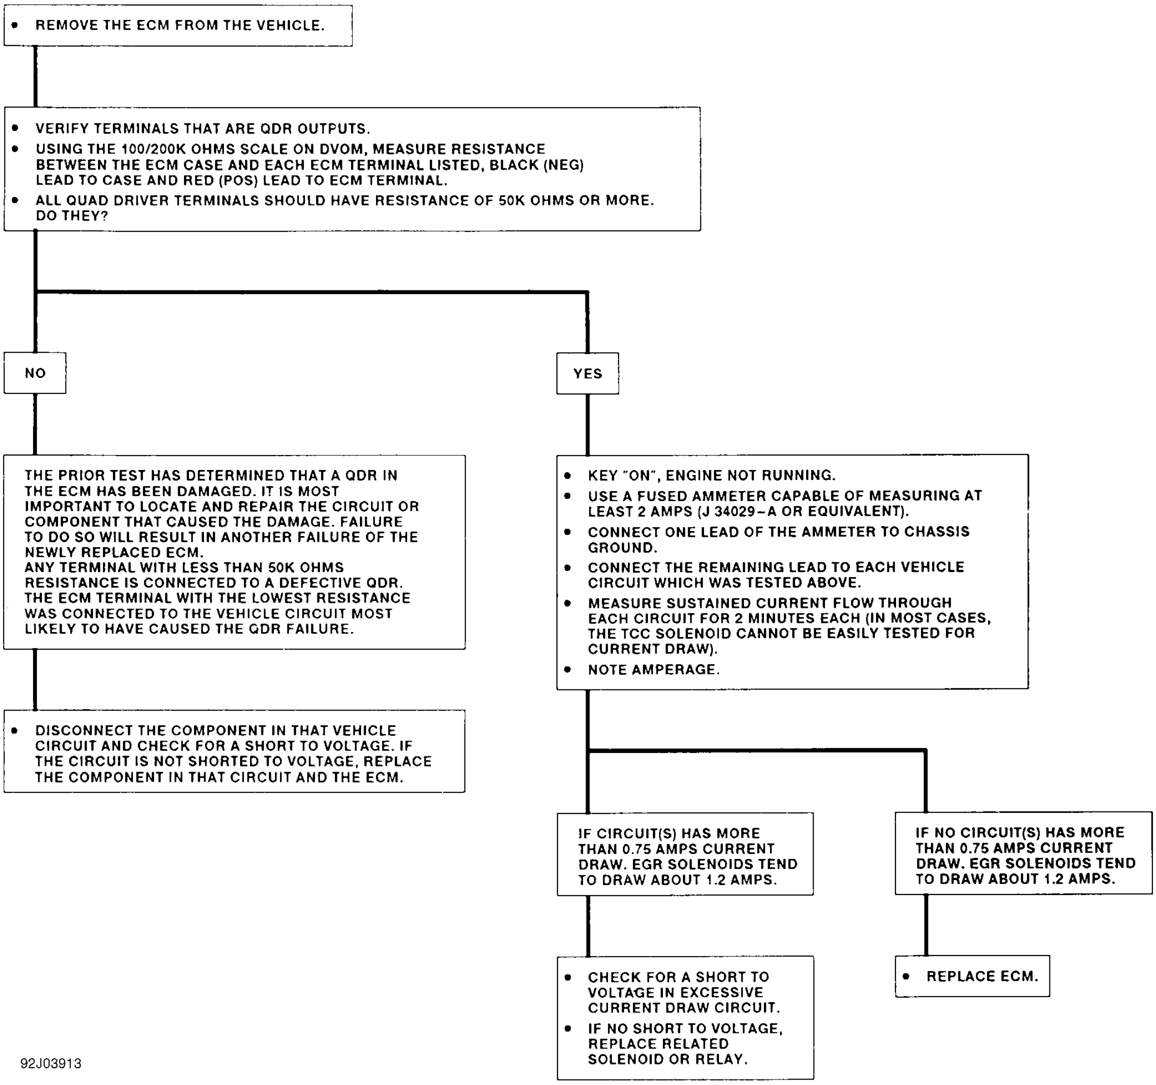
QUAD DRIVER TEST



- REMOVE THE ECM FROM THE VEHICLE.

- VERIFY TERMINALS THAT ARE QDR OUTPUTS.
- USING THE 100/200K OHMS SCALE ON DVOM, MEASURE RESISTANCE BETWEEN THE ECM CASE AND EACH ECM TERMINAL LISTED, BLACK (NEG) LEAD TO CASE AND RED (POS) LEAD TO ECM TERMINAL.
- ALL QUAD DRIVER TERMINALS SHOULD HAVE RESISTANCE OF 50K OHMS OR MORE. DO THEY?

NO

THE PRIOR TEST HAS DETERMINED THAT A QDR IN THE ECM HAS BEEN DAMAGED. IT IS MOST IMPORTANT TO LOCATE AND REPAIR THE CIRCUIT OR COMPONENT THAT CAUSED THE DAMAGE. FAILURE TO DO SO WILL RESULT IN ANOTHER FAILURE OF THE NEWLY REPLACED ECM.
ANY TERMINAL WITH LESS THAN 50K OHMS RESISTANCE IS CONNECTED TO A DEFECTIVE QDR. THE ECM TERMINAL WITH THE LOWEST RESISTANCE WAS CONNECTED TO THE VEHICLE CIRCUIT MOST LIKELY TO HAVE CAUSED THE QDR FAILURE.

- DISCONNECT THE COMPONENT IN THAT VEHICLE CIRCUIT AND CHECK FOR A SHORT TO VOLTAGE. IF THE CIRCUIT IS NOT SHORTED TO VOLTAGE, REPLACE THE COMPONENT IN THAT CIRCUIT AND THE ECM.

YES

- KEY "ON", ENGINE NOT RUNNING.
- USE A FUSED AMMETER CAPABLE OF MEASURING AT LEAST 2 AMPS (J 34029-A OR EQUIVALENT).
- CONNECT ONE LEAD OF THE AMMETER TO CHASSIS GROUND.
- CONNECT THE REMAINING LEAD TO EACH VEHICLE CIRCUIT WHICH WAS TESTED ABOVE.
- MEASURE SUSTAINED CURRENT FLOW THROUGH EACH CIRCUIT FOR 2 MINUTES EACH (IN MOST CASES, THE TCC SOLENOID CANNOT BE EASILY TESTED FOR CURRENT DRAW).
- NOTE AMPERAGE.

IF CIRCUIT(S) HAS MORE THAN 0.75 AMPS CURRENT DRAW. EGR SOLENOIDS TEND TO DRAW ABOUT 1.2 AMPS.

- CHECK FOR A SHORT TO VOLTAGE IN EXCESSIVE CURRENT DRAW CIRCUIT.
- IF NO SHORT TO VOLTAGE, REPLACE RELATED SOLENOID OR RELAY.

IF NO CIRCUIT(S) HAS MORE THAN 0.75 AMPS CURRENT DRAW. EGR SOLENOIDS TEND TO DRAW ABOUT 1.2 AMPS.

- REPLACE ECM.

Fig. 2: California Emission Standards - Enhanced & Partially Enhanced Program Areas - Heavy Duty Vehicles (ASM Test)

LEGEND

ESC - Emission Standard Category
GVWR - Manufacture's Gross Vehicle Weight Rating
LVW - Loaded Vehicle Weight
PC - Passenger Car
LDT1 - Light-Duty Truck up through 3750 LVW and GVWR no greater than 6000 lbs.
LDT2 - Light-Duty Truck greater than 3750 LVW and GVWR no greater than 6000 lbs.

MDV - Medium-Duty Vehicle, GVWR from 6001 to 8500 lbs.
HC - Hydrocarbon, ppm
CO - Carbon Monoxide, %
NO - Nitric Oxide, ppm

PASS/FAIL EMISSION STANDARDS = A+B / VTW

PASS/FAIL STANDARDS - Emission standards used to determine if a vehicle passes the emission inspection. A vehicle passes if the emission levels are equal to or less than the standards for HC, CO and NO for ASM 5015 and ASM 2525.

GROSS POLLUTER STANDARDS - Emission standards used to designate a vehicle as a gross polluter. A vehicle is designated as a gross polluter if the emission levels at the time of the initial inspection, before repairs are greater than the gross polluter standards for HC, CO or NO for ASM 5015 or ASM 2525.

NOTE: **If test data on emission pass/fail rates or gross polluter identification rates indicate adjustments are required, the emission standards may be increased or decreased by the bureau by 30% or by the following tolerances, or standards may be set for any specific vehicle and engine configuration which the bureau determines has excessive errors of commission of omission, whichever is necessary to comply with Section 44001.5 of the Health and Safety Code.**

COLORADO

1975-78	300 (3.0)
1979-80	300 (2.5)
1981 & Newer	220 (1.2)

(1) 8500 GVWR or less.

TENNESSEE

TENNESSEE EMISSION STANDARDS - MEMPHIS - IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (9000 GVWR Or Less)	
1971 & Older	900 (8.9)
1972-74	700 (8.2)
1975-79	600 (7.5)
1980	400 (4.7)
1981 & Newer	220 (1.2)
Heavy Duty Trucks (9001-25,999 GVWR)	
1971 & Older	1000 (8.9)
1972-74	1000 (8.2)

Application	HC ppm (CO %)
1975-79	1000 (8.0)
1980	800 (6.0)
1981 & Newer	400 (4.0)

TENNESSEE EMISSION STANDARDS - DAVIDSON & NASHVILLE COUNTIES - IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)	
1975-77	500 (5.0)
1978-79	400 (4.0)
1980	300 (3.0)
1981 & Newer	220 (1.2)
Medium Duty Trucks (6001-8500 GVWR)	
1975-77	750 (6.5)
1978-79	600 (6.0)
1980	400 (4.5)
1981 & Newer	400 (4.0)

TENNESSEE EMISSION STANDARDS - FOUR COUNTY AREA SURROUNDING NASHVILLE - IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)	
1975-77	500 (5.0)
1978-79	400 (4.0)
1980	300 (3.0)
1981 & Newer	220 (1.2)
Medium Duty Trucks (6001-8500 GVWR)	
1975-77	750 (6.5)
1978-79	600 (6.0)
1980	400 (4.5)
1981 & Newer	400 (4.0)

TEXAS

NOTE: **The Texas program incorporates original U.S. EPA recommended start-up ASM2525 and ASM5015 standards for 1995 and newer model year vehicles. Refer to appropriate model year range in appropriate table. See U. S. EPA ASM2525 & ASM5015 START-UP EMISSION STANDARDS.**

TEXAS EMISSION STANDARDS - 2-SPEED IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (8500 GVWR Or Less)	
1979	600 (6.0)
1980	400 (4.0)
1981 & Newer	220 (1.2)
Heavy Duty Vehicles (8501 GVWR Or More)	
1979-81	700 (7.0)
1982-84	500 (5.0)
1985 & Newer	300 (3.0)

UTAH

UTAH EMISSION STANDARDS - DAVIS COUNTY - DC98 TEST

Application	HC gpm (CO gpm)	NOx gpm
Light Duty Vehicles (6000 GVWR Or Less)		
1989-90	2.00 (30)	3.0
1991-95	1.2 (20)	2.5
Light Duty Trucks (6000 GVWR Or Less)		
1989-90	3.2 (80)	3.5
1991-95	2.4 (60)	3.0
Light Duty Trucks (6001-8500 GVWR)		
1989-90	3.2 (80)	5.0
1991-95	2.4 (60)	4.5

UTAH EMISSION STANDARDS - DAVIS COUNTY - 2-SPEED IDLE TEST

Application	HC ppm (CO %)
Light Duty Vehicles (6000 GVWR Or Less)	
1968-69	800 (6.0)
1970-74	700 (5.0)
1975-76	600 (4.0)

U. S. EPA REVISED FINAL ASM EMISSION STANDARDS (ASM5015 & ASM2525)

NOTE: **EPA has not published a revised final standards for High Altitude, Light Duty Trucks 2 (6000-8500 GVWR), or vehicles older than 1980 model year. EPA guidance as of February 2003 states that a program may choose to use combinations of the Original and the Revised Final Standards.**

U.S. EPA REVISED FINAL ASM EMISSION STANDARDS

Application	ASM5015		ASM2525	
HC ppm (CO %)		NOx ppm	HC ppm (CO %)	NOx ppm
Passenger Cars				
1980	275 (1.3)	8500	500 (2.3)	4750
1981-82	275 (1.3)	3600	500 (2.3)	3500
1983-89	275 (1.1)	3600	500 (1.6)	3500
1990 & Newer	275 (1.1)	3600	300 (1.6)	3500
Light Duty Trucks (Less Than 6000 GVWR)				
1980-83	1140 (9.7)	14,145	340 (23.28)	32,200
1984-87	537 (5.4)	14,145	160 (12.96)	32,200
1988-95	537 (5.4)	7380	160 (12.96)	16,800
1996 & Newer	275 (1.1)	6150	82 (4.40)	14,000

U.S. EPA IM240 EMISSION STANDARDS

START-UP STANDARDS

Start-up standards should be used during the first 2 years of program operation. Tier 1 standards are recommended for all 1996 and newer vehicles and may be used for 1994 and newer vehicles certified to Tier 1 standards as well.

U.S. EPA IM240 HYDROCARBONS EMISSION START-UP STANDARDS

Application	Hydrocarbons (Grams/Mile)	
Composite		Phase 2
Light Duty Vehicles		
1996 & Newer	0.80	0.50
1991-95	1.20	0.75
1983-90	2.00	1.25
1980-82	2.00	1.25
1975-79	7.50	5.00
1968-74	10.0	6.00
High Altitude Light Duty Vehicles		
1983-84	2.00	1.25
1982	2.00	1.25
Light Duty Trucks (0-6000 Lbs. GVWR)		

Application	Hydrocarbons (Grams/Mile)	
	Composite	Phase 2
1996 & Newer (Less Than 3750 LVW)	0.80	0.50
1996 & Newer (More Than 3750 LVW)	1.00	0.63
1991-95	2.40	1.50
1984-90	3.20	2.00
1979-83	7.50	5.00
1975-78	8.00	5.00
1968-74	10.0	6.00
High Altitude Light Duty Trucks (0-6000 Lbs. GVWR)		
1991 & Newer	3.00	2.00
1984-90	4.00	2.50
1982-83	8.00	5.00
Light Duty Trucks (6001-8500 Lbs. GVWR)		
1996 & Newer (Less Than 5750 ALVW)	1.00	0.63
1996 & Newer (More Than 5750 ALVW)	2.40	1.50
1991-95	2.40	1.50
1984-90	3.20	2.00
1979-83	7.50	5.00
1975-78	8.00	5.00

NOTE: Because of frequent revisions in state emission standards, the emission standards listed in this article should only be used as a guide.

ARIZONA EMISSION STANDARDS - PHOENIX & TUCSON AREA (DIESEL OPACITY LOADED CRUISE TEST)

Application		Altitude (Feet)	Opacity (% For 10 Seconds)
Light Duty Vehicles (8500 GVWR Or Less)			
	All Years	Less Than 2000	20 Or Less
B	B	2001-4000	30 Or Less
B	B	Greater Than 4000	40 Or Less

ARIZONA EMISSION STANDARDS - PHOENIX & TUCSON AREA (DIESEL J1667 SNAP IDLE TEST)

Application	Altitude (Feet)	Opacity (% For 10 Seconds)
Heavy Duty Vehicles (8500 GVWR Or Greater)		
1990 & Earlier	All	55
1991 & Newer	All	40

COLORADO

COLORADO EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
14,000 GVWR Or Less	
Non-Turbo	40
Turbo	35
14,000 GVWR Or More	
Non-Turbo	35
Turbo	20

CONNECTICUT

CONNECTICUT EMISSION STANDARDS - DIESEL OPACITY

Application	Opacity %
10,000 GVWR Or Less	
1979 & Newer	20
26,000 GVWR Or More	
1974 & Earlier	70
1974-90	55
1991 & Newer	40

IDAHO

IDAHO EMISSION STANDARDS - DIESEL OPACITY

Application	**Opacity %**
All Weight Range	
1965-74	70
1975-91	55
1992 & Newer	40

KENTUCKY

KENTUCKY EMISSION STANDARDS - BOONE, CAMPBELL & KENTON COUNTIES (DIESEL OPACITY)

Application	**Opacity**
18,000 GVWR Or Less	
All Years	10% @ Idle

MASSACHUSETTS

MASSACHUSETTS EMISSION STANDARDS - DIESEL OPACITY

Application	**Opacity %**
Light Duty (8500 GVWR Or Less)	
1984 & Newer	20
Light Duty (8501-10,000 GVWR Or Less)	
1984 & Newer	40
Heavy Duty Buses (10,000 GVWR Or More)	
1984-93	40
1994 & Newer	30
Heavy Duty Trucks (10,000 Or Less GVWR)	
1984-90	55
1991 & Newer	40

NEW YORK

NEW YORK EMISSION STANDARDS - DIESEL OPACITY TEST

1992 & Newer	40

GENERAL INFORMATION

Symptom Check List Worksheets

* PLEASE READ THIS FIRST *

NOTE: **This article is intended for general information purposes only. It does not apply specifically to one make or model.**

PURPOSE

NOTE: **This article is intended for general information purposes only. It does not apply specifically to one make or model.**

WHY USE THE SYMPTOM CHECK LIST WORKSHEETS?

One of the most difficult and critical lines of communication is between the service customer and the technician. The clearer the technician understands the customer's concerns, the more likely the problem will be "fixed right the first time".

The Symptom Check List Worksheets in this article are designed to improve this communication. When used consistently, they can be helpful in reducing shop comebacks, increasing technician productivity, and producing satisfied customers. They also provide other benefits:

- Reduce "No Trouble Found" problems
- Increase customer involvement
- Customer perceive that "they really care and listen"
- Save time during peak write-up periods
- Reduce recontacting customers for additional information
- Improve night drop information
- Insure all the right questions are asked at write-up

MAKING THE WORKSHEETS A PART OF YOUR NORMAL ROUTINE

The following information contains ideas that may be helpful in forming habits that promote daily use of the Symptom Check Lists:

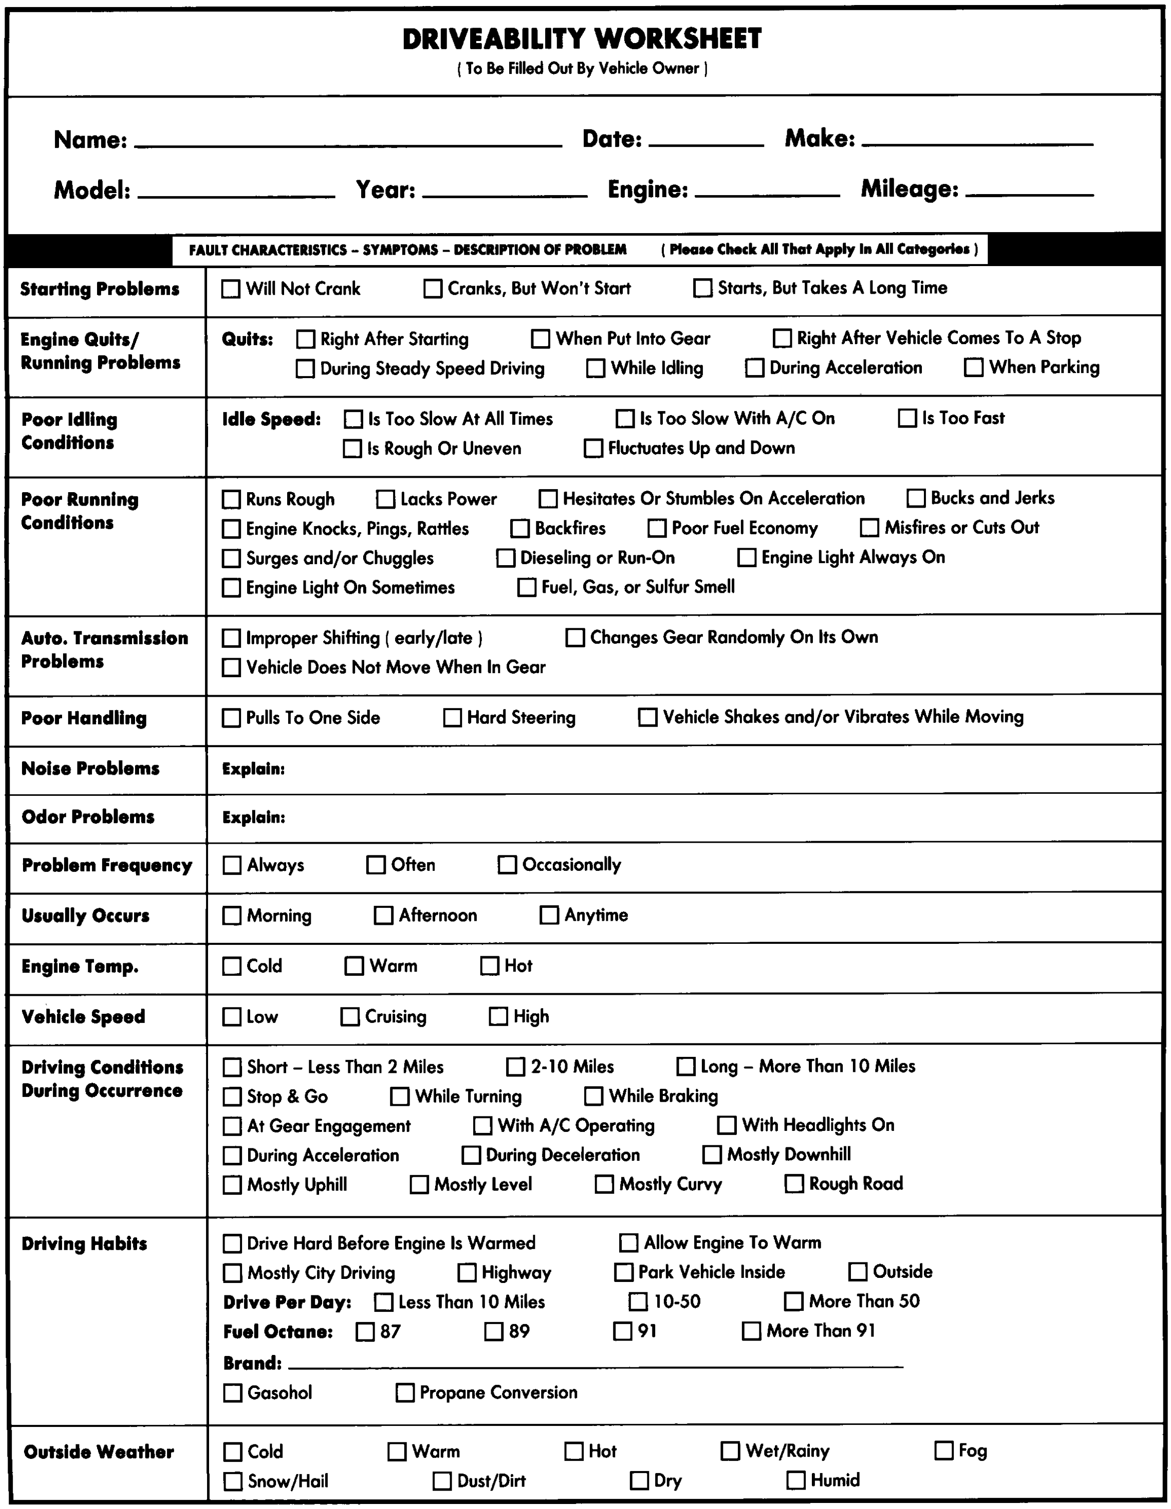
- HAVE THE SERVICE ADVISER FILL OUT THE FORM(S) WITH THE CUSTOMER WHENEVER POSSIBLE.
- Place them in your night drop for the customer to fill out, along with an instruction sheet to help them understand what to do.
- Hand out the worksheets to customers while they wait in line during the peak morning rush and ask them to fill it out. It will save time for all concerned and improve the quality of information received from the customer.
- Make sure it is attached to the hard copy when it goes to the technician.
- Place a copy with the final repair papers and review it with the customer at delivery.
- Put a new worksheet in the glovebox of all departing customers.
- Require that you personally see a copy of all worksheets filled out for shop comebacks.
- Hold a shop meeting to get employee buy-in and their ideas on how to make it effective in your shop.

There are many other ways to utilize the concept, but as with every other idea, successful implementation depends on employee involvement and buy-in.

SYMPTOM CHECK LIST WORKSHEETS

CONDENSED VERSION - ALL ON ONE PAGE

NOTE: Have the service adviser fill out this form with the customer whenever possible.



DRIVEABILITY WORKSHEET

(To Be Filled Out By Vehicle Owner)

Name: ____________________ **Date:** __________ **Make:** ____________

Model: ____________ **Year:** ____________ **Engine:** ____________ **Mileage:** __________

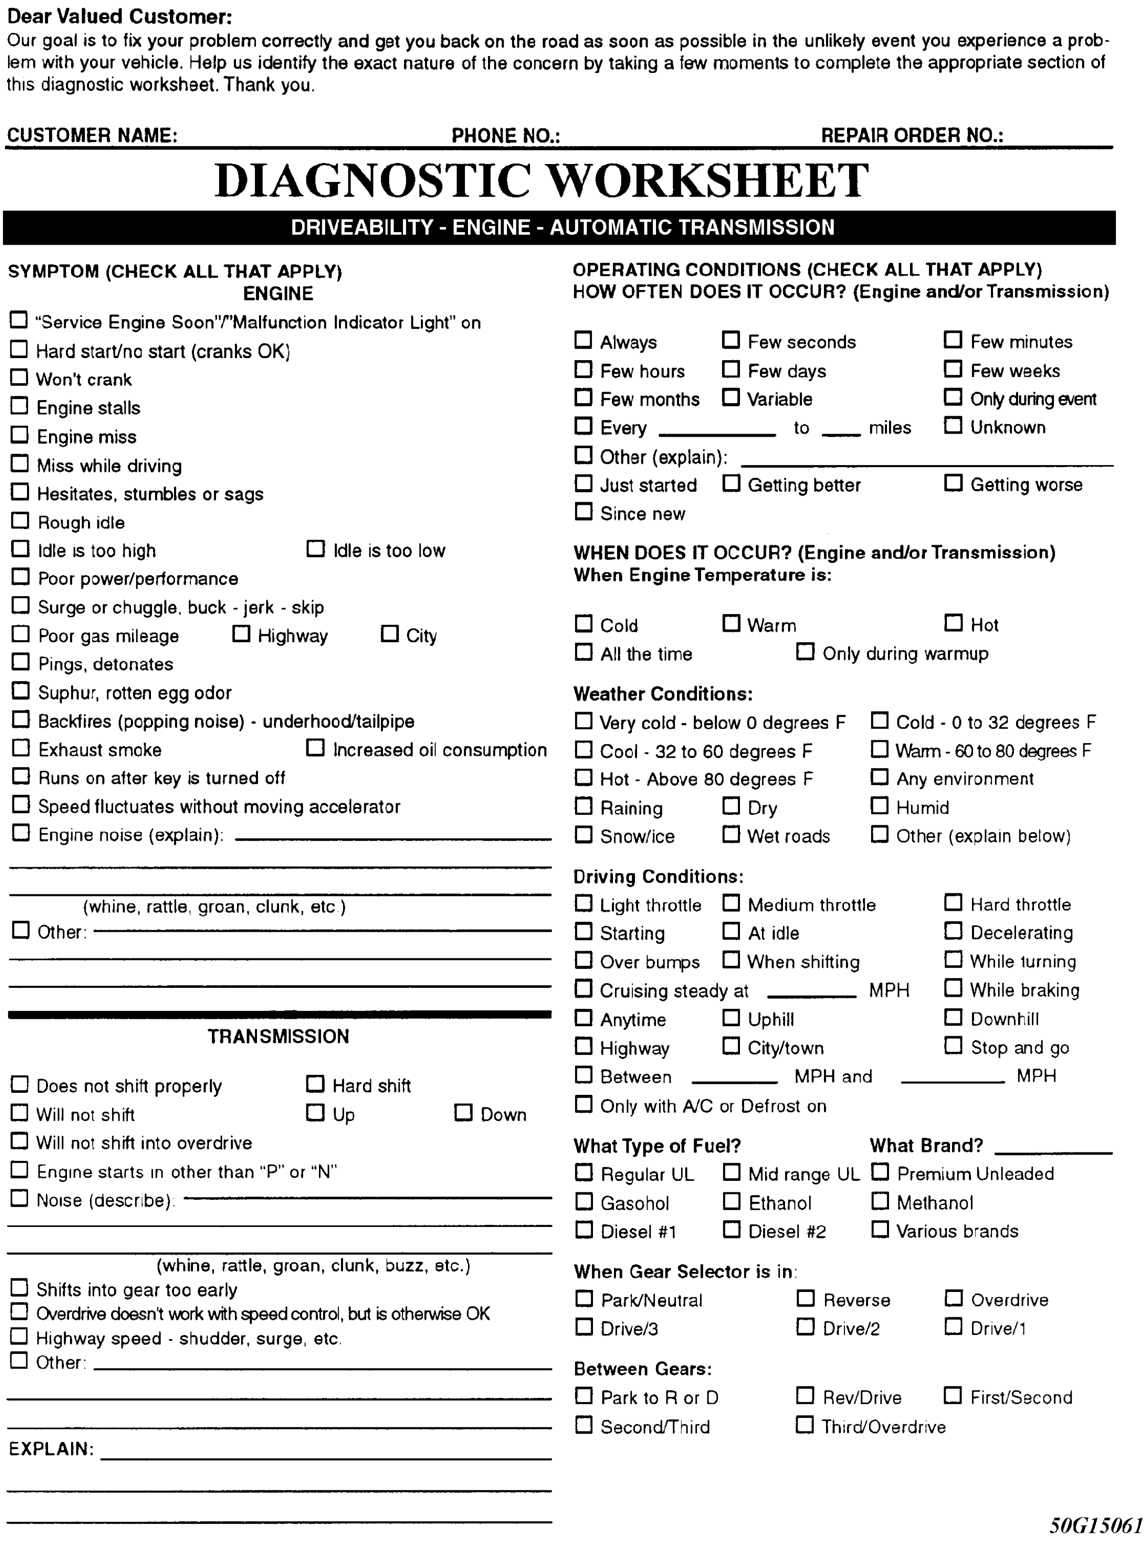
FAULT CHARACTERISTICS – SYMPTOMS – DESCRIPTION OF PROBLEM (**Please Check All That Apply In All Categories**)

Starting Problems	☐ Will Not Crank ☐ Cranks, But Won't Start ☐ Starts, But Takes A Long Time
Engine Quits/ Running Problems	**Quits:** ☐ Right After Starting ☐ When Put Into Gear ☐ Right After Vehicle Comes To A Stop ☐ During Steady Speed Driving ☐ While Idling ☐ During Acceleration ☐ When Parking
Poor Idling Conditions	**Idle Speed:** ☐ Is Too Slow At All Times ☐ Is Too Slow With A/C On ☐ Is Too Fast ☐ Is Rough Or Uneven ☐ Fluctuates Up and Down
Poor Running Conditions	☐ Runs Rough ☐ Lacks Power ☐ Hesitates Or Stumbles On Acceleration ☐ Bucks and Jerks ☐ Engine Knocks, Pings, Rattles ☐ Backfires ☐ Poor Fuel Economy ☐ Misfires or Cuts Out ☐ Surges and/or Chuggles ☐ Dieseling or Run-On ☐ Engine Light Always On ☐ Engine Light On Sometimes ☐ Fuel, Gas, or Sulfur Smell
Auto. Transmission Problems	☐ Improper Shifting (early/late) ☐ Changes Gear Randomly On Its Own ☐ Vehicle Does Not Move When In Gear
Poor Handling	☐ Pulls To One Side ☐ Hard Steering ☐ Vehicle Shakes and/or Vibrates While Moving
Noise Problems	**Explain:**
Odor Problems	**Explain:**
Problem Frequency	☐ Always ☐ Often ☐ Occasionally
Usually Occurs	☐ Morning ☐ Afternoon ☐ Anytime
Engine Temp.	☐ Cold ☐ Warm ☐ Hot
Vehicle Speed	☐ Low ☐ Cruising ☐ High
Driving Conditions During Occurrence	☐ Short – Less Than 2 Miles ☐ 2-10 Miles ☐ Long – More Than 10 Miles ☐ Stop & Go ☐ While Turning ☐ While Braking ☐ At Gear Engagement ☐ With A/C Operating ☐ With Headlights On ☐ During Acceleration ☐ During Deceleration ☐ Mostly Downhill ☐ Mostly Uphill ☐ Mostly Level ☐ Mostly Curvy ☐ Rough Road
Driving Habits	☐ Drive Hard Before Engine Is Warmed ☐ Allow Engine To Warm ☐ Mostly City Driving ☐ Highway ☐ Park Vehicle Inside ☐ Outside **Drive Per Day:** ☐ Less Than 10 Miles ☐ 10-50 ☐ More Than 50 **Fuel Octane:** ☐ 87 ☐ 89 ☐ 91 ☐ More Than 91 **Brand:** ____________________ ☐ Gasohol ☐ Propane Conversion
Outside Weather	☐ Cold ☐ Warm ☐ Hot ☐ Wet/Rainy ☐ Fog ☐ Snow/Hail ☐ Dust/Dirt ☐ Dry ☐ Humid

Fig. 1: Entire Vehicle - Symptom Check List For Customer

FULL VERSION - ALL ON FOUR PAGES

NOTE: Have the service adviser fill out these forms with the customer whenever possible.



Dear Valued Customer:

Our goal is to fix your problem correctly and get you back on the road as soon as possible in the unlikely event you experience a problem with your vehicle. Help us identify the exact nature of the concern by taking a few moments to complete the appropriate section of this diagnostic worksheet. Thank you.

CUSTOMER NAME: **PHONE NO.:** **REPAIR ORDER NO.:**

DIAGNOSTIC WORKSHEET

DRIVEABILITY - ENGINE - AUTOMATIC TRANSMISSION

SYMPTOM (CHECK ALL THAT APPLY)

ENGINE

☐ "Service Engine Soon"/"Malfunction Indicator Light" on
☐ Hard start/no start (cranks OK)
☐ Won't crank
☐ Engine stalls
☐ Engine miss
☐ Miss while driving
☐ Hesitates, stumbles or sags
☐ Rough idle
☐ Idle is too high ☐ Idle is too low
☐ Poor power/performance
☐ Surge or chuggle, buck - jerk - skip
☐ Poor gas mileage ☐ Highway ☐ City
☐ Pings, detonates
☐ Suphur, rotten egg odor
☐ Backfires (popping noise) - underhood/tailpipe
☐ Exhaust smoke ☐ Increased oil consumption
☐ Runs on after key is turned off
☐ Speed fluctuates without moving accelerator
☐ Engine noise (explain): ____________

(whine, rattle, groan, clunk, etc.)

☐ Other: ____________

TRANSMISSION

☐ Does not shift properly ☐ Hard shift
☐ Will not shift ☐ Up ☐ Down
☐ Will not shift into overdrive
☐ Engine starts in other than "P" or "N"
☐ Noise (describe): ____________

(whine, rattle, groan, clunk, buzz, etc.)

☐ Shifts into gear too early
☐ Overdrive doesn't work with speed control, but is otherwise OK
☐ Highway speed - shudder, surge, etc.
☐ Other: ____________

EXPLAIN: ____________

OPERATING CONDITIONS (CHECK ALL THAT APPLY)

HOW OFTEN DOES IT OCCUR? (Engine and/or Transmission)

☐ Always ☐ Few seconds ☐ Few minutes
☐ Few hours ☐ Few days ☐ Few weeks
☐ Few months ☐ Variable ☐ Only during event
☐ Every ______ to ___ miles ☐ Unknown
☐ Other (explain): ____________
☐ Just started ☐ Getting better ☐ Getting worse
☐ Since new

WHEN DOES IT OCCUR? (Engine and/or Transmission)

When Engine Temperature is:

☐ Cold ☐ Warm ☐ Hot
☐ All the time ☐ Only during warmup

Weather Conditions:

☐ Very cold - below 0 degrees F ☐ Cold - 0 to 32 degrees F
☐ Cool - 32 to 60 degrees F ☐ Warm - 60 to 80 degrees F
☐ Hot - Above 80 degrees F ☐ Any environment
☐ Raining ☐ Dry ☐ Humid
☐ Snow/ice ☐ Wet roads ☐ Other (explain below)

Driving Conditions:

☐ Light throttle ☐ Medium throttle ☐ Hard throttle
☐ Starting ☐ At idle ☐ Decelerating
☐ Over bumps ☐ When shifting ☐ While turning
☐ Cruising steady at ______ MPH ☐ While braking
☐ Anytime ☐ Uphill ☐ Downhill
☐ Highway ☐ City/town ☐ Stop and go
☐ Between ______ MPH and ______ MPH
☐ Only with A/C or Defrost on

What Type of Fuel? **What Brand?** ______

☐ Regular UL ☐ Mid range UL ☐ Premium Unleaded
☐ Gasohol ☐ Ethanol ☐ Methanol
☐ Diesel #1 ☐ Diesel #2 ☐ Various brands

When Gear Selector is in:

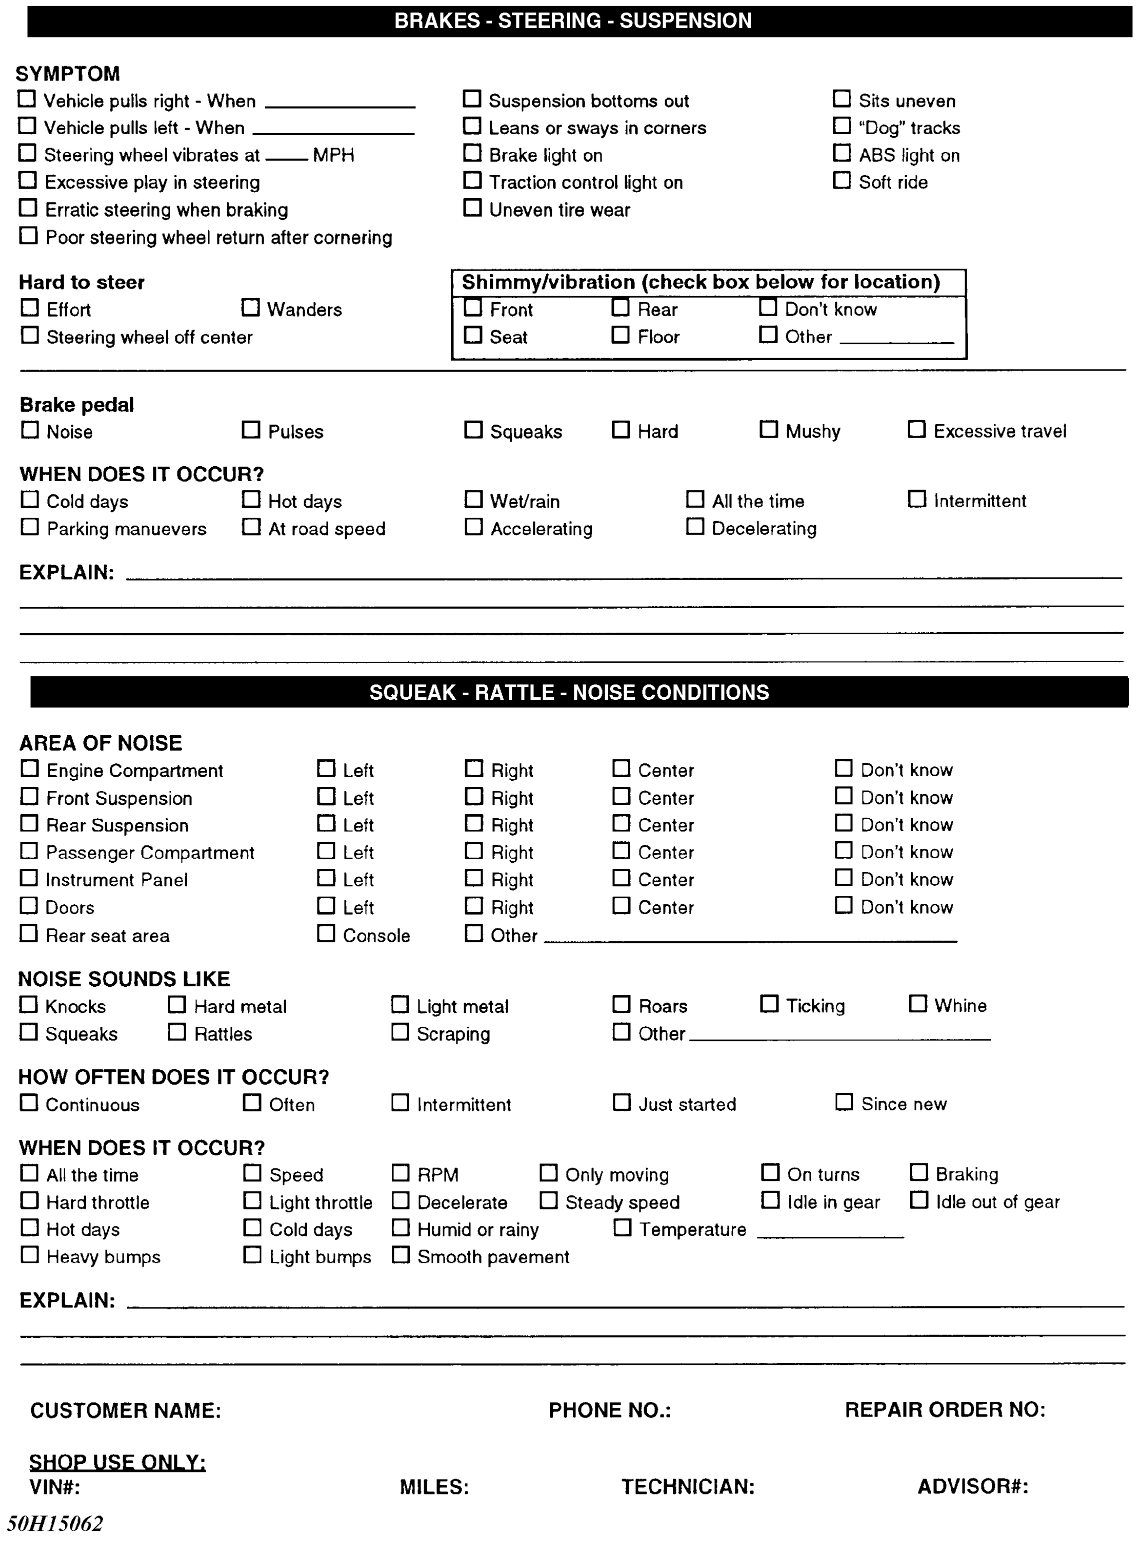
☐ Park/Neutral ☐ Reverse ☐ Overdrive
☐ Drive/3 ☐ Drive/2 ☐ Drive/1

Between Gears:

☐ Park to R or D ☐ Rev/Drive ☐ First/Second
☐ Second/Third ☐ Third/Overdrive

50G15061

Fig. 2: Symptom Check List - Page 1



BRAKES - STEERING - SUSPENSION

SYMPTOM

☐ Vehicle pulls right - When ____________
☐ Vehicle pulls left - When ____________
☐ Steering wheel vibrates at ____ MPH
☐ Excessive play in steering
☐ Erratic steering when braking
☐ Poor steering wheel return after cornering
☐ Suspension bottoms out
☐ Leans or sways in corners
☐ Brake light on
☐ Traction control light on
☐ Uneven tire wear
☐ Sits uneven
☐ "Dog" tracks
☐ ABS light on
☐ Soft ride

Hard to steer

☐ Effort ☐ Wanders
☐ Steering wheel off center

Shimmy/vibration (check box below for location)

☐ Front ☐ Rear ☐ Don't know
☐ Seat ☐ Floor ☐ Other __________

Brake pedal

☐ Noise ☐ Pulses ☐ Squeaks ☐ Hard ☐ Mushy ☐ Excessive travel

WHEN DOES IT OCCUR?

☐ Cold days ☐ Hot days ☐ Wet/rain ☐ All the time ☐ Intermittent
☐ Parking manuevers ☐ At road speed ☐ Accelerating ☐ Decelerating

EXPLAIN: ____

____

SQUEAK - RATTLE - NOISE CONDITIONS

AREA OF NOISE

☐ Engine Compartment	☐ Left	☐ Right	☐ Center	☐ Don't know
☐ Front Suspension	☐ Left	☐ Right	☐ Center	☐ Don't know
☐ Rear Suspension	☐ Left	☐ Right	☐ Center	☐ Don't know
☐ Passenger Compartment	☐ Left	☐ Right	☐ Center	☐ Don't know
☐ Instrument Panel	☐ Left	☐ Right	☐ Center	☐ Don't know
☐ Doors	☐ Left	☐ Right	☐ Center	☐ Don't know
☐ Rear seat area	☐ Console	☐ Other ____________		

NOISE SOUNDS LIKE

☐ Knocks ☐ Hard metal ☐ Light metal ☐ Roars ☐ Ticking ☐ Whine
☐ Squeaks ☐ Rattles ☐ Scraping ☐ Other ____________

HOW OFTEN DOES IT OCCUR?

☐ Continuous ☐ Often ☐ Intermittent ☐ Just started ☐ Since new

WHEN DOES IT OCCUR?

☐ All the time ☐ Speed ☐ RPM ☐ Only moving ☐ On turns ☐ Braking
☐ Hard throttle ☐ Light throttle ☐ Decelerate ☐ Steady speed ☐ Idle in gear ☐ Idle out of gear
☐ Hot days ☐ Cold days ☐ Humid or rainy ☐ Temperature __________
☐ Heavy bumps ☐ Light bumps ☐ Smooth pavement

AIR CONDITIONING - HEATER - VENTILATION

SYSTEM OR AREA AFFECTED

☐ Air conditioner ☐ Heater ☐ Defroster ☐ Vent ☐ Bi-Level ☐ Fan/blower
☐ Max A/C ☐ Automatic Temperature Control ☐ Mix/blend ☐ Economy ☐ All

SYMPTOM

☐ Does not work ☐ Blows wrong temperature air ☐ No air comes out of vents ☐ Rapid cycling
☐ Noisy (explain) ☐ Broken ☐ Odor ☐ Air comes from wrong outlets ☐ Blows fuse
☐ Leaks ☐ Insufficient heat or cool ☐ Other (explain below)

WHEN DOES IT OCCUR?

☐ All the time ☐ Hot ☐ Cold ☐ Intermittent ☐ Right after startup
☐ When change controls only ☐ Other (explain below) ☐ Fan blower speed High / Med / Low

EXPLAIN: ______________________________

____

ELECTRICAL - RADIO - TAPE/CD PLAYER

SYMPTOM - MUSIC SYSTEM

☐ Does not work ☐ Noisy ☐ Static ☐ Won't load ☐ Won't eject ☐ Poor reception
☐ Controls do not work ☐ Blows fuse ☐ Other (explain below)

SYSTEM AFFECTED

☐ Radio only ☐ AM ☐ FM ☐ FM stereo ☐ Graphic equalizer
☐ Tape player ☐ CD player ☐ Whole system ☐ Steering wheel buttons ☐ Phone
☐ Speakers ☐ Front ☐ Rear ☐ Left ☐ Right
☐ Antenna ☐ Clock ☐ Radio or player controls ☐ Rear seat controls

ALL OTHER ELECTRICAL ITEMS OR ACCESSORIES
Please list the complaint accessory or item and check any applicable symptom(s) from the list that follows:

______________________ ☐ Inoperable ☐ Noisy ☐ No control ☐ Erratic
☐ Check light on or flashing ☐ Works improperly (explain below)
☐ Blows fuse ☐ Intermittent ☐ Related system affected (explain below)

______________________ ☐ Inoperable ☐ Noisy ☐ No control ☐ Erratic
☐ Check light on or flashing ☐ Works improperly (explain below)
☐ Blows fuse ☐ Intermittent ☐ Related system affected (explain below)

______________________ ☐ Inoperable ☐ Noisy ☐ No control ☐ Erratic
☐ Check light on or flashing ☐ Works improperly (explain below)
☐ Blows fuse ☐ Intermittent ☐ Related system affected (explain below)

WHEN DOES IT OCCUR?

☐ All the time ☐ Hot ☐ Cold ☐ Just after starting - malfunctions for a while
☐ Intermittent ☐ After runs for ______ minutes ☐ Rough roads or bumps only
☐ Other (explain below)

MANUAL TRANSMISSION - CLUTCH

SYMPTOM - MANUAL GEAR SHIFT

☐ Hard to shift ☐ Doesn't shift
☐ Grinds going into_____ gear
☐ Noisy when in _______ gear or neutral _____
☐ Slips/pops out of gear
☐ Noise (describe): ______________________
____
____
☐ Upshift light stays on
☐ Upshift light doesn't light

WHEN DOES IT OCCUR?

☐ All the time ☐ Light load
☐ Heavy load

SYMPTOM - CLUTCH

☐ Hard to push ☐ Fail to release
☐ Noise when pressing pedal down (describe): _________
____
____
☐ Slips ☐ Chattering (grabbing)
☐ Odor present ☐ Pedal stays on the floor
☐ Squealing sound

WHEN DOES IT OCCUR?
When Engine Temperature is:

☐ Cold ☐ Hot
☐ Accelerating ☐ Decelerating

The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

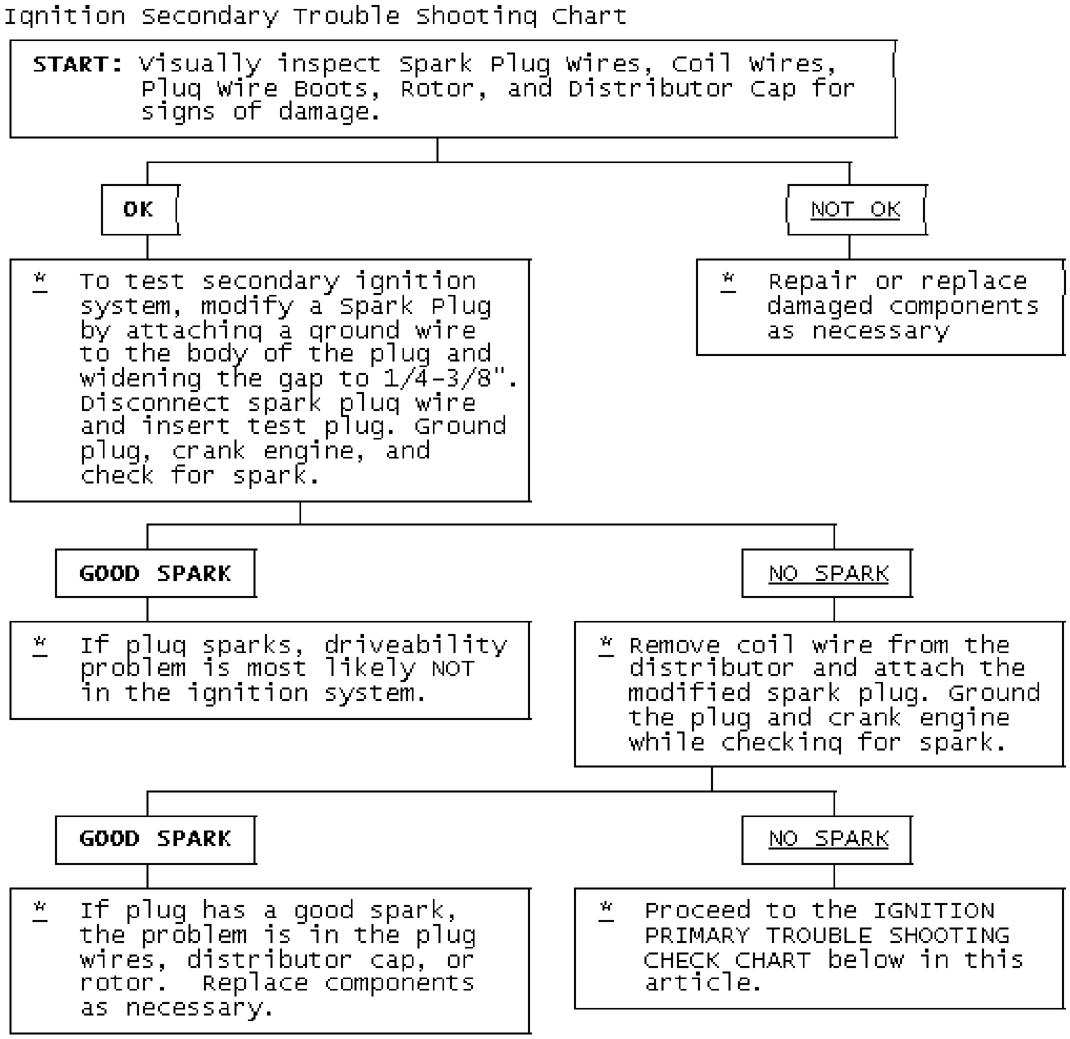
BASIC CHARGING SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Vehicle Will Not Start	
Dead battery	Check battery cells, alternator belt tension and alternator output
Loose or corroded battery connections	Check all charging system connections
Ignition circuit or switch malfunction	Check and replace as necessary
Alternator Light Stays On With Engine Running	
Loose or worn alternator drive belt	Check alternator drive tension and condition, See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Loose alternator wiring connections	Check all charging system connections
Short in alternator light wiring	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Defective alternator stator or diodes	See Bench Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Alternator Light Stays Off With Ignition Switch ON	
Blown fuse	See WIRING DIAGRAMS
Defective alternator	See Testing in ALTERNATOR article
Defective indicator light bulb or socket	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Alternator Light Stays OFF With Ignition Switch ON	
Short in alternator wiring	See On-Vehicle Tests in ALTERNATOR article

CONDITION & POSSIBLE CAUSE	CORRECTION
Defective rectifier bridge	See Bench Tests in ALTERNATOR article
Lights or Fuses Burn Out Frequently	
Defective alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Defective battery	Check and replace as necessary
Ammeter Gauge Shows Discharge	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Defective wiring	Check all wires and wire connections
Defective alternator or regulator	See Bench Tests and On-Vehicle Tests in ALTERNATOR article
Defective ammeter, or improper ammeter wiring connection	See Testing in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Noisy Alternator	
Loose drive pulley	Tighten drive pulley attaching nut
Loose mounting bolts	Tighten all alternator mounting bolts
Worn or dirty bearings	See Bearing Replacement ALTERNATOR article
Defective diodes or stator	See Bench Test in ALTERNATOR article
Battery Does Stay Charged	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in appropriate TUNE-UP article in the TUNE-UP section
Loose or corroded battery connections	Check all charging system connections
Loose alternator connections	Check all charging system connections
Defective alternator or battery	See On-Vehicle Tests and Bench Tests in ALTERNATOR article
Add-on electrical accessories exceeding alternator capacity	Install larger alternator
Battery Overcharged-Uses Too Much Water	
Defective battery	Check alternator output and repair as necessary
Defective alternator	See On-Vehicle Test and Bench Tests in ALTERNATOR article
Excessive alternator voltage	Check alternator output and repair as necessary

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**



Ignition Secondary Trouble Shooting Chart

START: Visually inspect Spark Plug Wires, Coil Wires, Plug Wire Boots, Rotor, and Distributor Cap for signs of damage.

OK

* To test secondary ignition system, modify a Spark Plug by attaching a ground wire to the body of the plug and widening the gap to 1/4-3/8". Disconnect spark plug wire and insert test plug. Ground plug, crank engine, and check for spark.

GOOD SPARK

* If plug sparks, driveability problem is most likely NOT in the ignition system.

NO SPARK

* Remove coil wire from the distributor and attach the modified spark plug. Ground the plug and crank engine while checking for spark.

GOOD SPARK

* If plug has a good spark, the problem is in the plug wires, distributor cap, or rotor. Replace components as necessary.

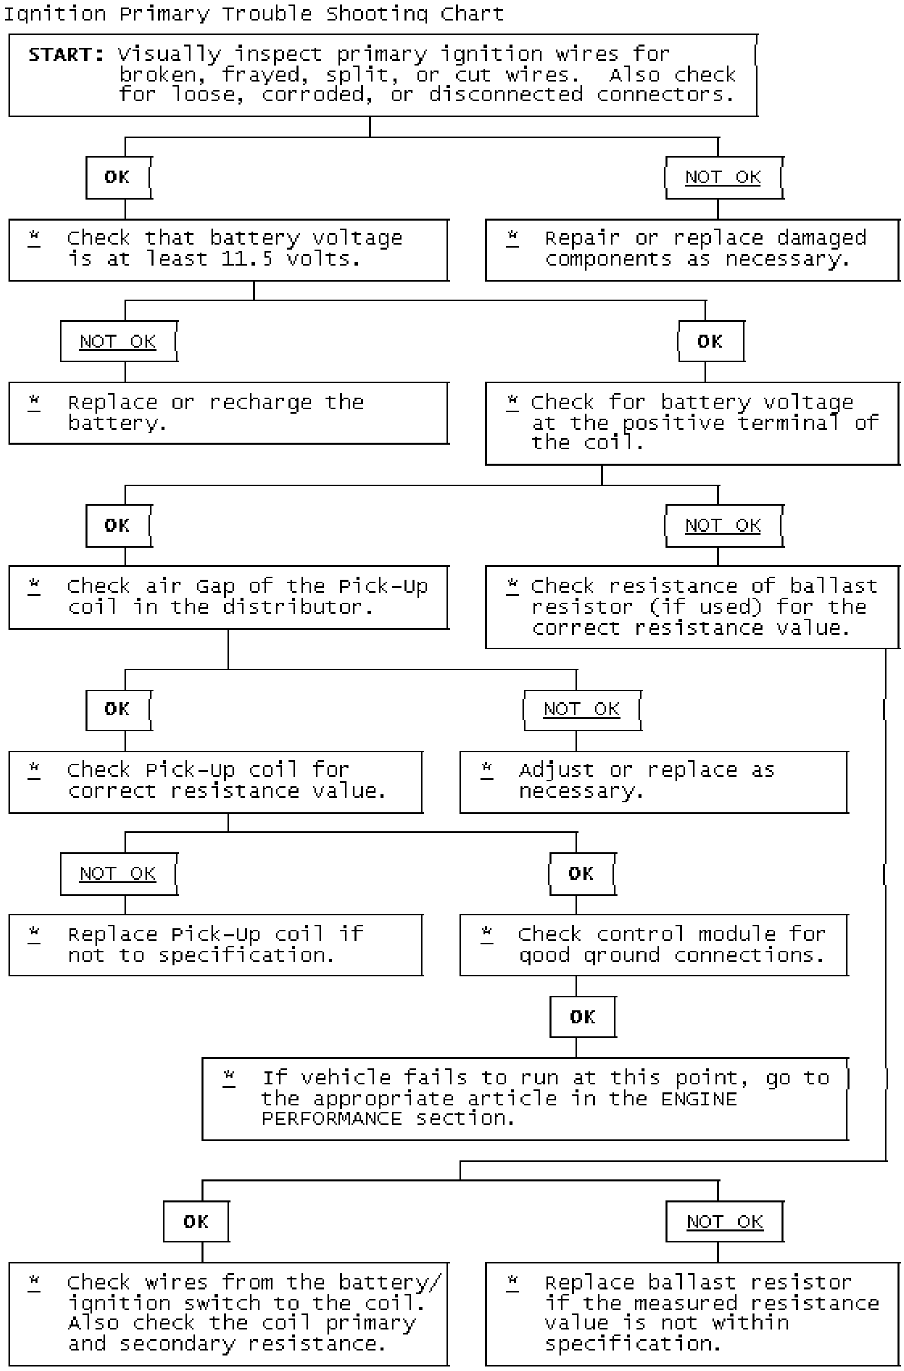
NO SPARK

* Proceed to the IGNITION PRIMARY TROUBLE SHOOTING CHECK CHART below in this article.

NOT OK

* Repair or replace damaged components as necessary

Fig. 1: Ignition Secondary Trouble Shooting Chart



Ignition Primary Trouble Shooting Chart
START: Visually inspect primary ignition wires for broken, frayed, split, or cut wires. Also check for loose, corroded, or disconnected connectors.
OK
NOT OK
* Check that battery voltage is at least 11.5 volts.
* Repair or replace damaged components as necessary.
NOT OK
OK
* Replace or recharge the battery.
* Check for battery voltage at the positive terminal of the coil.
OK
NOT OK
* Check air Gap of the Pick-Up coil in the distributor.
* Check resistance of ballast resistor (if used) for the correct resistance value.
OK
NOT OK
* Check Pick-Up coil for correct resistance value.
* Adjust or replace as necessary.
NOT OK
OK
* Replace Pick-Up coil if not to specification.
* Check control module for good ground connections.
OK
* If vehicle fails to run at this point, go to the appropriate article in the ENGINE PERFORMANCE section.
OK
NOT OK
* Check wires from the battery/ ignition switch to the coil. Also check the coil primary and secondary resistance.
* Replace ballast resistor if the measured resistance value is not within specification.

Fig. 2: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole	See STARTER article shoes
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearing	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article

CONDITION & POSSIBLE CAUSE	CORRECTION
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch	Replace ignition switch contacts sticking
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	solenoid
Low Current Draw	
Worn brushes or weak brush springs	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

AIR CONDITIONING & HEAT

AIR CONDITIONING TROUBLE SHOOTING

WARNING: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem**

symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC AIR CONDITIONING TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Compressor Not Working	Compressor clutch circuit open.
.....	Compressor clutch coil inoperative.
.....	Poor clutch ground connection.
.....	Fan belts loose.
.....	Thermostatic switch inoperative.
.....	Thermostatic switch not adjusted.
.....	Ambient temperature switch open.
.....	Superheat fuse blown.
Excessive Noise or Vibration	Missing or loose mounting bolts.
.....	Bad idler pulley bearings.
.....	Fan belts not tightened correctly.
.....	Compressor clutch contacting body.
.....	Excessive system pressure.
.....	Compressor oil level low.
.....	Damaged clutch bearings.
.....	Damaged reed valves.
.....	Damaged compressor.
Insufficient or No Cooling; Compressor Working	Expansion valve inoperative.
.....	Heater control valve stuck open.
.....	Low system pressure.
.....	Blocked condenser fins.
.....	Blocked evaporator fins.
.....	Vacuum system leak.
.....	Vacuum motors inoperative.
.....	Control cables improperly adjusted.
.....	Restricted air inlet.
.....	Mode doors binding.
.....	Blower motor inoperative.
.....	Temperature above system capacity.

HEATER SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC HEATER SYSTEM TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Insufficient, Erratic, or No Heat	Low Coolant Level
.....	Incorrect thermostat.
.....	Restricted coolant flow through core.
.....	Heater hoses plugged.
.....	Misadjusted control cable.

CONDITION	POSSIBLE CAUSE
.....	Sticking heater control valve.
.....	Vacuum hose leaking.
.....	Vacuum hose blocked.
.....	Vacuum motors inoperative.
.....	Blocked air inlet.
.....	Inoperative heater blower motor.
.....	Oil residue on heater core fins.
.....	Dirt on heater core fins.
Too Much Heat	Improperly adjusted cables.
.....	Sticking heater control valve.
.....	No vacuum to heater control valve.
.....	Temperature door stuck open.
Air Flow Changes During Acceleration	Vacuum system leak.
.....	Bad check valve or reservoir.
Air From Defroster At All Times	Vacuum system leak.
.....	Improperly adjusted control cables.
.....	Inoperative vacuum motor.
Blower Does Not Operate Correctly	Blown fuse.
.....	Blower motor windings open.
.....	Resistors burned out.
.....	Motor ground connection loose.
.....	Wiring harness connections loose.
.....	Blower motor switch inoperative.
.....	Blower relay inoperative.
.....	Fan binding or foreign object in housing.
.....	Fan blades broken or bent.

BRAKES

BRAKE SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BRAKE SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Brakes Pull Left or Right	
Incorrect tire pressure	Inflate tires to proper pressure
Front end out of alignment	See WHEEL ALIGNMENT
Mismatched tires	Check tires sizes
Restricted brake lines or hoses	Check hose routing
Loose or malfunctioning caliper	See DISC BRAKES or BRAKE SYSTEM
Bent shoe or oily linings	See DRUM BRAKES or BRAKE SYSTEM
Malfunctioning rear brakes	See DRUM, DISC BRAKES or BRAKE SYSTEM
Loose suspension parts	See SUSPENSION

CONDITION & POSSIBLE CAUSE	CORRECTION
Noises Without Brakes Applied	
Front linings worn out	Replace linings
Dust or oil on drums or rotors	See DRUM, DISC BRAKES or BRAKE SYSTEM
Noises With Brakes Applied	
Insulator on outboard shoe damaged	See DISC BRAKES or BRAKE SYSTEM
Incorrect pads or linings	Replace pads or linings
Brake Rough, Chatters or Pulsates	
Excessive lateral runout	Check rotor runout
Parallelism not to specifications	Reface or replace rotor
Wheel bearings not adjusted	See SUSPENSION
Rear drums out-of-round	Reface or replace drums
Disc pad reversed, steel against rotor	Remove and reinstall pad
Excessive Pedal Effort	
Malfunctioning power unit	See POWER BRAKES or BRAKE SYSTEM
Partial system failure	Check fluid and pipes
Worn disc pad or lining	Replace pad or lining
Caliper piston stuck or sluggish	See DISC BRAKES or BRAKE SYSTEM
Master cylinder piston stuck	See MASTER CYLINDERS or BRAKE SYSTEM
Brake fade due to incorrect pads for linings	Replace pads or linings
Linings or pads glazed	Replace pads or linings
Worn drums	Reface or replace drums
Excessive Pedal Travel	
Partial brake system failure	Check fluid and pipes
Insufficient fluid in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Air trapped in system	See BRAKE BLEEDING or BRAKE SYSTEM
Rear brakes not adjusted	See Adjustments in DRUM BRAKES or BRAKE SYSTEM
Bent shoe or lining	See DRUM BRAKES or BRAKE SYSTEM
Plugged master cylinder cap	See MASTER CYLINDERS or BRAKE SYSTEM
Improper brake fluid	Replace brake fluid
Pedal Travel Decreasing	
Compensating port plugged	See MASTER CYLINDERS or BRAKE SYSTEM
Swollen cup in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Master cylinder piston not returning	See MASTER CYLINDERS or BRAKE SYSTEM
Weak shoe retracting springs	See DRUM BRAKES BRAKE SYSTEM
Wheel cylinder piston sticking	See DRUM BRAKES or BRAKE SYSTEM
Dragging Brakes	
Master cylinder pistons not returning	See MASTER CYLINDERS BRAKE SYSTEM
Restricted brake lines or hoses	Check line routing
Incorrect parking brake adjustment	See DRUM BRAKES BRAKE SYSTEM
Parking Brake cables frozen	See DRUM BRAKES BRAKE SYSTEM
Incorrect installation of inboard disc pad	Remove and replace correctly

CONDITION & POSSIBLE CAUSE	CORRECTION
Power booster output rod too long	See POWER BRAKE UNITS BRAKE SYSTEM
Brake pedal not returning freely	See DISC, DRUM BRAKES BRAKE SYSTEM
Brakes Grab or Uneven Braking Action	
Malfunction of combination valve	See CONTROL VALVE or BRAKE SYSTEM
Malfunction of power brake unit	See POWER BRAKE UNITS or BRAKE SYSTEM
Binding brake pedal	See DISC, DRUM BRAKES or BRAKE SYSTEM
Pulsation or Roughness	
Uneven pad wear caused by caliper	See DISC BRAKES or BRAKE SYSTEM
Uneven rotor wear	See DISC BRAKES or BRAKE SYSTEM
Drums out-of-round	Reface or replace drums

ENGINE MECHANICAL

COOLING SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

COOLING SYSTEM TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Overheating	
Coolant Leak	Fill/Pressure Test System
A/C Condenser Fins Clogged	Remove/Clean Condenser
Radiator Fins Clogged	Remove/Clean Radiator
Thermostat Stuck Closed	Replace Thermostat
Clogged Cooling System Passages	Clean/Flush Cooling System
Water Pump Malfunction	Replace Water Pump
Fan Clutch Malfunction	Replace Fan Clutch
Retarded Ignition Timing	Reset Ignition Timing
Cooling Fan Malfunction	Test Cooling Fan/Circuit
Cooling Fan Motor Malfunction	Test Fan Motor
Cooling Fan Relay Malfunction	Test Fan Relay
Faulty Radiator Cap	Replace Radiator Cap
Broken/Slipping Fan Belt	Replace Fan Belt
Restricted Exhaust	Repair Exhaust System
Corrosion	
Impurities In Coolant	Clean/Flush System
Coolant Leakage	
Damaged hose	Replace Hose
Leaky Water Pump	Replace Water Pump
Damaged Radiator Seam	Replace/Repair Radiator
Leaky Thermostat Cover	Replace Thermostat Cover
Cylinder Head Problem	Check Head/Head Gasket
Leaky Freeze Plugs	Replace Freeze Plugs

CONDITION & POSSIBLE CAUSE	CORRECTION
Recovery System Inoperative	
Loose and/or Defective Radiator Cap	Replace Radiator Cap
Overflow Tube Clogged and/or Leaking	Repair Tube
Recovery Bottle Vent Restricted	Clean Vent
No Heater Core Flow	
Collapsed Heater Hose	Replace Heater Hose
Plugged Heater Core	Clean/Replace Heater Core
Faulty Heater Valve	Replace Heater Valve

GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Lopes At Idle	
Intake manifold-to-head leaks	Replace manifold gasket, See ENGINES
Blown head gasket	Replace head gasket, See ENGINES
Worn timing gears, chain or sprocket	Replace gears, chain or sprocket
Worn camshaft lobes	Replace camshaft, See ENGINES
Overheated engine	Check cooling system, See COOLING
Blocked crankcase vent valve	Remove restriction
Leaking EGR valve	Repair leak and/or replace valve
Faulty fuel pump	Replace fuel pump
Engine Has Low Power	
Leaking fuel pump	Repair leak and/or replace fuel pump
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Sticking valves or weak valve springs	Check valve train components, See ENGINES
Incorrect valve timing	Reset valve timing, See ENGINES
Worn camshaft lobes	Replace camshaft, See ENGINES
Blown head gasket	Replace head gasket. See ENGINES.
Clutch slipping	Adjust pedal and/or replace components, See ENGINES
Engine overheating	Check cooling system, See COOLING
Auto. Trans. pressure regulator valve faulty	Replace pressure regulator valve
Auto. Trans. fluid level too low	Add fluid as necessary
Improper vacuum diverter valve operation	Replace vacuum diverter valve
Vacuum leaks	Inspect vacuum system and repair as required
Leaking piston rings	Replace piston rings, See ENGINES
Faulty High Speed Operation	
Low fuel pump volume	Replace fuel pump
Leaking valves or worn	Replace valves and/or springs, See ENGINES
Incorrect valve timing	Reset valve timing,See ENGINES
Intake manifold restricted	Remove restriction
Worn distributor shaft	Replace distributor
Faulty Acceleration	

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Improper fuel pump stroke	Remove pump and reset pump stroke
Incorrect ignition timing	Reset ignition timing, See TUNE-UP
Leaking valves	Replace valves, See ENGINES
Worn fuel pump diaphragm or piston	Replace diaphragm or piston
Intake Backfire	
Improper ignition timing	Reset ignition timing, See TUNE-UP
Faulty accelerator pump discharge	Replace accelerator pump
Improper choke operation	Check choke and adjust as required
Defective EGR valve	Replace EGR valve
Fuel mixture too lean	Reset air/fuel mixture, See TUNE-UP
Choke valve initial clearance too large	Reset choke valve initial clearance
Exhaust Backfire	
Vacuum leak	Inspect and repair vacuum system
Faulty vacuum diverter valve	Replace vacuum diverter valve
Faulty choke operation	Check choke and adjust as required
Exhaust system leak	repair exhaust system leak
Engine Detonation	
Ignition timing too far advanced	Reset ignition timing, See TUNE-UP
Faulty ignition system	Check ignition timing, See TUNE-UP
Spark plugs loose or faulty	Retighten or replace plugs
Fuel delivery system clogged	Inspect lines, pump and filter for clog
EGR valve inoperative	Replace EGR valve
PCV system inoperative	Inspect and/or replace hoses or valve
Vacuum leaks	Check vacuum system and repair leaks
Excessive combustion chamber deposits	Remove built-up deposits
Leaking, sticking or broken valves	Inspect and/or replace valves
External Oil Leakage	
Fuel pump improperly seated or worn gasket	Remove pump, replace gasket and seat properly
Oil pan gasket broken or pan bent	Straighten pan and replace gasket
Timing chain cover gasket broken	Replace timing chain cover gasket
Rear main oil seal worn	Replace rear main oil seal
Oil pan drain plug not seated properly	Remove and reinstall drain plug
Camshaft bearing drain hole blocked	Remove restriction
Oil pressure sending switch leaking	Remove and reinstall sending switch
Excessive Oil Consumption	
Worn valve stems or guides	Replace stems or guides, See ENGINES
Valve "O" ring seals damaged	Replace "O" ring seals, See ENGINES
Plugged oil drain back holes	Remove restrictions
Improper PCV valve operation	Replace PCV valve
Engine oil level too high	Remove excess oil
Engine oil too thin	Replace thicker oil
Valve stem oil deflectors damaged	Replace oil deflectors
Incorrect piston rings	Replace piston rings, See ENGINES
Piston ring gaps not staggered	Reinstall piston rings, See ENGINES
Insufficient piston ring tension	Replace rings, See ENGINES
Piston ring grooves or oil return	slots clogged Replace piston rings, See ENGINES
Piston rings sticking in grooves	Replace piston rings, See ENGINES

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Piston ring grooves excessively worn	Replace piston and rings, See ENGINES
Compression rings installed upside down	Replace compression rings correctly, See ENGINES
Worn or scored cylinder walls	Rebore cylinders or replace block
Mismatched oil ring expander and rail	Replace oil ring expander and rail, See ENGINES
Intake gasket dowels too long	Replace intake gasket dowels
Excessive main or connecting rod bearing clearance	Replace main or connecting rod bearings, See ENGINES
No Oil Pressure	
Low oil level	Add oil to proper level
Oil pressure sender or gauge broken	Replace sender or gauge
Oil pump malfunction	Remove and overhaul oil pump, See ENGINES
Oil pressure relief valve sticking	Remove and reinstall valve
Oil pump passages blocked	Overhaul oil pump, See ENGINES
Oil pickup screen or tube blocked	Remove restriction
Loose oil inlet tube	Tighten oil inlet tube
Loose camshaft bearings	Replace camshaft bearings, See ENGINES
Internal leakage at oil passages	Replace block or cylinder head
Low Oil Pressure	
Low engine oil level	Add oil to proper level
Engine oil too thin	Remove and replace with thicker oil
Excessive oil pump clearance	Reduce oil pump clearance, See ENGINES
Oil pickup tube or screen blocked	Remove restrictions
Main, rod or cam bearing clearance excessive	Replace bearing to reduce clearance, See ENGINES
High Oil Pressure	
Improper grade of oil	Replace with proper oil
Oil pressure relief valve stuck closed	Eliminate binding
Oil pressure sender or gauge faulty	Replace sender or gauge
Noisy Main Bearings	
Inadequate oil supply	Check oil delivery to main bearings
Excessive main bearing clearance	Replace main bearings, See ENGINES
Excessive crankshaft end play	Replace crankshaft, See ENGINES
Loose flywheel or torque converter	Tighten attaching bolts
Loose or damaged vibration damper	Tighten or replace vibration damper
Crankshaft journals out-of-round	Re-grind crankshaft journals
Excessive belt tension	Loosen belt tension
Noisy Connecting Rods	
Excessive bearing clearance or missing bearing	Replace bearing, See ENGINES
Crankshaft rod journal out-of-round	Re-grind crankshaft journal
Misaligned connecting rod or cap	Remove rod or cap and realign
Incorrectly tightened rod bolts	Remove and re-tighten rod bolts
Noisy Pistons and Rings	
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Bore tapered or out-of-round	Rebore block
Piston ring broken	Replace piston rings, See ENGINES
Piston pin loose or seized	Replace piston pin, See ENGINES
Connecting rods misaligned	Realign connecting rods

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Ring side clearance too loose or tight	Replace with larger or smaller rings
Carbon build-up on piston	Remove carbon
Noisy Valve Train	
Worn or bent push rods	Replace push rods, See ENGINES
Worn rocker arms or bridged pivots	Replace push rods, See ENGINES
Dirt or chips in valve lifters	Remove lifters and remove dirt/chips
Excessive valve lifter leak-down	Replace valve lifters, See ENGINES
Valve lifter face worn	Replace valve lifters, See ENGINES
Broken or cocked valve springs	Replace or reposition springs
Too much valve stem-to-guide clearance	Replace valve guides, See ENGINES
Valve bent	Replace valve, See ENGINES
Loose rocker arms	Retighten rocker arms, See ENGINES
Excessive valve seat run-out	Reface valve seats, See ENGINES
Missing valve lock	Install new valve lock
Excessively worn camshaft lobes	Replace camshaft, See ENGINES
Plugged valve lifter oil holes	Eliminate restriction or replace lifter
Faulty valve lifter check ball	Replace lifter check ball, See ENGINES
Rocker arm nut installed upside down	Remove and reinstall correctly
Valve lifter incorrect for engine	Remove and replace valve lifters
Faulty push rod seat or lifter plunger	Replace plunger or push rod
Noisy Valves	
Improper valve lash	Re-adjust valve lash, See ENGINES
Worn or dirty valve lifters	Clean and/or replace lifters
Worn valve guides	Replace valve guides, See ENGINES
Excessive valve seat or face run-out	Reface seats or valve face
Worn camshaft lobes	Replace camshaft, See ENGINES
Loose rocker arm studs	Re-tighten rocker arm studs, See ENGINES
Bent push rods	Replace push rods, See ENGINES
Broken valve springs	Replace valve springs, See ENGINES
Burned,Sticking or Broken Valves	
Weak valve springs or warped valves	Replace valves and/or springs, See ENGINES
Improper lifter clearance	Re-adjust clearance or replace lifters
Worn guides or improper guide clearance	Replace valve guides, See ENGINES
Out-of-round valve seats or improper seat width	Re-grind valve seats
Gum deposits on valve stems, seats or guide	Remove deposits
Improper spark timing	Re-adjust spark timing
Broken Pistons/Rings	
Undersize pistons	Replace with larger pistons, See ENGINES
Wrong piston rings	Replace with correct rings, See ENGINES
Out-of-round cylinder bore	Re-bore cylinder bore
Improper connecting rod alignment	Remove and realign connecting rods
Excessively worn ring grooves	Replace pistons, See ENGINES
Improperly assembled piston pins	Re-assemble pin-to-piston, See ENGINES
Insufficient ring gap clearance	Install new rings, See ENGINES
Engine overheating	Check cooling system
Incorrect ignition timing	Re-adjust ignition timing, See TUNE-UP
Excessive Exhaust Noise	
Leaks at manifold to head, or to pipe	Replace manifold or pipe gasket

CONDITION & POSSIBLE CAUSE	CORRECTION
Exhaust manifold cracked or broken	Replace exhaust manifold, See ENGINES

ENGINE PERFORMANCE

CARBURETOR TROUBLE SHOOTING:

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC COLD START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Choke not closing	Check choke operation, see FUEL SYSTEMS
Choke linkage bent	Check linkage, see FUEL SYSTEM
Engine Starts, Then Dies	
Choke vacuum kick setting too wide	Check setting and adjust see, FUEL SYSTEMS
Fast idle RPM too low	Reset RPM to specification, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Vacuum leak	Inspect vacuum system for leaks
Low fuel pump outlet	Repair or replace pump, see FUEL SYSTEMS
Low carburetor fuel level	Check float setting see FUEL SYSTEM
Engine Quits Under Load	
Choke vacuum kick setting incorrect	Reset vacuum kick setting,see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEM
Incorrect hot fast idle speed RPM	Reset fast idle RPM, see TUNE-UP
Engine Starts, Runs Up, Then Idles, Slowly With Black Smoke	
Choke vacuum kick set too narrow	Reset vacuum kick, see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Hot fast idle RPM too low	Reset fast idle RPM, see TUNE-UP

BASIC HOT START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Engine flooded	Allow fuel to evaporate

BASIC COLD ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Stalls in Gear	
Choke vacuum kick setting incorrect	Reset choke vacuum kick, see FUEL SYSTEMS
Fast idle RPM incorrect	Reset fast idle RPM, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam see FUEL SYSTEMS
Acceleration Sag or Stall	
Defective choke control switch	Replace choke control switch
Choke vacuum kick setting incorrect	Reset choke vacuum kick see, FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, FUEL SYSTEMS
Accelerator pump defective	Repair or replace pump see FUEL SYSTEMS

CONDITION & POSSIBLE CAUSE	CORRECTION
Secondary throttles not closed	Inspect lockout adjustment, see FUEL SYSTEMS
Sag or Stall After Warmup	
Defective choke control switch	Replace choke control switch, see FUEL SYSTEMS
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, see FUEL SYSTEMS
Backfiring & Black Smoke	
Plugged heat crossover system	Remove restriction

BASIC WARM ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Hesitation With Small Amount of Gas Pedal Movement	
Vacuum leak	Inspect vacuum lines
Accelerator pump weak or inoperable	Replace pump, see FUEL SYSTEMS
Float level setting too low	Reset float level, see,FUEL SYSTEMS
Metering rods sticking or binding	Inspect and/or replace rods, see FUEL SYSTEMS
Carburetor idle or transfer system plugged	Inspect system and remove restriction
Frozen or binding heated air inlet	Inspect heated air door for binding
Hesitation With Heavy Gas Pedal Movement	
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Metering rod carrier sticking or binding	Remove restriction
Large vacuum leak	Inspect vacuum system and repair leak
Float level setting too low	Reset float level, see FUEL SYSTEMS
Defective fuel pump, lines or filter	Inspect pump, lines and filter
Air door setting incorrect	Adjust air door setting, see FUEL

DIESEL ENGINE TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

NOTE: **Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.**

BASIC DIESEL ENGINE TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Crank	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Bad starter connections or bad starter	Check connections and/or replace starter
Engine Cranks Slowly, Won't Start	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Engine oil too heavy	Replace engine oil
Engine Cranks Normally, But Will Not Start	
Glow plugs not functioning	Check glow plug system, see FUEL SYSTEMS
Glow plug control not functioning	Check controller, see FUEL SYSTEMS

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Fuel not injected into cylinders	Check fuel injectors, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Fuel filter blocked	Replace fuel filter
Fuel tank filter blocked	Replace fuel tank filter
Fuel pump not operating	Check pump operation and/or replace pump
Fuel return system blocked	Inspect system and remove restriction
No voltage to fuel solenoid	Check solenoid and connections
Incorrect or contaminated fuel	Replace fuel
Incorrect injection pump timing	Re-adjust pump timing, see FUEL SYSTEMS
Low compression	Check valves, pistons, rings, see ENGINES
Injection pump malfunction	Inspect and/or replace injection pump
Engine Starts, Won't Idle	
Incorrect slow idle adjustment	Reset idle adjustment, see TUNE-UP
Fast idle solenoid malfunctioning	Check solenoid and connections
Fuel return system blocked	Check system and remove restrictions
Glow plugs go off too soon	See glow plug diagnosis in FUEL SYSTEMS
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Incorrect or contaminated fuel	Replace fuel
Low compression	Check valves, piston, rings, see ENGINES
Injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Fuel solenoid closes in RUN position	Check solenoid and connections
Engines Starts/Idles Rough W/out Smoke or Noise	
Incorrect slow idle adjustment	Reset slow idle, see TUNE-UP
Injection line fuel leaks	Check lines and connections
Fuel return system blocked	Check lines and connections
Air in fuel system	Bleed air from system
Incorrect or contaminated fuel	Replace fuel
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engines Starts and Idles Rough W/out Smoke or Noise, But Clears After Warm-Up	
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Engine not fully broken in	Put more miles on engine
Air in system	Bleed air from system
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engine Idles Correctly, Misfires Above Idle	
Blocked fuel filter	Replace fuel filter
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Incorrect or contaminated fuel	Replace fuel
Engine Won't Return To Idle	
Fast idle adjustment incorrect	Reset fast idle, see TUNE-UP
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
External linkage binding	Check linkage and remove binding
Fuel Leaks On Ground	
Loose or broken fuel line	Check lines and connections
Internal injection pump seal leak	Replace injection pump, see FUEL SYSTEMS
Cylinder Knocking Noise	
Injector nozzles sticking open	Test injectors, see FUEL SYSTEMS
Very low nozzle opening pressure	Test injectors and/or replace

CONDITION & POSSIBLE CAUSE	CORRECTION
Loss of Engine Power	
Restricted air intake	Remove restriction
EGR valve malfunction	Replace EGR valve
Blocked or damaged exhaust system	Remove restriction and/or replace components
Blocked fuel tank filter	Replace filter
Restricted fuel filter	Remove restriction and/or replace filter
Block vent in gas cap	Remove restriction and/or replace cap
Tank-to-injection pump fuel supply blocked	Check fuel lines and connections
Blocked fuel return system	Remove restriction
Incorrect or contaminated fuel	Replace fuel
Blocked injector nozzles	Check nozzle for blockage, see FUEL SYSTEMS
Low compression	Check valves, rings, pistons, see ENGINES
Loud Engine Noise With Black Smoke	
Basic timing incorrect	Reset timing, see FUEL SYSTEMS
EGR valve malfunction	Replace EGR valve
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Incorrect injector pump housing pressure	Check pressure, see FUEL SYSTEMS
Engine Overheating	
Cooling system leaks	Check cooling system and repair leaks
Belt slipping or damaged	Check tension and/or replace belt
Thermostat stuck closed	Remove and replace thermostat, see ENGINE COOLING
Head gasket leaking	Replace head gasket
Oil Light on at Idle	
Low oil pump pressure	Check oil pump operation, see ENGINES
Oil cooler or line restricted	Remove restriction and/or replace cooler
Engine Won't Shut Off	
Injector pump fuel solenoid does not return fuel valve to OFF position	Remove and check solenoid and replace if needed

VACUUM PUMP DIAGNOSIS

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

FUEL INJECTION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

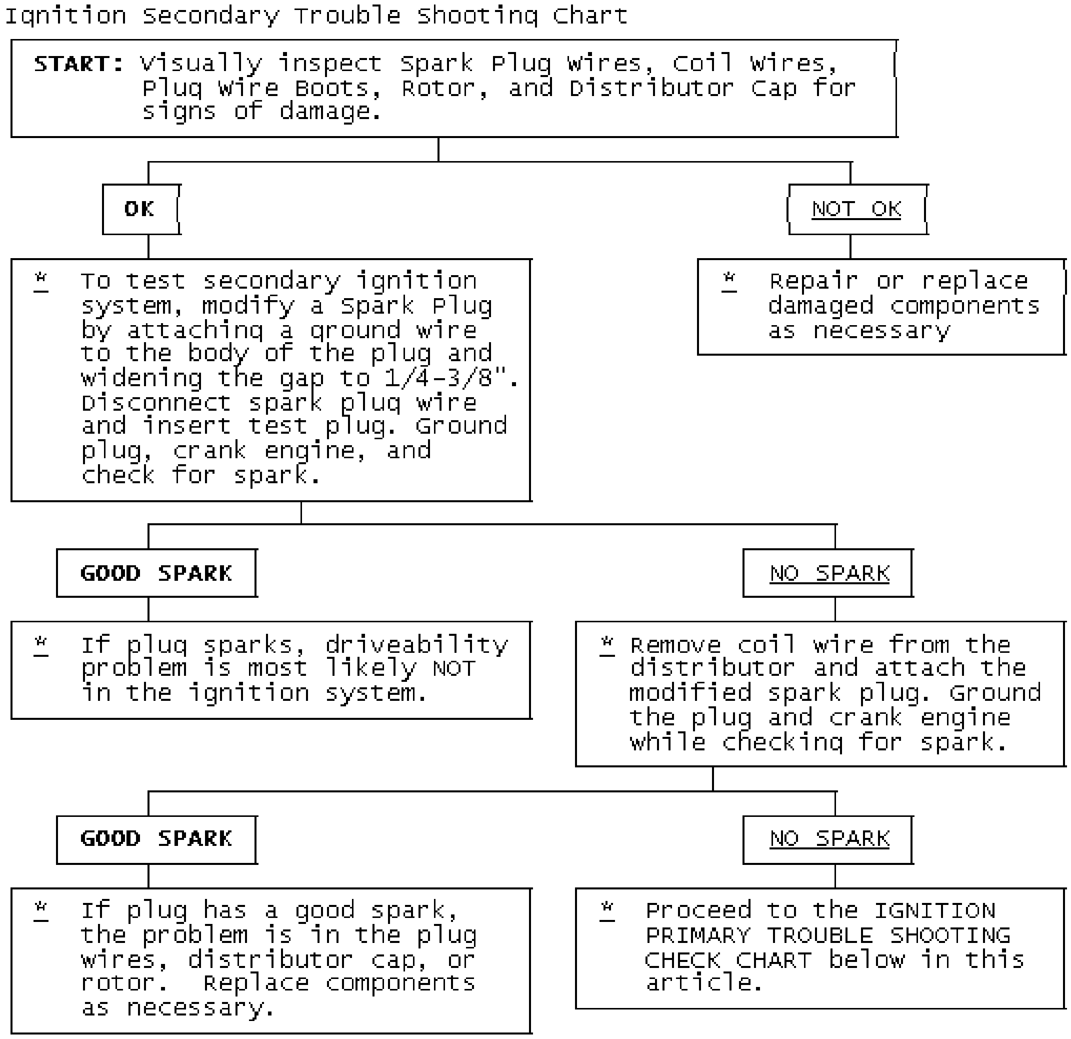
BASIC FUEL INJECTION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start (Cranks Normally)	
Cold start valve inoperative	Test valve and circuit
Poor connection;vacuum or wiring	Check vacuum and electrical connections
Contaminated fuel	Test fuel for water or alcohol
Defective fuel pump relay or circuit	Test relay and wiring
Battery too low	Charge and test battery
Low fuel pressure	Test pressure regulator and fuel pump, check for restricted lines and filters
No distributor reference pulses	Repair ignition system as necessary
Open coolant temperature sensor circuit	Test sensor and wiring
Shorted W.O.T. switch in T.P.S.	Disconnect W.O.T. switch, engine should start
Defective ECM	Replace ECM
Fuel tank residual pressure valve leaks	Test for fuel pressure drop after shut down
Hard Starting	
Disconnected hot air tube to air cleaner	Reconnect tube and test control valve
Defective Idle Air Control (IAC) valve	Test valve operation and circuit
Shorted, open or misadjusted T.P.S.	Test and adjust or replace T.P.S.
EGR valve open	Test EGR valve and control circuit
Poor Oxygen sensor signal	Test for shorted or circuit
Incorrect mixture from PCV system	Test PCV for flow, check sealing of oil filter cap
Poor High Speed Operation	
Low fuel pump volume	Faulty pump or restricted fuel lines or filters
Poor MAP sensor signal	Test MAP sensor, vacuum hose and wiring
Poor Oxygen sensor signal	Test for shorted or open sensor or circuit
Open coolant temperature sensor circuit	Test sensor and wiring
Faulty ignition operation	Check wires for cracks or poor con- nections, test secondary voltage with oscilloscope
Contaminated fuel	Test fuel for water or alcohol
Intermittent ECM ground	Test ECM ground connection for resistance
Restricted air cleaner	Replace air cleaner
Restricted exhaust system	Test for exhaust manifold back pressure
Poor MAF sensor signal	Check leakage between sensor and manifold
Poor VSS signal	If tester for ALCL hook-up is available check that VSS reading matches speedometer
Ping or Knock on Acceleration	
Poor Knock sensor signal	Test for shorted or open sensor or circuit
Poor Baro sensor signal	Test for shorted or open sensor or circuit
Improper ignition timing	See VEHICLE EMISSION CONTROL LABEL (where applicable)
Check for engine overheating problems	Low coolant, loose belts or electric cooling fan inoperative

NOTE: **For additional electronic fuel injection trouble shooting information, see the appropriate article in the ENGINE PERFORMANCE section (not all vehicles have Computer Engine Control articles). Information is provided there for diagnosing fuel system problems on vehicles with electronic fuel injection.**

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**



Ignition Secondary Trouble Shooting Chart

START: Visually inspect Spark Plug Wires, Coil Wires, Plug Wire Boots, Rotor, and Distributor Cap for signs of damage.

* To test secondary ignition system, modify a Spark Plug by attaching a ground wire to the body of the plug and widening the gap to 1/4-3/8". Disconnect spark plug wire and insert test plug. Ground plug, crank engine, and check for spark.

* Repair or replace damaged components as necessary

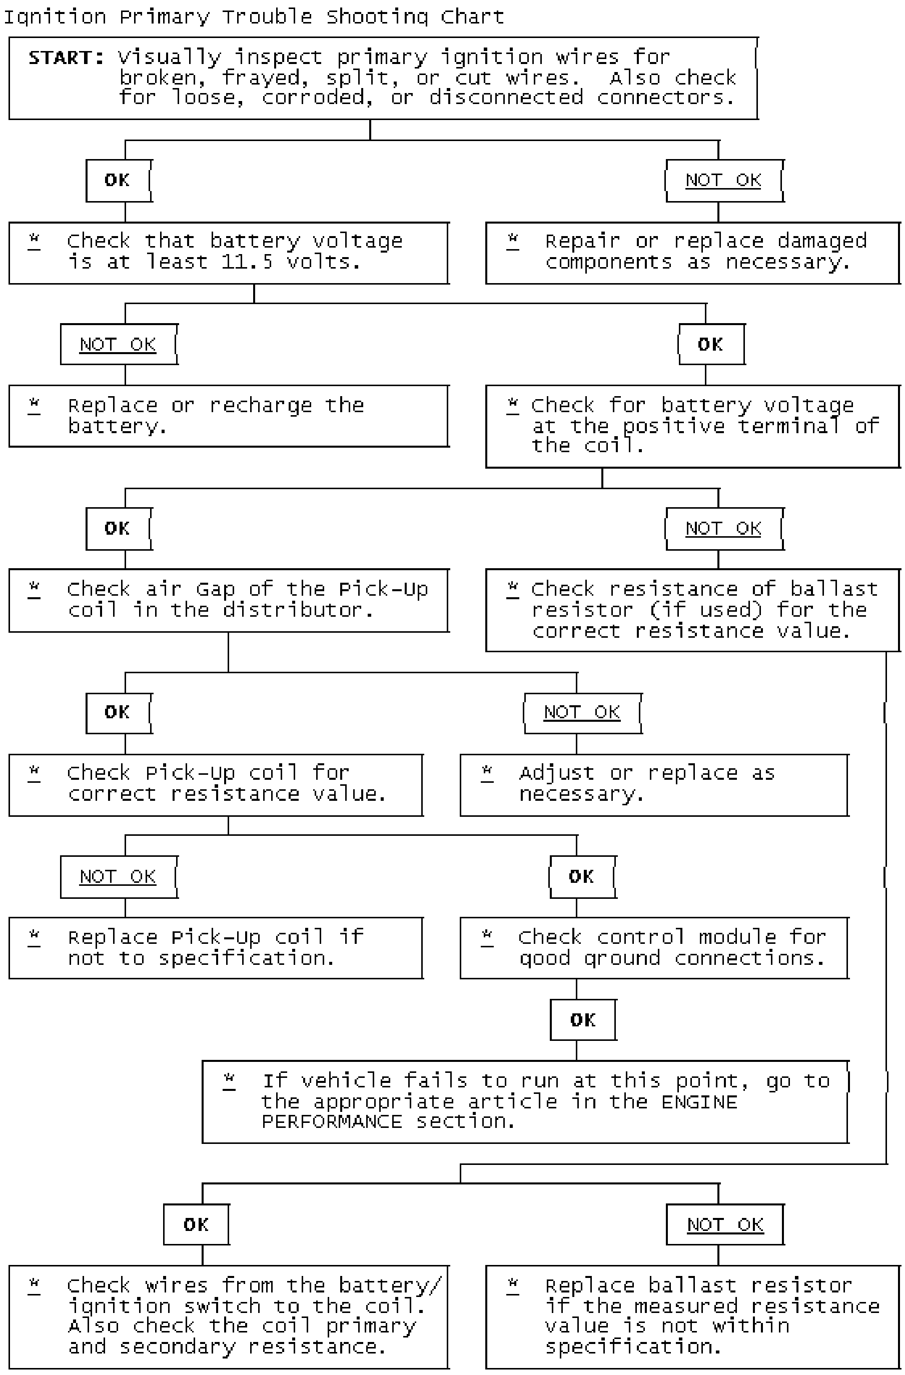
* If plug sparks, driveability problem is most likely NOT in the ignition system.

* Remove coil wire from the distributor and attach the modified spark plug. Ground the plug and crank engine while checking for spark.

* If plug has a good spark, the problem is in the plug wires, distributor cap, or rotor. Replace components as necessary.

* Proceed to the IGNITION PRIMARY TROUBLE SHOOTING CHECK CHART below in this article.

Fig. 3: Ignition Secondary Trouble Shooting Chart



Ignition Primary Trouble Shooting Chart
START: Visually inspect primary ignition wires for broken, frayed, split, or cut wires. Also check for loose, corroded, or disconnected connectors.
OK
NOT OK
* Check that battery voltage is at least 11.5 volts.
* Repair or replace damaged components as necessary.
NOT OK
OK
* Replace or recharge the battery.
* Check for battery voltage at the positive terminal of the coil.
OK
NOT OK
* Check air Gap of the Pick-Up coil in the distributor.
* Check resistance of ballast resistor (if used) for the correct resistance value.
OK
NOT OK
* Check Pick-Up coil for correct resistance value.
* Adjust or replace as necessary.
NOT OK
OK
* Replace Pick-Up coil if not to specification.
* Check control module for good ground connections.
OK
* If vehicle fails to run at this point, go to the appropriate article in the ENGINE PERFORMANCE section.
OK
NOT OK
* Check wires from the battery/ ignition switch to the coil. Also check the coil primary and secondary resistance.
* Replace ballast resistor if the measured resistance value is not within specification.

Fig. 4: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	See Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole shoes	See STARTER article
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearings	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article

CONDITION & POSSIBLE CAUSE	CORRECTION
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch contacts sticking	Replace ignition switch
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	Replace solenoid
Low Current Draw	
Worn brushes or weak	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

TUNE-UP TROUBLE SHOOTING - GAS ENGINE VEHICLES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem**

symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC SPARK PLUG TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Normal Spark Plug Condition	
Light Tan or Gray deposits	No Action
Electrode not burned or fouled	No Action
Gap tolerance not changed	No Action
Cold Fouling or Carbon Deposits	
Overrich air/fuel mixture	Adjust air/fuel mixture, see ENGINE PERFORMANCE section
Faulty choke	Replace choke assembly, see ENGINE PERFORMANCE section
Clogged air filter	Clean and/or replace air filter
Incorrect idle speed or dirty carburetor	Reset idle speed and/ or clean carburetor
Faulty ignition wires	Replace ignition wiring
Prolonged operation at idle	Shut engine off during long idle
Sticking valves or worn valve guide seals	Check valve train
Wet Fouling or Oil Deposits	
Worn rings and pistons	Install new rings and pistons
Excessive cylinder wear	Rebore or replace block
Excessive valve guide clearance	Worn or loose bearing
Gap Bridged	
Deposits in combustion chamber becoming fused to electrode	Clean combustion chamber of deposits
Blistered Electrode	
Engine overheating	Check cooling system
Wrong type of fuel	Replace with correct fuel
Loose spark plugs	Retighten spark plugs
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Pre-Ignition or Melted Electrodes	
Incorrect type of fuel	Replace with correct fuel
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Burned valves	Replace valves
Engine Overheating	Check cooling system
Wrong type of spark plug, too hot	Replace with correct spark plug, see ENGINE PERFORMANCE
Chipped Insulators	
Severe detonation	Check for over-advanced timing or combustion
Improper gapping procedure	Re-gap spark plugs
Rust Colored Deposits	
Additives in unleaded fuel	Try different fuel brand
Water In Combustion Chamber	
Blown head gasket or cracked head	Repair or replace head or head gasket

NOTE: **Before diagnosing an electronic ignition system, ensure that all wiring is connected properly between distributor, wiring connector and spark plugs.**

Ignition problem will show up either as: Engine Will Not Start or Engine Runs Rough.

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Open circuit between distributor and bulkhead connector	Repair circuit
Open circuit between bulkhead connector and ignition switch	Repair circuit
Open circuit between ignition switch and starter solenoid	Repair circuit
Engine Runs Rough	
Fuel lines leaking or clogged	Tighten fitting, remove restriction
Initial timing incorrect	Reset ignition timing see ENGINE PERFORMANCE
Centrifugal advance malfunction	Repair distributor advance
Defective spark plugs or wiring	Replace plugs or plug wiring
Component Failure	
Spark arc-over on cap, rotor or coil	Replace cap, rotor or or coil
Defective pick-up coil	Replace pick-up coil
Defective ignition coil	Replace ignition coil
Defective vacuum unit	Replace vacuum unit
Defective control module	Replace control module

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS - USING OSCILLOSCOPE PATTERNS

CONDITION & POSSIBLE CAUSE	CORRECTION
Firing Voltage Lines are the Same, but Abnormally High	
Retarded ignition timing	Reset ignition timing, see ENGINE PERFORMANCE section
Fuel mixture too lean	Readjust carburetor, see ENGINE PERFORMANCE
High resistance in coil wire	Replace coil wire
Corrosion in coil tower terminal	Clean and/or replace coil
Corrosion in distributor coil terminal	Clean and/or replace distributor cap
Firing Voltage Lines are the Same but Abnormally Low	
Fuel mixture too rich	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in coil wire causing arcing	Replace coil wire
Cracked coil tower causing arcing	Replace coil
Low coil output	Replace coil
Low engine compression	Determine cause and repair
One or More, But Not All Firing Voltage Lines are Higher Than Others	
Carburetor idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
EGR valve stuck open	Clean and/or replace valve
High resistance in spark plug wires	Replace spark plug wires
Cracked or broken spark plug insulator	Replace spark plugs
Intake vacuum leak	Repair leak
Defective spark plugs	Replace spark plugs

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Corroded spark plug terminals	Replace spark plugs
One or More, But Not All Firing Voltage Lines Are Lower Than Others	
Curb idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in plug wires	Replace plug wires causing arcing
Cracked coil tower causing arcing	Replace coil
Low compression	Determine cause and repair
Defective spark plugs	Replace spark plugs
Corroded spark plugs	Replace spark plugs
Cylinders Not Firing	
Cracked distributor cap terminals	Replace distributor cap
Shorted spark plug wire	Determine cause and repair
Mechanical problem in engine	Determine cause and repair
Defective spark plugs	Replace spark plugs
Spark plugs fouled	Replace spark plugs

BASIC DRIVEABILITY PROBLEMS TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Hard Starting	
Binding carburetor linkage	Eliminate binding
Binding choke linkage	Eliminate binding
Binding choke piston	Eliminate binding
Restricted choke vacuum	Check vacuum lines for blockage
Worn or dirty needle valve and seat	Clean carburetor, see ENGINE PERFORMANCE
Float sticking	Readjust or replace float see the ENGINE PERFORMANCE section
Incorrect choke adjustment	Reset choke adjustment see ENGINE PERFORMANCE
Defective coil	Replace coil
Improper spark plug gap	Regap spark plugs
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Detonation	
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective spark plugs	Replace spark plugs
Fuel lines clogged	Clean fuel lines
EGR system malfunction	Check and repair EGR system
PCV system malfunction	Repair PCV system
Vacuum leaks	Check and repair vacuum system
Loose fan belts	Tighten or replace fan belts, see ENGINE PERFORMANCE
Restricted airflow	Remove restriction
Vacuum advance malfunction	Check distributor operation
Dieseling	
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate blinding
Binding choke linkage or fast idle cam	Eliminate binding

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Defective idle solenoid	Replace idle solenoid see ENGINE PERFORMANCE
Improper base idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Incorrect idle mixture setting	Reset idle mixture, see ENGINE PERFORMANCE
Faulty Acceleration	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Engine cold and choke too lean	Adjust choke and allow engine to warm-up
Defective spark plugs	Replace spark plugs
Defective coil	Replace coil
Faulty Low Speed Operation	
Clogged idle transfer slots	Clean idle transfer slots, see FUEL
Restricted idle air bleeds and passages	Disassemble and clean carburetor, see FUEL
Clogged air cleaner	Replace air filter
Defective spark plugs	Replace spark plugs
Defective ignition wires	Replace ignition wire see ENGINE PERFORMANCE
Defective distributor cap	Replace distributor cap
Faulty High Speed Operation	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective distributor centrifugal advance	Replace advance mechanism
Defective distributor vacuum advance	Replace advance unit
Incorrect spark plugs or plug gap	Check gap and/or replace spark plugs
Faulty choke operation	Check choke and repair as required
Clogged vacuum passages	Remove restrictions
Improper size or clogged main jet	Check jet size and clean, see FUEL
Restricted air cleaner	Check filter and replace as necessary
Defective distributor cap, rotor or coil	Replace cap, rotor or coil
Misfire at All Speeds	
Defective spark plugs	Replace spark plugs
Defective spark plug wires	Replace spark plug wires
Defective distributor cap, rotor, or coil	Replace cap, rotor, or coil
Cracked or broken vacuum hoses	Replace vacuum hoses
Vacuum leaks	Repair vacuum leaks
Fuel lines clogged	Remove restriction
Hesitation	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair Vacuum leaks
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate binding
Binding choke linkage or fast idle cam	Eliminate binding
Improper float setting	Readjust float setting, see FUEL
Cracked or broken ignition wires	Replace ignition wires
Rough Idle, Missing or Stalling	

CONDITION & POSSIBLE CAUSE	CORRECTION
Incorrect curb idle or fast idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect basic timing	Reset ignition timing see ENGINE PERFORMANCE
Improper idle mixture adjustment	Reset idle mixture, see ENGINE PERFORMANCE
Improper feedback system operation	Check feedback system see ENGINE PERFORMANCE
Incorrect spark plug gap	Reset spark plug gap, see ENGINE PERFORMANCE
Moisture in ignition components	Dry components
Loose or broken ignition wires	Replace ignition wires
Damaged distributor cap or or rotor	Replace distributor cap or rotor
Faulty ignition coil	Replace ignition coil
Fuel filter clogged or worn	Replace fuel filter
Damaged idle mixture screw	Replace idle mixture screw, see FUEL
Improper fast idle cam adjustment	Reset fast idle cam adjustment, see TUNE- see ENGINE PERFORMANCE
Improper EGR valve operation	Replace EGR valve
Faulty PCV valve air flow	Replace PCV valve
Choke binding or improper choke setting	Reset choke or eliminate binding
Vacuum leak	Repair vacuum leak
Improper float bowl fuel level	Reset float adjustment, see FUEL
Clogged air bleed or idle passages	Clean carburetor passages, see FUEL
Clogged or worn air cleaner filter	Replace air filter
Faulty choke vacuum diaphragm	Replace diaphragm, see ENGINE PERFORMANCE
Exhaust manifold heat valve inoperative	Replace heat valve
Improper distributor spark advance	Check distributor operation
Leaking valves or valve components	Check and repair valvetrain
Improper carburetor mounting	Remove and remount carburetor
Excessive play in distributor shaft	Replace distributor
Loose or corroded wiring connections	Repair or replace as required
Engine Surges	
Improper PCV valve airflow	Replace PCV valve
Vacuum leaks	Repair vacuum leaks
Clogged air bleeds	Remove restriction
EGR valve malfunction	Replace EGR valve
Restricted air cleaner filter	Replace air filter
Cracked or broken vacuum hoses	Replace vacuum hoses
Cracked or broken ignition wires	Replace ignition wires
Vacuum advance malfunction	Check unit and replace as necessary
Defective or fouled spark plugs	Replace spark plugs
Ping or Spark Knock	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Distributor centrifugal or vacuum advance malfunction	Check operation and replace as necessary
Carburetor setting too lean	Readjust mixture setting, see ENGINE PERFORMANCE

CONDITION & POSSIBLE CAUSE	CORRECTION
Vacuum leak	Eliminate vacuum leak
EGR valve malfunction	Replace EGR valve
Poor Gasoline Mileage	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair vacuum leaks
Defective ignition wires	Replace wires
Incorrect choke setting	Readjust setting, see ENGINE PERFORMANCE
Defective vacuum advance	Replace vacuum advance
Defective spark plugs	Replace spark plugs
Binding carburetor power piston	Eliminate binding
Dirt in carburetor jets	Clean and/or replace jets
Incorrect float adjustment	Readjust float setting, see FUEL
Defective power valve	Replace power valve, see ENGINE PERFORMANCE
Incorrect idle speed	Readjust idle speed
Engine Stalls	
Improper float level	Readjust float level
Leaking needle valve and seat	Replace needle valve and seat
Vacuum leaks	Eliminate vacuum leaks

VACUUM PUMP - DIESEL TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

NOTE: **Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.**

VACUUM PUMP (DIESEL) TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

MANUAL TRANSMISSION

MANUAL TRANSMISSION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem**

symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

MANUAL TRANSMISSION/TRANSAXLE TROUBLE SHOOTING

Condition	Possible Cause
Noisy In Forward Gears	Low gear oil level, Loose bell housing bolts, Worn bearings or gears
Clunk On Deceleration (FWD Only)	Loose engine mounts, Worn inboard CV joints, Worn differential pinion shaft, Side gear hub counterbore in case worn oversize
Gear Clash When Shifting Forward Gears	Clutch Out Of Adjustment, Shift linkage damaged or out of adjustment, Gears or synchronizers damaged, Low gear oil level
Transmission Noisy When Moving (RWD Only) Quiet In Neutral With Clutch Engaged	Worn rear outputshaft bearing
Gear Rattle	Worn bearings, Wrong gear oil, Low gear oil, Worn gears
Steady Ticking At Idle (Increases With RPM)	Broken tooth on gear
Gear Clash When Shifting Forward Gears	Worn or broken synchronizers
Loud Whine In Reverse	Normal condition (1)
Noise When Stepping On Clutch	Bad release bearing, Worn pilot bearing
Ticking Or Screeching As Clutch Is Engaged	Faulty release bearing, Uneven pressure plate fingers
Click Or Snap When Clutch Is Engaged	Worn clutch fork, Worn or broken front bearing retainer
Transmission Shifts Hard	Clutch not releasing, Shift mechanism binding, Clutch installed backwards
Will Not Shift Into One Gear, Shifts Into All Others	Bent shift fork, Worn detent balls
Locked Into Gear, Cannot Shift	Clutch adjustment, Worn detent balls
Transmission Jumps Out Of Gear	Pilot bearing worn, Bent shift fork, Worn gear teeth or face, Excessive gear train end play, Worn synchronizers, Missing detent ball spring, Shift mechanism worn or out of adjustment, Engine or transmission mount bolts loose or out of adjustment, Transmission not aligned
Shift Lever Rattle	Worn shift lever or detents, Worn shift forks, Worn synchronizers sleeve
Shift Lever Hops Under Acceleration	Worn engine or transmission mounts
(1) Most units use spur cut gears in reverse and are noisy	

POWERTRAIN

CLUTCH TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC CLUTCH TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Chattering or Grabbing	

CONDITION & POSSIBLE CAUSE	CORRECTION
Incorrect clutch adjustment	Adjust clutch
Oil, grease or glaze on facings	Disassemble and clean or replace
Loose "U" joint flange	See DRIVE AXLES article
Worn input shaft spline	Replace input shaft
Binding pressure plate	Replace pressure plate
Binding release lever	See CLUTCH article
Binding clutch disc hub	Replace clutch disc
Unequal pressure plate contact	Replace worn/misaligned components
Loose/bent clutch disc	Replace clutch disc
Incorrect transmission alignment	Realign transmission
Worn pressure plate, disc or flywheel	Replace damaged components
Broken or weak pressure springs	Replace pressure plate
Sticking clutch pedal	Lubricate clutch pedal & linkage
Incorrect clutch disc facing	Replace clutch disc
Engine loose in chassis	Tighten all mounting bolts
Failure to Release	
Oil or grease on clutch facings	Clean or replace clutch clutch disc
Incorrect release lever or pedal adjustment	See CLUTCH article
Worn or broken clutch facings	Replace clutch disc
Bent clutch disc or pressure plate	Replace damaged components
Clutch disc hub binding on input shaft	Clean or replace clutch disc and/or input shaft
Binding pilot bearing	Replace pilot bearing
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Binding clutch cable	See CLUTCH article
Defective clutch master	Replace master cylinder
Defective clutch slave	Replace slave cylinder
Air in hydraulic system	Bleed hydraulic system
Rattling	
Weak or broken release lever spring	Replace spring and check alignment
Damaged pressure plate	Replace pressure plate
Broken clutch return spring	Replace return spring
Worn splines on clutch disc or input shaft	Replace clutch disc and/or input shaft
Worn clutch release bearing	Replace release bearing
Dry or worn pilot bearing	Lubricate or replace pilot bearing
Unequal release lever contact	Align or replace release lever
Incorrect pedal free play	Adjust free play
Warped or damaged clutch disc	Replace damaged components
Slipping	
Pressure springs worn or	Release pressure plate
Oily, greasy or worn facings	Clean or replace clutch disc
Incorrect clutch alignment	Realign clutch assembly
Warped clutch disc or pressure plate	Replace damaged components
Binding release levers or clutch pedal	Lubricate and/or replace release components
Squeaking	
Worn or damaged release	Replace release bearing
Dry or worn pilot or release bearing	Lubricate or replace assembly
Pilot bearing turning in crankshaft	Replace pilot bearing and/or crankshaft
Worn input shaft bearing	Replace bearing and seal

CONDITION & POSSIBLE CAUSE	CORRECTION
Incorrect transmission alignment	Realign transmission
Dry release fork between pivot	Lubricate release fork and pivot
Heavy and/or Stiff Pedal	
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Dry or binding clutch pedal hub	Lubricate and align components
Floor mat interference with pedal	Lay mat flat in proper area
Dry or binding ball/fork pivots	Lubricate and align components
Faulty clutch cable	Replace clutch cable
Noisy Clutch Pedal	
Faulty interlock switch	Replace interlock switch
Self-adjuster ratchet noise	Lubricate or replace self-adjuster
Speed control interlock switch	Lubricate or replace interlock switch
Clutch Pedal Sticks Down	
Binding clutch cable	See CLUTCH article
Springs weak in pressure plate	Replace pressure plate
Binding in clutch linkage	Lubricate and free linkage
Noisy	
Dry release bearing	Lubricate or replace release bearing
Dry or worn pilot bearing	Lubricate or replace bearing
Worn input shaft bearing	Replace bearing
Transmission Click	
Weak springs in pressure	Replace pressure plate plate
Release fork loose on ball stud	Replace release fork and/or ball stud
Oil on clutch disc damper	Replace clutch disc
Broken spring in slave cylinder	Replace slave cylinder

DRIVE AXLE - NOISE DIAGNOSIS

Unrelated Noises

Some driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. Ensure cause of trouble actually is in the drive axle before adjusting, repairing, or replacing any of its parts.

Non-Drive Axle Noises

A few conditions can sound just like drive axle noise and have to be considered in pre-diagnosis. The 4 most common noises are exhaust, tires, CV/universal joints and wheel trim rings.

In certain conditions, the pitch of the exhaust gases may e gear whine. At other times, it may be mistaken for a wheel bearing rumble.

Tires, especially radial and snow, can have a high-pitched tread whine or roar, similar to gear noise. Also, some non-standard tires with an unusual tread construction may emit a roar or whine.

Defective CV/universal joints may cause clicking noises or excessive driveline play that can be improperly diagnosed as drive axle problems.

Trim and moldings also can cause a whistling or whining noise. Ensure none of these components are causing the noise before disassembling the drive axle.

Gear Noise

A "howling" or "whining" noise from the ring and pinion gear can be caused by an improper gear pattern, gear damage, or improper bearing preload. It can occur at various speeds and driving conditions, or it can be continuous.

Before disassembling axle to diagnose and correct gear ke sure that tires, exhaust, and vehicle trim have been checked as possible causes.

Chuckle

This is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It occurs while decelerating from 40 MPH and usually can be heard until vehicle comes to a complete stop. The frequency varies with the speed of the vehicle.

A chuckle that occurs on the driving phase is usually caused ive clearance due to differential gear wear, or by a damaged tooth on the coast side of the pinion or ring gear. Even a very small tooth nick or a ridge on the edge of a gear tooth is enough the cause the noise.

This condition can be corrected simply by cleaning the gear tooth nick or ridge with a small grinding wheel. If either gear is damaged or scored badly, the gear set must be replaced. If metal has broken loose, the carrier and housing must be cleaned to remove particles that could cause damage.

Knock

This is very similar to a chuckle, though it may be louder, and occur on acceleration or deceleration. Knock can be caused by a gear tooth that is damaged on the drive side of the ring and pinion gears. Ring gear bolts that are hitting the carrier casting can cause knock. Knock can also be due to excessive end play in the axle shafts.

Clunk

Clunk is a metallic noise heard when an automatic transmission is engaged in Reverse or Drive, or when throttle is applied or released. It is caused by backlash somewhere in the driveline, but not necessarily in the axle. To determine whether driveline clunk is caused by the axle, check the total axle backlash as follows:

1. Raise vehicle on a frame or twinpost hoist so that drive wheels are free. Clamp a bar between axle companion flange and a part of the frame or body so that flange cannot move.
2. On conventional drive axles, lock the left wheel to keep it from turning. On all models, turn the right wheel slowly until it is felt to be in Drive condition. Hold a chalk marker on side of tire about 12" from center of wheel. Turn wheel in the opposite direction until it is again felt to be in Drive condition.
3. Measure the length of the chalk mark, which is the total axle backlash. If backlash is one inch or less, drive axle is not the source of clunk noise.

Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by malfunctioning pinion bearings. Pinion bearings operate at drive shaft speed. Roller wheel bearings may whine in a similar manner if they run completely dry of lubricant. Bearing noise will occur at all driving speeds. This distinguishes it from gear whine, which usually comes and goes as speed changes.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. It is usually caused by a malfunctioning wheel bearing. The lower pitch is because the wheel bearing turns at only about 1/3 of drive shaft speed.

Chatter On Turns

This is a condition where the entire front or rear of vehicle vibrates when vehicle is moving. The vibration is plainly felt as well as heard. Extra differential thrust washers installed during axle repair can cause a condition of partial lock-up that creates this chatter.

Axle Shaft Noise

Axle shaft noise is similar to gear noise and pinion bearing whine. Axle shaft bearing noise will normally distinguish itself from gear noise by occurring in all driving modes (Drive, cruise, coast and float), and will persist with transmission in Neutral while vehicle is moving at problem speed.

If vehicle displays this noise condition, remove suspect parts, replace wheel seals and install a new set of bearings. Re-evaluate vehicle for noise before removing any internal components.

Vibration

Vibration is a high-frequency trembling, shaking or grinding condition (felt or heard) that may be constant or variable in level and can occur during the total operating speed range of the vehicle.

The types of vibrations that can be felt in the vehicle can d into 3 main groups:

- Vibrations of various unbalanced rotating parts of the vehicle.
- Resonance vibrations of the body and frame structures caused by rotating of unbalanced parts.
- Tip-in moans of resonance vibrations from stressed engine or exhaust system mounts or driveline flexing modes.

DRIVE AXLE - RWD TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing. For definitions of listed noises or sounds, see DRIVE AXLE - NOISE DIAGNOSIS under POWERTRAIN.**

DRIVE AXLE (RWD) TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Knocking or Clunking	
Differential Side Gear Clearance	Check Clearance
Worn Pinion Shaft	Replace Pinion Shaft
Axle Shaft End Play	Check End Play
Missing Gear Teeth	Check Differential/Replace Gear
Wrong Axle Backlash	Check Backlash
Misaligned Driveline	Realign Driveline
Clinking During Engagement	
Side Gear Clearance	Check Clearance
Ring and Pinion Backlash	Check Backlash
Worn/Loose Pinion Shaft	Replace Shaft/Bearing
Bad "U" Joint	Replace "U" Joint
Sticking Slip Yoke	Lube Slip Yoke
Broken Rear Axle Mount	Replace Mount
Loose Drive Shaft Flange	Check Flange
Click/Chatter On Turns	
Differential Side Gear Clearance	Check Clearance
Wrong Turn On Plates (1)	Replace Clutch Plates
Wrong Differential Lubricant (1)	Change Lubricant
Knock Or Click	
Flat Spot on Rear Wheel Bearing	Replace Wheel Bearing

CONDITION & POSSIBLE CAUSE	CORRECTION
Low Vibration At All Speeds	
Faulty Wheel Bearing	Replace Wheel Bearing
Faulty "U" Joint	Replace "U" Joint
Faulty Drive Shaft	Balance Drive Shaft
Faulty Companion Flange	Replace Flange
Faulty Slip Yoke Flange	Replace Flange
(1) Limited slip differential only.	

FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Grease Leaks	CV boot torn or cracked
Clicking Noise on Cornering	Damaged outer CV
Clunk Noise on Acceleration	Damaged inner CV
Vibration or Shudder on Acceleration	Sticking, damaged or worn CV Misalignment or spring height

STEERING & SUSPENSION

MANUAL STEERING GEAR TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC MANUAL STEERING GEAR TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise in Rack and Pinion	
Rack and pinion mounting bracket loose	Tighten all mounting bolts
Lack of/or incorrect lubricant	Correct as necessary
Steering gear mounting bolts loose	Tighten all mounting bolts
Excessive Play	
Front wheel bearing improperly adjusted	See FRONT SUSPENSION article
Loose or worn steering linkage	See STEERING LINKAGE article
Loose or worn steering gear shift	See MANUAL STEERING GEAR article
Steering arm loose on gear shaft	See MANUAL STEERING GEAR article
Steering gear housing bolts loose	Tighten all mounting bolts
Steering gear adjustment too loose	See MANUAL STEERING GEAR article
Steering arms loose on knuckles	Tighten and check steering linkage
Rack and pinion mounting loose	Tighten all mounting bolts
Rack and pinion out of adjustment	See adjustment in STEERING article
Tie rod end loose	Tighten and check steering linkage

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Pitman shaft-to-ball nut lash	Repair as necessary
Poor Returnability	
Lack of lubricant in ball joint or linkage	Lubricate and service systems
Binding in linkage or ball joints	See STEERING LINKAGE and SUSPENSION article
Improper front end alignment	See WHEEL ALIGNMENT article
Improper tire pressure	Inflate to proper pressure
Tie rod binding	Inflate to proper pressure
Shaft seal rubbing shaft	See STEERING COLUMN article
Excessive Vertical Motion	
Improper tire pressure	Inflate to proper pressure
Tires, wheels or rotors out of balance	Balance tires then check wheels and rotors
Worn or faulty shock absorbers	Check and replace if necessary
Loose tie rod ends or steering	Tighten or replace if necessary
Loose or worn wheel bearings	See SUSPENSION article
Steering Pulls to One Side	
Improper tire pressure	Inflate to proper pressure
Front tires are different sizes	Rotate or replace if necessary
Wheel bearings not adjusted properly	See FRONT SUSPENSION article
Bent or broken suspension components	See FRONT SUSPENSION article
Improper wheel alignment	See WHEEL ALIGNMENT article
Brakes dragging	See BRAKES article
Instability	
Low or uneven tire pressure	Inflate to proper pressure
Loose or worn wheel bearings	See FRONT SUSPENSION article
Loose or worn idler arm bushing	See FRONT SUSPENSION article
Loose or worn strut bushings	See FRONT SUSPENSION article
Incorrect front wheel alignment	See WHEEL ALIGNMENT article
Steering gear not centered	See MANUAL STEERING GEARS article
Springs or shock	Check and replace if necessary
Improper cross shaft	See MANUAL STEERING GEARS article

POWER STEERING TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC POWER STEERING TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise	
Pressure hoses touching engine parts	Adjust to proper clearance
Loose Pitman shaft	Adjust or replace if necessary
Tie rods ends or Pitman arm loose	Tighten and check system
Rack and pinion mounts loose	Tighten all mounting bolts
Free play in worm gear	See POWER STEERING GEAR article
Loose sector shaft or thrust bearing adjustment	See POWER STEERING GEAR
Free play in pot coupling	See STEERING COLUMN article

CONDITION & POSSIBLE CAUSE	CORRECTION
Worn shaft serrations	See STEERING COLUMN article
Growl in Steering Pump	
Excessive pressure in hoses	Restricted hoses, see POWER STEERING GEAR article
Scored pressure plates	See POWER STEERING GEAR article
Scored thrust plates or rotor	See POWER STEERING GEAR article
Extreme wear of cam ring	See POWER STEERING GEAR article
Rattle in Steering Pump	
Vanes not installed	See POWER STEERING PUMP article
Vanes sticking in rotor	See POWER STEERING PUMP article
Swish noise in Pump	
Defective flow control valve	See POWER STEERING PUMP article
Groan in Steering Pump	
Air in fluid	See POWER STEERING PUMP article
Poor pressure hose connection	Tighten and check, replace if necessary
Squawk When Turning	
Damper "O" ring on valve spool cut	See POWER STEERING PUMP article
Moan or Whine in Pump	
Pump shaft bearing scored	Replace bearing and fluid
Air in fluid or fluid level low	See POWER STEERING PUMP article
Hose or column grounded	Check and replace if necessary
Cover "O" ring missing or damaged	See POWER STEERING PUMP article
Valve cover baffle missing or damaged	See POWER STEERING PUMP article
Interference of components in pump	See POWER STEERING PUMP article
Loose or poor bracket alignment	Correct or replace if necessary
Hissing When Parking	
Internal leakage in steering gear	Check valved assembly first
Chirp in Steering Pump	
Loose or worn power steering belt	Adjust or replace if necessary
Buzzing When Not Steering	
Noisy pump	See POWER STEERING PUMP article
Free play in steering shaft bearing	See STEERING COLUMN article
Bearing loose on shaft serrations	See STEERING COLUMN article
Clicking Noise in Pump	
Pump slippers too long	See POWER STEERING PUMP article
Broken slipper springs	See POWER STEERING PUMP article
Excessive wear or nicked rotors	See POWER STEERING PUMP article
Damaged cam contour	See POWER STEERING PUMP article
Poor Return of Wheel	
Wheel rubbing against turn signal	See STEERING COLUMN SWITCHES article
Flange rubbing steering gear adjuster	See STEERING COLUMN article
Tight or frozen steering shaft bearing	See STEERING COLUMN article
Steering gear out of adjustment	See POWER STEERING GEAR article
Sticking or plugged spool valve	See POWER STEERING PUMP article
Improper front end alignment	See WHEEL ALIGNMENT article
Wheel bearings worn or loose	See FRONT SUSPENSION article
Ties rods or ball joints binding	Check and replace if necessary
Intermediate shaft joints binding	See STEERING COLUMN article

CONDITION & POSSIBLE CAUSE	CORRECTION
Kinked pressure hoses	Correct or replace if necessary
Loose housing head spanner nut	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Sector shaft adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Worm thrust bearing adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Reaction ring sticking in cylinder	See POWER STEERING GEAR article
Reaction ring sticking in housing head	See POWER STEERING GEAR article
Steering pump internal leakage	See POWER STEERING PUMP article
Steering gear-to-column misalignment	See STEERING COLUMN article
Lack of lubrication in linkage	Service front suspension
Lack of lubrication in ball joints	Service front suspension
Increased Effort When Turning Wheel Fast Foaming, Milky Power Steering Fluid, Low Fluid Level or Low Pressure	
High internal pump leakage	See POWER STEERING PUMP article
Power steering pump belt slipping	Adjust or replace if necessary
Low fluid level	Check and fill to proper level
Engine idle speed to low	Adjust to correct setting
Air in pump fluid system	See POWER STEERING PUMP article
Pump output low	See POWER STEERING PUMP article
Steering gear malfunctioning	See POWER STEERING GEAR article
Wheel Surges or Jerks	
Low fluid level	Check and fill to proper level
Loose fan belt	Adjust or replace if necessary
Insufficient pump pressure	See POWER STEERING PUMP article
Sticky flow control valve	See POWER STEERING PUMP article
Linkage hitting oil pan at full turn	Replace bent components
Kick Back or Free Play	
Air in pump fluid system	See POWER STEERING PUMP article
Worn poppet valve in steering gear	See POWER STEERING PUMP article
Excessive over center lash	See POWER STEERING GEAR article
Thrust bearing out of adjustment	See POWER STEERING GEAR article
Free play in pot coupling	See POWER STEERING PUMP article
Steering gear coupling loose on shaft	See POWER STEERING PUMP article
Steering disc mounting bolts loose	Tighten or replace if necessary
Coupling loose on worm shaft	Tighten or replace if necessary
Improper sector shaft adjustment	See POWER STEERING GEAR article
Excessive worm piston side play	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Universal joint loose	Tighten or replace if necessary
Defective rotary valve	See POWER STEERING GEAR article
No Power When Parking	
Sticking flow control valve	See POWER STEERING PUMP article
Insufficient pump pressure output	See POWER STEERING PUMP article
Excessive internal pump leakage	See POWER STEERING PUMP article
Excessive internal gear leakage	See POWER STEERING PUMP article
Flange rubs against gear adjust plug	See STEERING COLUMN article
Loose pump belt	Adjust or replace if necessary

CONDITION & POSSIBLE CAUSE	CORRECTION
Low fluid level	Check and add proper amount of fluid
Engine idle too low	Adjust to correct setting
Steering gear-to-column misaligned	See STEERING COLUMN article
No Power, Left Turn	
Left turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Left turn reaction seal damaged/missing	See POWER STEERING GEAR article
Cylinder head "O" ring damaged	See POWER STEERING PUMP article
No Power, Right Turns	
Column pot coupling bottomed	See STEERING COLUMN article
Right turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Right turn reaction seal damaged	See POWER STEERING GEAR article
Internal leakage through piston end plug	See POWER STEERING GEAR article
Internal leakage through side plugs	See POWER STEERING GEAR article
Lack of Effort in Turning	
Left and/or right reaction seal sticking in cylinder head	Replace, see POWER STEERING GEAR article
Wanders to One Side	
Front end alignment incorrect	See WHEEL ALIGNMENT article
Unbalanced steering gear valve	See POWER STEERING GEAR article
Low Pressure Due to Steering Pump	
Flow control valve stuck or inoperative	See POWER STEERING PUMP article
Pressure plate not flat against cam ring	See POWER STEERING PUMP article
Extreme wear of cam ring	Replace and check adjustments
Scored plate, thrust plate or rotor	See POWER STEERING PUMP article
Vanes not installed properly	See POWER STEERING PUMP article
Vanes sticking in rotor slots	See POWER STEERING PUMP article
Cracked/broken thrust or pressure plate	See POWER STEERING PUMP article

STEERING COLUMN TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC STEERING COLUMN TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Noise in Steering	
Coupling pulled apart	See STEERING COLUMNS article
Column not correctly aligned	See STEERING COLUMNS article
Broken lower joint	Replace joint
Horn contact ring not	See STEERING COLUMN article
Bearing not lubricated	See STEERING COLUMN article
Shaft snap ring not properly seated	Reseat or replace snap ring
Plastic spherical joint not lubricated	See STEERING COLUMN article
Shroud or housing loose	Tighten holding screws
Lock plate retaining ring not seated	See STEERING COLUMN article
Loose sight shield	Tighten holding screws
High Steering Shaft Effort	

CONDITION & POSSIBLE CAUSE	CORRECTION
Column assembly misaligned	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Tight steering universal joint	See STEERING COLUMN article
High Shift Effort	
Column is out of alignment	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Seals or bearings not lubricated	See STEERING COLUMNS article
Mounting bracket screws too long	Replace with new shorter screws
Burrs on shift tube	Remove burrs or replace tube
Lower bowl bearing assembled wrong	See STEERING COLUMN article
Shift tube bent or broken	Replace as necessary
Improper adjustment of shift levers	See STEERING COLUMN article
Improper Trans. Shifting	
Sheared shift tube joint	Replace as necessary
Sheared lower shaft lever	Replace as necessary
Improper shift lever adjustment	See STEERING COLUMN article
Improper gate plate adjustment	See STEERING COLUMN article
Excess Play in Column	
Instrument panel bracket bolts loose	Tighten bolts and check bracket
Broken weld nut on jacket	See STEERING COLUMN article
Instrument bracket capsule sheared	See STEERING COLUMN article
Column bracket/jacket bolts loose	Tighten bolts and check bracket
Steering Locks in Gear	
Release lever mechanism	See STEERING COLUMN article

SUSPENSION TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.**

BASIC SUSPENSION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Front End Noise	
Loose or worn wheel	See Wheel Bearing Adjustment in SUSPENSION
Worn shocks or shock mountings	Replace struts or strut mountings
Worn struts or strut mountings	Replace struts or strut mountings
Loose or worn lower control arm	See SUSPENSION
Loose steering gear-to-frame bolts	See STEERING
Worn control arm bushings	See SUSPENSION
Ball joints not lubricated	Lubricate ball joints & see Ball Joint Checking in SUSPENSION
Front Wheel Shake, Shimmy, or Vibration	
Tires or wheels out of balance	Check tire balance
Incorrect wheel alignment	See WHEEL ALIGNMENT
Drive shaft unbalanced	Check drive shaft balance
Loose or worn wheel bearings	See WHEEL ALIGNMENT

CONDITION & POSSIBLE CAUSE	CORRECTION
Loose or worn tie rod ends	See SUSPENSION
Worn upper ball joints	See Ball Joint Checking in SUSPENSION
Worn shock absorbers	Replace shock absorbers
Worn strut bushings	Replace strut bushings
Car Pulls to One Side	
Mismatched or uneven tires	Check tire condition
Broken or sagging springs	See SUSPENSION
Loose or worn strut bushings	See SUSPENSION
Improper wheel alignment	See WHEEL ALIGNMENT
Improper rear axle alignment	Check rear axle alignment
Power steering gear unbalanced	See STEERING
Front brakes dragging	See BRAKES
Abnormal Tire Wear	
Unbalanced tires	Check tire balance & rotation
Sagging or broken springs	See SUSPENSION
Incorrect front end alignment	See WHEEL ALIGNMENT
Faulty shock absorbers	Replace chock absorbers
Scuffed Tires	
Toe-In incorrect	See WHEEL ALIGNMENT
Suspension arm bent or twisted	See appropriate SUSPENSION article
Springs Bottom or Sag	
Bent or broken springs	See SUSPENSION
Leaking or worn shock absorbers	Replace shock absorbers
Frame misalignment	Check frame for damage
Spring Noises	
Loose "U" Bolts	See SUSPENSION
Loose or worn bushings	See SUSPENSION
Worn or missing interliners	See SUSPENSION
Shock Absorber Noise	
Loose shock mountings	Check & tighten mountings
Worn bushings	Replace bushings
Air in system	Bleed air from system
Undercoating on shocks	Remove undercoating
Car Leans or Sways on Corners	
Loose stabilizer bar	See SUSPENSION
Faulty shocks or mountings	Replace shocks or mountings
Broken or sagging springs	See SUSPENSION
Shock Absorbers Leaking	
Worn seals or reservoir tube crimped	See SUSPENSION
Broken Springs	
Loose "U" bolts	See SUSPENSION
Inoperative shock absorbers	Replace shock absorbers

WHEEL ALIGNMENT TROUBLE SHOOTING

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem**

symptoms. For model-specific Trouble Shooting, refer to SUBJECT, DIAGNOSTIC, or TESTING articles available in the section(s) you are accessing.

BASIC WHEEL ALIGNMENT TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Premature Tire Wear	
Improper tire inflation	Check tire pressure
Front alignment out of tolerance	See ALIGNMENT SPECS in WHEEL ALIGNMENT section
Suspension components worn	See SUSPENSION section
Steering system components worn	See STEERING section
Improper standing height	See WHEEL ALIGNMENT
Uneven or sagging springs	See SUSPENSION section
Bent wheel	See WHEEL ALIGNMENT
Improper torsion bar adjustment	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARING ADJ. in SUSPENSION section
Worn or defective shock	Replace shock absorbers
Tires out of balance	Check tire balance
Pulls to One Side	
Improper tire inflation	Check tire pressure
Brake dragging	See BRAKE section
Mismatched tires	See WHEEL ALIGNMENT
Broken or sagging spring	See SUSPENSION section
Broken torsion bar	See SUSPENSION section
Power steering valve not centered	See STEERING section
Front alignment out of tolerance	See WHEEL ALIGNMENT section
Defective wheel bearing	See WHEEL BEARINGS in SUSPENSION section
Uneven sway bar links	See SUSPENSION section
Frame bent	Check for frame damage
Steering system bushing worn	See STEERING section
Hard Steering	
Idler arm bushing too tight	See STEERING LINKAGE in STEERING section
Ball joint tight or seized	See SUSPENSION section
Steering linkage too tight	See STEERING LINKAGE in STEERING section
Power steering fluid low	Add proper amount of fluid
Power steering drive belt loose	See STEERING section
Power steering pump defective	See STEERING section
Steering gear out of adjustment	See STEERING section
Incorrect wheel alignment	See WHEEL ALIGNMENT
Damaged steering gear	See STEERING section
Damaged suspension	See SUSPENSION section
Bent steering knuckle or supports	See SUSPENSION section
Vehicle "Wanders"	
Strut rod or control arm bushing worn	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARINGS in SUSPENSION section
Improper tire inflation	Check tire pressure

CONDITION & POSSIBLE CAUSE	**CORRECTION**
Stabilizer bar missing or defective	See SUSPENSION section
Wheel alignment out of tolerance	See Adjustment in WHEEL ALIGNMENT section
Broken spring	See SUSPENSION section
Defective shock absorber	Replace shock absorbers
Worn steering & suspension components	See SUSPENSION section
Front End Shimmy	
Tire out of balance/round	Check tire balance
Excessive wheel runout	See WHEEL ALIGNMENT
Insufficient or improper caster	See WHEEL ALIGNMENT section
Worn suspension or steering components	See SUSPENSION section
Defective shock absorbers	Replace shock absorber
Wheel bearings worn or loose	See WHEEL BEARING ADJ. in SUSPENSION section
Power steering reaction Bracket loose	See STEERING section
Steering gear box (rack) mounting loose	See STEERING section
Steering gear adjustment loose	See STEERING section
Worn spherical joints	See SUSPENSION section
Toe-In Not Adjustable	
Lower control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Camber Not Adjustable	
Control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Hub & bearing not seated properly	See SUSPENSION section

ENGINE PERFORMANCE

NOTE: **This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the ENGINE PERFORMANCE category.**

TUNE-UP TROUBLE SHOOTING

Problem & Possible Cause	Action
Carbon Fouled Plugs	
Clogged Air Filter	Replace Air Filter
Incorrect Idle Speed	Reset Idle Speed
Faulty Ignition Wiring	Replace Ignition Wiring
Sticky Valves/Worn Valve Seal	Check Valve Train
Fuel Injection Operation	Check Fuel Injection
Wet/Oil Fouled Plugs	
Worn Rings/Pistons	Overhaul/Replace Engine
Excessive Cylinder Wear	Overhaul/Replace Engine
Plug Gap Bridged	
Combustion Chamber Carbon Deposits	Clean Combustion Chamber
Blistered Electrode	
Engine Overheating	Check Cooling System
Loose Spark Plugs	Clean/Torque Plugs
Over-Advanced Timing	Reset Timing
Wrong Plug Heat Range	Install Correct Plug
Melted Electrodes	
Incorrect Timing	Reset Timing
Burned Valves	Replace Valves
Engine Overheating	Check Cooling System
Wrong Plug Heat Range	Install Correct Plug
Engine Won't Start	
Loose Connections	Check Connections
No Power	Check Fuses/Battery
Loose/Worn Timing Belt/Chain/Gears	Check Belt/Chain/Gears
Engine Runs Rough	
Leaky/Clogged Fuel Injectors	Repair Fuel Injectors
Leaky/Clogged Fuel Lines	Repair Fuel Lines
Clogged Fuel Filter	Replace Fuel Filter
Incorrect Timing	Reset Timing/Check Advance
Faulty Plugs/Wires	Replace Plugs/Wires
Uneven Compression	Overhaul/Replace Engine
Poor Acceleration	

Problem & Possible Cause	Action
Incorrect Ignition Timing	Reset Timing
Leaky Valves	Check Compression
Component Failure	
Spark Arcing	Replace Faulty Part
Defective Pick-Up Coil	Replace Pick-Up Coil
Defective Ignition Coil	Replace Ignition Coil
Defective Control Unit	Replace Control Unit
Ignition Diagnosis By Scope Pattern	
All Firing Lines Abnormally High	
Retarded Ignition Timing	Reset Ignition Timing
Lean Air/Fuel Mixture	Adjust Fuel Mixture
High Secondary Resistance	Repair Secondary Ignition
All Firing Lines Abnormally Low	
Rich Air/Fuel Mixture	Adjust Air/Fuel Mixture
Arcing Coil Wire	Replace Coil Wire
Cracked Coil	Replace Coil
Low Coil Output	Replace Coil
Low Compression	Check/Repair Engine
Several High Firing Lines	
Fuel Mixture Unbalanced	Check Fuel System
EGR Valve Stuck Open	Clean/Replace EGR Valve
High Plug Wire Resistance	Replace Plug Wire
Cracked/Broken Plugs	Replace Plugs
Intake Vacuum Leak	Repair Leak
Several Low Firing Lines	
Fuel Mixture Unbalanced	Adjust Fuel Mixture
Plug Wires Arcing	Replace Plug Wires
Cracked Coil Arcing	Replace Coil
Uneven Compression	Check/Repair Engine
Faulty Spark Plugs	Replace Plugs
Cylinders Not Firing	
Cracked Distributor Cap	Replace Cap
Shorted Plug Wires	Replace Plug Wires
Mechanical Engine Fault	Check/Repair Engine
Spark Plugs Fouled	Replace Plugs
Carbon Track in Distributor Cap	Replace Cap
Hard Starting	
Defective Ignition Coil(s)	Replace Coil(s)
Fouled Spark Plugs	Replace Plugs
Incorrect Timing	Reset Ignition Timing

NOTE: **This article is generic in nature and all information does not apply to all vehicles. For vehicle specific information, see the appropriate articles in the ENGINE PERFORMANCE category.**

FUEL INJECTION TROUBLE SHOOTING

Problem & Possible Cause	Action
Cold Start Valve Inoperative	Test Cold Start Valve
Poor Vacuum/Electrical Connection	Repair Connections

Problem & Possible Cause	**Action**
Contaminated Fuel	Test Fuel for Water/Alcohol
Bad Fuel Pump Relay/Circuit	Test Relay/Wiring
Battery Voltage Low	Charge/Test Battery
Low Fuel Pressure	Test Press. Regulator/Pump
No Distributor Reference Pulse	Repair Ignition System
Coolant Temp. Sensor Defective	Test Temp. Sensor/Circuit
No Power To Injectors	Check Injector Fuse/Relay
Hard Starting	
Defective Idle Air Control (IAC)	Test IAC and Circuit
EGR Valve Open	Test EGR Valve/Control Circuit
Restricted Fuel Lines	Inspect/Replace Fuel Lines
Poor MAP Sensor Signal	Test MAP Sensor/Circuit
Engine Stalls During Parking Maneuver	Check P.S. Press. Switch
Rough Idle	
Dirty Fuel Injectors	Clean/Replace Injectors
Poor MAP Sensor Signal	Test MAP Sensor/Circuit
Intermittent Fuel Injector Operation	Check Harness Connectors
Erratic Vehicle Speed Sensor Inputs	Harness Too Close to Plug Wires
Poor O_2 Sensor Signal	Test O_2 Sensor/Circuit
Faulty PCV System	Check PCV Valve and Hoses
Poor Acceleration	
Weak Fuel Pump	Replace Fuel Pump
Dirty Fuel Injectors	Clean/Replace Injectors
Excessive Intake Valve Deposits	Clean Intake System
Poor High Speed Operation	
Low Fuel Pump Volume	Faulty Fuel Pump/Filter
Poor MAP Sensor Signal	Test Speed Sensor/Circuit
Acceleration Ping/Knock	
Faulty EGR System	Check EGR Valve and Hoses
Poor Knock Sensor Signal	Test Knock Sensor/Circuit
Poor Baro Sensor Signal	Test Baro Sensor/Circuit
Improper Ignition Timing	Adjust Timing
Engine Overheating	Check Cooling System
Poor Quality Fuel	Use Different Fuel
Carbon Build-Up	Decarbon Engine

GENERAL INFORMATION

Waveforms - Injector Pattern Tutorial

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

PURPOSE OF THIS ARTICLE

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Learning how to interpret injector drive patterns from a Lab Scope can be like learning ignition patterns all over again. This article exists to ease you into becoming a skilled injector pattern interpreter.

You will learn:

- How a DVOM and noid light fall short of a lab scope.
- The two types of injector driver circuits, voltage controlled & current controlled.
- The two ways injector circuits can be wired, constant ground/switched power & constant power/switched ground.
- The two different pattern types you can use to diagnose with, voltage & current.
- All the valuable details injector patterns can reveal.

SCOPE OF THIS ARTICLE

This is NOT a manufacturer specific article. All different types of systems are covered here, regardless of the specific year/make/model/engine.

The reason for such broad coverage is because there are only a few basic ways to operate a solenoid-type injector. By understanding the fundamental principles, you will understand all the major points of injector patterns you encounter. Of course there are minor differences in each specific system, but that is where a waveform library helps out.

If this is confusing, consider a secondary ignition pattern. Even though there are many different implementations, each still has a primary voltage turn-on, firing line, spark line, etc.

If specific waveforms are available in On Demand for the engine and vehicle you are working on, you will find them in the Engine Performance section under the Engine Performance category.

IS A LAB SCOPE NECESSARY?

INTRODUCTION

You probably have several tools at your disposal to diagnose injector circuits. But you might have questioned "Is a lab scope necessary to do a thorough job, or will a set of noid lights and a multifunction DVOM do just as well?"

In the following text, we are going to look at what noid lights and DVOMs do best, do not do very well, and when they can mislead you. As you might suspect, the lab scope, with its ability to look inside an active circuit, comes to the rescue by answering for the deficiencies of these other tools.

OVERVIEW OF NOID LIGHT

The noid light is an excellent "quick and dirty" tool. It can usually be hooked to a fuel injector harness fast and the flashing light is easy to understand. It is a dependable way to identify a no-pulse situation.

However, a noid light can be very deceptive in two cases:

- If the wrong one is used for the circuit being tested. Beware: Just because a connector on a noid light fits the harness does not mean it is the right one.
- If an injector driver is weak or a minor voltage drop is present.

Use the Right Noid Light

In the following text we will look at what can happen if the wrong noid light is used, why there are different types of noid lights (besides differences with connectors), how to identify the types of noid lights, and how to know the right type to use.

First, let's discuss what can happen if the incorrect type of noid light is used. You might see:

- A dimly flashing light when it should be normal.
- A normal flashing light when it should be dim.

A noid light will flash dim if used on a lower voltage circuit than it was designed for. A normally operating circuit would appear underpowered, which could be misinterpreted as the cause of a fuel starvation problem.

Here are the two circuit types that could cause this problem:

- Circuits with external injector resistors. Used predominately on some Asian & European systems, they are used to reduce the available voltage to an injector in order to limit the current flow. This lower voltage can cause a dim flash on a noid light designed for full voltage.
- Circuits with current controlled injector drivers (e.g. "Peak and Hold"). Basically, this type of driver allows a quick burst of voltage/current to flow and then throttles it back significantly for the remainder of the pulse width duration. If a noid light was designed for the other type of driver (voltage controlled, e.g. "Saturated"), it will appear dim because it is expecting full voltage/current to flow for the entire duration of the pulse width.

Let's move to the other situation where a noid light flashes normally when it should be dim. This could occur if a more sensitive noid light is used on a higher voltage/amperage circuit that was weakened enough to cause problems (but not outright broken). A circuit with an actual problem would thus appear normal.

Let's look at why. A noid light does not come close to consuming as much amperage as an injector solenoid. If there is a partial driver failure or a minor voltage drop in the injector circuit, there can be adequate amperage to fully operate the noid light BUT NOT ENOUGH TO OPERATE THE INJECTOR.

If this is not clear, picture a battery with a lot of corrosion on the terminals. Say there is enough corrosion that the starter motor will not operate; it only clicks. Now imagine turning on the headlights (with the ignition in the RUN position). You find they light normally and are fully bright. This is the same idea as noid light: There is a problem, but enough amp flow exists to operate the headlights ("noid light"), but not the starter motor ("injector").

How do you identify and avoid all these situations? By using the correct type of noid light. This requires that you understanding the types of injector circuits that your noid lights are designed for. There are three. They are:

- Systems with a voltage controlled injector driver. Another way to say it: The noid light is designed for a circuit with a "high" resistance injector (generally 12 ohms or above).
- Systems with a current controlled injector driver. Another way to say it: The noid light is designed for a circuit with a low resistance injector (generally less than 12 ohms) without an external injector resistor.

- Systems with a voltage controlled injector driver and an external injector resistor. Another way of saying it: The noid light is designed for a circuit with a low resistance injector (generally less than 12 ohms) and an external injector resistor.

NOTE: **Some noid lights can meet both the second and third categories simultaneously.**

If you are not sure which type of circuit your noid light is designed for, plug it into a known good car and check out the results. If it flashes normally during cranking, determine the circuit type by finding out injector resistance and if an external injector resistor is used. You now know enough to identify the type of injector circuit. Label the noid light appropriately.

Next time you need to use a noid light for diagnosis, determine what type of injector circuit you are dealing with and select the appropriate noid light.

Of course, if you suspect a no-pulse condition you could plug in any one whose connector fit without fear of misdiagnosis. This is because it is unimportant if the flashing light is dim or bright. It is only important that it flashes.

In any cases of doubt regarding the use of a noid light, a lab scope will overcome all inherent weaknesses.

OVERVIEW OF DVOM

A DVOM is typically used to check injector resistance and available voltage at the injector. Some techs also use it check injector on-time either with a built-in feature or by using the dwell/duty function.

There are situations where the DVOM performs these checks dependably, and other situations where it can deceive you. It is important to be aware of these strengths and weaknesses. We will cover the topics above in the following text.

Checking Injector Resistance

If a short in an injector coil winding is constant, an ohmmeter will accurately identify the lower resistance. The same is true with an open winding. Unfortunately, an intermittent short is an exception. A faulty injector with an intermittent short will show "good" if the ohmmeter cannot force the short to occur during testing.

Alcohol in fuel typically causes an intermittent short, happening only when the injector coil is hot and loaded by a current high enough to jump the air gap between two bare windings or to break down any oxides that may have formed between them.

When you measure resistance with an ohmmeter, you are only applying a small current of a few milliamps. This is nowhere near enough to load the coil sufficiently to detect most problems. As a result, most resistance checks identify intermittently shorted injectors as being normal.

There are two methods to get around this limitation. The first is to purchase an tool that checks injector coil windings under full load. The Kent-Moore J-39021 is such a tool, though there are others. The Kent-Moore costs around $240 at the time of this writing and works on many different manufacturer's systems.

The second method is to use a lab scope. Remember, a lab scope allows you to see the regular operation of a circuit in real time. If an injector is having an short or intermittent short, the lab scope will show it.

Checking Available Voltage At the Injector

Verifying a fuel injector has the proper voltage to operate correctly is good diagnostic technique. Finding an open circuit on the feed circuit like a broken wire or connector is an accurate check with a DVOM. Unfortunately, finding an intermittent or excessive resistance problem with a DVOM is unreliable.

Let's explore this drawback. Remember that a voltage drop due to excessive resistance will only occur when a circuit is operating? Since the injector circuit is only operating for a few milliseconds at a time, a DVOM will only see a potential fault for a few milliseconds. The remaining 90+% of the time the unloaded injector circuit will show normal battery voltage.

Since DVOMs update their display roughly two to five times a second, all measurements in between are averaged. Because a potential voltage drop is visible for such a small amount of time, it gets "averaged out", causing you to miss it.

Only a DVOM that has a "min-max" function that checks EVERY MILLISECOND will catch this fault consistently (if used in that mode). The Fluke 87 among others has this capability.

A "min-max" DVOM with a lower frequency of checking (100 millisecond) can miss the fault because it will probably check when the injector is not on. This is especially true with current controlled driver circuits. The Fluke 88, among others fall into this category.

Outside of using a Fluke 87 (or equivalent) in the 1 mS "min-max" mode, the only way to catch a voltage drop fault is with a lab scope. You will be able to see a voltage drop as it happens.

One final note. It is important to be aware that an injector circuit with a solenoid resistor will always show a voltage drop when the circuit is energized. This is somewhat obvious and normal; it is a designed-in voltage drop. What can be unexpected is what we already covered--a voltage drop disappears when the circuit is unloaded. The unloaded injector circuit will show normal battery voltage at the injector. Remember this and do not get confused.

Checking Injector On-Time With Built-In Function

Several DVOMs have a feature that allows them to measure injector on-time (mS pulse width). While they are accurate and fast to hookup, they have three limitations you should be aware of:

- They only work on voltage controlled injector drivers (e.g "Saturated Switch"), NOT on current controlled injector drivers (e.g. "Peak & Hold").
- A few unusual conditions can cause inaccurate readings.
- Varying engine speeds can result in inaccurate readings.

Regarding the first limitation, DVOMs need a well-defined injector pulse in order to determine when the injector turns ON and OFF. Voltage controlled drivers provide this because of their simple switch-like operation. They completely close the circuit for the entire duration of the pulse. This is easy for the DVOM to interpret.

The other type of driver, the current controlled type, start off well by completely closing the circuit (until the injector pintle opens), but then they throttle back the voltage/current for the duration of the pulse. The DVOM understands the beginning of the pulse but it cannot figure out the throttling action. In other words, it cannot distinguish the throttling from an open circuit (de-energized) condition.

Yet current controlled injectors will still yield a millisecond on-time reading on these DVOMs. You will find it is also always the same, regardless of the operating conditions. This is because it is only measuring the initial completely-closed circuit on-time, which always takes the same amount of time (to lift the injector pintle off its seat). So even though you get a reading, it is useless.

The second limitation is that a few erratic conditions can cause inaccurate readings. This is because of a DVOM's slow display rate; roughly two to five times a second. As we covered earlier, measurements in between display updates get averaged. So conditions like skipped injector pulses or intermittent long/short injector pulses tend to get "averaged out", which will cause you to miss important details.

The last limitation is that varying engine speeds can result in inaccurate readings. This is caused by the quickly shifting injector on-time as the engine load varies, or the RPM moves from a state of acceleration to stabilization, or similar situations. It too is caused by the averaging of all measurements in between DVOM display periods. You can avoid this by checking on-time when there are no RPM or load changes.

A lab scope allows you to overcome each one of these limitations.

Checking Injector On-Time With Dwell Or Duty

If no tool is available to directly measure injector millisecond on-time measurement, some techs use a simple DVOM dwell or duty cycle functions as a replacement.

While this is an approach of last resort, it does provide benefits. We will discuss the strengths and weaknesses in a moment, but first we will look at how a duty cycle meter and dwell meter work.

How A Duty Cycle Meter and Dwell Meter Work

All readings are obtained by comparing how long something has been OFF to how long it has been ON in a fixed time period. A dwell meter and duty cycle meter actually come up with the same answers using different scales. You can convert freely between them. See **RELATIONSHIP BETWEEN DWELL & DUTY CYCLE READINGS TABLE**.

The DVOM display updates roughly one time a second, although some DVOMs can be a little faster or slower. All measurements during this update period are tallied inside the DVOM as ON time or OFF time, and then the total ratio is displayed as either a percentage (duty cycle) or degrees (dwell meter).

For example, let's say a DVOM had an update rate of exactly 1 second (1000 milliseconds). Let's also say that it has been measuring/tallying an injector circuit that had been ON a total of 250 mS out of the 1000 mS. That is a ratio of one-quarter, which would be displayed as 25% duty cycle or 15B° dwell (six-cylinder scale). Note that most duty cycle meters can reverse the readings by selecting the positive or negative slope to trigger on. If this reading were reversed, a duty cycle meter would display 75%.

Strengths of Dwell/Duty Meter

The obvious strength of a dwell/duty meter is that you can compare injector on-time against a known-good reading. This is the only practical way to use a dwell/duty meter, but requires you to have known-good values to compare against.

Another strength is that you can roughly convert injector mS on-time into dwell reading with some computations.

A final strength is that because the meter averages everything together it does not miss anything (though this is also a severe weakness that we will look at later). If an injector has a fault where it occasionally skips a pulse, the meter registers it and the reading changes accordingly.

Let's go back to figuring out dwell/duty readings by using injector on-time specification. This is not generally practical, but we will cover it for completeness. You NEED to know three things:

- Injector mS on-time specification.
- Engine RPM when specification is valid.
- How many times the injectors fire per crankshaft revolution.

The first two are self-explanatory. The last one may require some research into whether it is a bank-fire type that injects every 360B° of crankshaft rotation, a bank-fire that injects every 720B°, or an SFI that injects every 720B°. Many manufacturers do not release this data so you may have to figure it out yourself with a frequency meter.

Here are the four complete steps to convert millisecond on-time:

1. Determine the injector pulse width and RPM it was obtained at. Let's say the specification is for one millisecond of on-time at a hot idle of 600 RPM.
2. Determine injector firing method for the complete 4 stroke cycle. Let's say this is a 360B° bank-fired, meaning an injector fires each and every crankshaft revolution.
3. Determine how many times the injector will fire at the specified engine speed (600 RPM) in a fixed time period. We will use 100 milliseconds because it is easy to use. Six hundred crankshaft Revolutions Per Minute (RPM) divided by 60 seconds equals 10 revolutions per second. Multiplying 10 times .100 yields

one; the crankshaft turns one time in 100 milliseconds. With exactly one crankshaft rotation in 100 milliseconds, we know that the injector fires exactly one time.

4. Determine the ratio of injector on-time vs. off-time in the fixed time period, then figure duty cycle and/or dwell. The injector fires one time for a total of one millisecond in any given 100 millisecond period. One hundred minus one equals 99. We have a 99% duty cycle. If we wanted to know the dwell (on 6 cylinder scale), multiple 99% times .6; this equals 59.4B° dwell.

Weaknesses of Dwell/Duty Meter

The weaknesses are significant. First, there is no one-to-one correspondence to actual mS on-time. No manufacturer releases dwell/duty data, and it is time-consuming to convert the mS on-time readings. Besides, there can be a large degree of error because the conversion forces you to assume that the injector(s) are always firing at the same rate for the same period of time. This can be a dangerous assumption.

Second, all level of detail is lost in the averaging process. This is the primary weakness. You cannot see the details you need to make a confident diagnosis.

Here is one example. Imagine a vehicle that has a faulty injector driver that occasionally skips an injector pulse. Every skipped pulse means that that cylinder does not fire, thus unburned O2 gets pushed into the exhaust and passes the O2 sensor. The O2 sensor indicates lean, so the computer fattens up the mixture to compensate for the supposed "lean" condition.

A connected dwell/duty meter would see the fattened pulse width but would also see the skipped pulses. It would tally both and likely come back with a reading that indicated the "pulse width" was within specification because the rich mixture and missing pulses offset each other.

This situation is not a far-fetched scenario. Some early GM 3800 engines were suffering from exactly this. The point is that a lack of detail could cause misdiagnosis.

As you might have guessed, a lab scope would not miss this.

RELATIONSHIP BETWEEN DWELL & DUTY CYCLE READINGS

Dwell Meter (2)	Duty Cycle Meter
1B°	1%
15B°	25%
30B°	50%
45B°	75%
60B°	100%

(1) These are just some examples for your understanding. It is okay to fill in the gaps.

(2) Dwell meter on the six-cylinder scale.

THE TWO TYPES OF INJECTOR DRIVERS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

OVERVIEW

There are two types of transistor driver circuits used to operate electric fuel injectors: voltage controlled and current controlled. The voltage controlled type is sometimes called a "saturated switch" driver, while the current controlled type is sometimes known as a "peak and hold" driver.

The basic difference between the two is the total resistance of the injector circuit. Roughly speaking, if a particular leg in an injector circuit has total resistance of 12 or more ohms, a voltage control driver is used. If less than 12 ohms, a current control driver is used.

It is a question of what is going to do the job of limiting the current flow in the injector circuit; the inherent "high" resistance in the injector circuit, or the transistor driver. Without some form of control, the current flow through the injector would cause the solenoid coil to overheat and result in a damaged injector.

VOLTAGE CONTROLLED CIRCUIT ("SATURATED SWITCH")

The voltage controlled driver inside the computer operates much like a simple switch because it does not need to worry about limiting current flow. Recall, this driver typically requires injector circuits with a total leg resistance of 12 or more ohms.

The driver is either ON, closing/completing the circuit (eliminating the voltage-drop), or OFF, opening the circuit (causing a total voltage drop).

Some manufacturers call it a "saturated switch" driver. This is because when switched ON, the driver allows the magnetic field in the injector to build to saturation. This is the same "saturation" property that you are familiar with for an ignition coil.

There are two ways "high" resistance can be built into an injector circuit to limit current flow. One method uses an external solenoid resistor and a low resistance injector, while the other uses a high resistance injector without the solenoid resistor. See the left side of Fig. Fig. 1.

In terms of injection opening time, the external resistor voltage controlled circuit is somewhat faster than the voltage controlled high resistance injector circuit. The trend, however, seems to be moving toward use of this latter type of circuit due to its lower cost and reliability. The ECU can compensate for slower opening times by increasing injector pulse width accordingly.

NOTE: **Never apply battery voltage directly across a low resistance injector. This will cause injector damage from solenoid coil overheating.**

Fig. 1: Injector Driver Types - Current and Voltage

CURRENT CONTROLLED CIRCUIT ("PEAK & HOLD")

The current controlled driver inside the computer is more complex than a voltage controlled driver because as the name implies, it has to limit current flow in addition to its ON-OFF switching function. Recall, this driver typically requires injector circuits with a total leg resistance of less than 12 ohms.

Once the driver is turned ON, it will not limit current flow until enough time has passed for the injector pintle to open. This period is preset by the particular manufacturer/system based on the amount of current flow needed to open their injector. This is typically between two and six amps. Some manufacturers refer to this as the "peak" time, referring to the fact that current flow is allowed to "peak" (to open the injector).

Once the injector pintle is open, the amp flow is considerably reduced for the rest of the pulse duration to protect the injector from overheating. This is okay because very little amperage is needed to hold the injector open, typically in the area of one amp or less. Some manufacturers refer to this as the "hold" time, meaning that just enough current is allowed through the circuit to "hold" the already-open injector open.

There are a couple methods of reducing the current. The most common trims back the available voltage for the circuit, similar to turning down a light at home with a dimmer.

The other method involves repeatedly cycling the circuit ON-OFF. It does this so fast that the magnetic field never collapses and the pintle stays open, but the current is still significantly reduced. See the right side of Fig. **Fig. 1** for an illustration.

The advantage to the current controlled driver circuit is the short time period from when the driver transistor goes ON to when the injector actually opens. This is a function of the speed with which current flow reaches its peak due to the low circuit resistance. Also, the injector closes faster when the driver turns OFF because of the lower holding current.

NOTE: **Never apply battery voltage directly across a low resistance injector. This will cause injector damage from solenoid coil overheating.**

THE TWO WAYS INJECTOR CIRCUITS ARE WIRED

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

Like other circuits, injector circuits can be wired in one of two fundamental directions. The first method is to steadily power the injectors and have the computer driver switch the ground side of the circuit. Conversely, the injectors can be steadily grounded while the driver switches the power side of the circuit.

There is no performance benefit to either method. Voltage controlled and current controlled drivers have been successfully implemented both ways.

However, 95% percent of the systems are wired so the driver controls the ground side of the circuit. Only a handful of systems use the drivers on the power side of the circuit. Some examples of the latter are the 1970's Cadillac EFI system, early Jeep 4.0 EFI (Renix system), and Chrysler 1984-87 TBI.

INTERPRETING INJECTOR WAVEFORMS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

INTERPRETING A VOLTAGE CONTROLLED PATTERN

NOTE: **Voltage controlled drivers are also known as "Saturated Switch" drivers. They typically require injector circuits with a total leg resistance of 12 ohms or more.**

NOTE: **This example is based on a constant power/switched ground circuit.**

- See **Fig. 2** for pattern that the following text describes.

Point "A" is where system voltage is supplied to the injector. A good hot run voltage is usually 13.5 or more volts. This point, commonly known as open circuit voltage, is critical because the injector will not get sufficient current saturation if there is a voltage shortfall. To obtain a good look at this precise point, you will need to shift your Lab Scope to five volts per division.

You will find that some systems have slight voltage fluctuations here. This can occur if the injector feed wire is also used to power up other cycling components, like the ignition coil(s). Slight voltage fluctuations are normal and are no reason for concern. Major voltage fluctuations are a different story, however. Major voltage shifts on the injector feed line will create injector performance problems. Look for excessive resistance problems in the feed circuit if you see big shifts and repair as necessary.

Note that circuits with external injector resistors will not be any different because the resistor does not affect open circuit voltage.

Point "B" is where the driver completes the circuit to ground. This point of the waveform should be a clean square point straight down with no rounded edges. It is during this period that current saturation of the injector windings is taking place and the driver is heavily stressed. Weak drivers will distort this vertical line.

Point "C" represents the voltage drop across the injector windings. Point "C" should come very close to the ground reference point, but not quite touch. This is because the driver has a small amount of inherent resistance. Any significant offset from ground is an indication of a resistance problem on the ground circuit that needs repaired. You might miss this fault if you do not use the negative battery post for your Lab Scope hook-up, so it is HIGHLY recommended that you use the battery as your hook-up.

The points between "B" and "D" represent the time in milliseconds that the injector is being energized or held open. This line at Point "C" should remain flat. Any distortion or upward bend indicates a ground problem, short problem, or a weak driver. Alert readers will catch that this is exactly opposite of the current controlled type drivers (explained in the next section), because they bend upwards at this point.

How come the difference? Because of the total circuit resistance. Voltage controlled driver circuits have a high resistance of 12+ ohms that slows the building of the magnetic field in the injector. Hence, no counter voltage is built up and the line remains flat.

On the other hand, the current controlled driver circuit has low resistance which allows for a rapid magnetic field build-up. This causes a slight inductive rise (created by the effects of counter voltage) and hence, the upward bend. You should not see that here with voltage controlled circuits.

Point "D" represents the electrical condition of the injector windings. The height of this voltage spike (inductive kick) is proportional to the number of windings and the current flow through them. The more current flow and greater number of windings, the more potential for a greater inductive kick. The opposite is also true. The less current flow or fewer windings means less inductive kick. Typically you should see a minimum 35 volts at the top of Point "D".

If you do see approximately 35 volts, it is because a zener diode is used with the driver to clamp the voltage. Make sure the beginning top of the spike is squared off, indicating the zener dumped the remainder of the spike. If it is not squared, that indicates the spike is not strong enough to make the zener fully dump, meaning the injector has a weak winding.

If a zener diode is not used in the computer, the spike from a good injector will be 60 or more volts.

Point "E" brings us to a very interesting section. As you can see, the voltage dissipates back to supply value after the peak of the inductive kick. Notice the slight hump? This is actually the mechanical injector pintle closing. Recall that moving an iron core through a magnetic field will create a voltage surge. The pintle is the iron core here.

This pintle hump at Point "E" should occur near the end of the downward slope, and not afterwards. If it does occur after the slope has ended and the voltage has stabilized, it is because the pintle is slightly sticking because of a faulty injector

If you see more than one hump it is because of a distorted pintle or seat. This faulty condition is known as "pintle float".

It is important to realize that it takes a good digital storage oscilloscope or analog lab scope to see this pintle hump clearly. Unfortunately, it cannot always be seen.

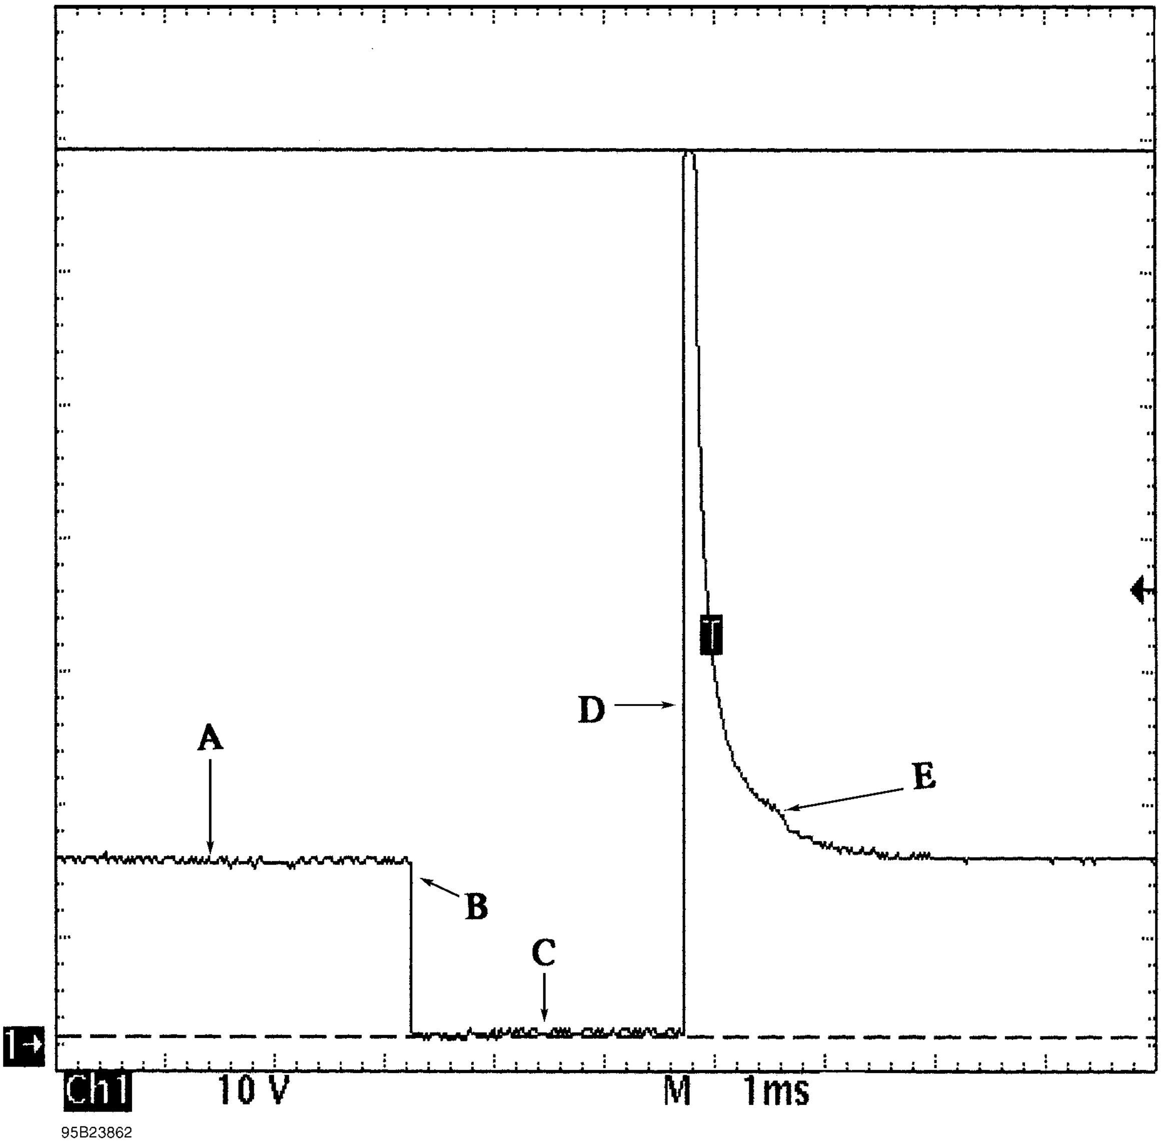

Fig. 2: Identifying Voltage Controlled Type Injector Pattern

INTERPRETING A CURRENT CONTROLLED PATTERN

NOTE: **Current controlled drivers are also known as "Peak and Hold" drivers. They typically require injector circuits with a total leg resistance with less than 12 ohm.**

NOTE: **This example is based on a constant power/switched ground circuit.**

- See **Fig. 3** for pattern that the following text describes.

Point "A" is where system voltage is supplied to the injector. A good hot run voltage is usually 13.5 or more volts. This point, commonly known as open circuit voltage, is critical because the injector will not get sufficient current saturation if there is a voltage shortfall. To obtain a good look at this precise point, you will need to shift your Lab Scope to five volts per division.

You will find that some systems have slight voltage fluctuations here. This could occur if the injector feed wire is also used to power up other cycling components, like the ignition coil(s). Slight voltage fluctuations are normal and are no reason for concern. Major voltage fluctuations are a different story, however. Major voltage shifts on the injector feed line will create injector performance problems. Look for excessive resistance problems in the feed circuit if you see big shifts and repair as necessary.

Point "B" is where the driver completes the circuit to ground. This point of the waveform should be a clean square point straight down with no rounded edges. It is during this period that current saturation of the injector windings is taking place and the driver is heavily stressed. Weak drivers will distort this vertical line.

Point "C" represents the voltage drop across the injector windings. Point "C" should come very close to the ground reference point, but not quite touch. This is because the driver has a small amount of inherent resistance. Any significant offset from ground is an indication of a resistance problem on the ground circuit that needs repaired. You might miss this fault if you do not use the negative battery post for your Lab Scope hook-up, so it is HIGHLY recommended that you use the battery as your hook-up.

Right after Point "C", something interesting happens. Notice the trace starts a normal upward bend. This slight inductive rise is created by the effects of counter voltage and is normal. This is because the low circuit resistance allowed a fast build-up of the magnetic field, which in turn created the counter voltage.

Point "D" is the start of the current limiting, also known as the "Hold" time. Before this point, the driver had allowed the current to free-flow ("Peak") just to get the injector pintle open. By the time point "D" occurs, the injector pintle has already opened and the computer has just significantly throttled the current back. It does this by only allowing a few volts through to maintain the minimum current required to keep the pintle open.

The height of the voltage spike seen at the top of Point "D" represents the electrical condition of the injector windings. The height of this voltage spike (inductive kick) is proportional to the number of windings and the current flow through them. The more current flow and greater number of windings, the more potential for a greater inductive kick. The opposite is also true. The less current flow or fewer windings means less inductive kick. Typically you should see a minimum 35 volts.

If you see approximately 35 volts, it is because a zener diode is used with the driver to clamp the voltage. Make sure the beginning top of the spike is squared off, indicating the zener dumped the remainder of the spike. If it is not squared, that indicates the spike is not strong enough to make the zener fully dump, meaning there is a problem with a weak injector winding.

If a zener diode is not used in the computer, the spike from a good injector will be 60 or more volts.

At Point "E", notice that the trace is now just a few volts below system voltage and the injector is in the current limiting, or the "Hold" part of the pattern. This line will either remain flat and stable as shown here, or will cycle up and down rapidly. Both are normal methods to limit current flow. Any distortion may indicate shorted windings.

Point "F" is the actual turn-off point of the driver (and injector). To measure the millisecond on-time of the injector, measure between points "C" and "F". Note that we used cursors to do it for us; they are measuring a 2.56 mS on-time.

The top of Point "F" (second inductive kick) is created by the collapsing magnetic field caused by the final turn-off of the driver. This spike should be like the spike on top of point "D".

Point "G" shows a slight hump. This is actually the mechanical injector pintle closing. Recall that moving an iron core through a magnetic field will create a voltage surge. The pintle is the iron core here.

This pintle hump at Point "E" should occur near the end of the downward slope, and not afterwards. If it does occur after the slope has ended and the voltage has stabilized, it is because the pintle is slightly sticking. Some older Nissan TBI systems suffered from this.

If you see more than one hump it is because of a distorted pintle or seat. This faulty condition is known as "pintle float".

It is important to realize that it takes a good digital storage oscilloscope or analog lab scope to see this pintle hump clearly. Unfortunately, it cannot always be seen.

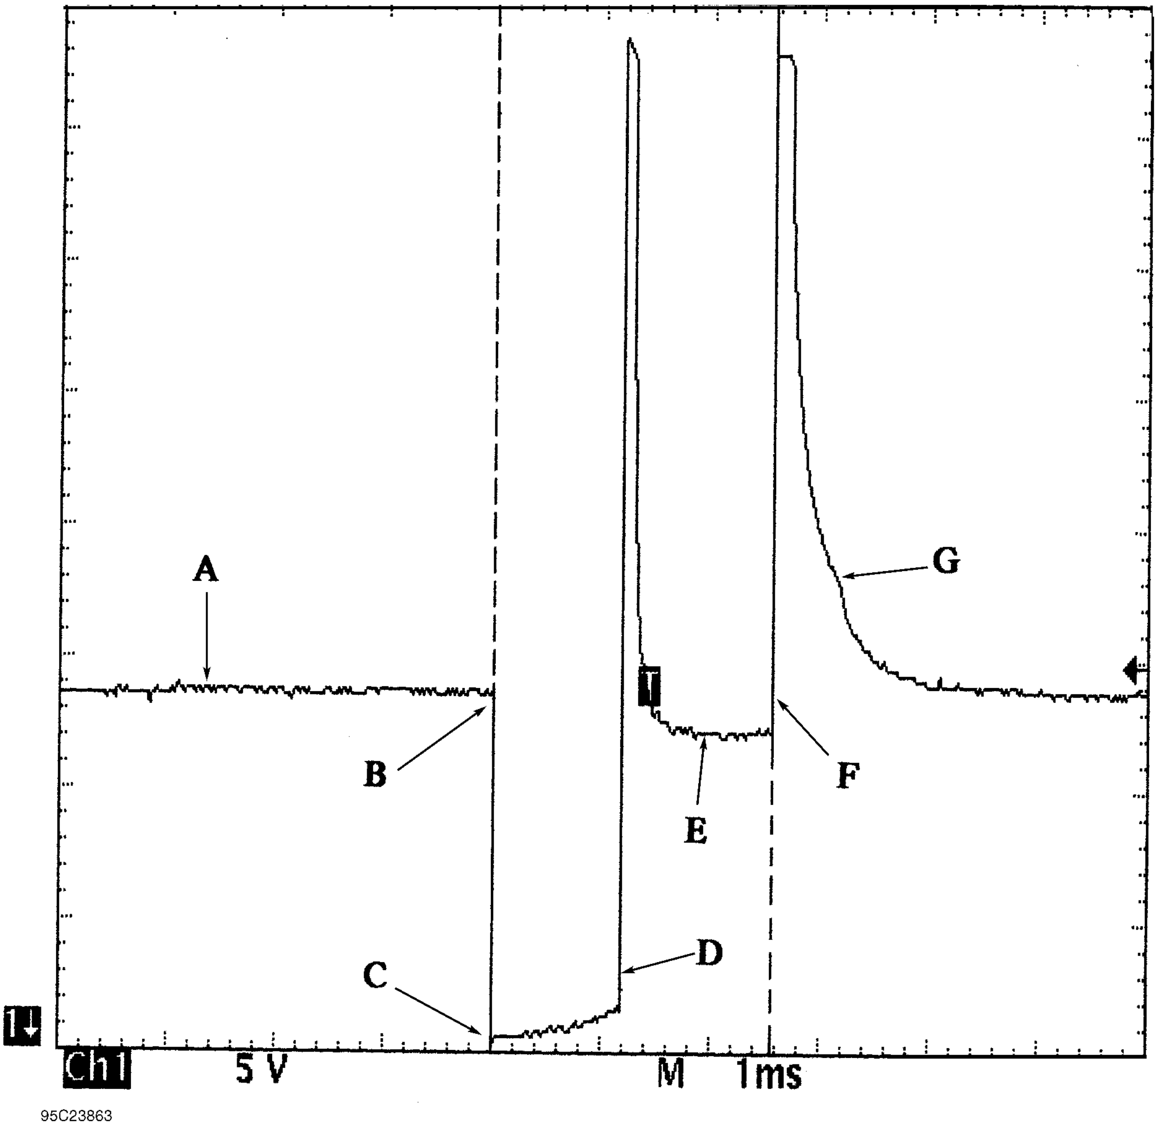

Fig. 3: Identifying Current Controlled Type Injector Pattern

CURRENT WAVEFORM SAMPLES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

EXAMPLE #1 - VOLTAGE CONTROLLED DRIVER

The waveform pattern shown in Fig. Fig. 4 indicate a normal current waveform from a Ford 3.0L V6 VIN [U] engine. This voltage controlled type circuit pulses the injectors in groups of three injectors. Injectors No. 1, 3, and 5 are pulsed together and cylinders 2, 4, and 6 are pulsed together. The specification for an acceptable bank resistance is 4.4 ohms. Using Ohm's Law and assuming a hot run voltage of 14 volts, we determine that the bank would draw a current of 3.2 amps.

However this is not the case because as the injector windings become saturated, counter voltage is created which impedes the current flow. This, coupled with the inherent resistance of the driver's transistor, impedes the current flow even more. So, what is a known good value for a dynamic current draw on a voltage controlled bank of injectors? The waveform pattern shown below indicates a good parallel injector current flow of 2 amps. See **Fig. 4**.

Note that if just one injector has a resistance problem and partially shorts, the entire parallel bank that it belongs to will draw more current. This can damage the injector driver.

The waveform pattern in Fig. **Fig. 5** indicates this type of problem with too much current flow. This is on other bank of injectors of the same vehicle; the even side. Notice the Lab Scope is set on a one amp per division scale. As you can see, the current is at an unacceptable 2.5 amps.

It is easy to find out which individual injector is at fault. All you need to do is inductively clamp onto each individual injector and compare them. To obtain a known-good value to compare against, we used the good bank to capture the waveform in Fig. **Fig. 6**. Notice that it limits current flow to 750 milliamps.

The waveform shown in Fig. **Fig. 7** illustrates the problem injector we found. This waveform indicates an unacceptable current draw of just over one amp as compared to the 750 milliamp draw of the known-good injector. A subsequent check with a DVOM found 8.2 ohms, which is under the 12 ohm specification.

EXAMPLE #2 - VOLTAGE CONTROLLED DRIVER

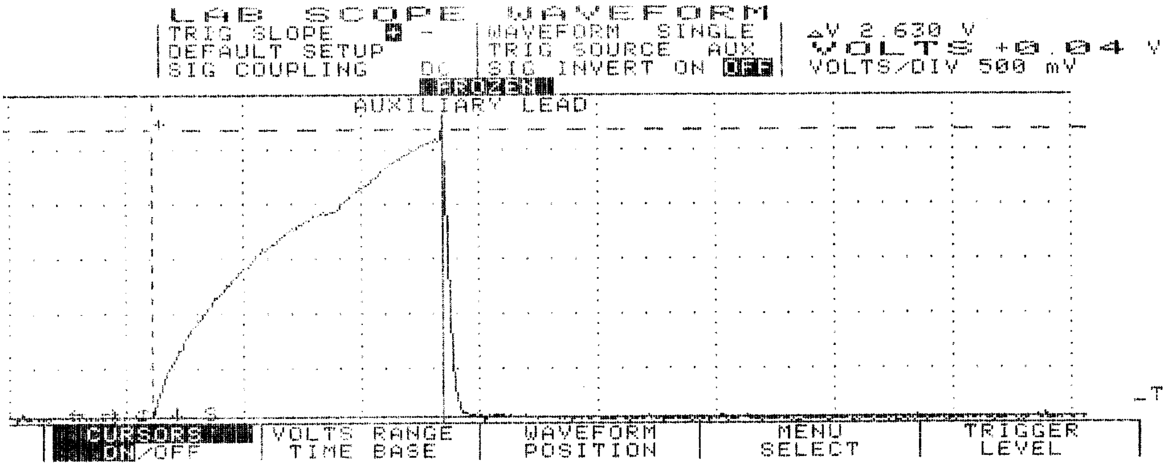
This time we will look at a GM 3.1L V6 VIN [T]. Fig. **Fig. 8** shows the 1, 3, 5 (odd) injector bank with the current waveform indicating about a 2.6 amp draw at idle. This pattern, taken from a known good vehicle, correctly stays at or below the maximum 2.6 amps current range. Ideally, the current for each bank should be very close in comparison.

Notice the small dimple on the current flow's rising edge. This is the actual injector opening or what engineers refer to as the "set point." For good idle quality, the set point should be uniform between the banks.

When discussing Ohm's Law as it pertains to this parallel circuit, consider that each injector has specified resistance of 12.2 ohms. Since all three injectors are in parallel the total resistance of this parallel circuit drops to 4.1 ohms. Fourteen volts divided by four ohms would pull a maximum of 3.4 amps on this bank of injectors. However, as we discussed in **EXAMPLE #1** above, other factors knock this value down to roughly the 2.6 amp neighborhood.

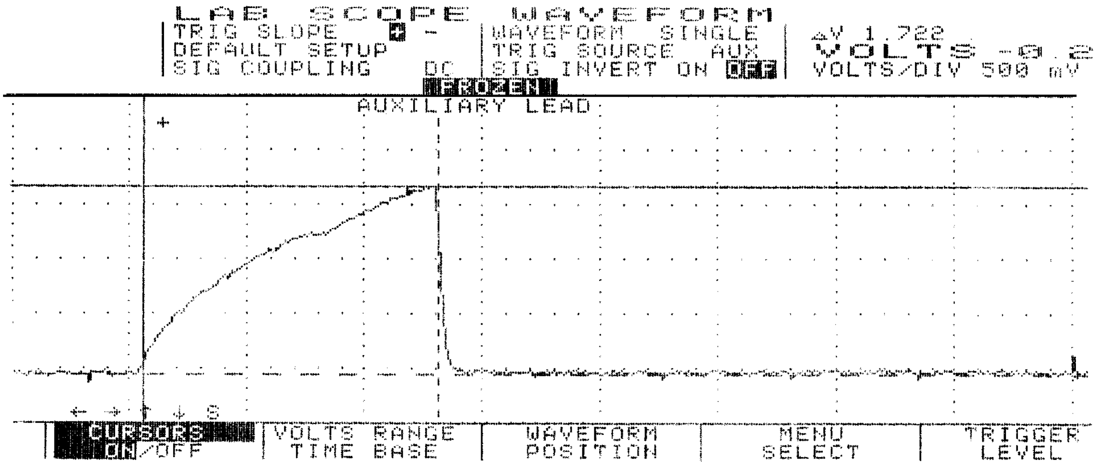
Now we are going to take a look at the even bank of injectors; injectors 2, 4, and 6. See **Fig. 9**. Notice this bank peaked at 1.7 amps at idle as compared to the 2.6 amps peak of the odd bank (Fig. **Fig. 8**). Current flow between even and odd injectors banks is not uniform, yet it is not causing a driveability problem. That is because it is still under the maximum amperage we figured out earlier. But be aware this vehicle could develop a problem if the amperage flow increases any more.

Checking the resistance of this even injector group with a DVOM yielded 6.2 ohms, while the odd injector group in the previous example read 4.1 ohms.



95E23873

Fig. 8: Injector Odd Bank w/Normal Current Flow - Current Pattern



95F23874

Fig. 9: Injector Even Bank w/Normal Current Flow - Current Pattern

EXAMPLE #3 - VOLTAGE CONTROLLED DRIVER

Example #3 is of a Ford 5.0L V8 SEFI. Fig. Fig. 10 shows a waveform of an individual injector at idle with the Lab Scope set on 200 milliamps per division. Notice the dimple in the rising edge. This dimple indicates the actual opening of the injector (set point) occurred at 400 milliamps and current peaked at 750 milliamps. This is a good specification for this engine.

The next waveform pattern in Fig. Fig. 11 shows an abnormality with another injector. With the Lab Scope set on 500 milliamps per division, you can see that the current waveform indicates a 1200 milliamp draw. This is a faulty injector.

Abnormally low resistance injectors create excessive current draw, causing rough idle, and possible computer driver damage.

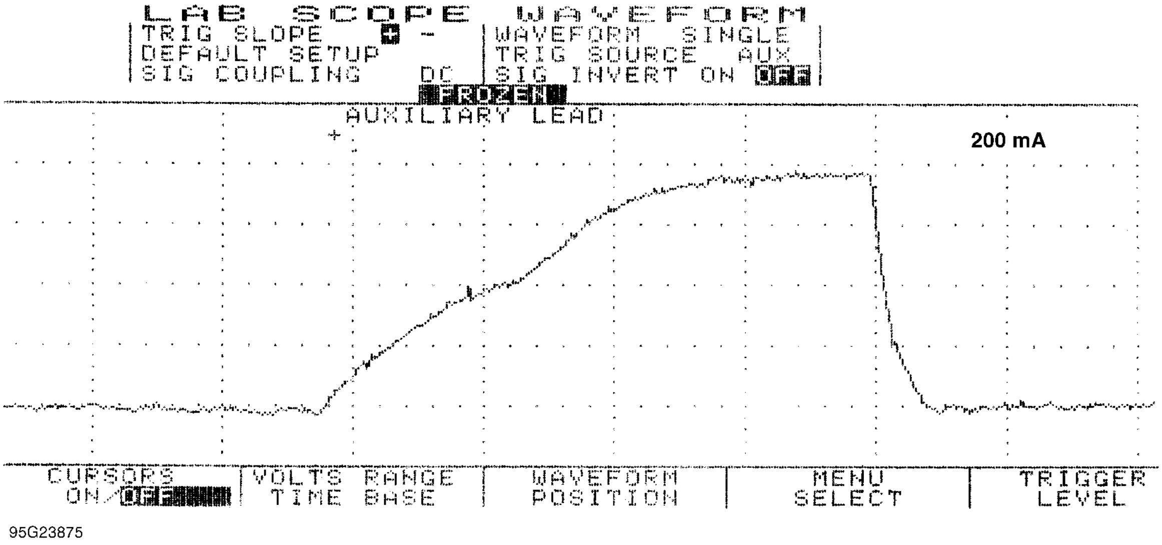


Fig. 10: Single Injector w/Normal Current Flow - Current Pattern

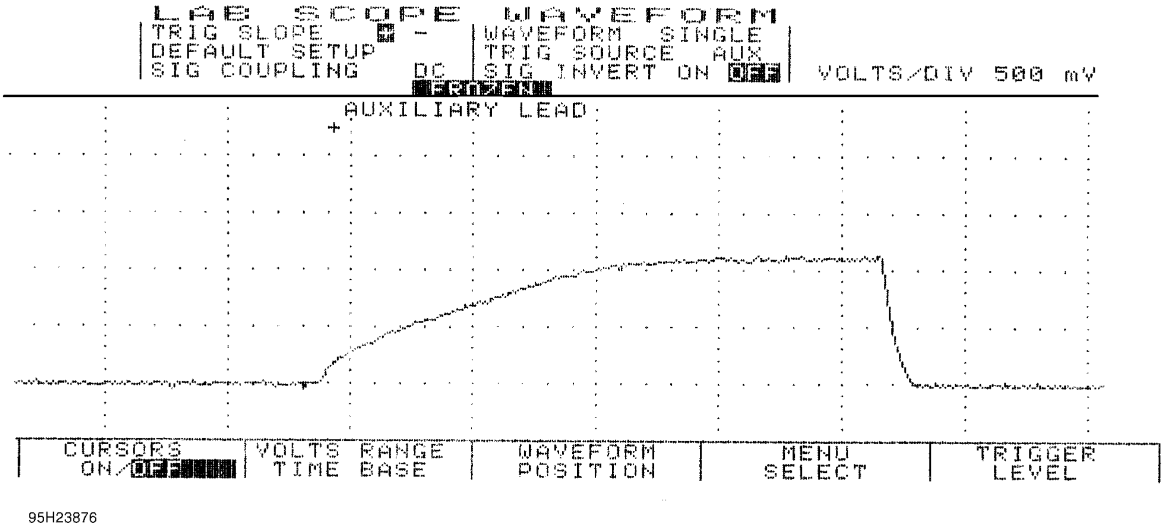

Fig. 11: Single Injector w/Excessive Current Flow - Current Pattern

EXAMPLE #4 - CURRENT CONTROLLED DRIVER

Example #4 is of a Ford 4.6L SEFI VIN [W]. See Fig. 12 for the known-good waveform pattern. This Ford system is different from the one above in EXAMPLE #3 as it peaks at 900 milliamps and the actual opening of the injector (set point) is just below 600 milliamps.

This is offered as a comparison against the Ford pattern listed above, as they are both Ford SEFI injectors but with different operating ranges. The point is that you should not make any broad assumptions for any manufacturer.

EXAMPLE #6 - CURRENT CONTROLLED DRIVER

This next known-good waveform is from a Ford 5.0L V8 CFI VIN [F]. See Fig. 14. The pattern, which is set on a 250 milliamps scale, indicates a 1.25 amp peak draw and a hold at 350 milliamps.

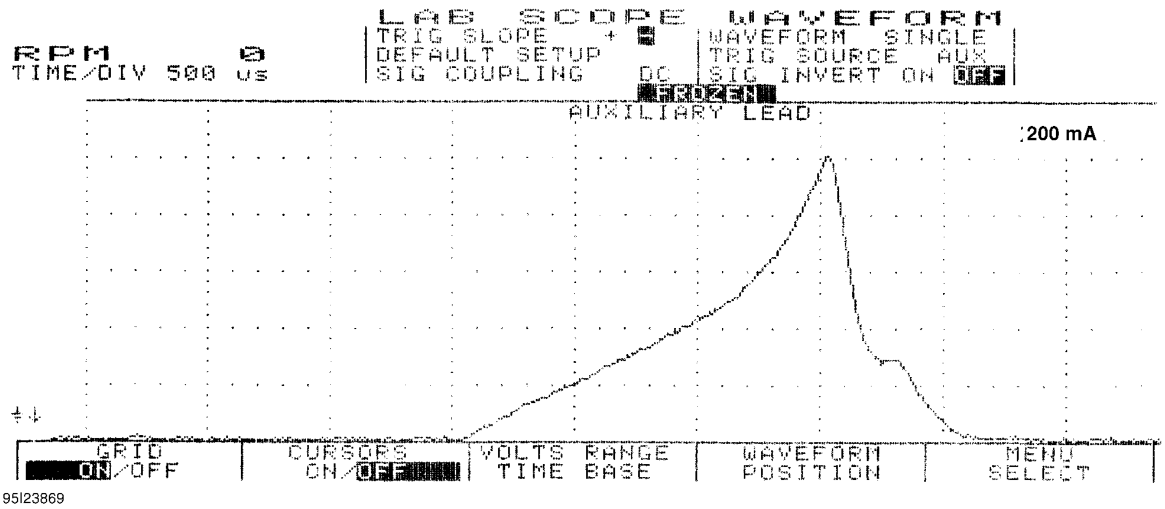

Fig. 14: Single Injector w/Normal Current Flow - Current Pattern

EXAMPLE #7 - CURRENT CONTROLLED DRIVER

The known-good current controlled type waveform in Fig. Fig. 15 is from a GM 2.0L TBI VIN [1]. With the lab scope set at 2 amps per division, notice that this system peaks at 4 amps and holds at 1 amp.

The next waveform is from the same type of engine, except that it shows a faulty injector. See Fig. 16. Notice that the current went to almost 5 amps and stayed at 1 amp during the hold pattern. Excessive amounts of current flow from bad injectors are a common source of intermittent computer shutdown. Using a current waveform pattern is the most accurate method of pinpointing this problem.

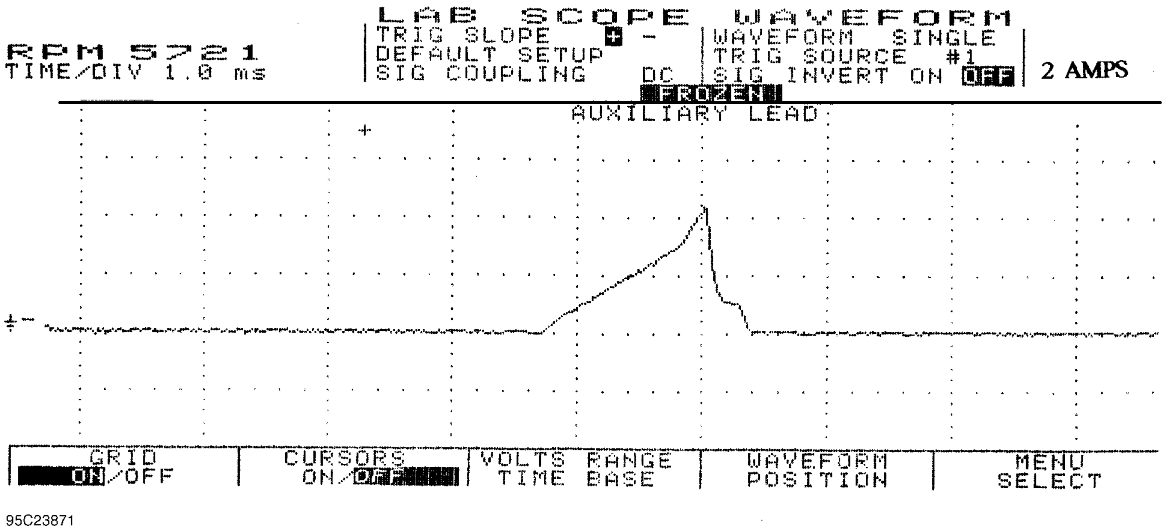

Fig. 15: Single Injector w/Normal Current Flow - Current Pattern

VOLTAGE WAVEFORM SAMPLES

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

EXAMPLE #1 - VOLTAGE CONTROLLED DRIVER

These two known-good waveform patterns are from a Ford 4.6L V8 VIN [W]. Fig. Fig. 18 illustrates the 64 volt inductive kick on this engine, indicating no clamping is occurring. The second pattern, Fig. Fig. 19, was taken during hot idle, closed loop, and no load.

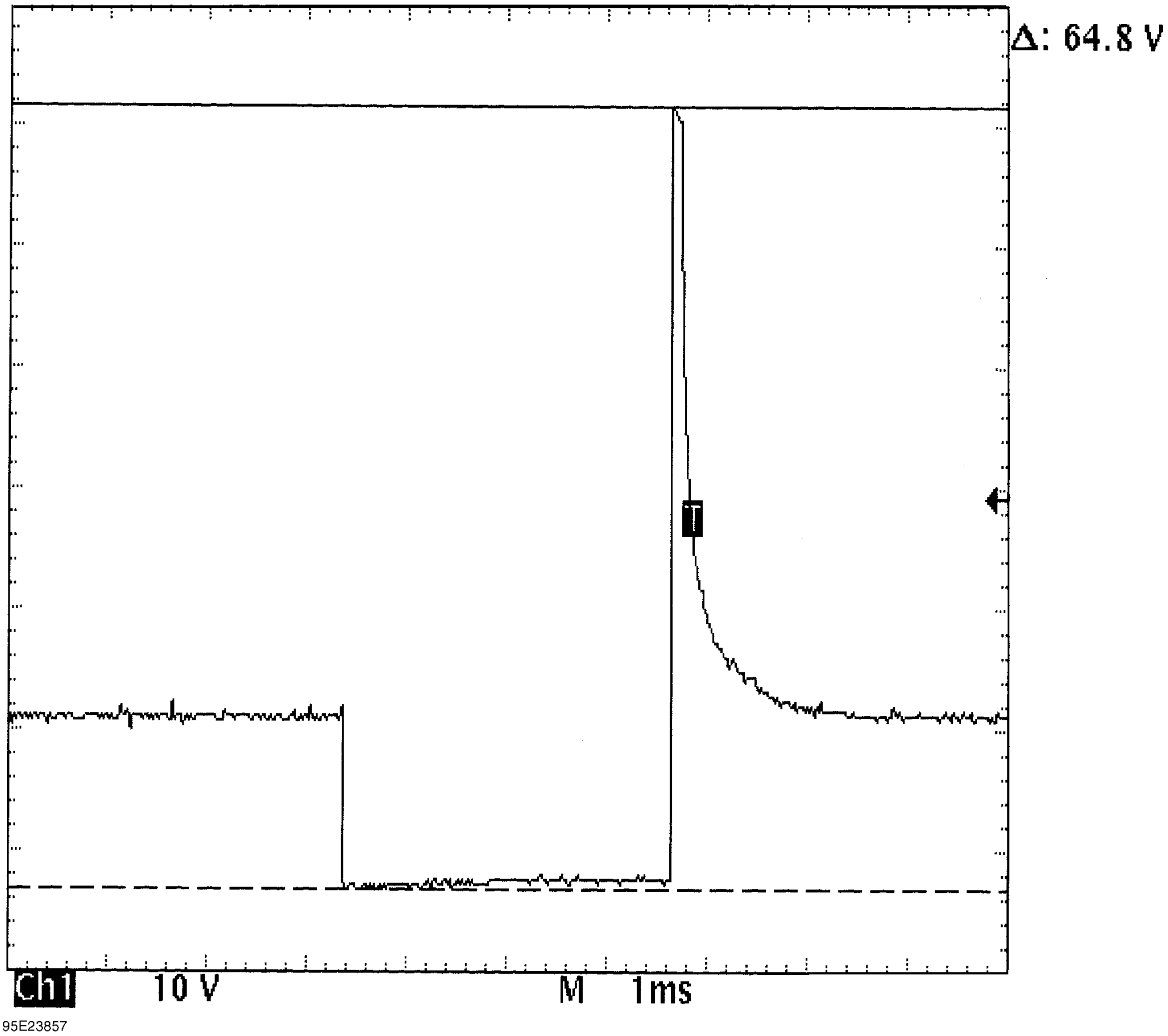

Fig. 18: Injector Bank - Known Good - Voltage Pattern

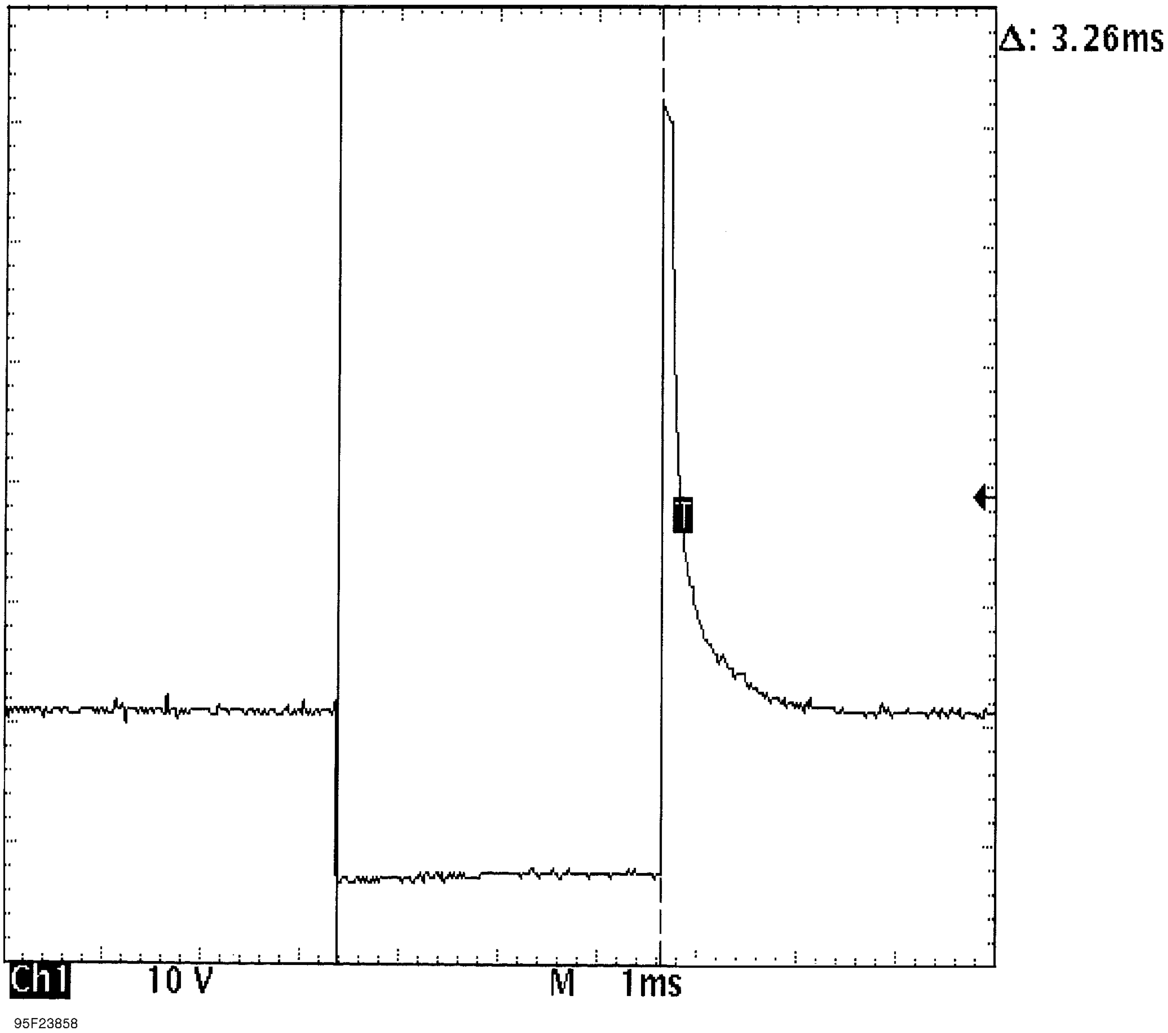

Fig. 19: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #2 - VOLTAGE CONTROLLED DRIVER

The known-good waveform pattern in Fig. Fig. 20 is from a GM 3.8L V6 PFI VIN [3]. It was taken during hot idle, closed loop and no load.

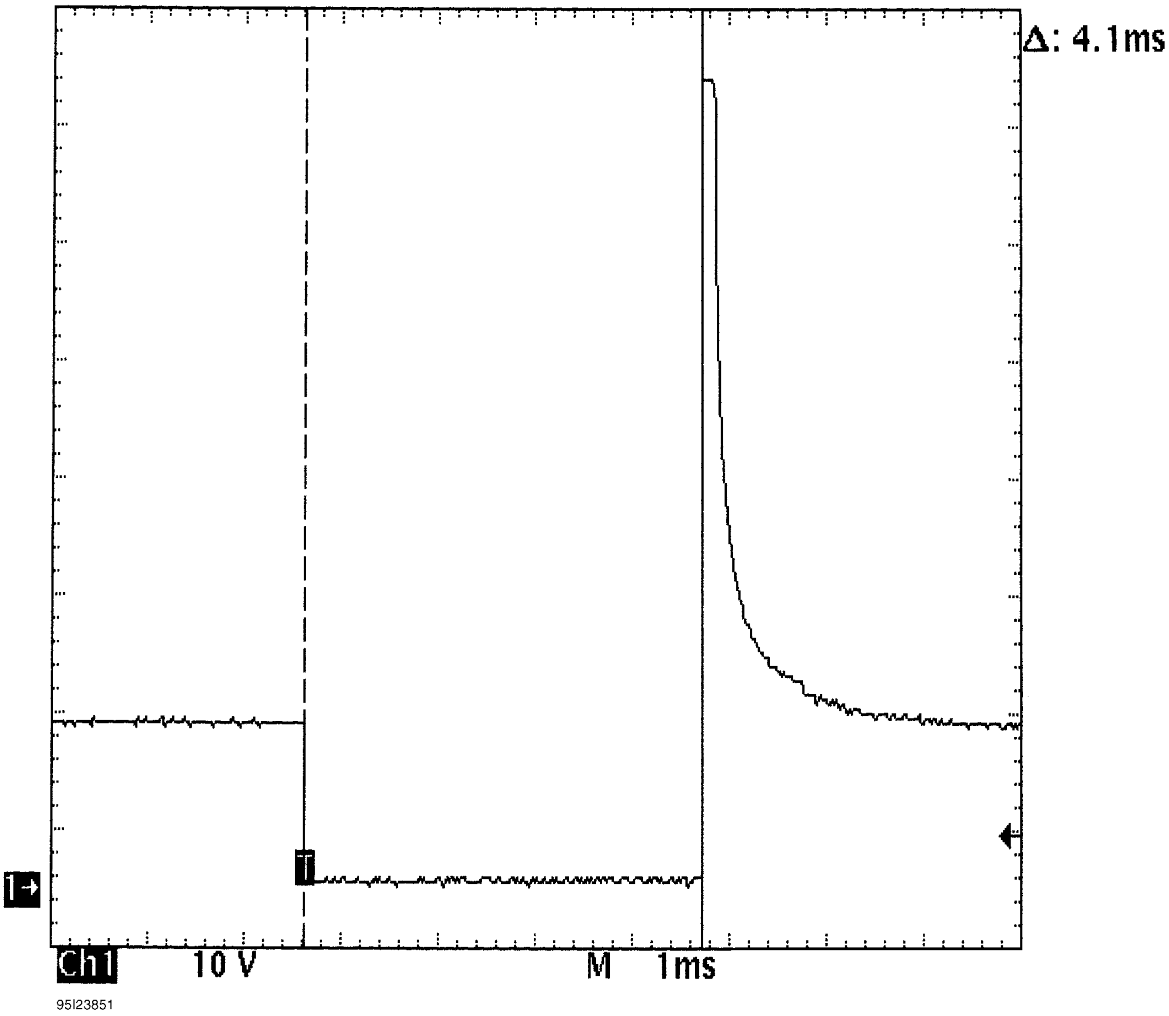

Fig. 20: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #3 - VOLTAGE CONTROLLED DRIVER

This known-good waveform pattern, Fig. **Fig. 21**, is from a GM 5.0L V8 TPI VIN [F]. It was taken during hot idle, closed loop and no load.

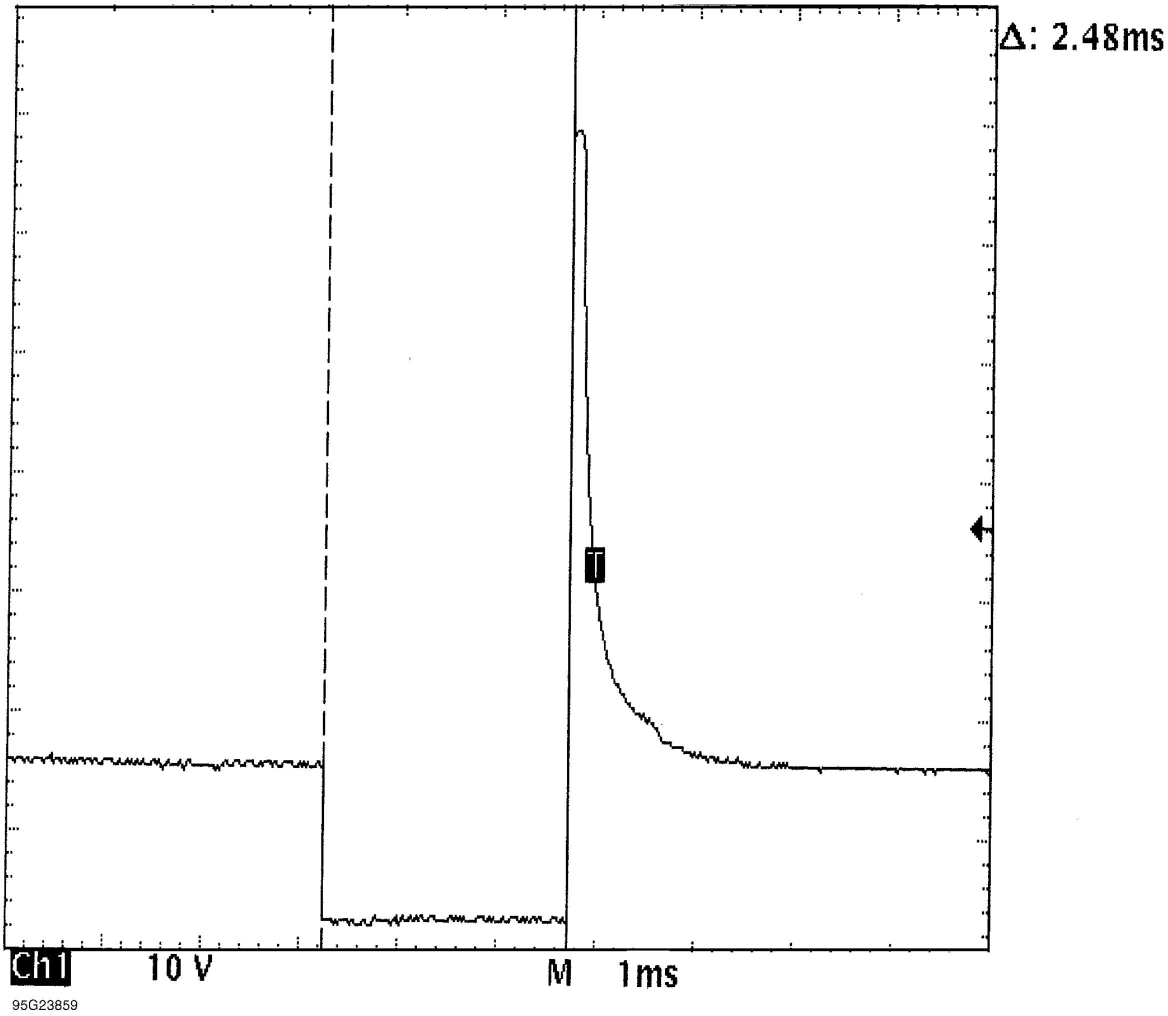

Fig. 21: Injector Bank - Known Good - Voltage Pattern

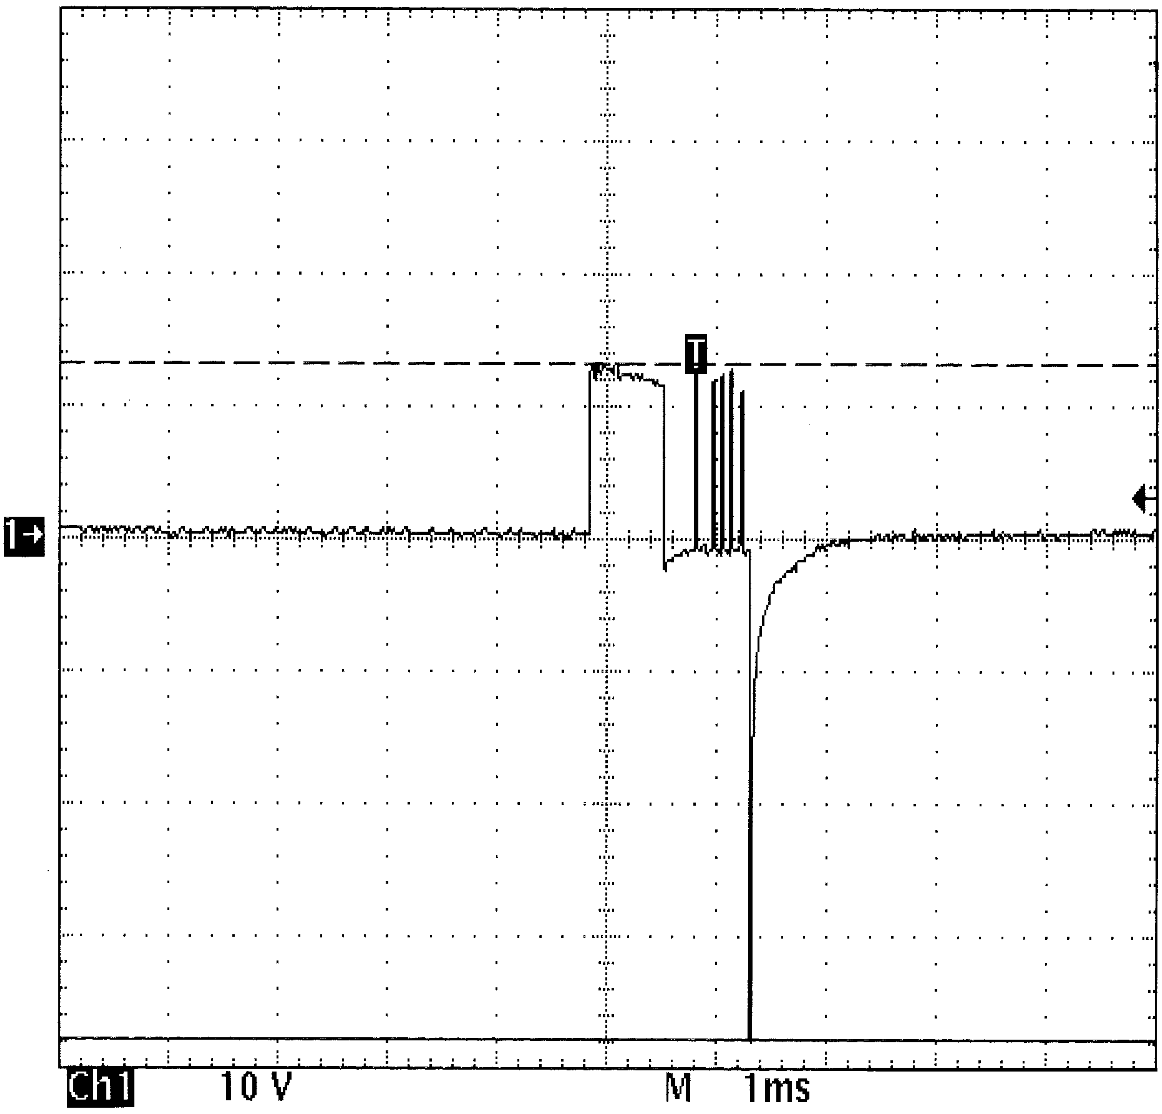
EXAMPLE #4 - CURRENT CONTROLLED DRIVER

From 1984 to 1987, Chrysler used this type injector drive on their TBI-equipped engines. See Fig. 22 for a known-good pattern. Instead of the ground side controlling the injector, Chrysler permanently grounds out the injector and switches the power feed side. Most systems do not work this way.

These injectors peak at 6 amps of current flow and hold at 1 amp.



95J23860

Fig. 22: Single Injector - Known Good - Voltage Pattern

EXAMPLE #5 - CURRENT CONTROLLED DRIVER

These two known-good waveform patterns are from a Chrysler 3.0L V6 VIN [3]. The first waveform, Fig. Fig. 23, is a dual trace pattern that illustrates how Chrysler uses the rising edge of the engine speed signal to trigger the injectors. The second waveform, Fig. Fig. 24, was taken during hot idle, closed loop, and no load.

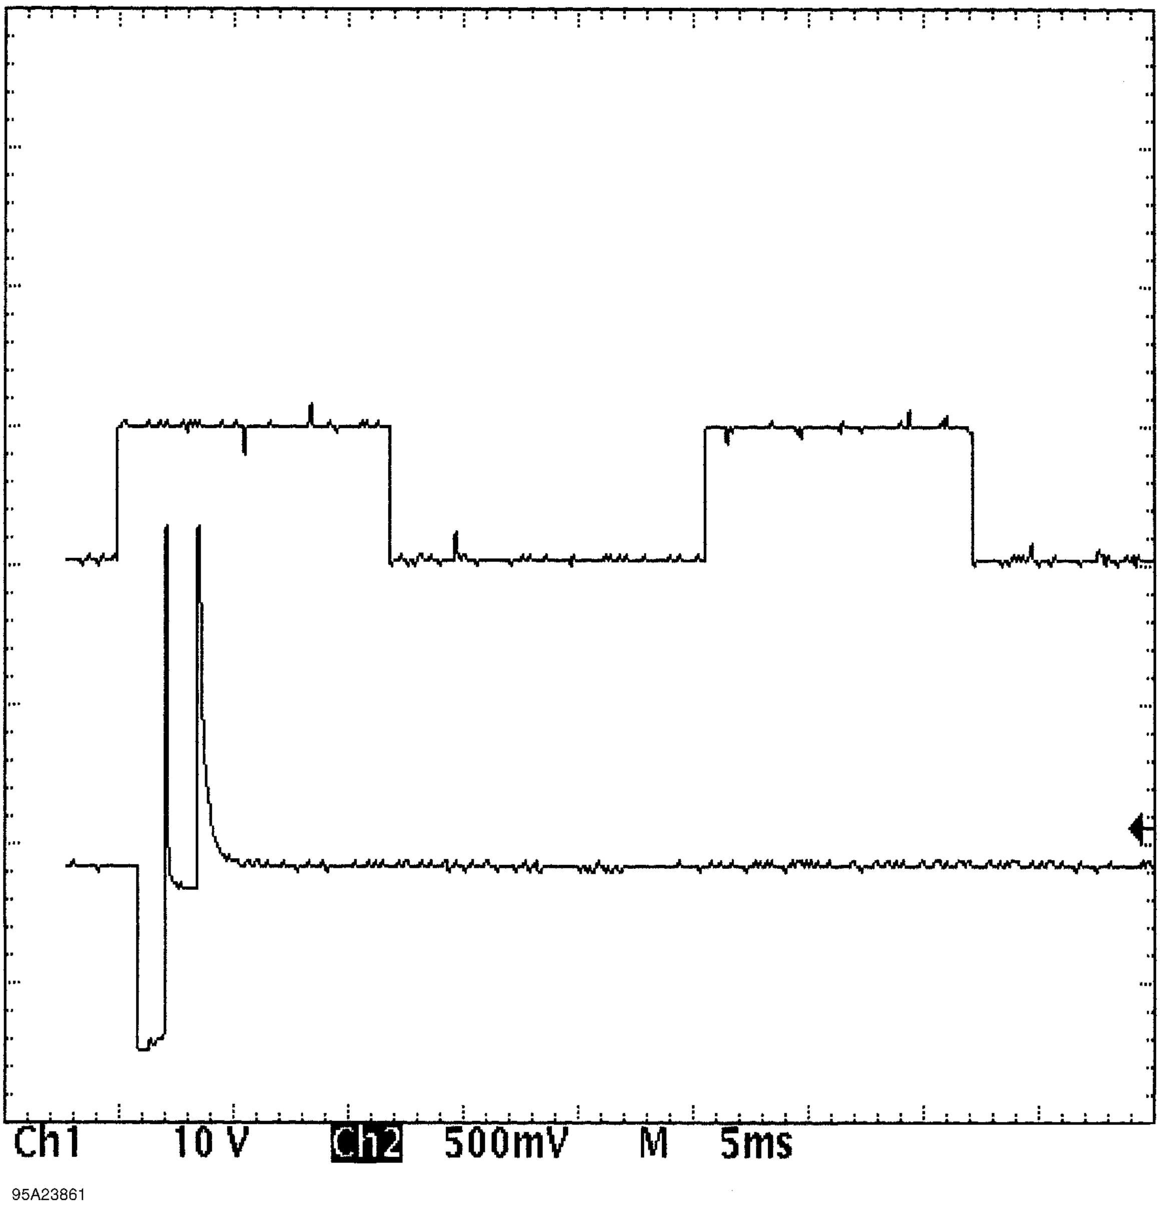


Fig. 23: Injector Bank - Known Good - Voltage Pattern

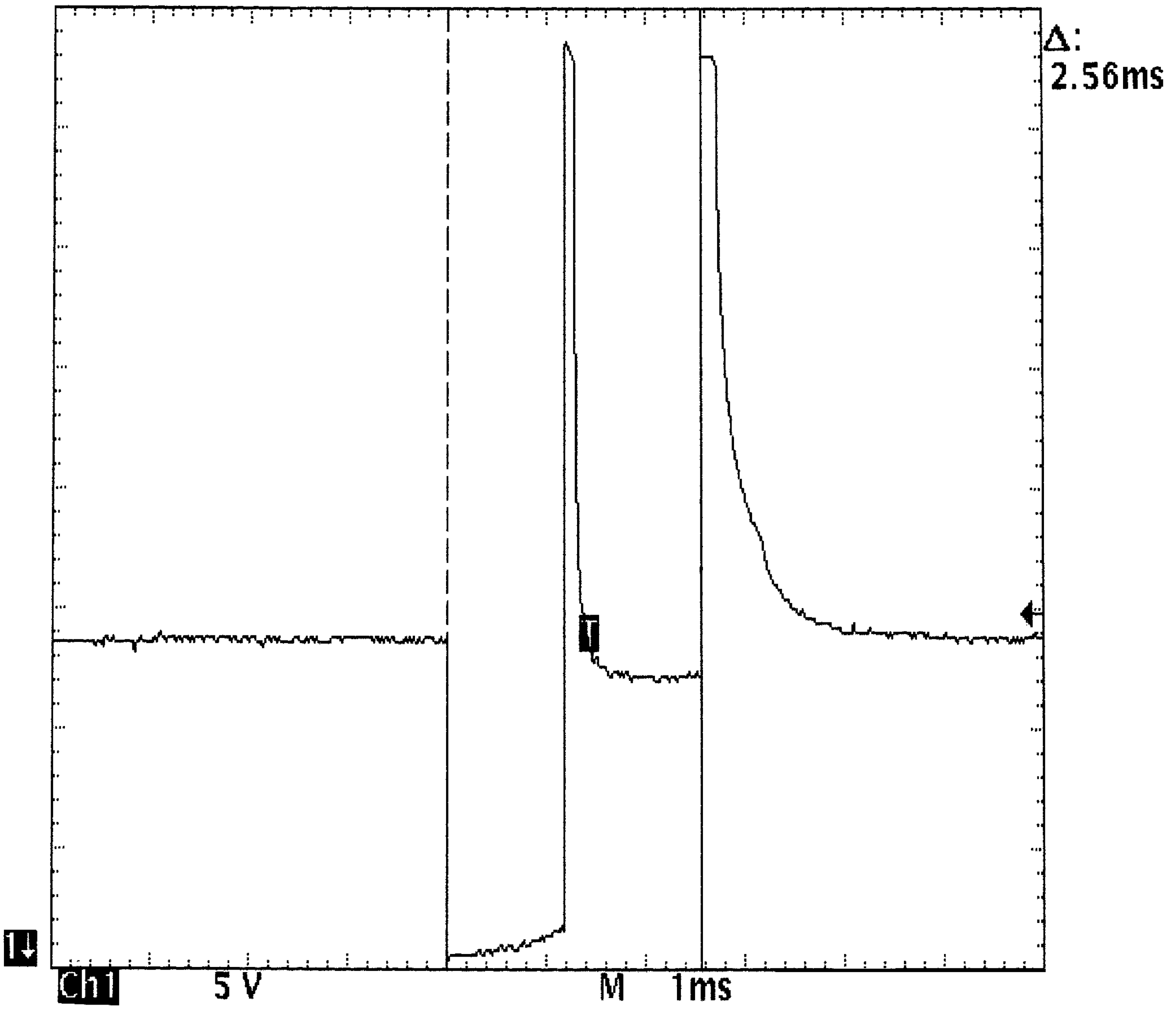
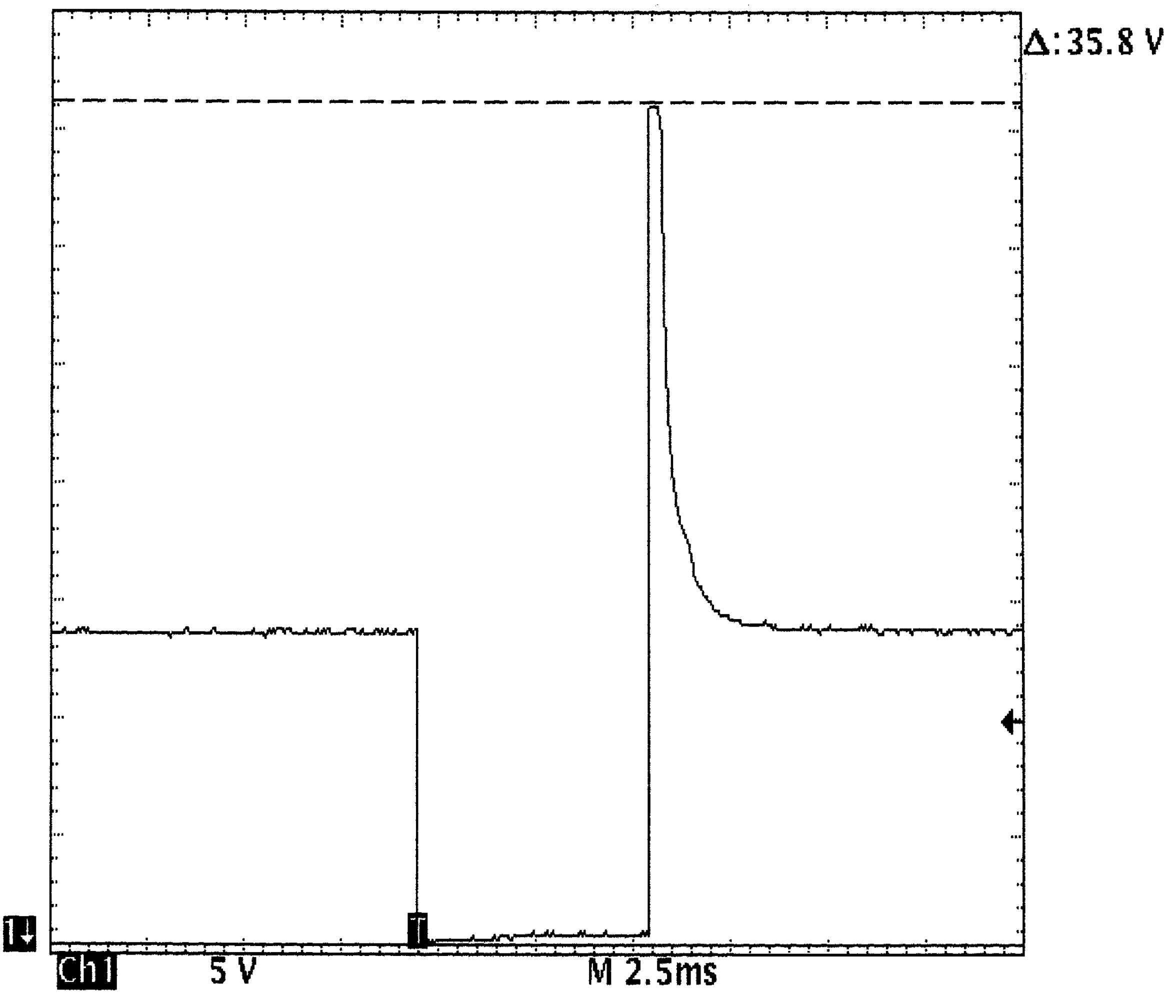


95B23854

Fig. 24: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #6 - CURRENT CONTROLLED DRIVER

This known-good pattern from a Ford 3.0L V6 PFI VIN [U] illustrates that a zener diode inside the computer is used to clamp the injector's inductive kick to 35-volts on this system. See Fig. 25.

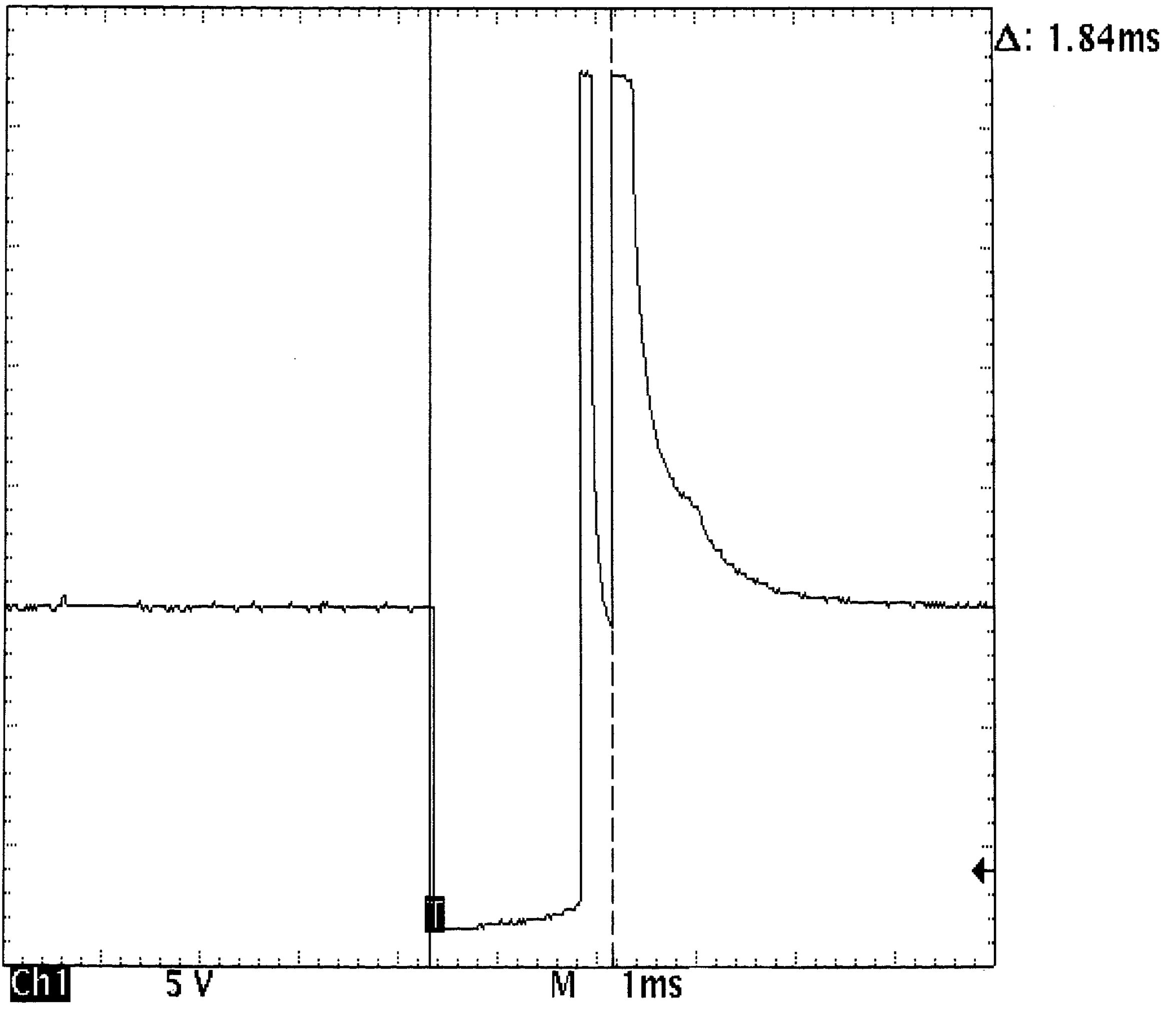


95J23852

Fig. 25: Injector Bank - Known Good - Voltage Pattern

EXAMPLE #7 - CURRENT CONTROLLED DRIVER

This known-good waveform from a Ford 5.0L V8 CFI VIN [F] was taken during hot idle, closed loop, and no load. See **Fig. 26**.



95D23856

Fig. 26: Single Injector - Known Good - Voltage Pattern

EXAMPLE #8 - CURRENT CONTROLLED DRIVER

These two known-good waveform patterns are from a GM 2.0L In-Line 4 VIN [1]. Fig. **Fig. 27** illustrates the 78 volt inductive spike that indicates a zener diode is not used. The second waveform, Fig. **Fig. 28**, was taken during hot idle, closed loop, and no load.

Wheel Alignment Theory & Operation

* PLEASE READ THIS FIRST *

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

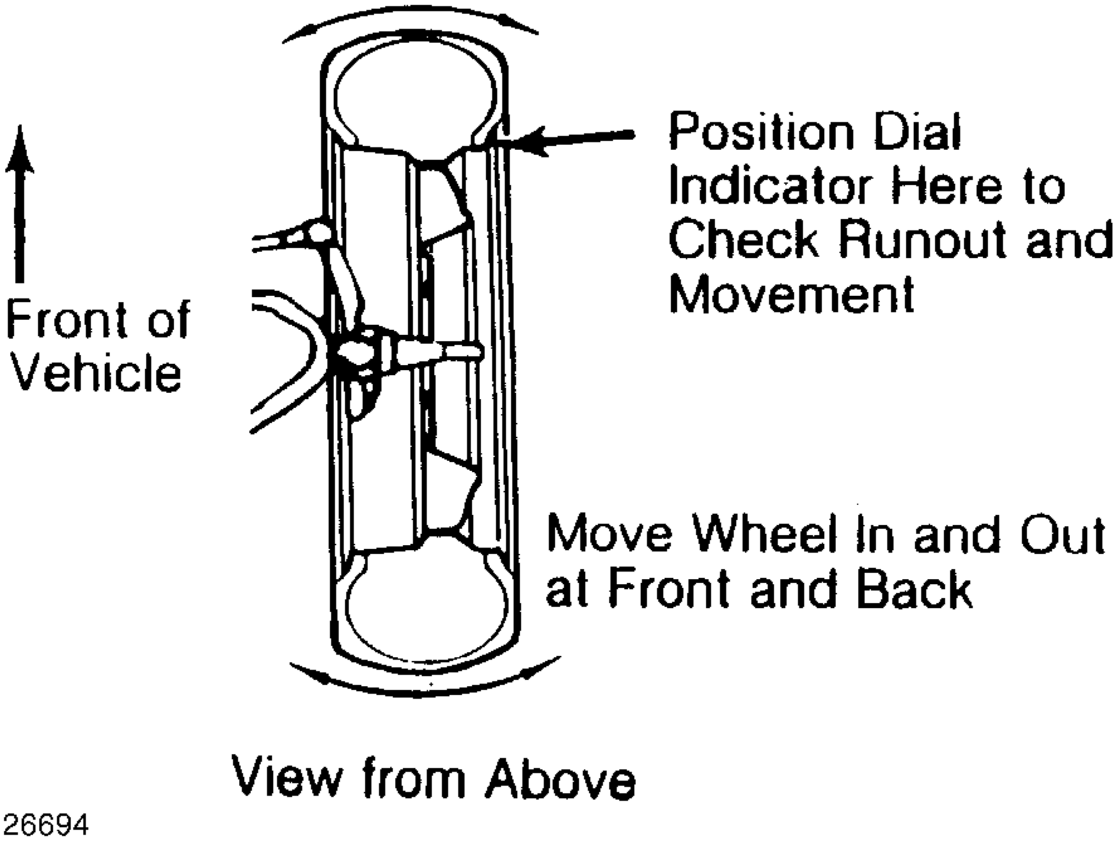
PRE-ALIGNMENT INSTRUCTIONS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

GENERAL ALIGNMENT CHECKS

Before adjusting wheel alignment, check the following:

- Each axle uses tires of same construction and tread style, equal in tread wear and overall diameter. Verify that radial and axial runout is not excessive. Inflation should be at manufacturer's specifications.
- Steering linkage and suspension must not have excessive play. Check for wear in tie rod ends and ball joints. Springs must not be sagging. Control arm and strut rod bushings must not have excessive play. See **Fig. 1**.



Position Dial Indicator Here to Check Runout and Movement
Front of Vehicle
Move Wheel In and Out at Front and Back
View from Above
26694

Fig. 1: Checking Steering Linkage

- Vehicle must be on level floor with full fuel tank, no passenger load, spare tire in place and no load in trunk. Bounce front and rear end of vehicle several times. Confirm vehicle is at normal riding height.
- Steering wheel must be centered with wheels in straight ahead position. If required, shorten one tie rod adjusting sleeve and lengthen opposite sleeve (equal amount of turns). See Fig. 2.
- Wheel bearings should have the correct preload and lug nuts must be tightened to manufacturer's specifications. Adjust camber, caster and toe-in using this sequence. Follow instructions of the alignment equipment manufacturer.

CAUTION: **DO NOT attempt to correct alignment by straightening parts. Damaged parts MUST be replaced.**

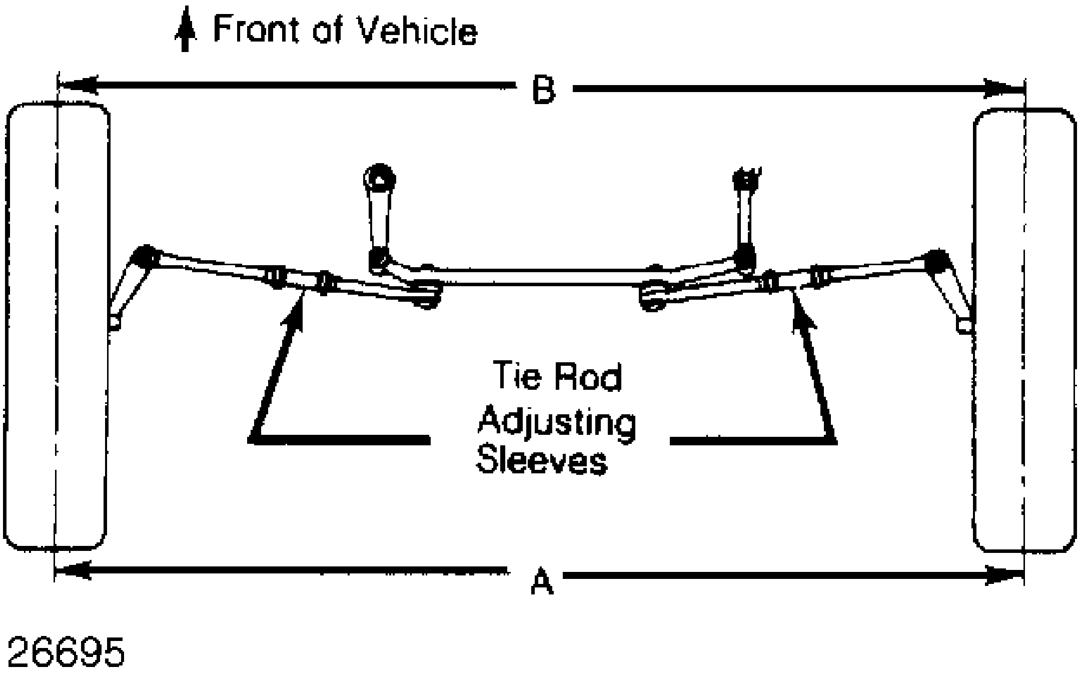


Fig. 2: Adjusting Tie Rod Sleeves (Top View)

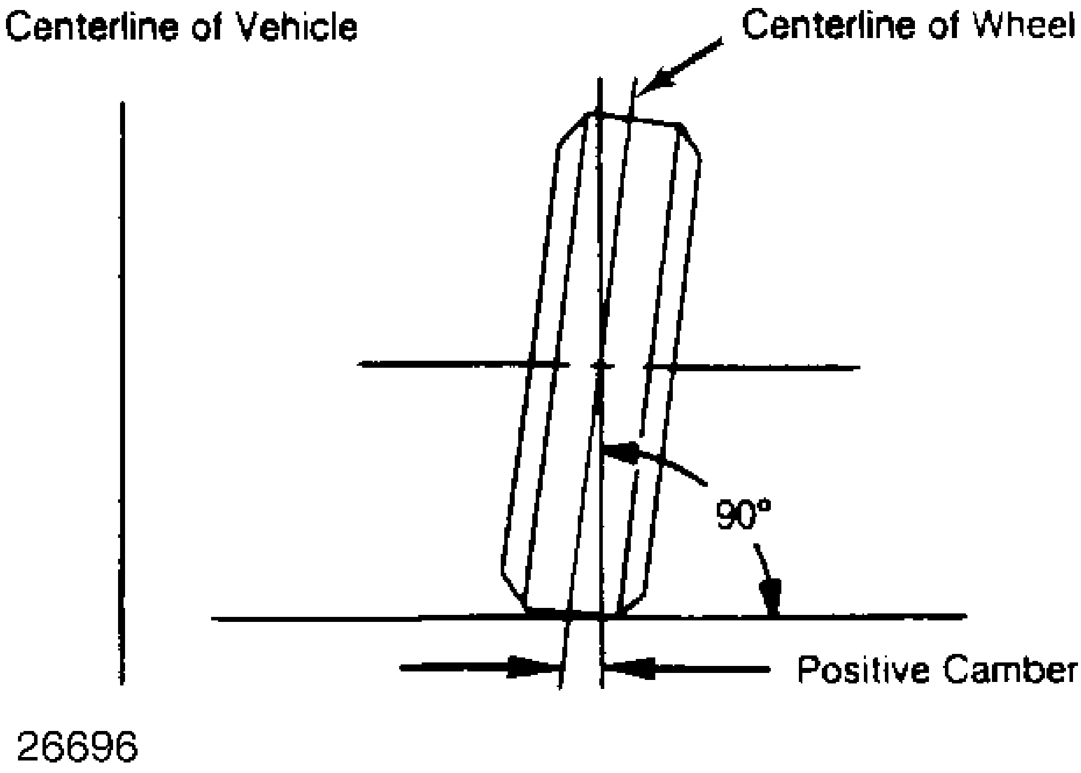
ADJUSTMENTS

NOTE: **This is GENERAL information. This article is not intended to be specific to any unique situation or individual vehicle configuration. For model-specific information see appropriate articles where available.**

CAMBER

1. Camber is the tilting of the wheel, outward at either top or bottom, as viewed from front of vehicle. See Fig. 3.
2. When wheels tilts outward at the top (from centerline of vehicle), camber is positive. When wheels tilt inward at top, camber is negative. Amount of tilt is measured in degrees from vertical.



Centerline of Vehicle
Centerline of Wheel
90°
Positive Camber
26696

Fig. 3: Determining Camber Angle

CASTER

1. Caster is tilting of front steering axis either forward or backward from vertical, as viewed from side of vehicle. See Fig. 4.
2. When axis is tilted backward from vertical, caster is positive. This creates a trailing action on front wheels. When axis is tilted forward, caster is negative, causing a leading action on front wheels.

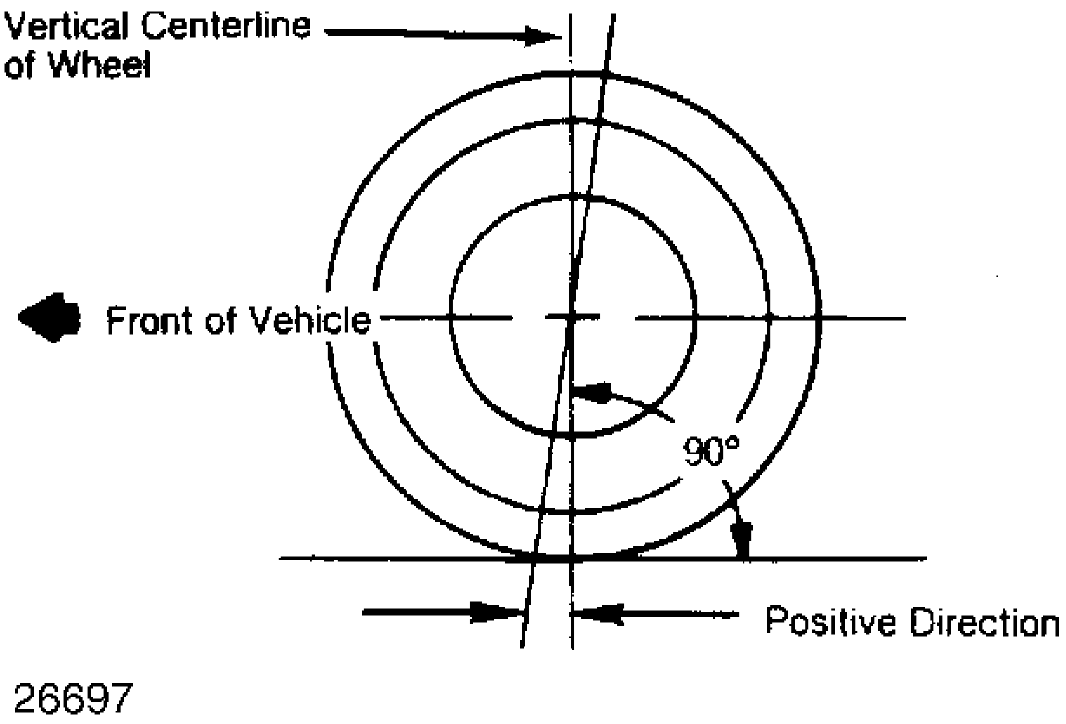


Fig. 4: Determining Caster Angle

TOE-IN ADJUSTMENT

Toe-in is the width measured at the rear of the tires subtracted by the width measured at the front of the tires at about spindle height. A positive figure would indicate toe-in and a negative figure would indicate toe-out. If the distance between the front and rear of the tires is the same, toe measurement would be zero. To adjust:

1) Measure toe-in with front wheels in straight ahead position and steering wheel centered. To adjust toe-in, loosen clamps and turn adjusting sleeve or adjustable end on right and left tie rods. See Fig. 2 and Fig. 5 .

2) Turn equally and in opposite directions to maintain steering wheel in centered position. Face of tie rod end must be parallel with machined surface of steering rod end to prevent binding.

3) When tightening clamps, make certain that clamp bolts are positioned so there will be no interference with other parts throughout the entire travel of linkage.

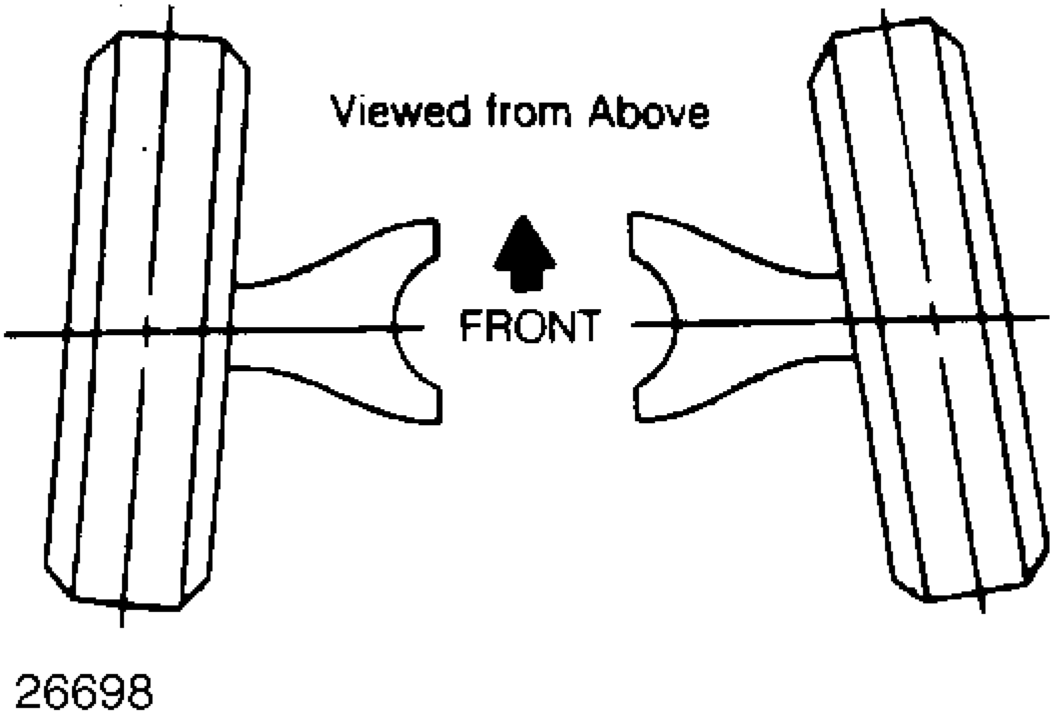

Fig. 5: Wheel Toe-In (Dimension A Less Dimension B)

TOE-OUT ON TURNS

1. Toe-out on turns (turning radius) is a check for bent or damaged parts, and not a service adjustment. With caster, camber, and toe-in properly adjusted, check toe-out with weight of vehicle on wheels.
2. Use a full floating turntable under each wheel, repeating test with each wheel positioned for right and left turns. Incorrect toe-out generally indicates a bent steering arm. Replace arm, if necessary, and recheck wheel alignment.

STEERING AXIS INCLINATION

1. Steering axis inclination is a check for bent or damaged parts, and not a service adjustment. Vehicle must be level and camber should be properly adjusted. See Fig. 6.
2. If camber cannot be brought within limits and steering axis inclination is correct, steering knuckle is bent. If camber and steering axis inclination are both incorrect by approximately the same amount, the upper and lower control arms are bent.

DTC TROUBLESHOOTING

DTC B296D (D-A2), B296D (68)

DTC B296D, DTC screen D-A2, or DTC screen 68 : Electric heater coolant Pump Communication Fail

DTC Description	DTC
B296D Electric heater coolant Pump Communication Fail	B

DTC (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Display audio type: Set the A/C icon and the fan control icon or the fan control button to ON.

   Color audio type: Set the A/C button and the fan control button to ON.

   -4. Wait for at least 30 seconds.

   -5. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

   -6. Check for the climate control unit DTCs.

DTC Description	DTC
B296D Electric heater coolant Pump Communication Fail	B

   Is DTC B296D, Error on the DTC screen D-A2 (climate control panel without display), or DTC screen 68 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A23**

   Is the fuse OK?

   YES

   Go to step 3.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. A23 fuse circuit.

3. Relay circuit board check

-1. Remove the relay circuit board from the under-hood fuse/relay box, and **test it** .

Is the relay circuit board OK?

YES

Go to step 4.

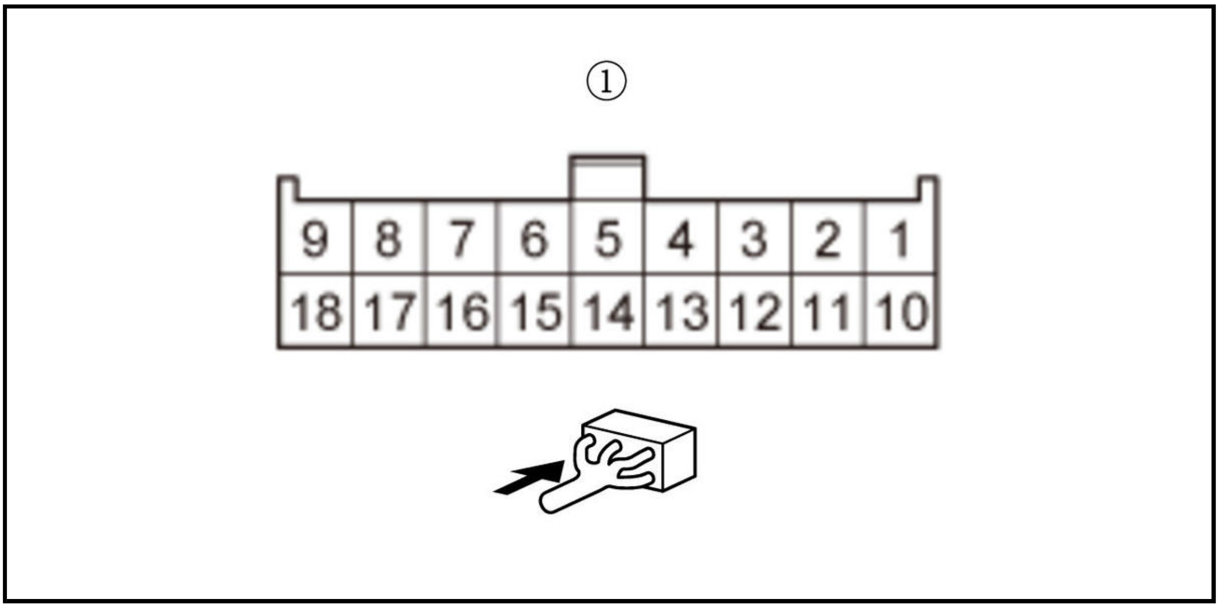
NO

Replace the relay circuit board .

4. Open wire check (+B A/C WATER PUMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 15: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B A/C WATER PUMP wire is OK. Go to step 5.

NO

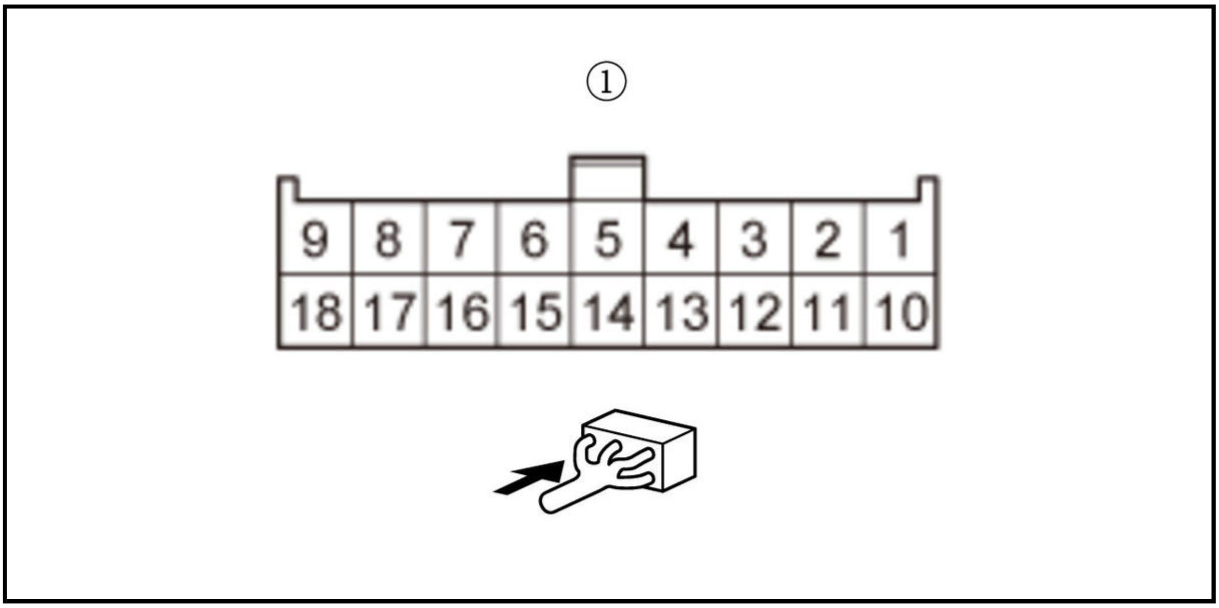
Repair an open in the +B A/C WATER PUMP wire.

5. Open wire check (IG2_A/C line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 6: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG2_A/C wire is OK. Go to step 6.

NO

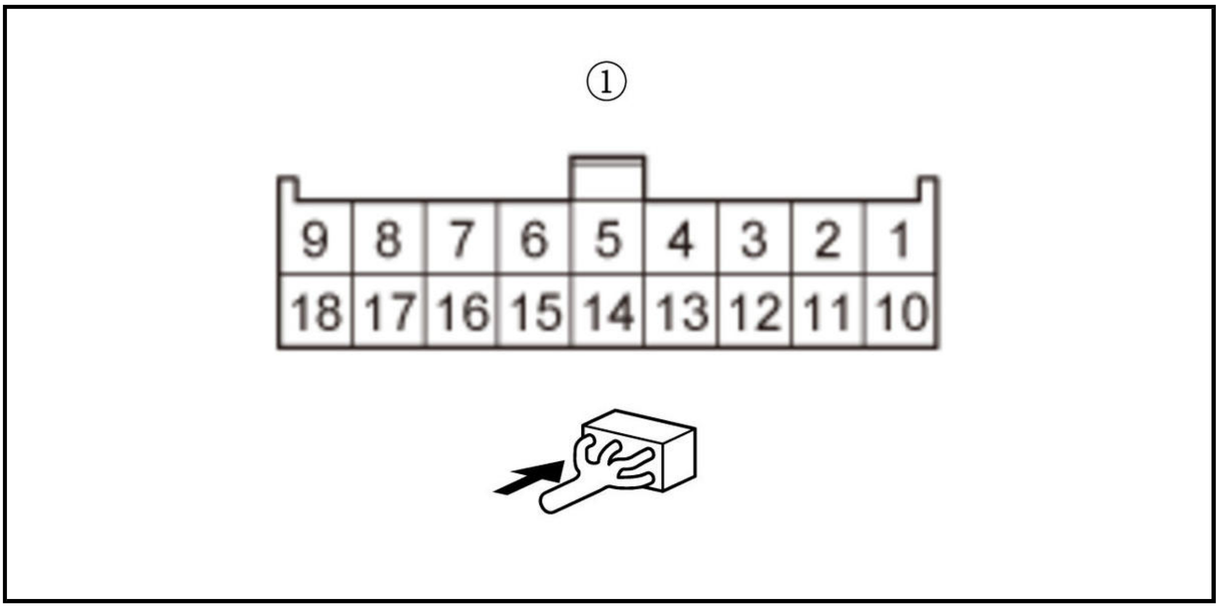
Repair an open in the IG2_A/C wire.

6. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Relay circuit board connector C (18P): disconnected
Test point 1	Relay circuit board connector C (18P) (female terminals) No. 8: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 7.

NO

Check for an open in the GND wire. If the wire is OK, check for poor ground at G351.

7. Determine possible failure area (EWP_PWM line, A/C_WATER_PUMP line)

-1. Reinstall the relay circuit board

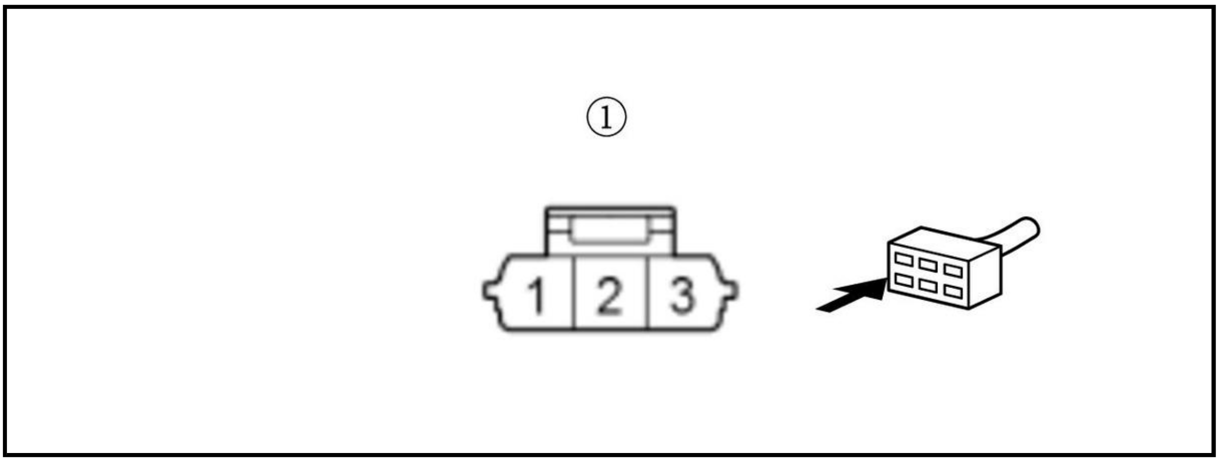
-2. Disconnect the following connector.

Electric heater coolant pump 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Electric heater coolant pump 3P connector: disconnected
Test point 1	Electric heater coolant pump 3P connector (female terminals) No. 1: ①
Test point 2	Electric heater coolant pump 3P connector (female terminals) No. 3: ①



Is there battery voltage?

YES

The A/C_WATER_PUMP wire is OK. Go to step 8.

NO

Go to step 10.

8. Open wire check (EWP_PWM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

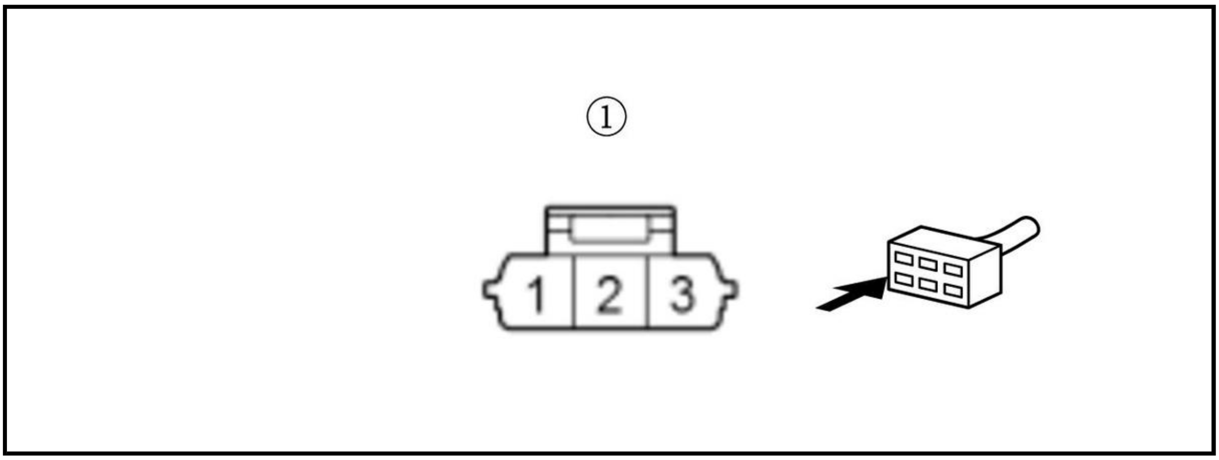
-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector A (32P): disconnected Electric heater coolant pump 3P connector: disconnected

Test point 1	**Climate control unit connector A (32P) No. 3**
Test point 2	Electric heater coolant pump 3P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The EWP_PWM wire is not open. Go to step 9.

NO

Repair an open in the EWP_PWM wire.

9. Shorted wire check (EWP_PWM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Electric heater coolant pump 3P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 3**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the electric heater coolant pump , and recheck. If the DTC detected, **replace the climate control unit** .

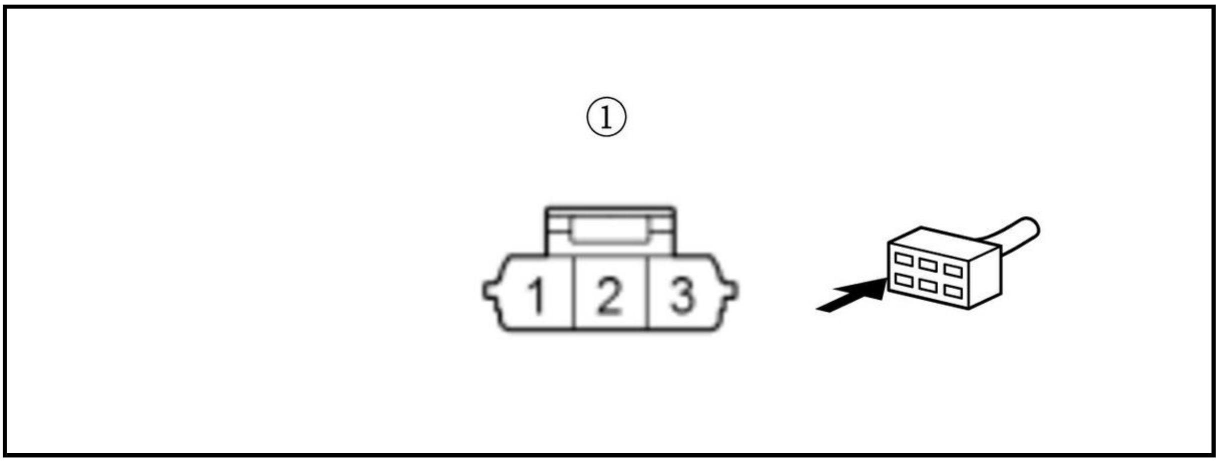
NO

Repair a short to body ground in the EWP_PWM wire.

10. Open wire check (A/C_WATER_PUMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Electric heater coolant pump 3P connector: disconnected
Test point 1	Electric heater coolant pump 3P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

Check for an open in the GND wire between the electric heater coolant pump and body ground. If the wire is OK, check for poor ground at G351

NO

Repair an open in the A/C_WATER_PUMP wire.

TROUBLESHOOTING

CLIMATE CONTROL SYSTEM DTC TROUBLESHOOTING: A-A4, CD

DTC screen A-A4 or DTC indicator Cd : Unknown sunlight sensor type

1. DTC check

    -1. Clear the DTC with the HDS.

    -2. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

    -3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

    -4. Check for DTCs.

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	B

    Is DTC B123F or Error on the DTC screen A-A3 (climate control panel without display) or 17 (climate control panel with display) indicated?

    YES

    Go to climate control DTC B123F troubleshooting.

    NO

    Go to step 2.

2. Problem verification

    -1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

    -2. Do the Self-Diagnostic Function with the climate control unit .

    -3. Check for DTCs.

    Is Error on the DTC screen A-A4 (climate control panel without display) or Cd (climate control panel with display) indicated?

    YES

    Go to step 3.

    NO

    Intermittent failure, the system is OK at this time.

3. Connector check

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Check connection of the following connectors.

Sunlight sensor 2P connector (with automatic wiper or without automatic lighting)
Automatic lighting control unit-sensor 5P connector (without automatic wiper and with automatic lighting)
Climate control unit connector A (32P)

Is the connection OK?

YES

Replace the climate control unit .

NO

Reconnect or repair the connector, then recheck the system.

CLIMATE CONTROL SYSTEM DTC TROUBLESHOOTING: I-A4

DTC screen I-A4 : Climate control unit lost communication with center display unit

NOTE: The DTC may be stored due to the grounding failure or the power source failure at the center display (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

1. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -2. Do the Self-Diagnostic Function with the climate control unit .

   -3. Check for DTCs.

   Is Error on the DTC screen I-A4 indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose wires or poor connections.

2. Open wire check (B-CAN_H line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Audio unit connector A (24P) (without navigation)
Audio-navigation unit connector A (24P) (with navigation)
Climate control unit connector A (32P)

   -3. Check for continuity between test points 1 and 2.

   Without navigation

Test condition	Vehicle OFF (LOCK) mode
	Audio unit connector A (24P): disconnected
	Climate control unit connector A (32P): disconnected

Test point 1	**Audio unit connector A (24P) No. 14**

Test point 2	**Climate control unit connector A (32P) No. 25**

With navigation

Test condition	Vehicle OFF (LOCK) mode Audio-navigation unit connector A (24P): disconnected Climate control unit connector A (32P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 14**
Test point 2	**Climate control unit connector A (32P) No. 25**

Is there continuity?

YES

The B-CAN_H wire is OK. Go to step 3.

NO

Repair an open in the B-CAN_H wire.

3. Open wire check (B-CAN_L line)

-1. Check for continuity between test points 1 and 2.

Without navigation

Test condition	Vehicle OFF (LOCK) mode Audio unit connector A (24P): disconnected Climate control unit connector A (32P): disconnected
Test point 1	**Audio unit connector A (24P) No. 24**
Test point 2	**Climate control unit connector A (32P) No. 8**

With navigation

Test condition	Vehicle OFF (LOCK) mode Audio-navigation unit connector A (24P): disconnected Climate control unit connector A (32P): disconnected
Test point 1	**Audio-navigation unit connector A (24P) No. 24**
Test point 2	**Climate control unit connector A (32P) No. 8**

Is there continuity?

YES

Replace the **audio unit (without navigation)** or the **audio-navigation unit (with navigation)** .

NO

Repair an open in the B-CAN_L wire.

CLIMATE CONTROL SYSTEM DTC TROUBLESHOOTING: I-B8, C0

DTC screen I-B8 or DTC indicator C0 : Climate control unit internal error

1. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. Do the Self-Diagnostic Function with the climate control unit .

-3. Check for DTCs.

Is Error on the DTC screen I-B8 (climate control panel without display) or C0 (climate control panel with display) indicated?

YES

Replace the climate control unit .

NO

Intermittent failure, the climate control unit is OK at this time.

DTC TROUBLESHOOTING: B120A (I-B4), B120A (8A)

DTC B120A or DTC screen I-B4 or DTC indicator 8A : Climate Control Unit LIN Communication Bus Line Error

DTC Description	DTC
B120A Climate Control Unit LIN Communication Bus Line Error	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Check for DTCs.

DTC Description	DTC
B120A Climate Control Unit LIN Communication Bus Line Error	B

Is DTC B120A or Error on the DTC screen I-B4 (climate control panel without display) or 8A (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the climate control panel circuit.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D9 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 3.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. D9 (10 A) fuse circuit.

3. Determine possible failure area (BUS-DATA line, others)

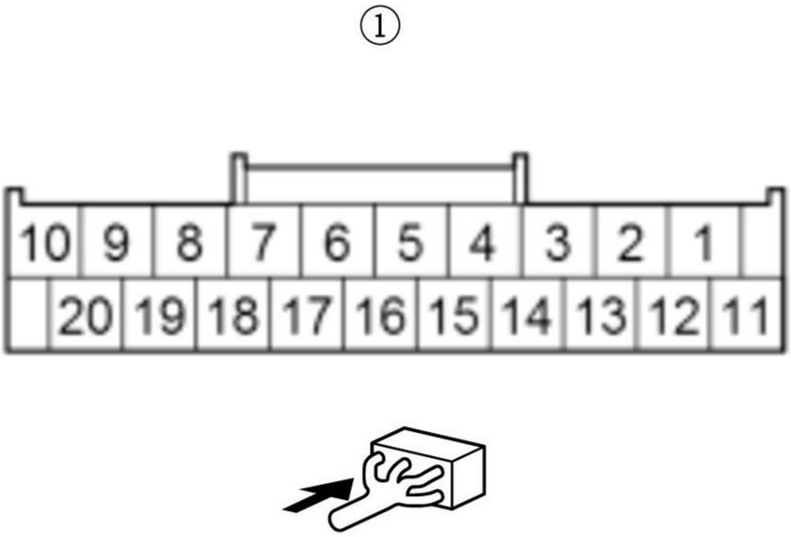
-1. Disconnect the following connector.

Climate control panel 20P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control panel 20P connector: disconnected
Test point 1	Climate control panel 20P connector (female terminals) No. 13: ①
Test point 2	Climate control panel 20P connector (female terminals) No. 19: ①



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (BUS-DATA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Climate control panel 20P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 29**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the BUS-DATA wire.

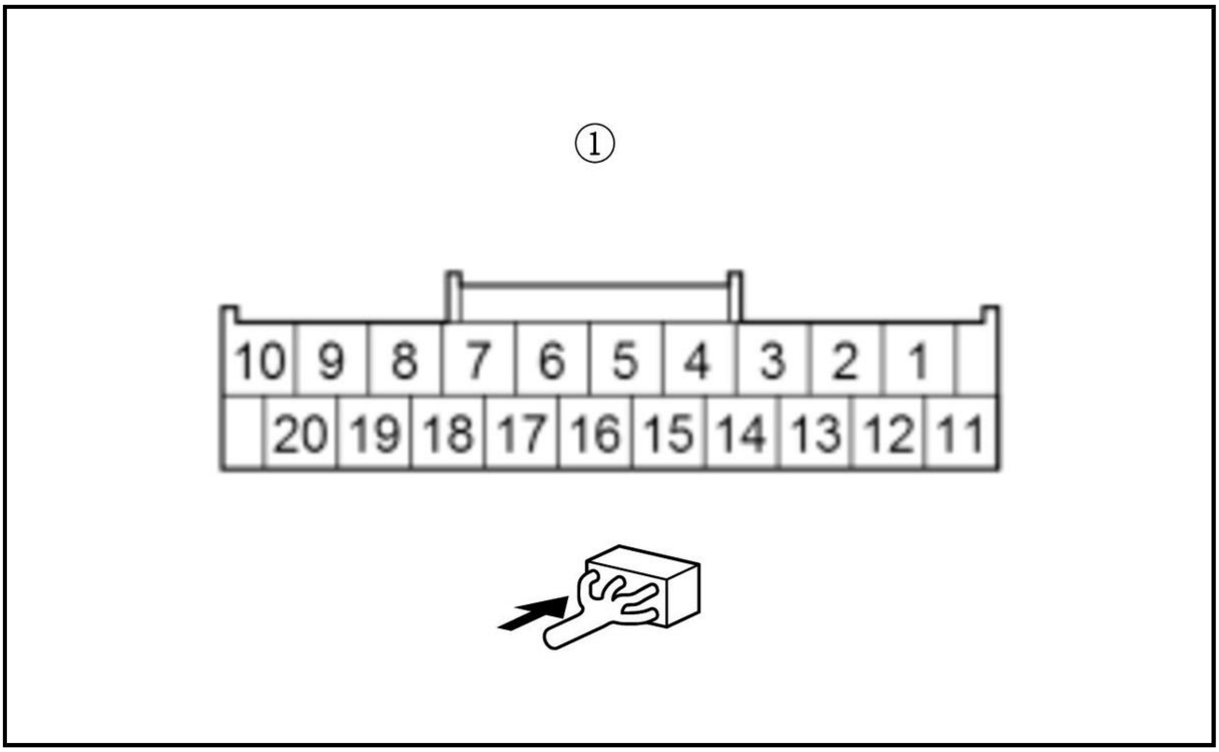
NO

The BUS-DATA wire is not shorted. Go to step 5.

5. Open wire check (BUS-DATA line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Climate control panel 20P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 29**
Test point 2	Climate control panel 20P connector (female terminals) No. 18: ①



Is there continuity?

YES

The BUS-DATA wire is not open. Go to step 6.

NO

Repair an open in the BUS-DATA wire.

6. Climate control panel check (substitution)

-1. Reconnect the following connector.

Climate control unit connector A (32P)

-2. **Substitute a known-good climate control panel** .

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-5. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-6. Check for DTCs.

DTC Description	DTC
B120A Climate Control Unit LIN Communication Bus Line Error	B

Is DTC B120A or Error on the DTC screen I-B4 (climate control panel without display) or 8A (climate control panel with display) indicated?

YES

Replace the climate control unit .

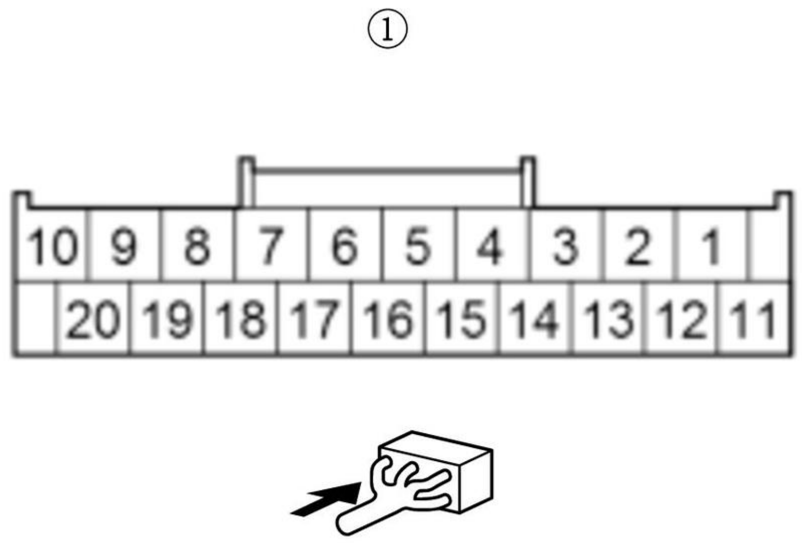
NO

Replace the original climate control panel .

7. Open wire check (IG2 A/C line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Climate control panel 20P connector: disconnected
Test point 1	Climate control panel 20P connector (female terminals) No. 19: ①
Test point 2	Body ground



Is there battery voltage?

YES

Check for an open in the GND wire. If the wire is OK, check for poor ground at G402.

NO

Repair an open in the IG2 A/C wire.

DTC TROUBLESHOOTING: B121A (B-B1), B121A (49)

DTC B121A or DTC screen B-B1 or DTC indicator 49 : An open in the mode control motor circuit

DTC Description	DTC
B121A An open in the mode control motor circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-4. Check for DTCs.

DTC Description	DTC
B121A An open in the mode control motor circuit	B

Is DTC B121A, Error on the DTC screen B-B1 (climate control panel without display) or 49 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the mode control motor circuit.

2. Determine possible failure area (MDD-P line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

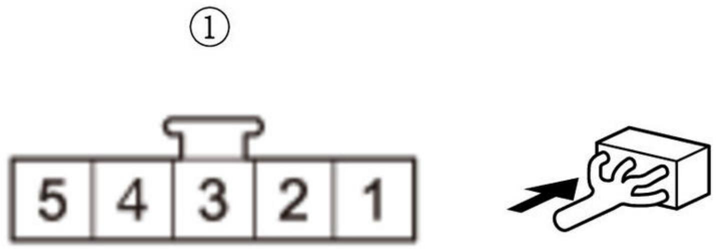
-2. Disconnect the following connector.

Mode control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

The MDD-P wire is OK. Go to step 3.

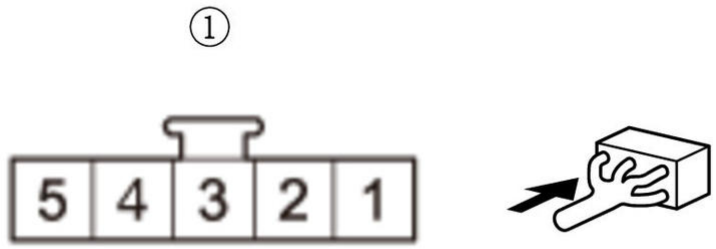
NO

Go to step 4.

3. Open wire check (SENS-COM line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 2: ①
Test point 2	Mode control motor 5P connector (female terminals) No. 1: ①



Is there about 5 V?

YES

Replace the mode control motor .

NO

Repair an open in the SENS-COM wire.

4. Open wire check (MDD-P line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Mode control motor 5P connector: disconnected
Test point 1	Climate control unit connector B (24P) No. 5
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the MDD-P wire.

NO

Replace the climate control unit .

DTC TROUBLESHOOTING: B121B (B-B2), B121B (4A)

DTC B121B or DTC screen B-B2 or DTC indicator 4A : A short in the mode control motor circuit

NOTE: If other short circuit DTCs are indicated at the same time, there may be an open or short to body ground in the power (5 V) circuit.

DTC Description	DTC
B121B A short in the mode control motor circuit	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

   -4. Check for DTCs.

DTC Description	DTC
B121B A short in the mode control motor circuit	B

   Is DTC B121B or Error on the DTC screen B-B2 (climate control panel without display) or 4A (climate control panel with display) indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the mode control motor circuit.

2. Determine possible failure area (S5V line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

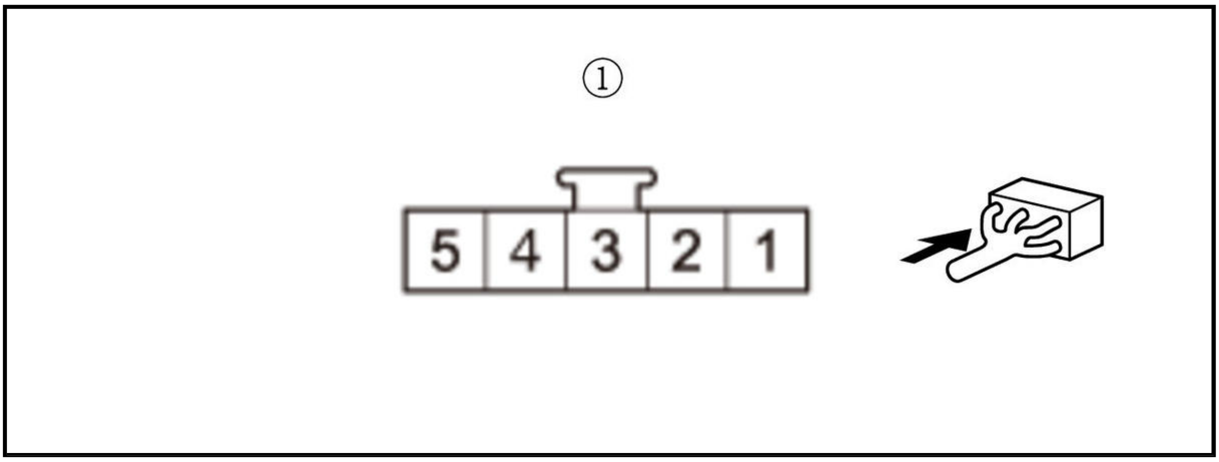
   -2. Disconnect the following connector.

Mode control motor 5P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The S5V wire is OK. Go to step 3.

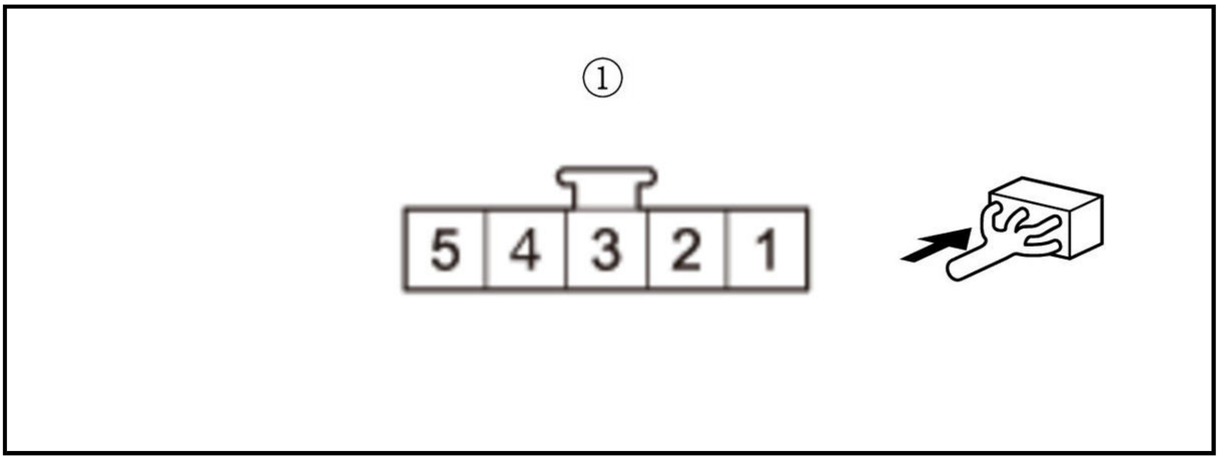
NO

Go to step 4.

3. Determine possible failure area (mode control motor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the mode control motor .

NO

Go to step 6.

4. Open wire check (S5V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the S5V wire.

NO

Go to step 5.

5. Shorted wire check (S5V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the S5V wire.

NO

Replace the climate control unit .

6. Shorted wire check (MDD-P line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 5**

Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the MDD-P wire.

NO

Replace the climate control unit .

DTC TROUBLESHOOTING: B121D (A-B6), B121D (89) (2020 2021)

DTC B121D or DTC screen A-B6 or DTC indicator 89 : Humidity/In-Car Temperature Sensor Communication Error

DTC Description	DTC
B121D Humidity/in-car temperature sensor communication error	B

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

   -4. Check for DTCs.

DTC Description	DTC
B121D Humidity/in-car temperature sensor communication error	B

   Is DTC B121D, Error on the DTC screen A-B6 (climate control panel without display), or 89 (climate control panel with display) indicated?

   YES: Climate control panel without display

   Go to step 2.

   YES: Climate control panel with display

   Go to step 4.

   NO

   Intermittent failure. Check for loose wires or poor connections on the humidity/in-car temperature sensor circuit.

2. Climate control unit check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Humidity/in-car temperature sensor 4P connector

   -3. Turn the vehicle to the ON mode.

-4. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.

Is Normal on the DTC screen A-B7 indicated?

YES

Go to step 7.

NO

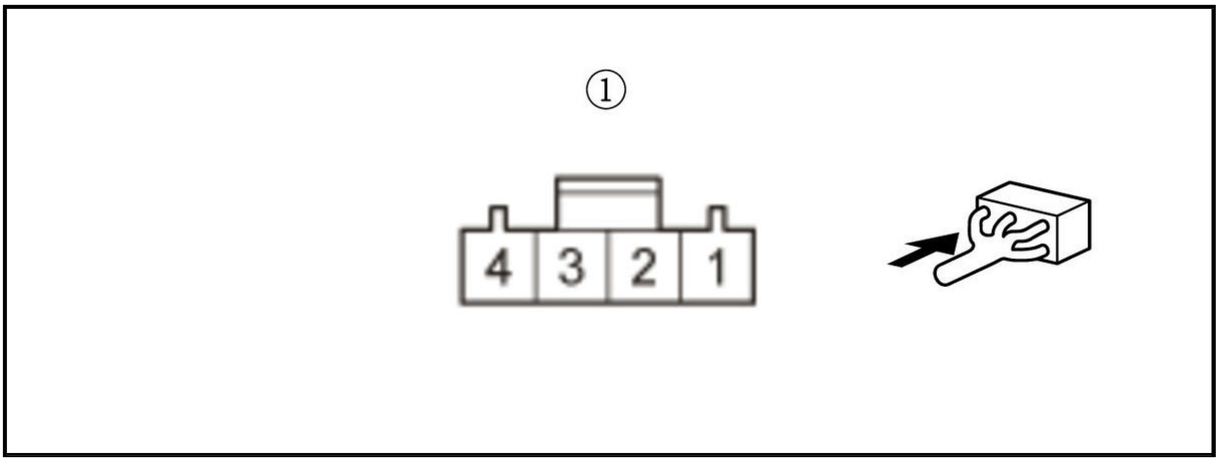
Go to step 3.

3. Climate control unit check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Humidity/in-car temperature sensor 4P connector No. 2: ①
Terminal B	Humidity/in-car temperature sensor 4P connector No. 4: ①



-3. Turn the vehicle to the ON mode.

-4. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.

Is Normal on the DTC screen A-B7 indicated?

YES

Go to step 6.

NO

Go to step 8.

4. Climate control unit check 1

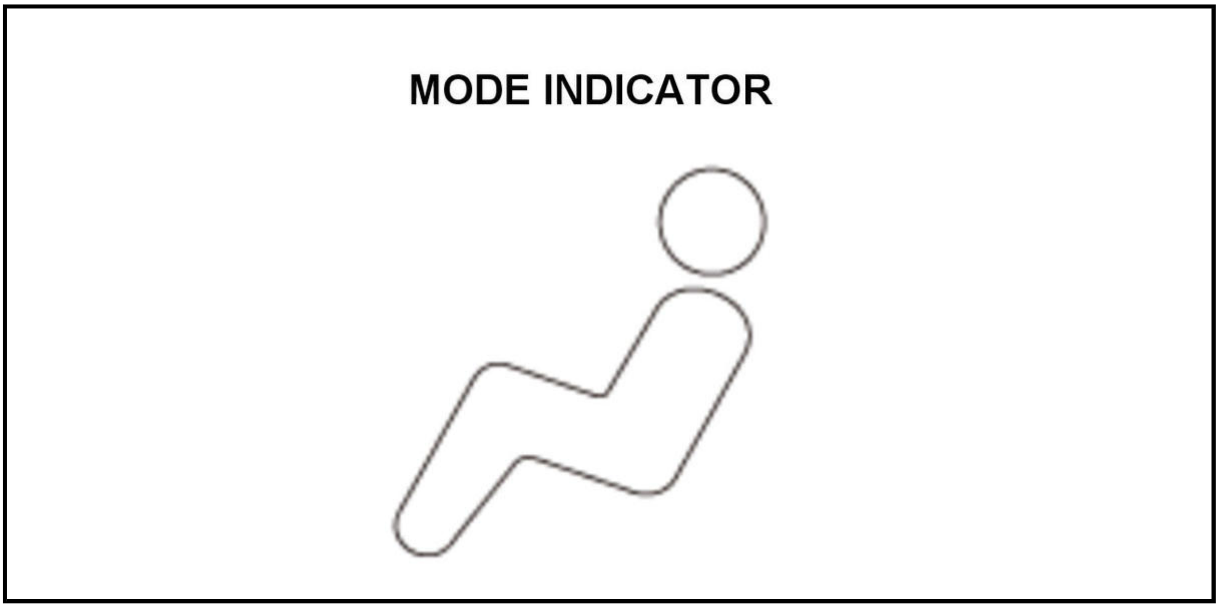
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Humidity/in-car temperature sensor 4P connector

-3. Turn the vehicle to the ON mode.

-4. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.



Does the MODE indicator turn on?

YES

Go to step 7.

NO

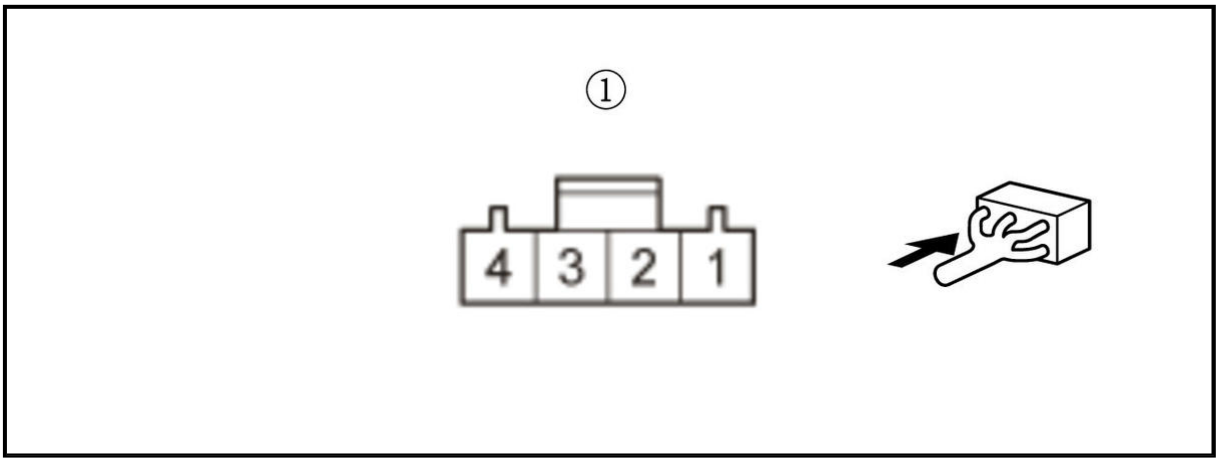
Go to step 5.

5. Climate control unit check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

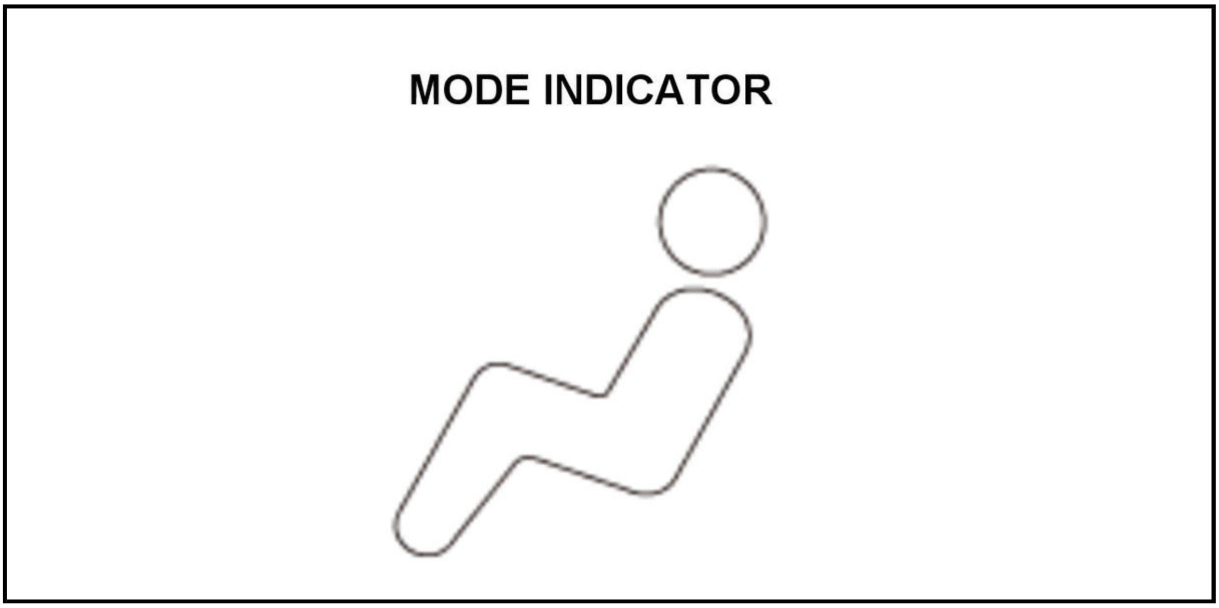
-2. Connect terminals A and B with a jumper wire.

Terminal A	Humidity/in-car temperature sensor 4P connector No. 2: ①
Terminal B	Humidity/in-car temperature sensor 4P connector No. 4: ①



-3. Turn the vehicle to the ON mode.

-4. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.



Does the MODE indicator turn on?

YES

Go to step 6.

NO

Go to step 8.

6. Determine possible failure area (humidity/in-car temperature sensor, others)

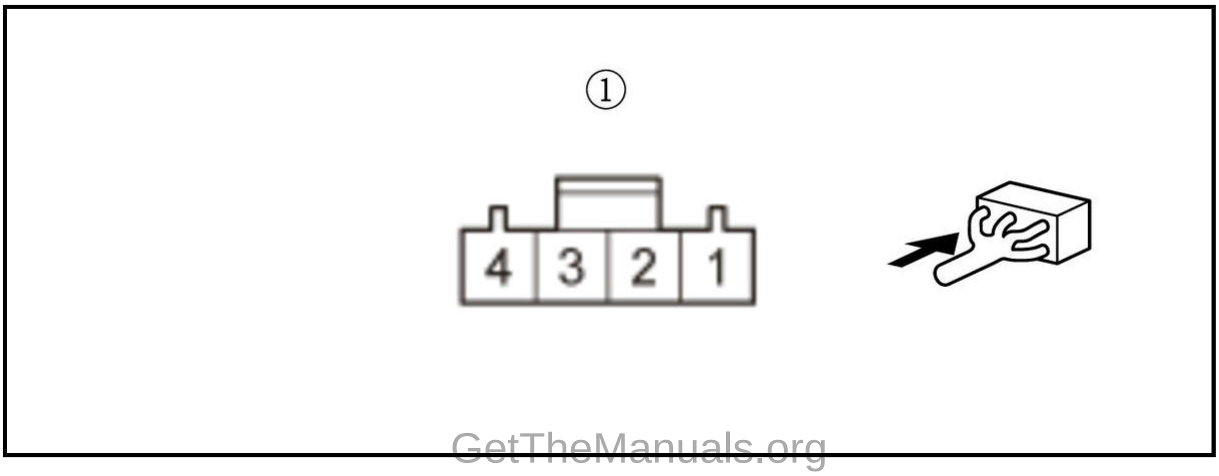
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	Humidity/in-car temperature sensor 4P connector No. 1: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the humidity/in-car temperature sensor .

NO

Go to step 12.

7. Shorted wire check (HUM DATA line to HUM CLK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 7**
Test point 2	**Climate control unit connector A (32P) No. 24**

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short in the HUM DATA wire to HUM CLK wire.

8. Open wire check (HUM DATA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

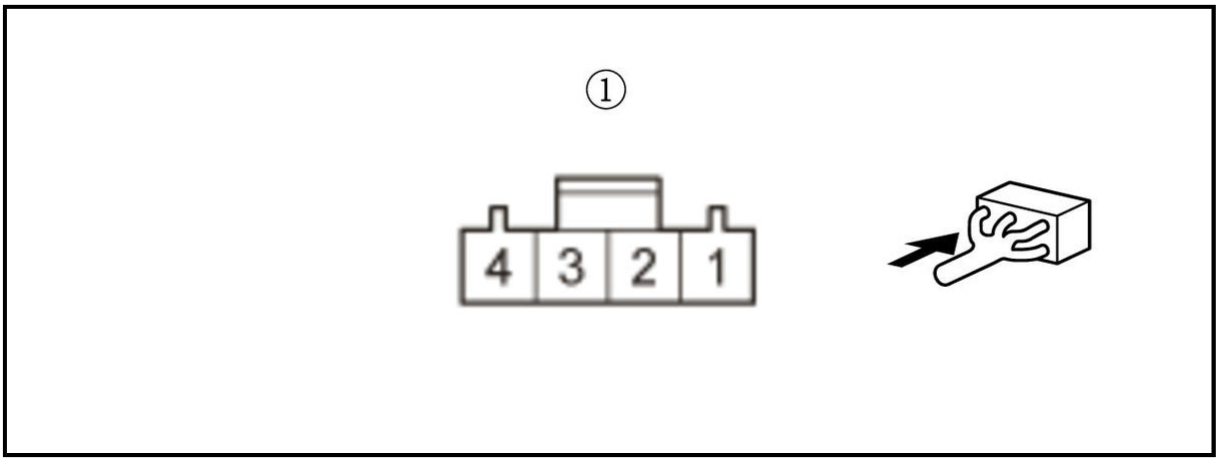
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Climate control unit connector A (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 7**
Test point 2	Humidity/in-car temperature sensor 4P connector No. 2: ①



Is there 1.0 Ω or less?

YES

The HUM DATA wire is not open. Go to step 9.

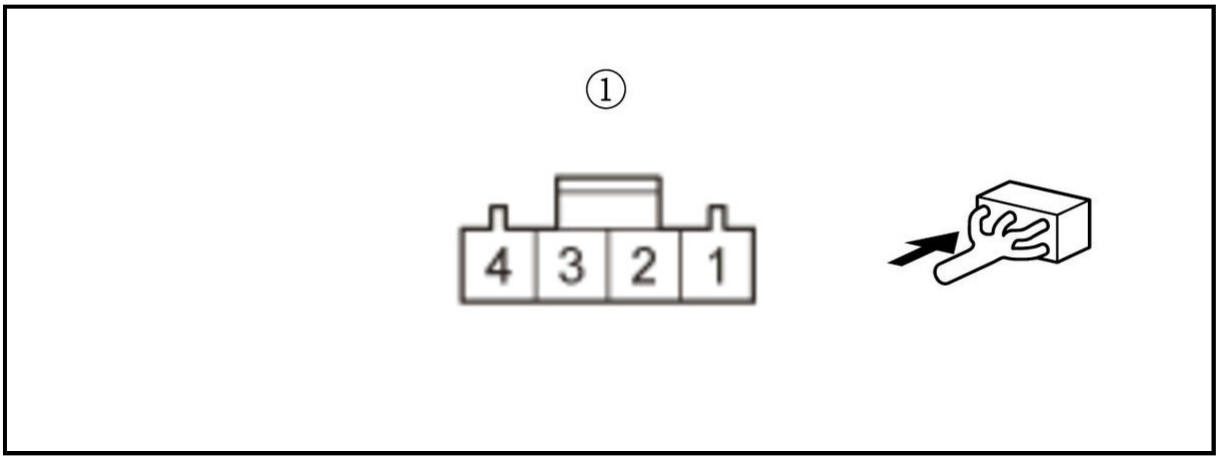
NO

Repair an open in the HUM DATA wire.

9. Open wire check (HUM CLK line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 24**
Test point 2	Humidity/in-car temperature sensor 4P connector No. 4: ①



Is there 1.0 Ω or less?

YES

The HUM CLK wire is not open. Go to step 10.

NO

Repair an open in the HUM CLK wire.

10. Shorted wire check (HUM DATA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 7**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The HUM DATA wire is OK. Go to step 11.

NO

Repair a short to ground in the HUM DATA wire.

11. Shorted wire check (HUM CLK line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 24**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short to ground in the HUM CLK wire.

12. Open wire check (S 5V line)

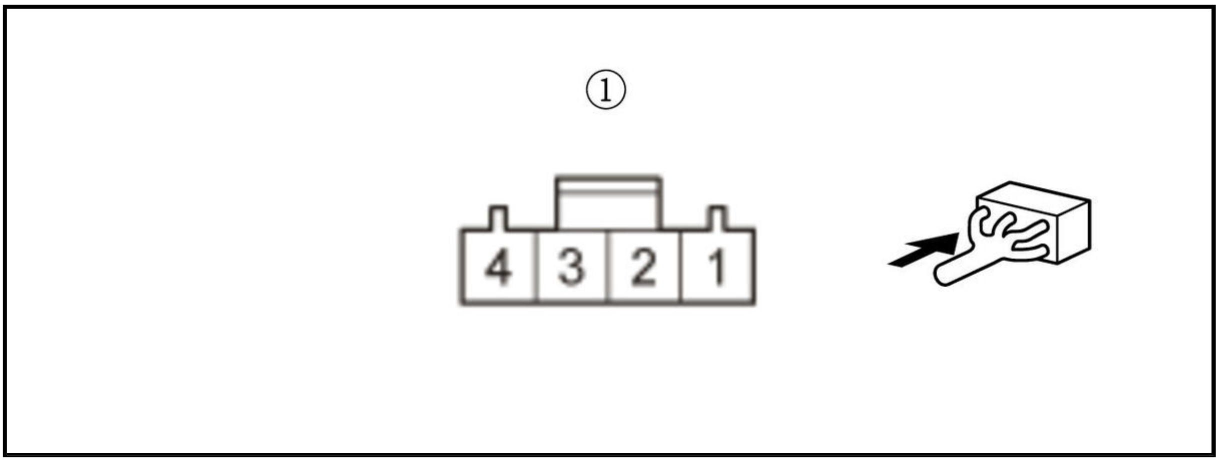
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 26**
Test point 2	Humidity/in-car temperature sensor 4P connector No. 1: ①



Is there 1.0 Ω or less?

YES

The S 5V line is not open. Go to step 13.

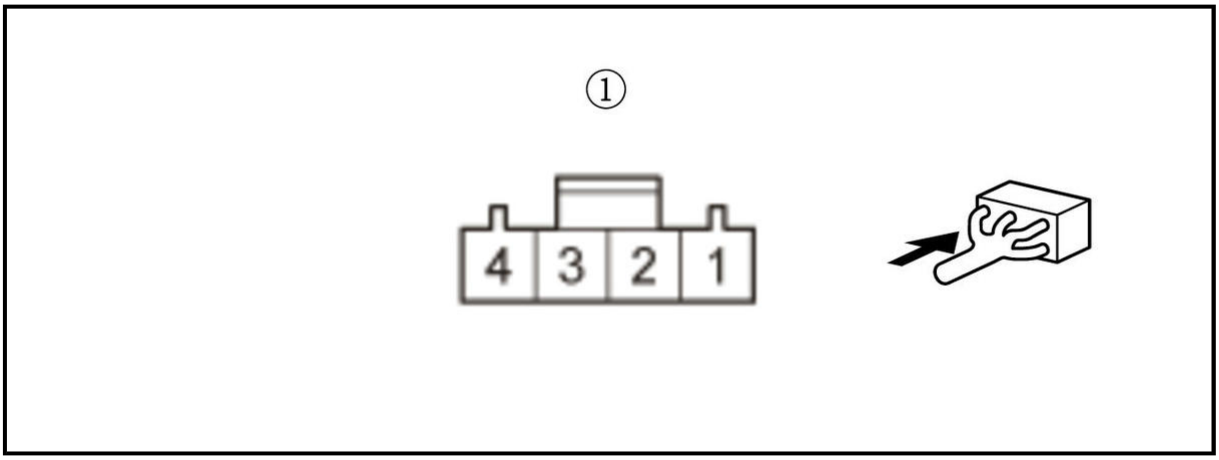
NO

Repair an open in the S 5V wire.

13. Open wire check (SENSOR COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 12**
Test point 2	Humidity/in-car temperature sensor 4P connector No. 3: ①



Is there 1.0 Ω or less?

YES

The SENSOR COM wire is OK. Go to step 14.

NO

Repair an open in the SENSOR COM wire.

14. Shorted wire check (S 5V line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	Climate control unit connector A (32P) No. 26
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short to ground in the S 5V wire.

DTC TROUBLESHOOTING: B1220 (B-B5), B1220 (56)

DTC B1220 or DTC screen B-B5 or DTC indicator 56 : A Short in the recirculation control motor circuit

NOTE: If other short circuit DTCs are indicated at the same time, there may be an open or short to body ground in the power (5 V) circuit.

DTC Description	DTC
B1220 A Short in the recirculation control motor circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Check for DTCs.

DTC Description	DTC
B1220 A Short in the recirculation control motor circuit	B

Is DTC B1220 or Error on the DTC screen B-B5 (climate control panel without display) or 56 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the recirculation control motor circuit.

2. Determine possible failure area (S5V line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

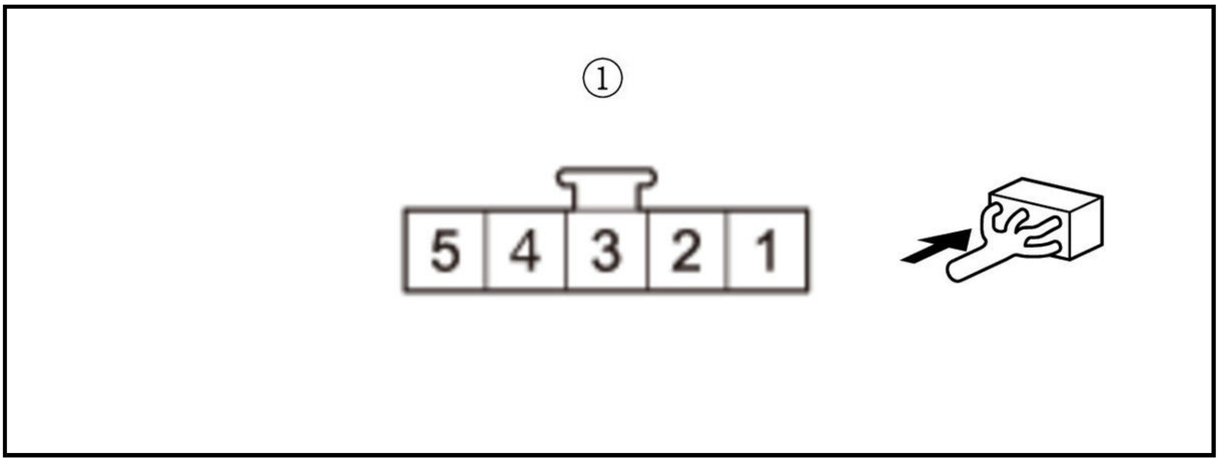
-2. Disconnect the following connector.

Recirculation control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The S5V wire is OK. Go to step 3.

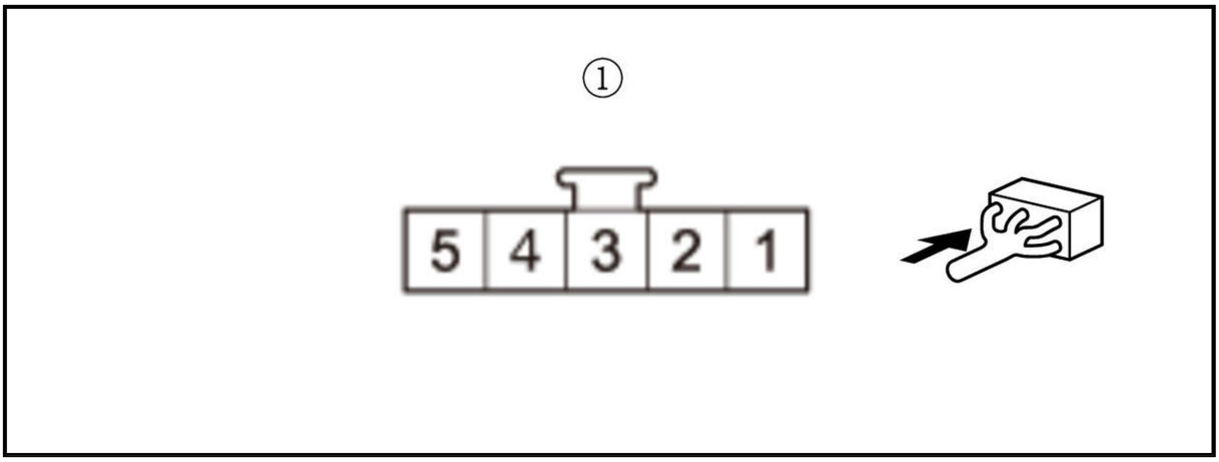
NO

Go to step 4.

3. Determine possible failure area (recirculation control motor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the recirculation control motor .

NO

Go to step 6.

4. Open wire check (S5V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the S5V wire.

NO

Go to step 5.

5. Shorted wire check (S5V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short in the S5V wire.

NO

Replace the climate control unit .

6. Shorted wire check (RFD-P line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Climate control unit connector B (24P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 4**
Test point 2	Body ground

   Is there continuity?

   YES

   Repair a short in the RFD-P wire.

   NO

   Replace the climate control unit .

DTC TROUBLESHOOTING: B1225 (A-B1), B1225 (01)

DTC B1225 or DTC screen A-B1 or DTC indicator 01 : An open in the in-car temperature sensor circuit

DTC Description	DTC
B1225 An open in the in-car temperature sensor circuit	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

   -4. Check for DTCs.

DTC Description	DTC
B1225 An open in the in-car temperature sensor circuit	B

Is DTC B1225 or Error on the DTC screen A-B1 (climate control panel without display) or 01 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the in-car temperature sensor circuit.

2. Open wire check (TR line)

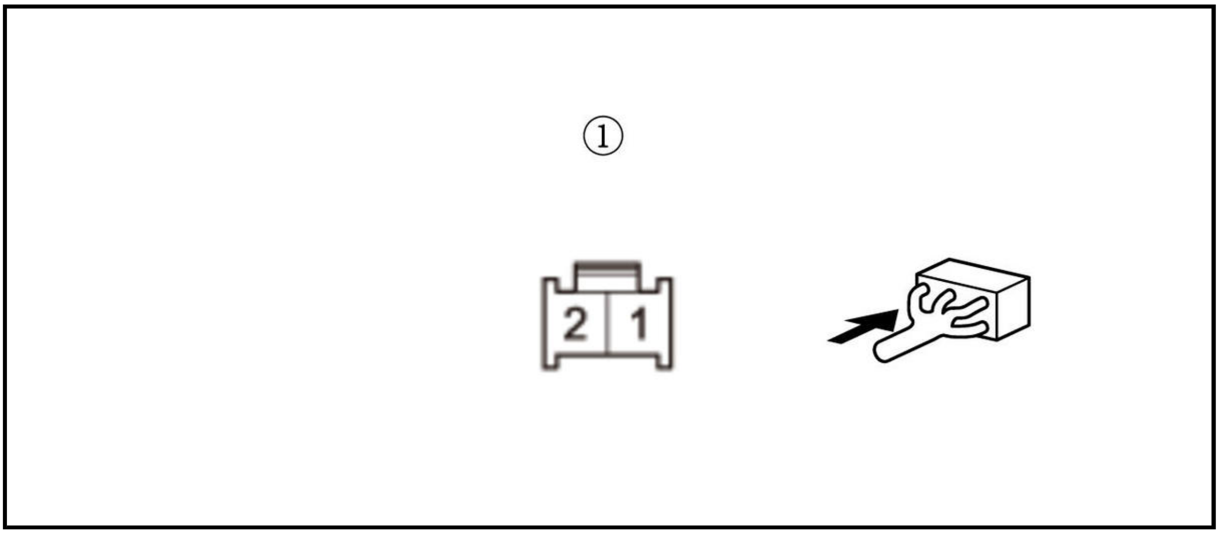
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector A (32P)
In-car temperature sensor 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconected
	In-car temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 27**
Test point 2	In-car temperature sensor 2P connector (female terminals) No. 2: ①



Is there continuity?

YES

The TR wire is not open. Go to step 3.

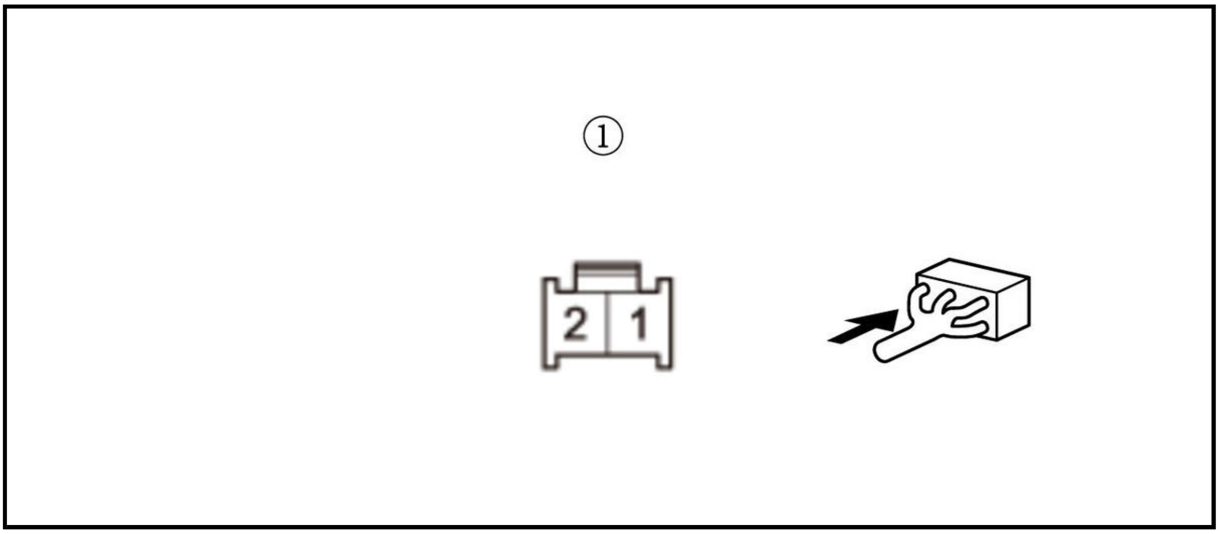
NO

Repair an open in the TR wire.

3. Open wire check (SENSOR COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	In-car temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 12**
Test point 2	In-car temperature sensor 2P connector (female terminals) No. 1: ①



Is there continuity?

YES

The SENSER COM wire is OK. Go to step 4.

NO

Repair an open in the SENSOR COM wire.

4. Shorted wire check (TR line to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control unit connector A (32P): disconnected
	In-car temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 27**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the TR wire.

NO

The TR wire is OK. Go to step 5.

5. In-car temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Test the in-car temperature sensor .

Is the in-car temperature sensor OK?

YES

Replace the climate control unit .

NO

Replace the in-car temperature sensor .

DTC TROUBLESHOOTING: B1226 (A-B2), B1226 (02)

DTC B1226 or DTC screen A-B2 or DTC indicator 02 : A short in the in-car temperature sensor circuit

DTC Description	DTC
B1226 A short in the in-car temperature sensor circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Check for DTCs.

DTC Description	DTC
B1226 A short in the in-car temperature sensor circuit	B

Is DTC B1226 or Error on the DTC screen A-B2 (climate control panel without display) or 02 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the in-car temperature sensor circuit.

2. Shorted wire check (TR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector A (32P)
In-car temperature sensor 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected

	In-car temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 27**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the TR wire.

NO

The TR wire is not shorted. Go to step 3.

3. Shorted wire check (TR line to SENSOR COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	In-car temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 12**
Test point 2	**Climate control unit connector A (32P) No. 27**

Is there continuity?

YES

Repair a short in the TR wire to SENSOR COM wire.

NO

The TR wire and SENSOR COM wire are OK. Go to step 4.

4. In-car temperature sensor check

-1. **Test the in-car temperature sensor** .

Is the in-car temperature sensor OK?

YES

Replace the climate control unit .

NO

Replace the in-car temperature sensor .

DTC TROUBLESHOOTING: B1227 (A-A1), B1227 (05)

DTC B1227 or DTC screen A-A1 or DTC indicator 05 : An open in the outside air temperature sensor circuit

DTC Description	DTC
B1227 An open in the outside air temperature sensor circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-4. Check for DTCs.

DTC Description	DTC
B1227 An open in the outside air temperature sensor circuit	B

Is DTC B1227 or Error on the DTC screen A-A1 (climate control panel without display) or 05 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the outside air temperature sensor circuit.

2. Open wire check (TAM line)

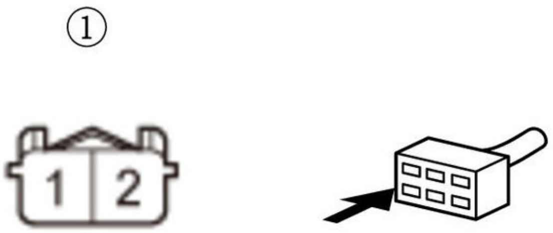
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector A (32P)
Outside air temperature sensor 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 11**
Test point 2	Outside air temperature sensor 2P connector (female terminals) No. 2: ①



Is there continuity?

YES

The TAM wire is not open. Go to step 3.

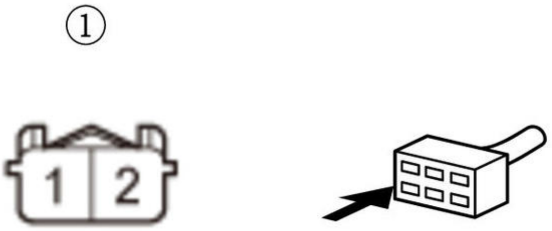
NO

Repair an open in the TAM wire.

3. Open wire check (SENSOR COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 12**
Test point 2	Outside air temperature sensor 2P connector (female terminals) No. 1: ①



Is there continuity?

YES

The SENSOR COM wire is OK. Go to step 4.

NO

Repair an open in the SENSOR COM wire.

4. Shorted wire check (TAM line to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 11**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the TAM wire.

NO

The TAM wire is OK. Go to step 5.

5. Outside air temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Test the outside air temperature sensor .

Is the outside air temperature sensor OK?

YES

Replace the climate control unit .

NO

Replace the outside air temperature sensor .

DTC TROUBLESHOOTING: B1228 (A-A2), B1228 (06)

DTC B1228 or DTC screen A-A2 or DTC indicator 06 : A short in the outside air temperature sensor circuit

DTC Description	DTC
B1228 A short in the outside air temperature sensor circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Check for DTCs.

DTC Description	DTC
B1228 A short in the outside air temperature sensor circuit	B

Is DTC B1228 or Error on the DTC screen A-A2 (climate control panel without display) or 06 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the outside air temperature sensor circuit.

2. Shorted wire check (TAM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector A (32P)
Outside air temperature sensor 2P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 11**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the TAM wire.

NO

The TAM wire is not shorted. Go to step 3.

3. Shorted wire check (TAM line to SENSOR COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 11**
Test point 2	**Climate control unit connector A (32P) No. 12**

Is there continuity?

YES

Repair a short in the TAM wire to SENSOR COM wire.

NO

The TAM wire and SENSOR COM wire are OK. Go to step 4.

4. Outside air temperature sensor check

-1. **Test the outside air temperature sensor** .

Is the outside air temperature sensor OK?

YES

Replace the climate control unit .

NO

Replace the outside air temperature sensor .

DTC TROUBLESHOOTING: B1231 (A-A5), B1231 (09)

DTC B1231 or DTC screen A-A5 or DTC indicator 09 : An open in the evaporator temperature sensor circuit

DTC Description	DTC
B1231 An open in the evaporator temperature sensor circuit	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

   -4. Check for DTCs.

DTC Description	DTC
B1231 An open in the evaporator temperature sensor circuit	B

   Is DTC B1231 or Error on the DTC screen A-A5 (climate control panel without display) or 09 (climate control panel with display) indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the evaporator temperature sensor circuit.

2. Shorted wire check (TEVA line to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Climate control unit connector B (24P)

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control unit connector B (24P): disconnected
Test point 1	**Climate control unit connector B (24P) No. 8**
Test point 2	Body ground

   Is there any voltage?

   YES

   Repair a short to power in the TEVA wire.

   NO

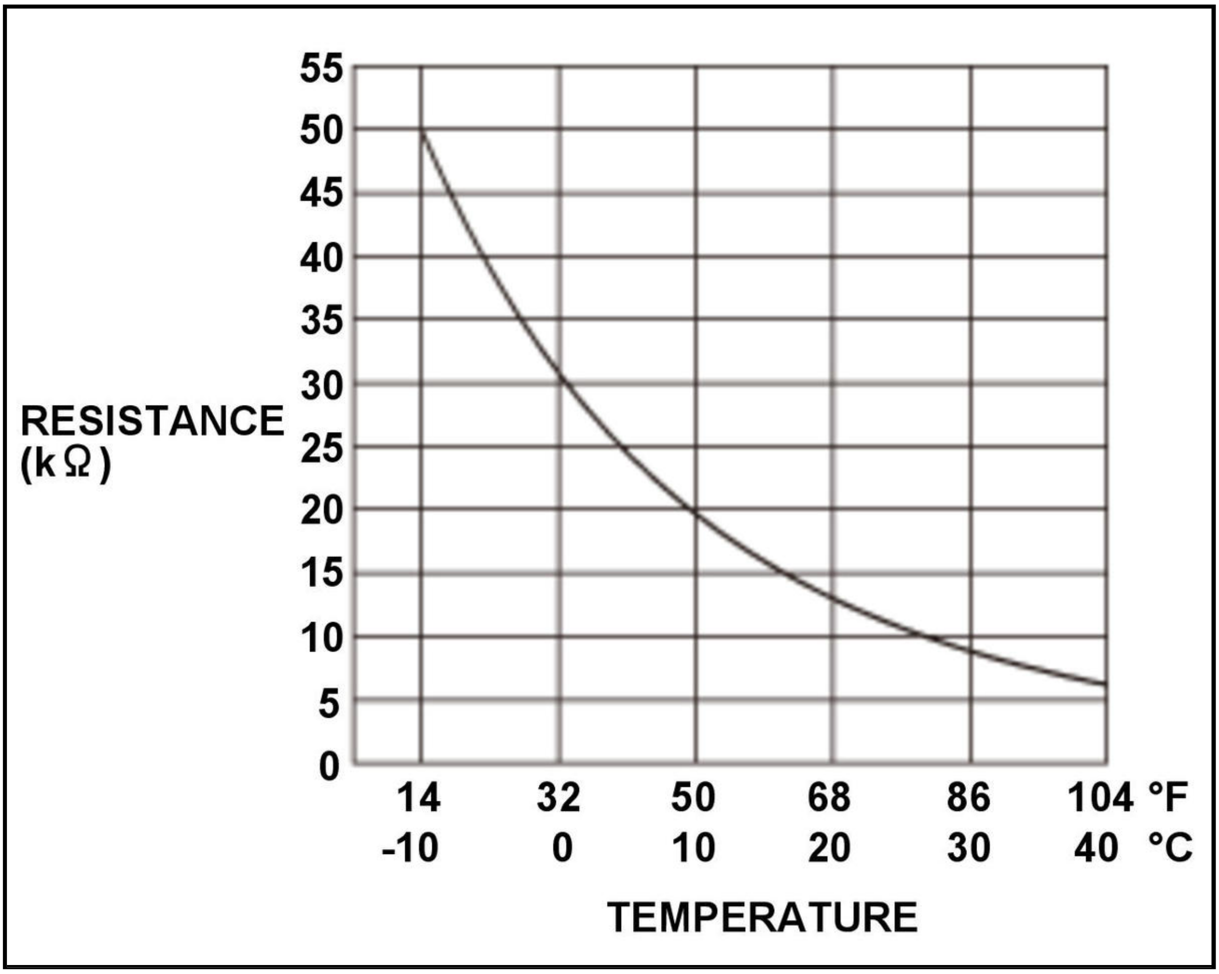
   The TEVA wire is not shorted. Go to step 3.

3. Determine possible failure area (climate control unit, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected
Test point 1	**Climate control unit connector B (24P) No. 8**
Test point 2	**Climate control unit connector B (24P) No. 10**



Is resistance value within the range?

YES

Replace the climate control unit .

NO

Go to step 4.

4. Open wire check (TEVA line)

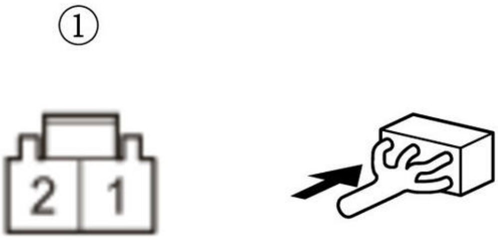
-1. Disconnect the following connector.

Evaporator temperature sensor 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Evaporator temperature sensor 2P connector: disconnected

Test point 1	**Climate control unit connector B (24P) No. 8**
Test point 2	Evaporator temperature sensor 2P connector (female terminals) No. 1: ①



Is there continuity?

YES

The TEVA wire is OK. Go to step 5.

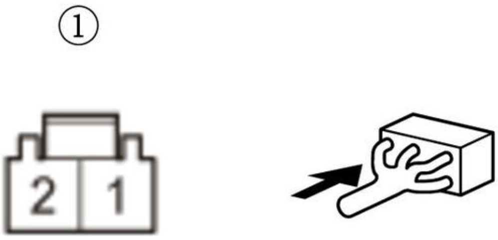
NO

Repair an open in the TEVA wire.

5. Open wire check (SENS-COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Evaporator temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 10**
Test point 2	Evaporator temperature sensor 2P connector (female terminals) No. 2: ①



Is there continuity?

YES

Replace the evaporator temperature sensor .

NO

Repair an open in the SENS-COM wire.

DTC TROUBLESHOOTING: B1232 (A-A6), B1232 (0A)

DTC B1232 or DTC screen A-A6 or DTC indicator 0A : A short in the evaporator temperature sensor circuit

DTC Description	DTC
B1232 A short in the evaporator temperature sensor circuit	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

   -4. Check for DTCs.

DTC Description	DTC
B1232 A short in the evaporator temperature sensor circuit	B

   Is DTC B1232 or Error on the DTC screen A-A6 (climate control panel without display) or 0A (climate control panel with display) indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the evaporator temperature sensor circuit.

2. Shorted wire check (TEVA line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Climate control unit connector B (24P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
Test point 1	Climate control unit connector B (24P) No. 8
Test point 2	Body ground

   Is there continuity?

   YES

   Repair a short to ground in the TEVA wire.

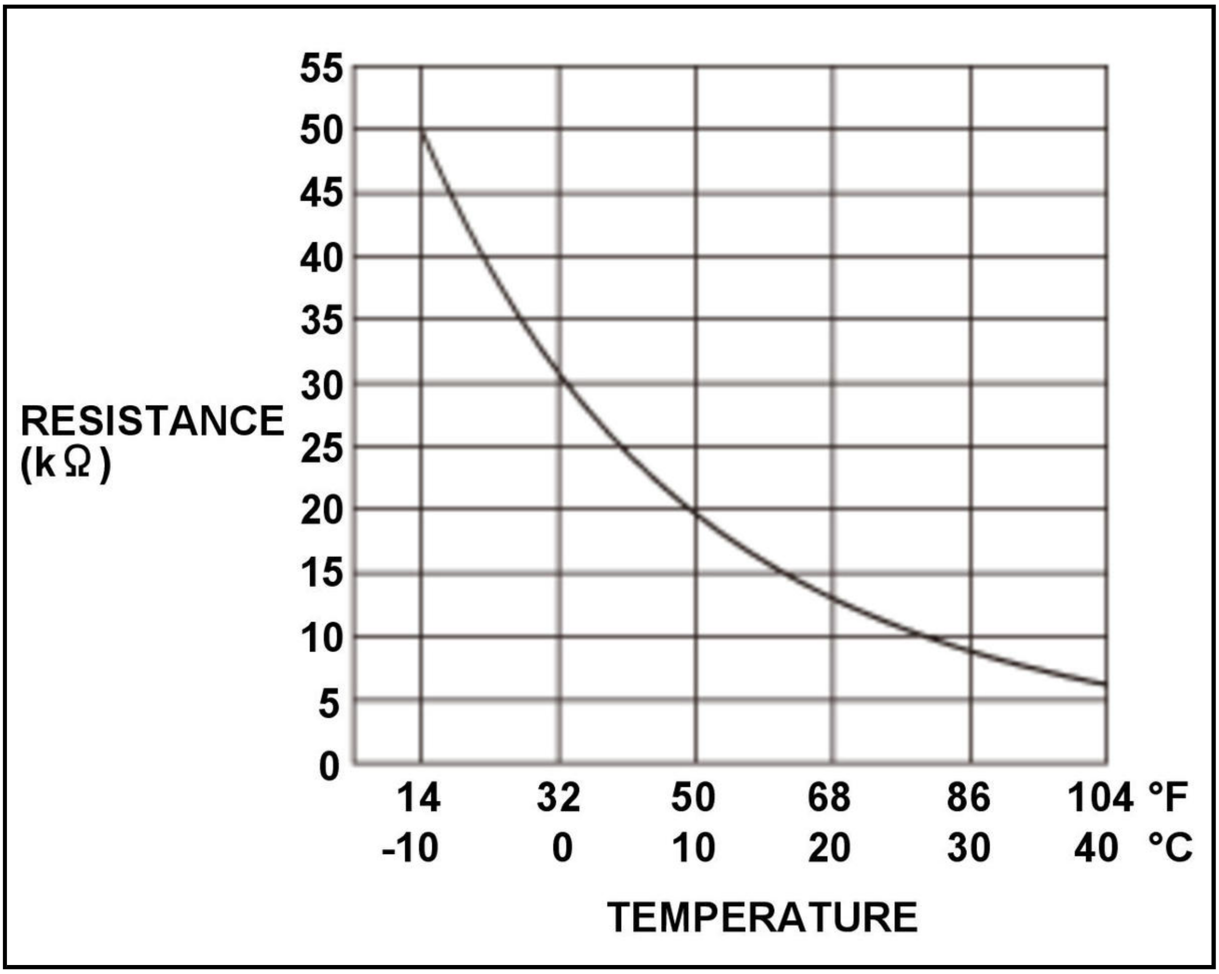
NO

The TEVA wire is not shorted. Go to step 3.

3. Determine possible failure area (climate control unit, others)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected
Test point 1	**Climate control unit connector B (24P) No. 8**
Test point 2	**Climate control unit connector B (24P) No. 10**



Is resistance value within the range?

YES

Replace the climate control unit .

NO

Go to step 4.

4. Shorted wire check (TEVA line to SENS-COM line)

-1. Disconnect the following connector.

Evaporator temperature sensor 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Evaporator temperature sensor 2P connector: disconnected
Test point 1	Climate control unit connector B (24P) No. 8

Test point 2	Climate control unit connector B (24P) No. 10

Is there continuity?

YES

Repair a short in the TEVA wire to SENS-COM wire.

NO

Replace the evaporator temperature sensor .

DTC TROUBLESHOOTING: B1233 (B-A1), B1233 (40)

DTC B1233 or DTC screen B-A1 or DTC indicator 40 : An open in the air mix control motor circuit (driver's)

DTC Description	DTC
B1233 An open in the air mix control motor circuit (driver's)	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

   -4. Check for DTCs.

DTC Description	DTC
B1233 An open in the air mix control motor circuit (driver's)	B

   Is DTC B1233 or Error on the DTC screen B-A1 (climate control panel without display) or 40 (climate control panel with display) indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the air mix control motor circuit.

   NO

   Intermittent failure. Check for loose wires or poor connections on the driver's air mix control motor circuit.

2. Determine possible failure area (AMD-P-DR line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

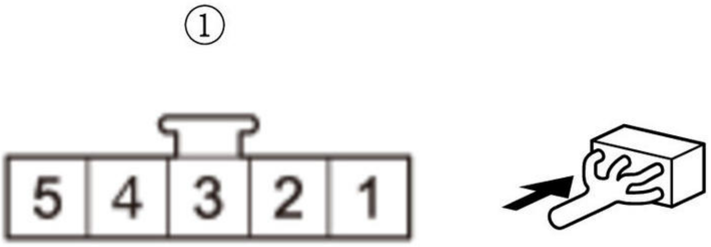
Without dual zone control: Air mix control motor 5P connector
With dual zone control: Driver's air mix control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

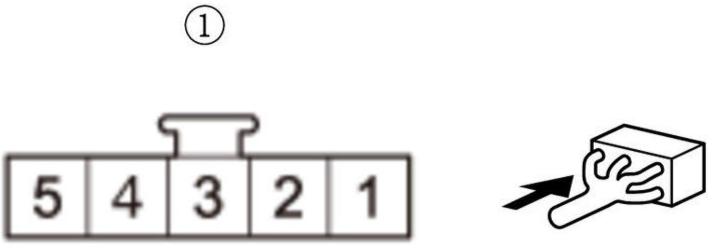
Without dual zone control

Test condition	Vehicle ON mode Air mix control motor 5P connector: disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



With dual zone control

Test condition	Vehicle ON mode Driver's air mix control motor 5P connector: disconnected
Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

The AMD-P-DR wire is OK. Go to step 3.

NO

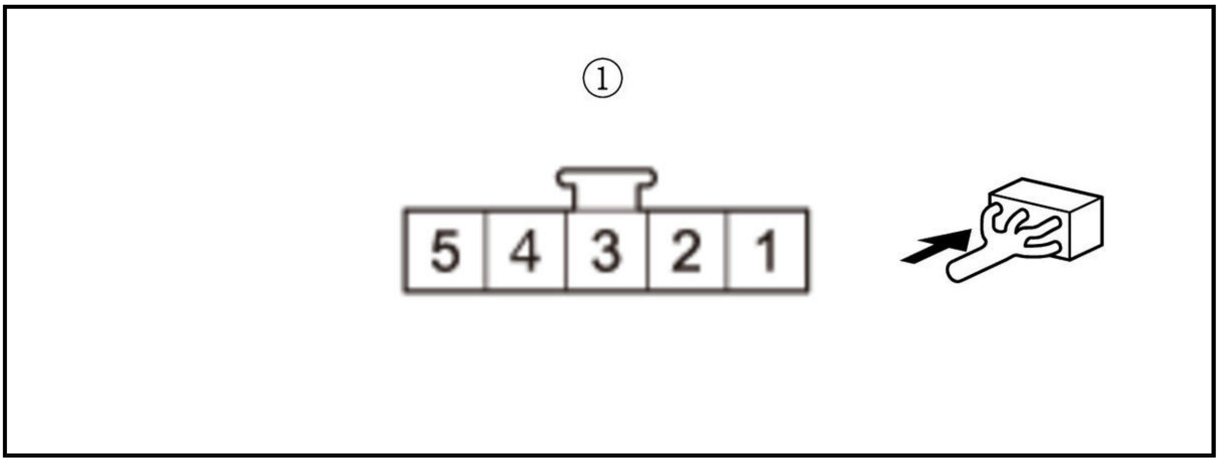
Go to step 4.

3. Open wire check (SENS-COM line)

-1. Measure the voltage between test points 1 and 2.

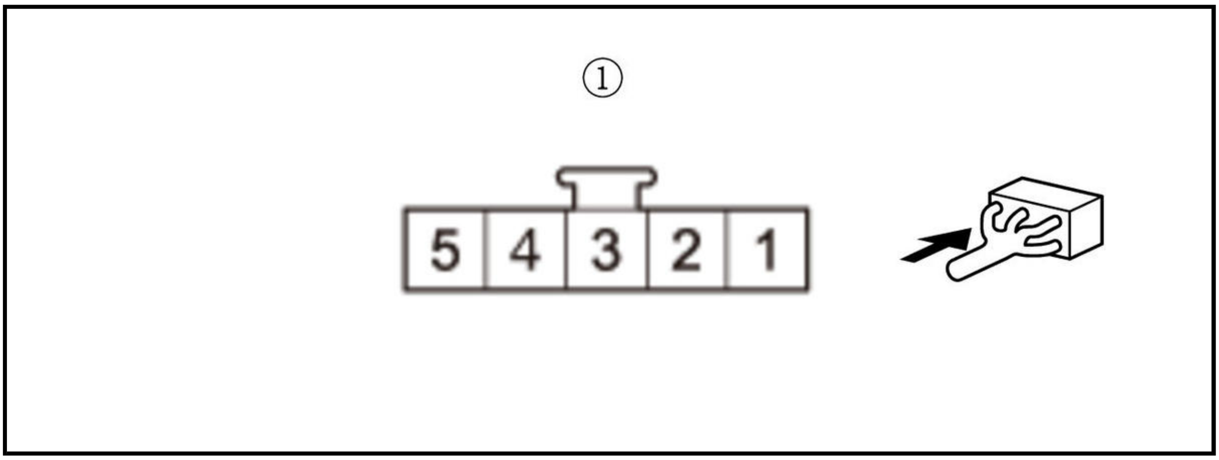
Without dual zone control

Test condition	Vehicle ON mode Air mix control motor 5P connector: disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Air mix control motor 5P connector (female terminals) No. 1: ①



With dual zone control

Test condition	Vehicle ON mode Driver's air mix control motor 5P connector: disconnected
Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Driver's air mix control motor 5P connector (female terminals) No. 3: ①



Is there about 5 V?

YES

Replace the air mix control motor (without dual zone control) or driver's air mix control motor (with dual zone control) .

NO

Repair an open in the SENS-COM wire.

4. Open wire check (AMD-P-DR line)

-1. Measure the voltage between test points 1 and 2.

Without dual zone control

Test condition	Vehicle ON mode
	Air mix control motor 5P connector: disconnected
Test point 1	Climate control unit connector B (24P) No. 2
Test point 2	Body ground

With dual zone control

Test condition	Vehicle ON mode
	Driver's air mix control motor 5P connector: disconnected
Test point 1	Climate control unit connector B (24P) No. 2
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the AMD-P-DR wire.

NO

Replace the climate control unit .

DTC TROUBLESHOOTING: B1234 (B-A2), B1234 (41)

DTC B1234 or DTC screen B-A2 or DTC indicator 41 : A short in the air mix control motor circuit (driver's)

NOTE: If other short circuit DTCs are indicated at the same time, there may be an open or short to body ground in the power (5 V) circuit.

DTC Description	DTC
B1234 A short in the air mix control motor circuit (driver's)	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Check for DTCs.

DTC Description	DTC
B1234 A short in the air mix control motor circuit (driver's)	B

Is DTC B1234 or Error on the DTC screen B-A2 (climate control panel without display) or 41 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the air mix control motor circuit.

NO

Intermittent failure. Check for loose wires or poor connections on the driver's air mix control motor circuit.

2. Determine possible failure area (S5V line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

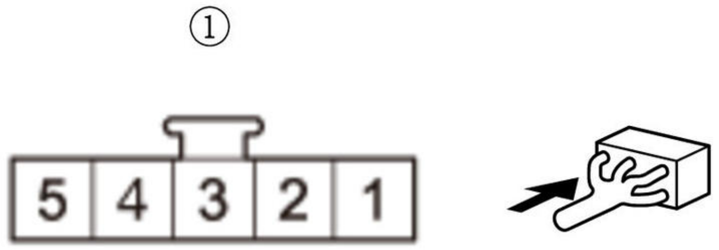
Without dual zone control: Air mix control motor 5P connector
With dual zone control: Driver's air mix control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Without dual zone control

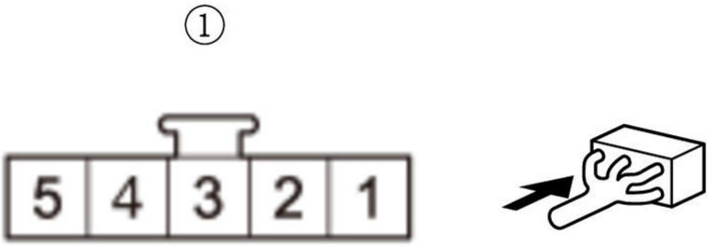
Test condition	Vehicle ON mode
	Air mix control motor 5P connector: disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



With dual zone control

Test condition	Vehicle ON mode
	Driver's air mix control motor 5P connector: disconnected

Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5 V?

YES

The S5V wire is OK. Go to step 3.

NO

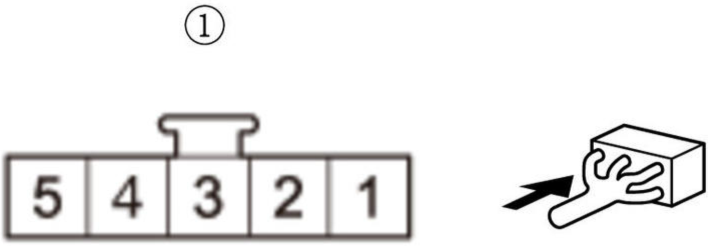
Go to step 4.

3. Determine possible failure area (air mix control motor (without dual zone control) or driver's air mix control motor (with dual zone control) check, others)

-1. Measure the voltage between test points 1 and 2.

Without dual zone control

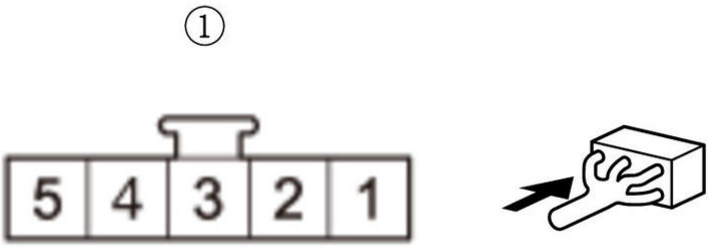
Test condition	Vehicle ON mode
	Air mix control motor 5P connector: disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



With dual zone control

Test condition	Vehicle ON mode
	Driver's air mix control motor 5P connector: disconnected

Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the air mix control motor (without dual zone control) or driver's air mix control motor (with dual zone control) .

NO

Go to step 6.

4. Open wire check (S5V line)

-1. Measure the voltage between test points 1 and 2.

Without dual zone control

Test condition	Vehicle ON mode
	Air mix control motor 5P connector: disconnected

Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

With dual zone control

Test condition	Vehicle ON mode
	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the S5V wire.

NO

The S5V wire is not open. Go to step 5.

5. Shorted wire check (S5V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Without dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

With dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the S5V wire.

NO

Replace the climate control unit .

6. Shorted wire check (AMD-P-DR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Without dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 2**
Test point 2	Body ground

With dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected

	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 2**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the AMD-P-DR wire.

NO

Replace the climate control unit .

DTC TROUBLESHOOTING: B1235 (B-A3), B1235 (42)

DTC B1235 or DTC screen B-A3 or DTC indicator 42 : A problem in the air mix control motor circuit, linkage, door, or motor (driver's)

DTC Description	DTC
B1235 A problem in the air mix control motor circuit, linkage, door, or motor (driver's)	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

   -4. Check for DTCs.

DTC Description	DTC
B1235 A problem in the air mix control motor circuit, linkage, door, or motor (driver's)	B

   Is DTC B1235 or Error on the DTC screen B-A3 (climate control panel without display) or 42 (climate control panel with display) indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the air mix control motor circuit.

2. Open wire check (M-HOT-DR line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

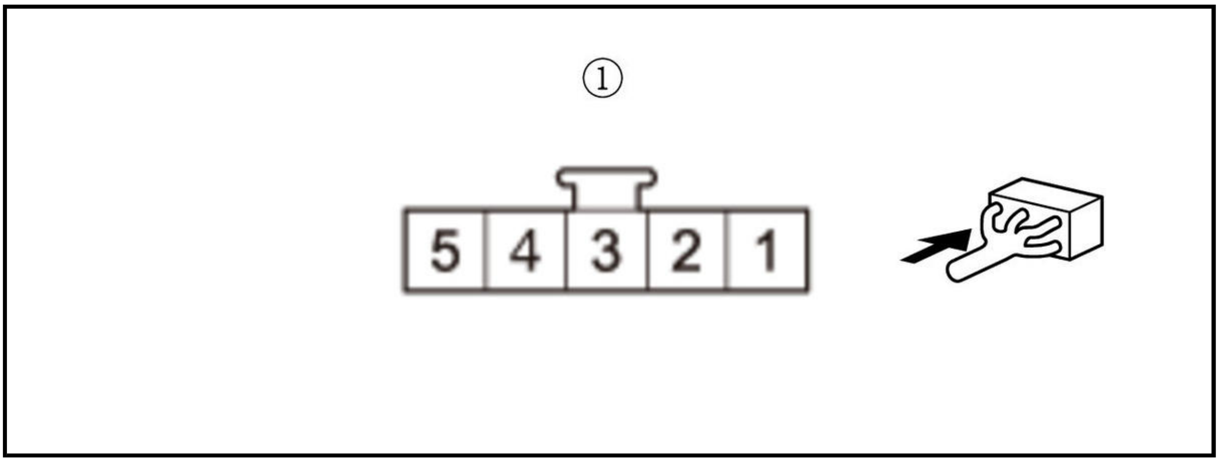
Climate control unit connector B (24P)
Without dual zone control: Air mix control motor 5P connector

With dual zone control: Driver's air mix control motor 5P connector

-3. Check for continuity between test points 1 and 2.

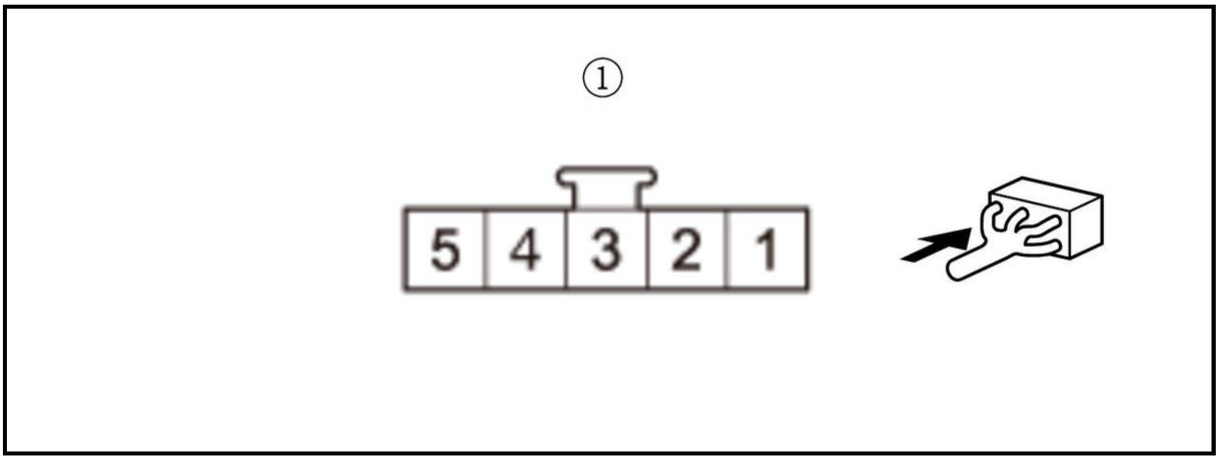
Without dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 13**
Test point 2	Air mix control motor 5P connector (female terminals) No. 5: ①



With dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 13**
Test point 2	Driver's air mix control motor 5P connector (female terminals) No. 4: ①



Is there continuity?

YES

The M-HOT-DR wire is not open. Go to step 3.

NO

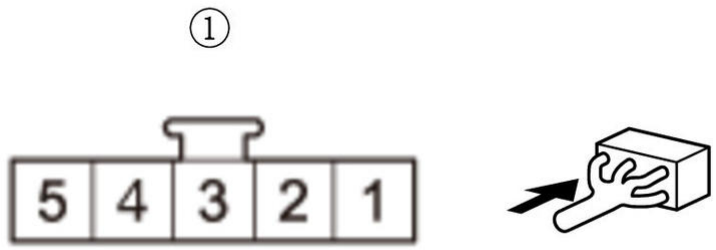
Repair an open in the M-HOT-DR wire.

3. Open wire check (M-COOL-DR line)

-1. Check for continuity between test points 1 and 2.

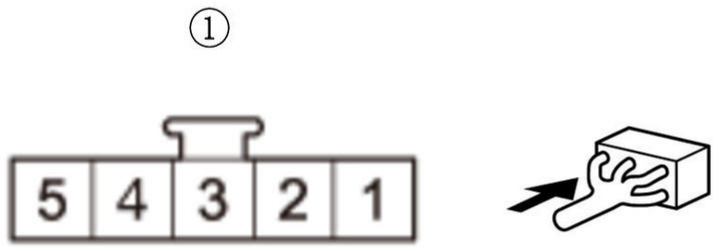
Without dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 14**
Test point 2	Air mix control motor 5P connector (female terminals) No. 4: ①



With dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 14**
Test point 2	Driver's air mix control motor 5P connector (female terminals) No. 5: ①



Is there continuity?

YES

The M-COOL-DR wire is not open. Go to step 4.

NO

Repair an open in the M-COOL-DR wire.

4. Shorted wire check (M-HOT-DR line)

-1. Check for continuity between test points 1 and 2.

Without dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 13**
Test point 2	Body ground

With dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 13**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the M-HOT-DR wire.

NO

The M-HOT-DR wire is OK. Go to step 5.

5. Shorted wire check (M-COOL-DR line)

-1. Check for continuity between test points 1 and 2.

Without dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 14**
Test point 2	Body ground

With dual zone control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 14**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the M-COOL-DR wire.

NO

The M-COOL-DR wire is OK. Go to step 6.

6. Air mix control motor (without dual zone control) or driver's air mix control motor (with dual zone control) check

-1. **Test the air mix control motor (without dual zone control) or driver's air mix control motor (with dual zone control)** .

Is the air mix control motor (without dual zone control) or driver's air mix control motor (with dual zone control) OK?

YES

Replace the climate control unit .

NO

Replace the air mix control motor , or repair the air mix control linkage or door.

NO

Replace the driver's air mix control motor , or repair the driver's air mix control linkage or door.

DTC TROUBLESHOOTING: B1236 (B-A4)

DTC B1236 or DTC screen B-A4 : An open in the passenger's air mix control motor circuit

DTC Description	DTC
B1236 An open in the passenger's air mix control motor circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-4. Check for DTCs.

DTC Description	DTC
B1236 An open in the passenger's air mix control motor circuit	B

Is DTC B1236 or Error on the DTC screen B-A4 indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the passenger's air mix control motor circuit.

2. Determine possible failure area (AMD-P-AS line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

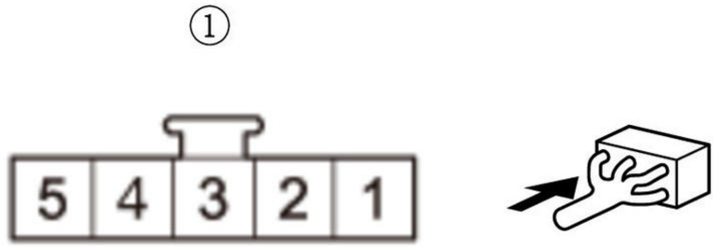
-2. Disconnect the following connector.

Passenger's air mix control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

The AMD-P-AS wire is OK. Go to step 3.

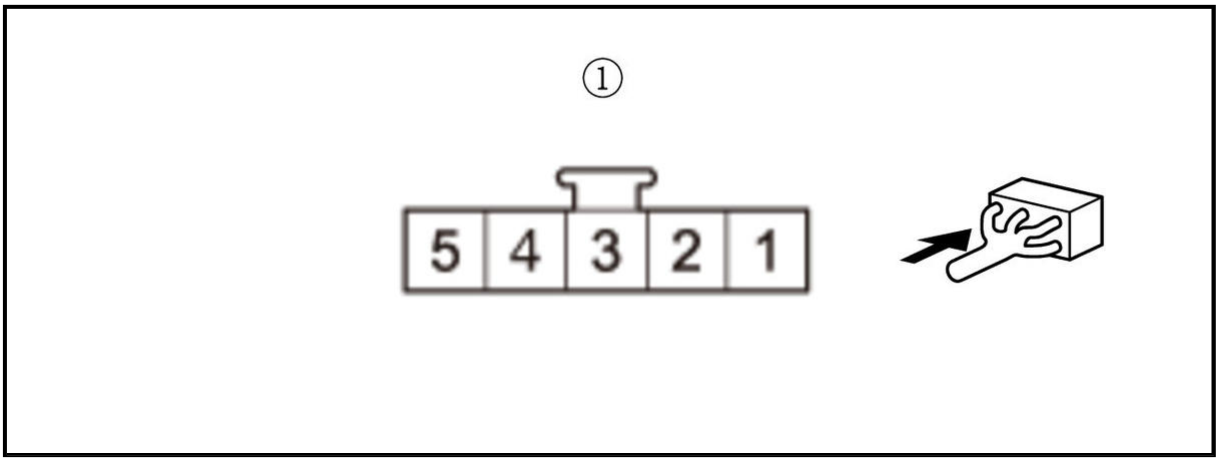
NO

Go to step 4.

3. Open wire check (SENS-COM line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Passenger's air mix control motor 5P connector (female terminals) No. 1: ①



Is there about 5 V?

YES

Replace the passenger's air mix control motor .

NO

Repair an open in the SENS-COM wire.

4. Open wire check (AMD-P-AS line)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 3**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the AMD-P-AS wire.

NO

Replace the climate control unit .

DTC TROUBLESHOOTING: B1237 (B-A5)

DTC B1237 or DTC screen B-A5 : A short in the passenger's air mix control motor circuit

NOTE: If other short circuit DTCs are indicated at the same time, there may be an open or short to body ground in the power (5 V) circuit.

DTC Description	DTC
B1237 A short in the passenger's air mix control motor circuit	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Check for DTCs.

DTC Description	DTC
B1237 A short in the passenger's air mix control motor circuit	B

Is DTC B1237 or Error on the DTC screen B-A5 indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the passenger's air mix control motor circuit.

2. Determine possible failure area (S5V line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

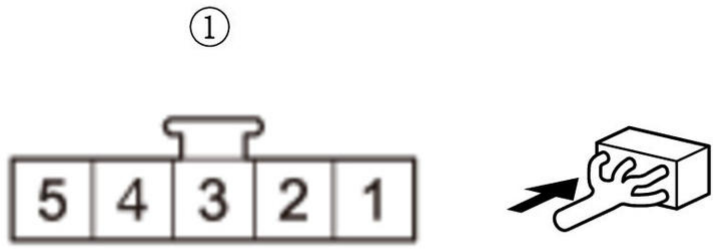
-2. Disconnect the following connector.

Passenger's air mix control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The S5V wire is OK. Go to step 3.

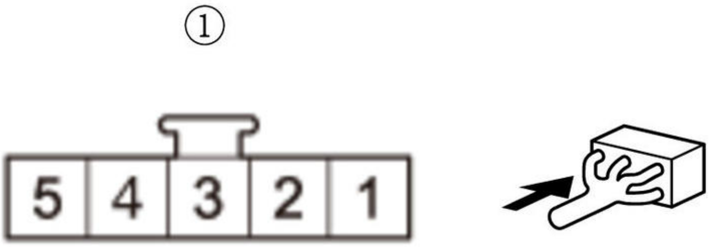
NO

Go to step 4.

3. Determine possible failure area (passenger's air mix control motor, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the passenger's air mix control motor .

NO

Go to step 6.

4. Open wire check (S5V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the S5V wire.

NO

The S5V wire is not open. Go to step 5.

5. Shorted wire check (S5V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the S5V wire.

NO

Replace the climate control unit .

6. Shorted wire check (AMD-P-AS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the AMD-P-AS wire.

NO

Replace the climate control unit .

DTC TROUBLESHOOTING: B1238 (B-A6)

DTC B1238 or DTC screen B-A6 : A problem in the passenger's air mix control motor circuit, linkage, door, or motor

DTC Description	DTC
B1238 A problem in the passenger's air mix control motor circuit, linkage, door, or motor	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-4. Check for DTCs.

DTC Description	DTC
B1238 A problem in the passenger's air mix control motor circuit, linkage, door, or motor	B

Is DTC B1238 or Error on the DTC screen B-A6 indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the passenger's air mix control motor circuit.

2. Open wire check (M-HOT-AS line)

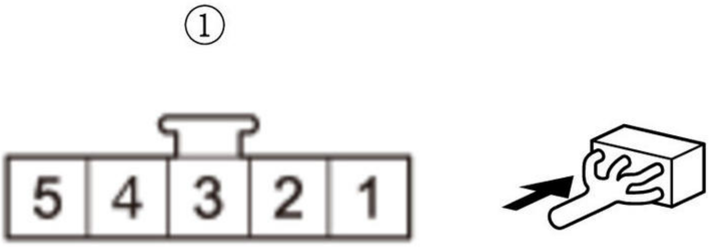
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Passenger's air mix control motor 5P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 15**
Test point 2	Passenger's air mix control motor 5P connector (female terminals) No. 5: ①



Is there continuity?

YES

The M-HOT-AS wire is not open. Go to step 3.

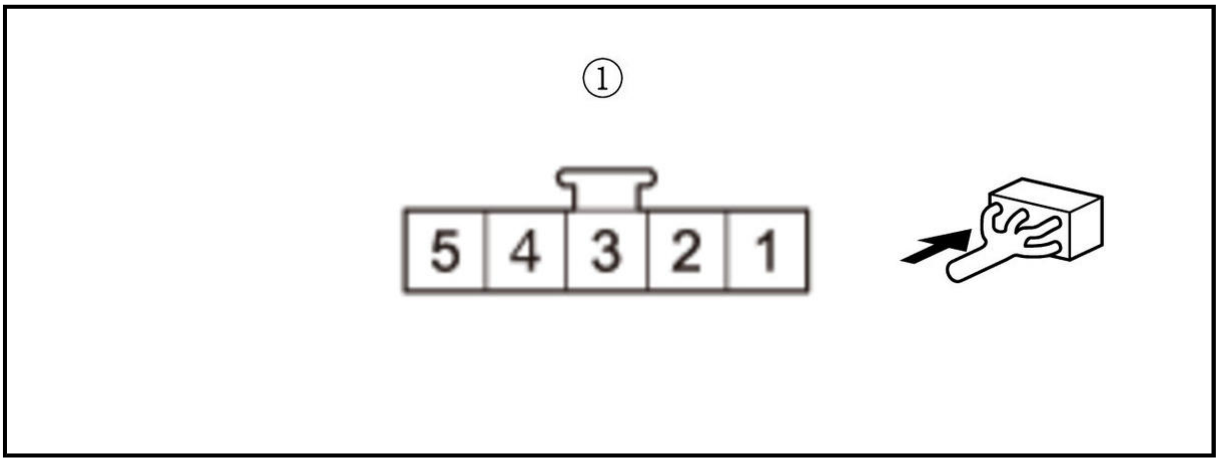
NO

Repair an open in the M-HOT-AS wire.

3. Open wire check (M-COOL-AS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 16**
Test point 2	Passenger's air mix control motor 5P connector (female terminals) No. 4: ①



Is there continuity?

YES

The M-COOL-AS wire is not open. Go to step 4.

NO

Repair an open in the M-COOL-AS wire.

4. Shorted wire check (M-HOT-AS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 15**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the M-HOT-AS wire.

NO

The M-HOT-AS wire is OK. Go to step 5.

5. Shorted wire check (M-COOL-AS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	Climate control unit connector B (24P) No. 16
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the M-COOL-AS wire.

NO

The M-COOL-AS wire is OK. Go to step 6.

6. Passenger's air mix control motor check

-1. Test the passenger's air mix control motor check .

Is the passenger's air mix control motor OK?

YES

Replace the climate control unit .

NO

Replace the passenger's air mix control motor , or repair the passenger's air mix control linkage or door.

DTC TROUBLESHOOTING: B123F (A-A3), B123F (17) (2017 2018 2019)

DTC B123F or DTC screen A-A3 or DTC indicator 17 : Automatic lighting control unit/sunlight sensor error

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Check for DTCs.

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	B

Is DTC B123F or Error on the DTC screen A-A3 (climate control panel without display) or 17 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time.

2. Equipment check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Confirm the vehicle have an automatic lighting system.

   Does the combination light switch have an AUTO position?

   YES

   Go to step 3.

   NO

   Go to step 4.

3. Equipment check 2

   -1. Confirm the vehicle have an automatic wiper system.

   Does the wiper/washer switch have an AUTO position?

   YES

   Go to step 4.

   NO

   Go to step 9.

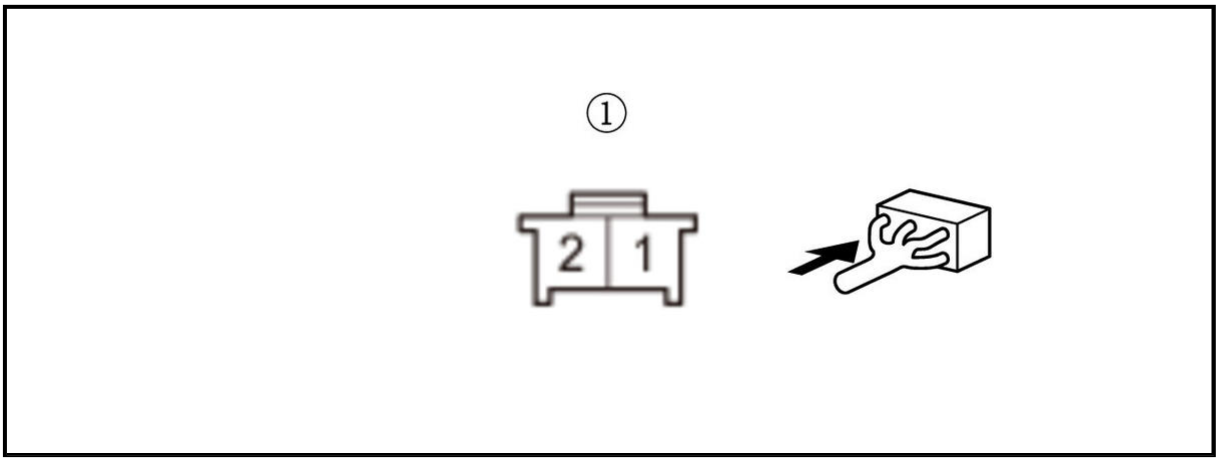
4. Open wire check (TSUN line)

   -1. Disconnect the following connectors.

Climate control unit connector A (32P)
Sunlight sensor 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 10**
Test point 2	Sunlight sensor 2P connector (female terminals) No. 2: ①



Is there continuity?

YES

The TSUN wire is not open. Go to step 5.

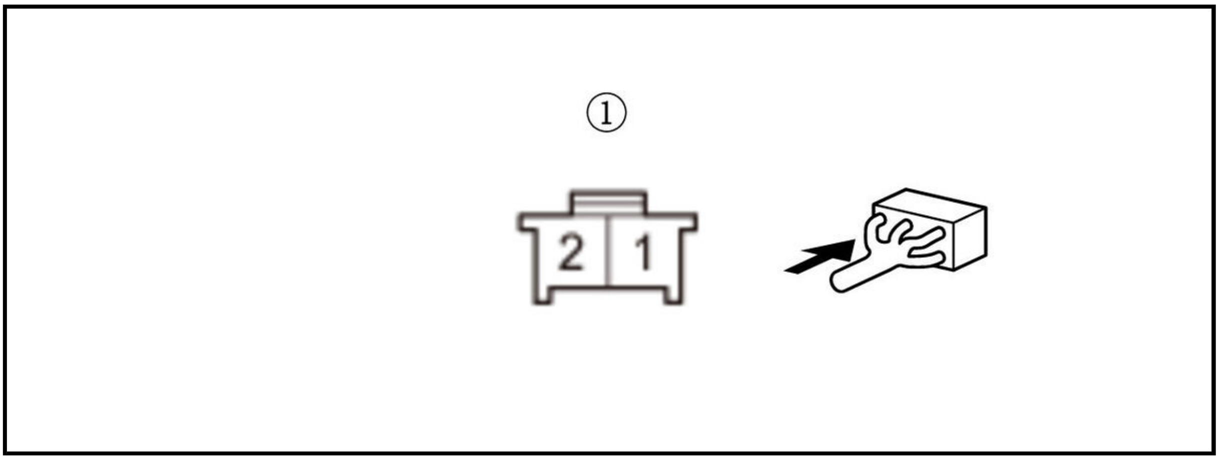
NO

Repair an open in the TSUN wire.

5. Open wire check (SENSOR COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 12**
Test point 2	Sunlight sensor 2P connector (female terminals) No. 1: ①



Is there continuity?

YES

The SENSOR COM wire is OK. Go to step 6.

NO

Repair an open in the SENSOR COM wire.

6. Shorted wire check (TSUN line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 10**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the TSUN wire.

NO

The TSUN wire is not shorted. Go to step 7.

7. Shorted wire check (TSUN line to SENSOR COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 10**
Test point 2	**Climate control unit connector A (32P) No. 12**

Is there continuity?

YES

Repair a short in the TSUN wire to SENSOR COM wire.

NO

The TSUN wire and SENSOR COM wire are OK. Go to step 8.

8. Sunlight sensor check

-1. Reconnect the following connectors.

Climate control unit connector A (32P)
Sunlight sensor 2P connector

-2. **Test the sunlight sensor** .

Is the sunlight sensor OK?

YES

Replace the climate control unit .

NO

Replace the sunlight sensor .

9. Fuse check:

NOTE: **Check for DTCs. If a DTC U1280 or Error on the DTC screen I-A1 (climate control panel without display) or 80 (climate control panel with display) indicated, troubleshoot the DTC first.**

-1. Check the following fuse.

Fuse	No. A18 (10 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 10.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. A18 (10 A) fuse circuit.

10. Determine possible failure area (B-CAN lines, others)

-1. Disconnect the following connector.

Automatic lighting control unit-sensor 5P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
Test point 1	Automatic lighting control unit-sensor 5P connector No. 3
Test point 2	Automatic lighting control unit-sensor 5P connector No. 4

Is there battery voltage?

YES

Go to step 11.

NO

Go to step 14.

11. Open wire check (B-CAN_H line)

-1. Disconnect the following connector.

Climate control unit connector A (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
	Climate control unit connector A (32P): disconnected
Test point 1	Automatic lighting control unit-sensor 5P connector No. 1
Test point 2	Climate control unit connector A (32P) No. 25

Is there continuity?

YES

The B-CAN_H wire is OK. Go to step 12.

NO

Repair an open in the B-CAN_H wire.

12. Open wire check (B-CAN_L line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
	Climate control unit connector A (32P): disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 2**
Test point 2	**Climate control unit connector A (32P) No. 8**

Is there continuity?

YES

The B-CAN_L wire is OK. Go to step 13.

NO

Repair an open in the B-CAN_L wire.

13. DTC check

-1. Reconnect the following connectors.

Automatic lighting control unit-sensor 5P connector
Climate control unit connector A (32P)

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

-4. Wait for at least 8 seconds.

-5. **Do the Self-Diagnostic Function with the climate control unit** .

-6. Check for DTCs.

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	B
U128D Climate Control Unit Lost communication with gauge control module	B

Is DTC B123F or Error on the DTC screen A-A3 (climate control panel without display) or 17 (climate control panel with display) and DTC U128D or Error on the DTC screen I-A2 (climate control panel without display) or 83 (climate control panel with display) indicated?

YES

Replace the climate control unit .

NO

Replace the automatic lighting control unit-sensor .

14. Open wire check (+B BACK UP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 4**
Test point 2	Body ground

Is there battery voltage?

YES

Check for an open in the GND wire. If the wire is OK, check for poor ground at G402.

NO

Repair an open in the +B BACK UP wire.

DTC TROUBLESHOOTING: B123F (A-A3), B123F (17) (2020 2021)

DTC B123F or DTC screen A-A3 or DTC indicator 17 : Automatic lighting control unit/sunlight sensor error

*1: Without auto idle stop system

*2: With auto idle stop system

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-4. Check for DTCs.

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	B

Is DTC B123F or Error on the DTC screen A-A3 (climate control panel without display) or 17 (climate control panel with display) indicated?

YES *1

Go to step 3

YES *2

Go to step 2

NO

Intermittent failure, the system is OK at this time.

2. Fuse check

-1. Check the following fuse.

Fuse	No. B27 (30 A)
Location	Fuse/relay holder A

Is the fuse OK?

YES

Go to step 3.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. B27 (30 A) fuse circuit.

3. Equipment check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Confirm the vehicle have an automatic lighting system.

Does the combination light switch have an AUTO position?

YES

Go to step 4.

NO

Go to step 5.

4. Equipment check 2

-1. Confirm the vehicle have an automatic wiper system.

Does the wiper/washer switch have an AUTO position?

YES

Go to step 5.

NO

Go to step 10.

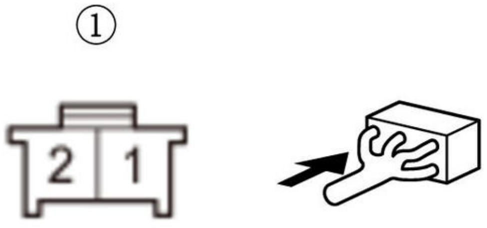
5. Open wire check (TSUN line)

-1. Disconnect the following connectors.

Climate control unit connector A (32P)
Sunlight sensor 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 10**
Test point 2	Sunlight sensor 2P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The TSUN wire is not open. Go to step 6.

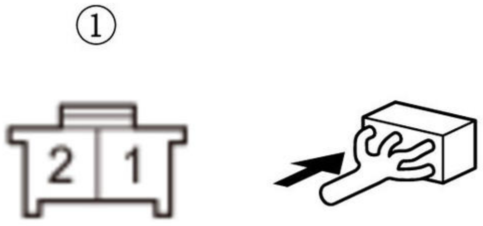
NO

Repair an open in the TSUN wire.

6. Open wire check (SENSOR COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 12**
Test point 2	Sunlight sensor 2P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The SENSOR COM wire is OK. Go to step 7.

NO

Repair an open in the SENSOR COM wire.

7. Shorted wire check (TSUN line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 10**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The TSUN wire is not shorted. Go to step 8.

NO

Repair a short to ground in the TSUN wire.

8. Shorted wire check (TSUN line to SENSOR COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 10**
Test point 2	**Climate control unit connector A (32P) No. 12**

Is there 1 MΩ or more?

YES

The TSUN wire and SENSOR COM wire are OK. Go to step 9.

NO

Repair a short in the TSUN wire to SENSOR COM wire.

9. Sunlight sensor check

-1. Reconnect the following connectors.

Climate control unit connector A (32P)
Sunlight sensor 2P connector

-2. **Test the sunlight sensor** .

Is the sunlight sensor OK?

YES

Replace the climate control unit .

NO

Replace the sunlight sensor .

10. Fuse check:

NOTE: **Check for DTCs. If a DTC U1280 or Error on the DTC screen I-A1 (climate control panel without display) or 80 (climate control panel with display) indicated, troubleshoot the DTC first.**

-1. Check the following fuse.

Fuse	No. A18 (10 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 11.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. A18 (10 A) fuse circuit.

11. Determine possible failure area (B-CAN lines, others)

-1. Disconnect the following connector.

Automatic lighting control unit-sensor 5P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 3**
Test point 2	**Automatic lighting control unit-sensor 5P connector No. 4**

Is there battery voltage?

YES

Go to step 12.

NO

Go to step 15.

12. Open wire check (B-CAN_H line)

-1. Disconnect the following connector.

Climate control unit connector A (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	Automatic lighting control unit-sensor 5P connector: disconnected
	Climate control unit connector A (32P): disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 1**
Test point 2	**Climate control unit connector A (32P) No. 25**

Is there 1.0 Ω or less?

YES

The B-CAN_H wire is OK. Go to step 13.

NO

Repair an open in the B-CAN_H wire.

13. Open wire check (B-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
	Climate control unit connector A (32P): disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 2**
Test point 2	**Climate control unit connector A (32P) No. 8**

Is there 1.0 Ω or less?

YES

The B-CAN_L wire is OK. Go to step 14.

NO

Repair an open in the B-CAN_L wire.

14. DTC check

-1. Reconnect the following connectors.

Automatic lighting control unit-sensor 5P connector

Climate control unit connector A (32P)

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode then the ON mode.

-4. Wait for at least 8 seconds.

-5. **Do the Self-Diagnostic Function with the climate control unit** .

-6. Check for DTCs.

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	B
U128D Climate Control Unit Lost communication with gauge control module	B

Is DTC B123F or Error on the DTC screen A-A3 (climate control panel without display) or 17 (climate control panel with display) and DTC U128D or Error on the DTC screen I-A2 (climate control panel without display) or 83 (climate control panel with display) indicated?

YES

Replace the climate control unit .

NO

Replace the automatic lighting control unit-sensor .

15. Open wire check (+B BACK UP *1, +B BACKUP2 SUB *2 line):-1.

    Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Automatic lighting control unit-sensor 5P connector: disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 4**
Test point 2	Body ground

    Is there battery voltage?

    YES

    Check for an open in the GND wire between the automatic lighting control unit-sensor and body ground. If the wire is OK, check for poor ground at G402.

    NO

    Repair an open in the +B BACK UP *1, +B BACKUP2 SUB *2 wire.

DTC TROUBLESHOOTING: B1240 (B-B3), B1240 (4B)

DTC B1240 or DTC screen B-B3 or DTC indicator 4b : A problem in the mode control motor circuit, linkage, door, or motor

DTC Description	DTC
B1240 A problem in the mode control motor circuit, linkage, door, or motor	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

   -4. Check for DTCs.

DTC Description	DTC
B1240 A problem in the mode control motor circuit, linkage, door, or motor	B

   Is DTC B1240 or Error on the DTC screen B-B3 (climate control panel without display) or 4b (climate control panel with display) indicated?

   YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the mode control motor circuit.

2. Open wire check (M-DEF line)

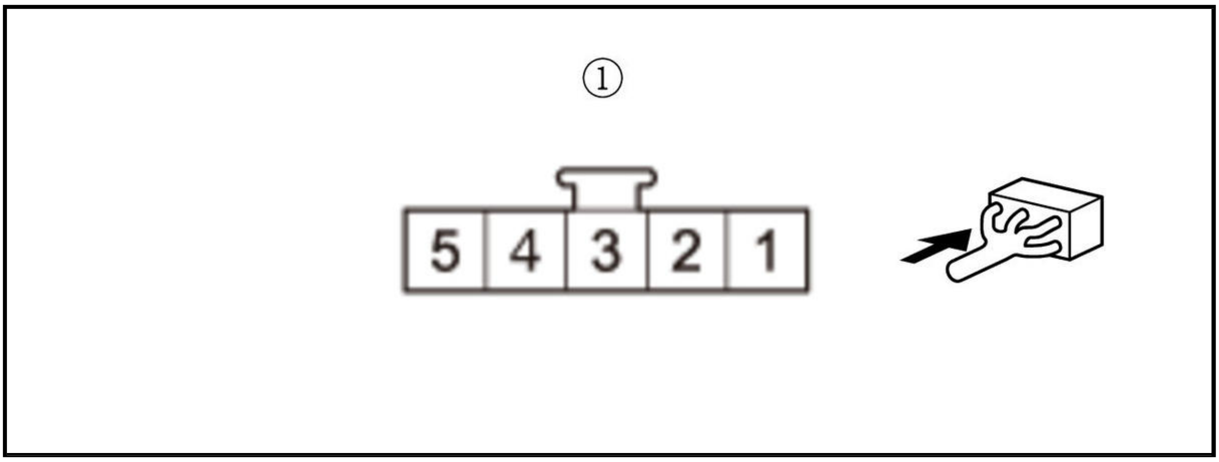
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Mode control motor 5P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 20**
Test point 2	Mode control motor 5P connector (female terminals) No. 5: ①



Is there continuity?

YES

The M-DEF wire is not open. Go to step 3.

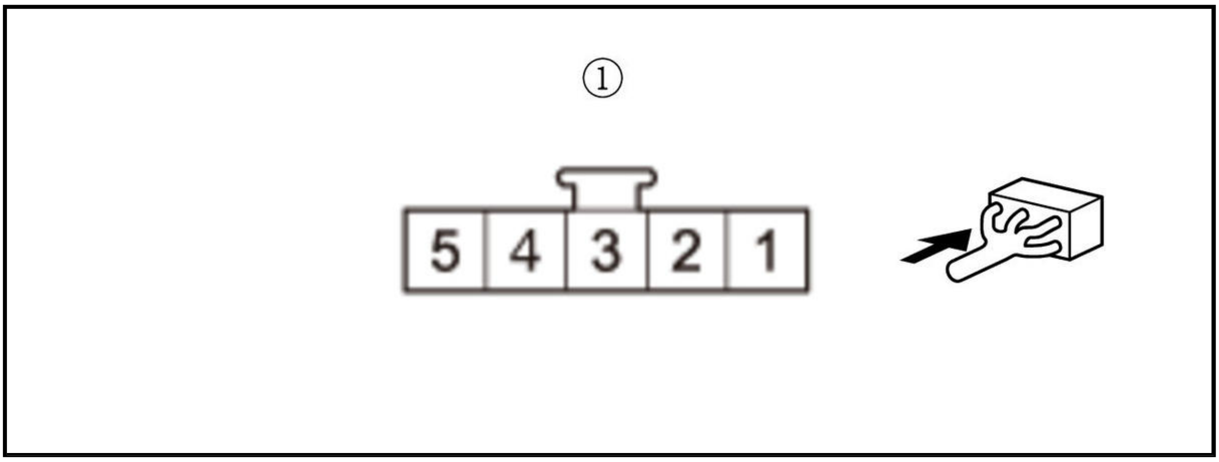
NO

Repair an open in the M-DEF wire.

3. Open wire check (M-VENT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 19**
Test point 2	Mode control motor 5P connector (female terminals) No. 4: ①



Is there continuity?

YES

The M-VENT wire is not open. Go to step 4.

NO

Repair an open in the M-VENT wire.

4. Shorted wire check (M-DEF line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 20**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the M-DEF wire.

NO

The M-DEF wire is OK. Go to step 5.

5. Shorted wire check (M-VENT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 19**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the M-VENT wire.

NO

The M-VENT wire is OK. Go to step 6.

6. Mode control motor check

-1. Test the mode control motor .

Is the mode control motor OK?

YES

Replace the climate control unit .

NO

Replace the mode control motor , or repair the mode control linkage or door.

DTC TROUBLESHOOTING: B1241 (D-A1), B1241 (59)

DTC B1241 or DTC screen D-A1 or DTC indicator 59 : A problem in the blower motor circuit

DTC Description	DTC
B1241 A problem in the blower motor circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Check for DTCs.

DTC Description	DTC
B1241 A problem in the blower motor circuit	B

Is DTC B1241 or Error on the DTC screen D-A1 (climate control panel without display) or 59 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the blower motor circuit.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A3-1 (40 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 3.

NO

Replace the fuse, and recheck. If fuse blows again, repair a short in the No. A3-1 (40 A) fuse circuit.

3. Blower motor power circuit check

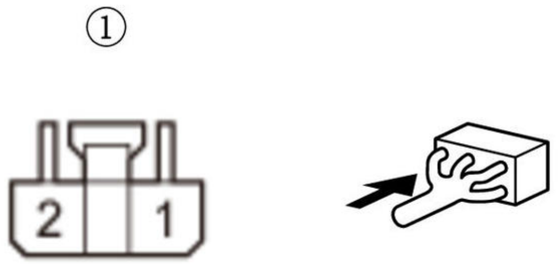
-1. Disconnect the following connector.

Blower motor 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Blower motor 2P connector: disconnected
Test point 1	Blower motor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 12.

4. Blower motor operation check

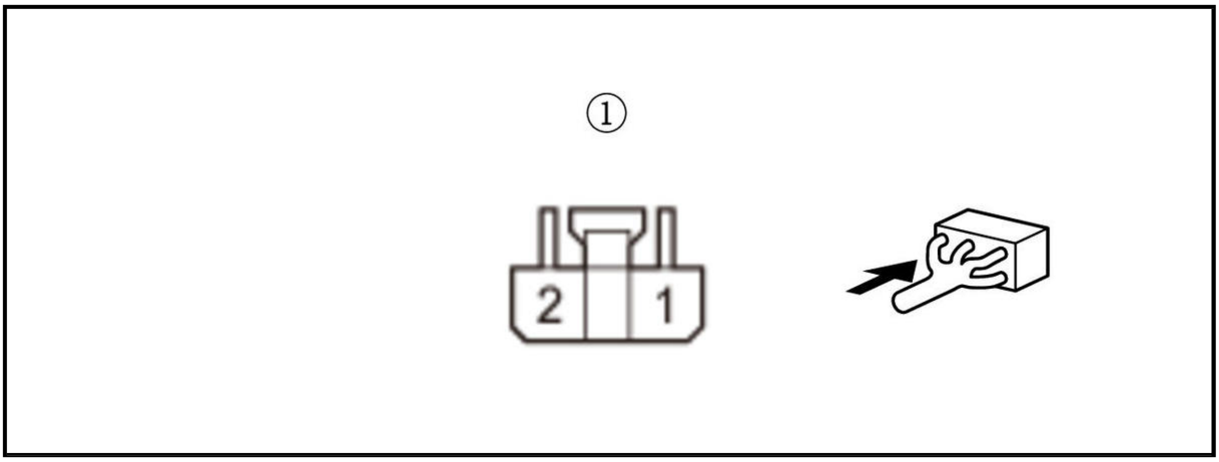
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect the blower motor 2P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Blower motor 2P connector (female terminals) No. 1: ①

Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

Does the blower motor run at high speed?

YES

Go to step 5.

NO

Replace the blower motor .

5. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

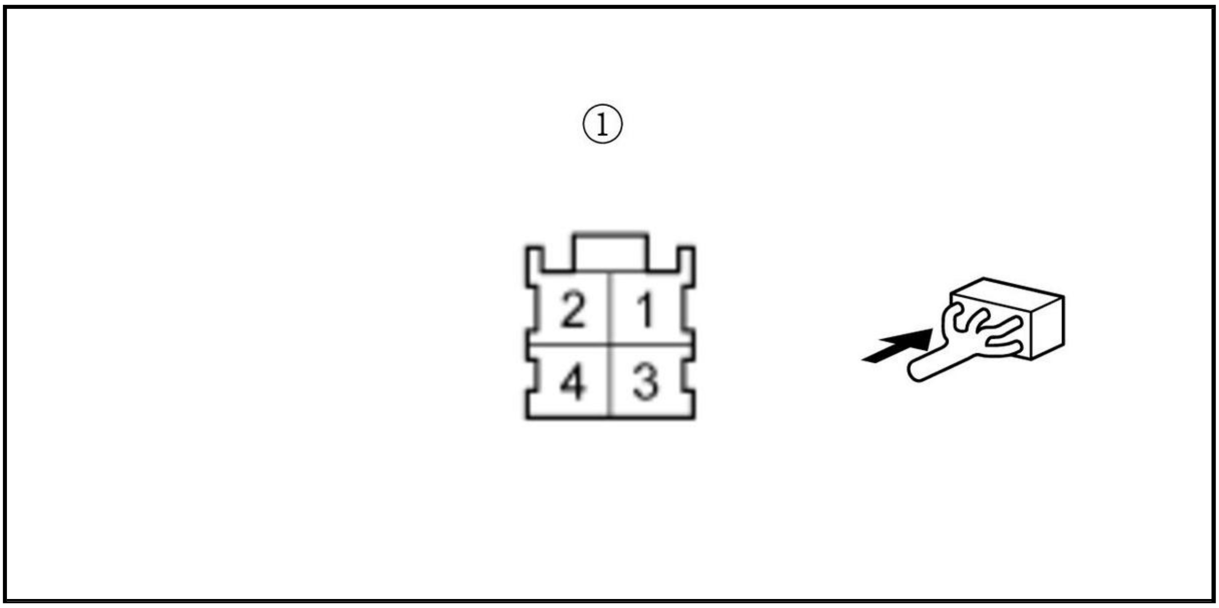
-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Power transistor 4P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Power transistor 4P connector: disconnected
Test point 1	Power transistor 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Go to step 6.

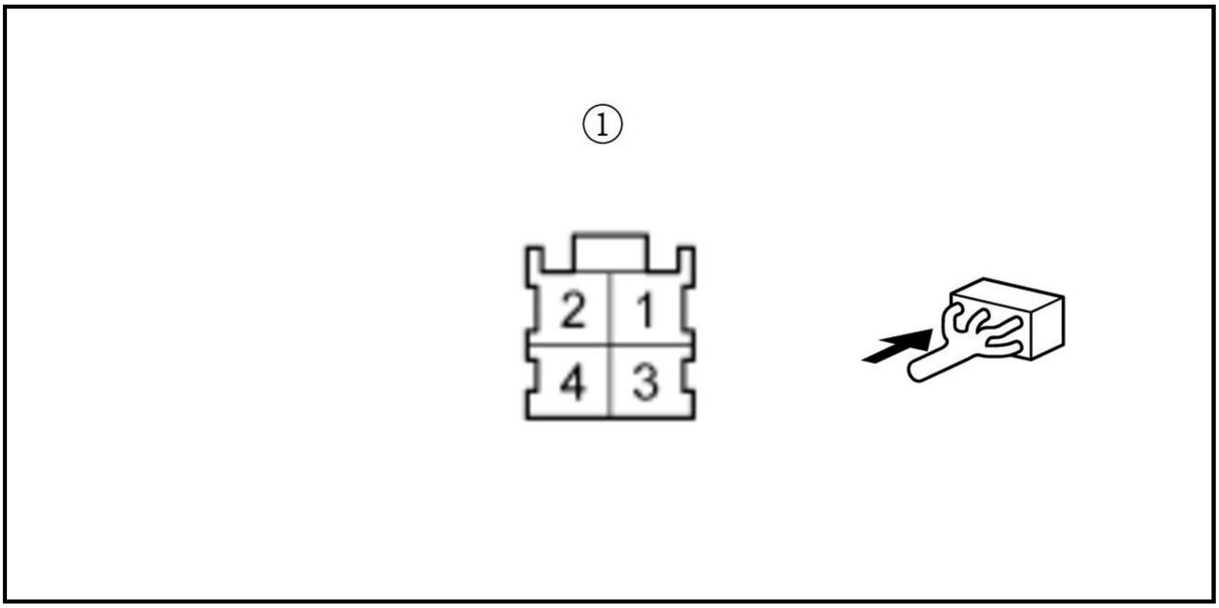
NO

Check for an open in the GND wire. If the wire is OK, check for poor ground at G251.

6. Open wire check (BLW-M line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Power transistor 4P connector (female terminals) No. 1: ①
Terminal B	Power transistor 4P connector (female terminals) No. 2: ①



-2. Turn the vehicle to the ON mode.

Does the blower motor run at high speed?

YES

The BLW-M wire is OK. Go to step 7.

NO

Repair an open in the BLW-M wire.

7. Shorted wire check (BLW-V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Disconnect the following connector.

Climate control unit connector B (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Power transistor 4P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 12**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the BLW-V wire.

NO

The BLW-V wire is not shorted. Go to step 8.

8. Shorted wire check (BLW-G line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Power transistor 4P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 11**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the BLW-G wire.

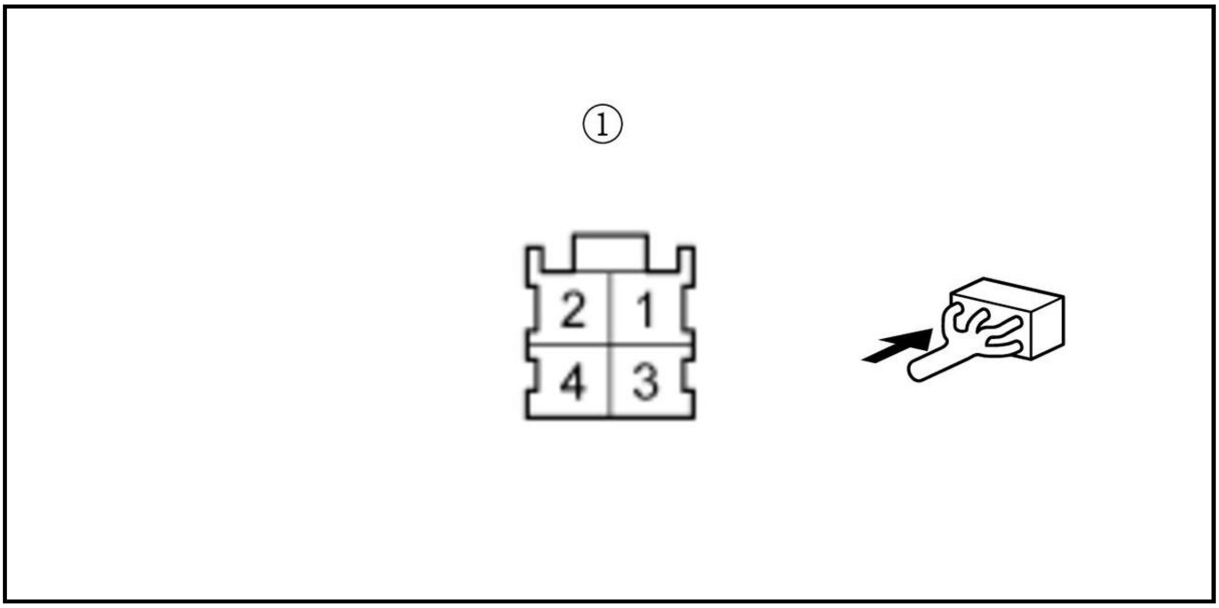
NO

The BLW-G wire is not shorted. Go to step 9.

9. Open wire check (BLW-V line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Power transistor 4P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 12**
Test point 2	Power transistor 4P connector (female terminals) No. 3: ①



Is there continuity?

YES

The BLW-V wire is OK. Go to step 10.

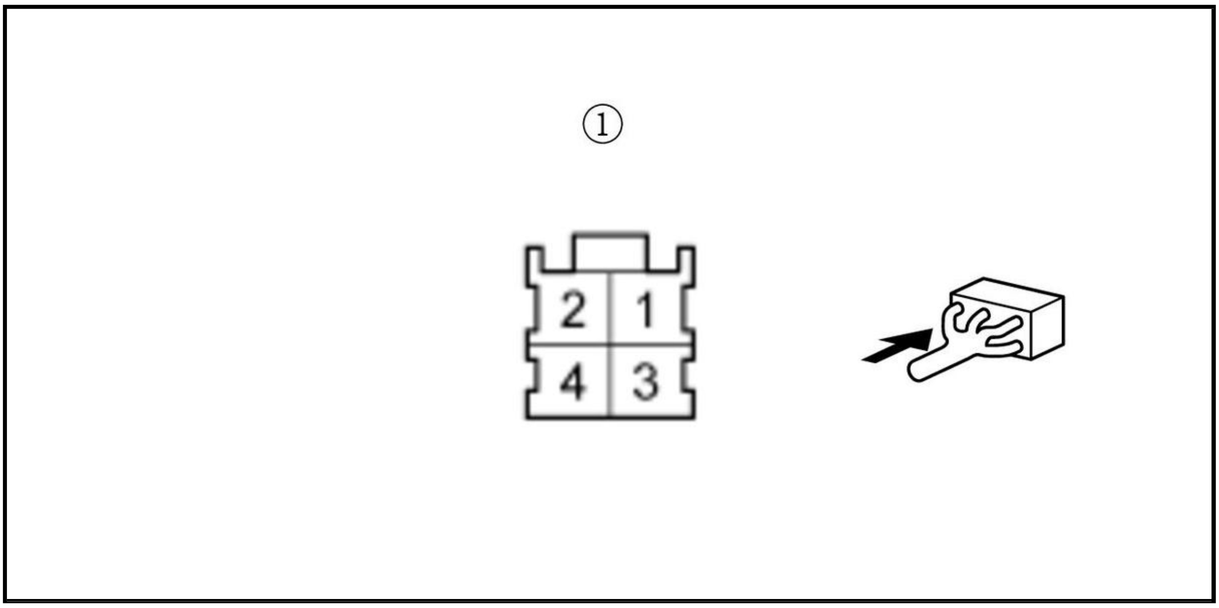
NO

Repair an open in the BLW-V wire.

10. Open wire check (BLW-G line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Power transistor 4P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 11**
Test point 2	Power transistor 4P connector (female terminals) No. 4: ①



Is there continuity?

YES

The BLW-G wire is OK. Go to step 11.

NO

Repair an open in the BLW-G wire.

11. Power transistor check

-1. **Test the power transistor** .

Is the power transistor OK?

YES

Replace the climate control unit .

NO

Replace the power transistor .

NOTE: **If the power transistor is faulty, check the blower motor for damage. If necessary, replace the blower motor .**

12. Front blower motor relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the front blower motor relay from the under-hood fuse/relay box, and **test it** .

Is the relay OK?

YES

Go to step 13.

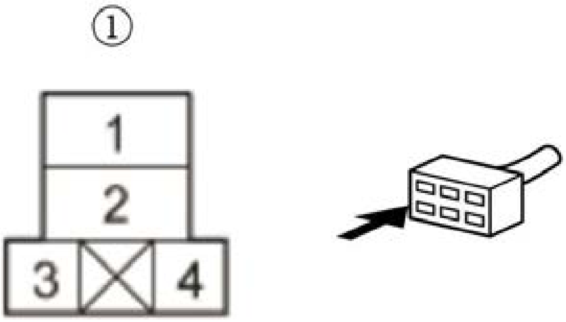
NO

Replace the front blower motor relay.

13. Open wire check (+B HTR MTR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front blower motor relay: disconnected
Test point 1	Front blower motor relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B HTR MTR wire is OK. Go to step 14.

NO

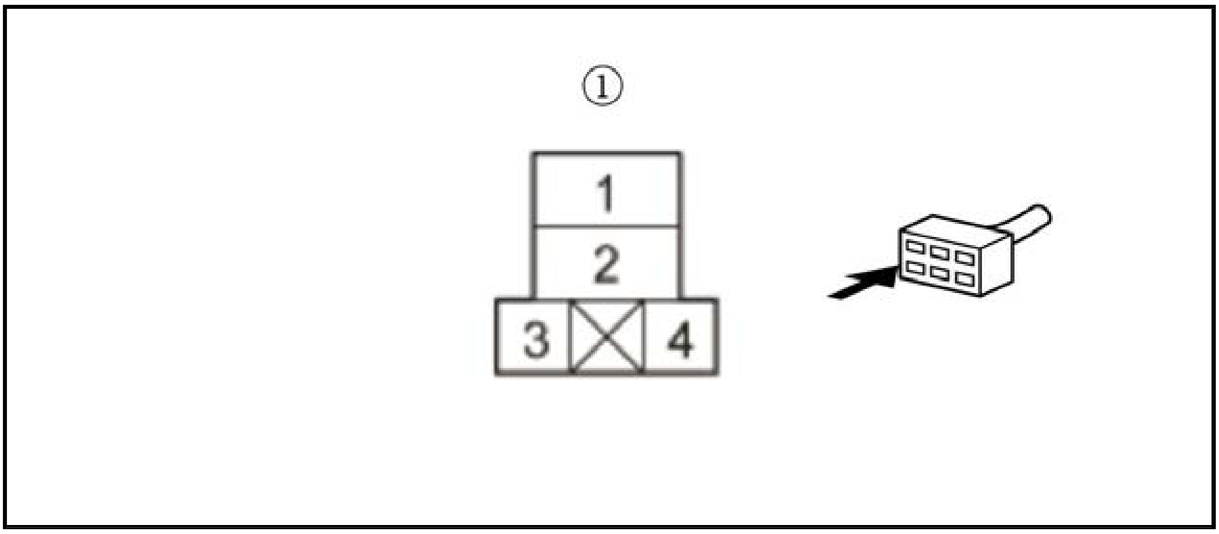
Repair an open in the +B HTR MTR wire.

14. Open wire check (IG2 A/C line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Front blower motor relay: disconnected
Test point 1	Front blower motor relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG2 A/C wire is OK. Go to step 15.

NO

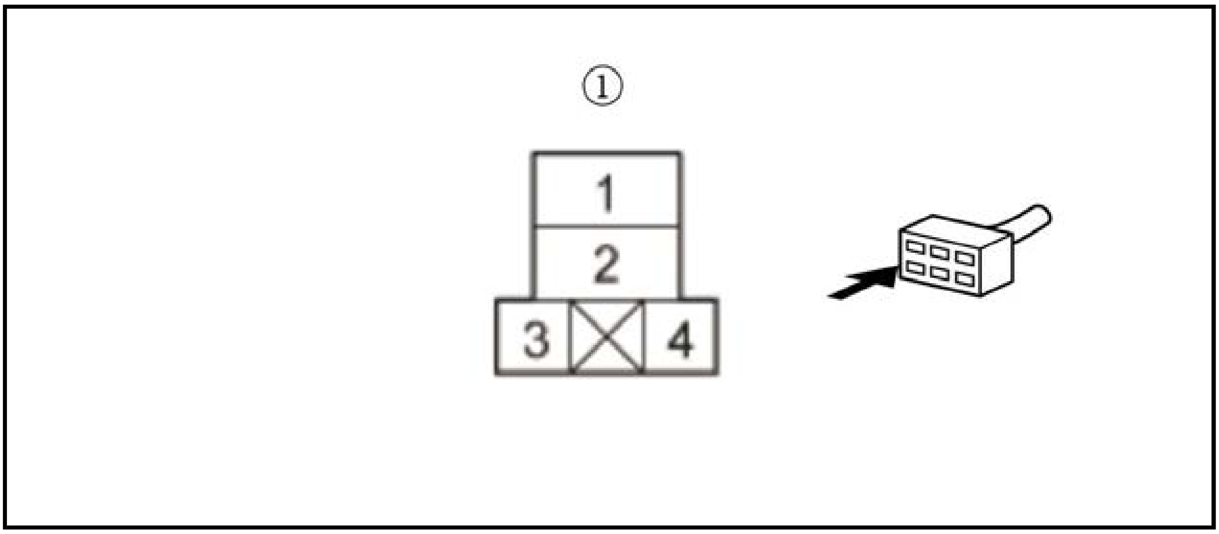
Repair an open in the IG2 A/C wire.

15. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front blower motor relay: disconnected
Test point 1	Front blower motor relay 4P socket (female terminals) No. 4: ①
Test point 2	Body ground



Is there continuity?

YES

Repair an open in the BLOWER MTR wire.

NO

Check for an open in the GND wire. If the wire is OK, check for poor ground at G351.

DTC TROUBLESHOOTING: B2964 (I-B5), B2964 (93)

DTC B2964 or DTC screen I-B5 or DTC indicator 93 : Climate control unit lost communication with Front PANEL (climate control panel)

DTC Description	DTC
B2964 Climate control unit lost communication with Front PANEL (climate control panel)	B

DTCs (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

   -4. Check for DTCs.

DTC Description	DTC
B2964 Climate control unit lost communication with Front PANEL (climate control panel)	B

   Is DTC B2964 or Error on the DTC screen I-B5 (climate control panel without display) or 93 (climate control panel with display) indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the climate control panel circuit.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. D9 (10 A)
Location	Under-dash fuse/relay box

   Is the fuse OK?

   YES

   Go to step 3.

   NO

   Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. D9 (10 A) fuse circuit.

3. Determine possible failure area (BUS-DATA line, others)

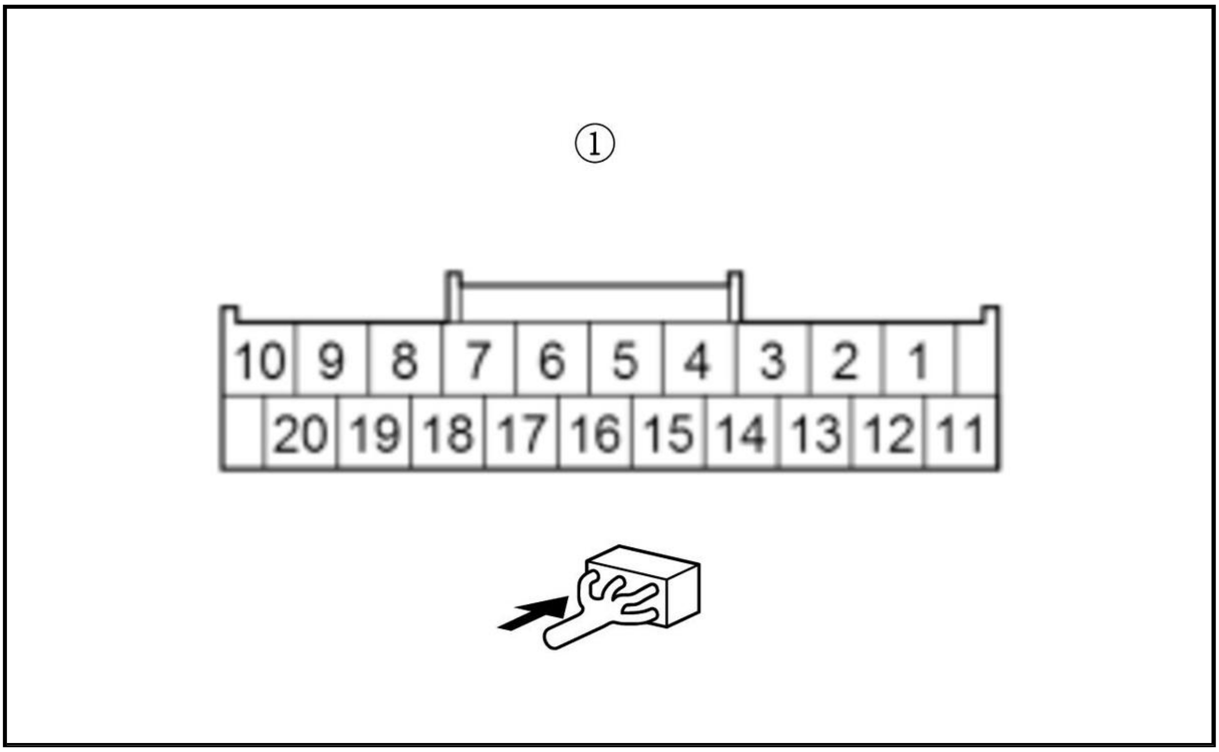
-1. Disconnect the following connector.

Climate control panel 20P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control panel 20P connector: disconnected
Test point 1	Climate control panel 20P connector (female terminals) No. 13: ①
Test point 2	Climate control panel 20P connector (female terminals) No. 19: ①



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (BUS-DATA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector A (32P): disconnected Climate control panel 20P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 29**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the BUS-DATA wire.

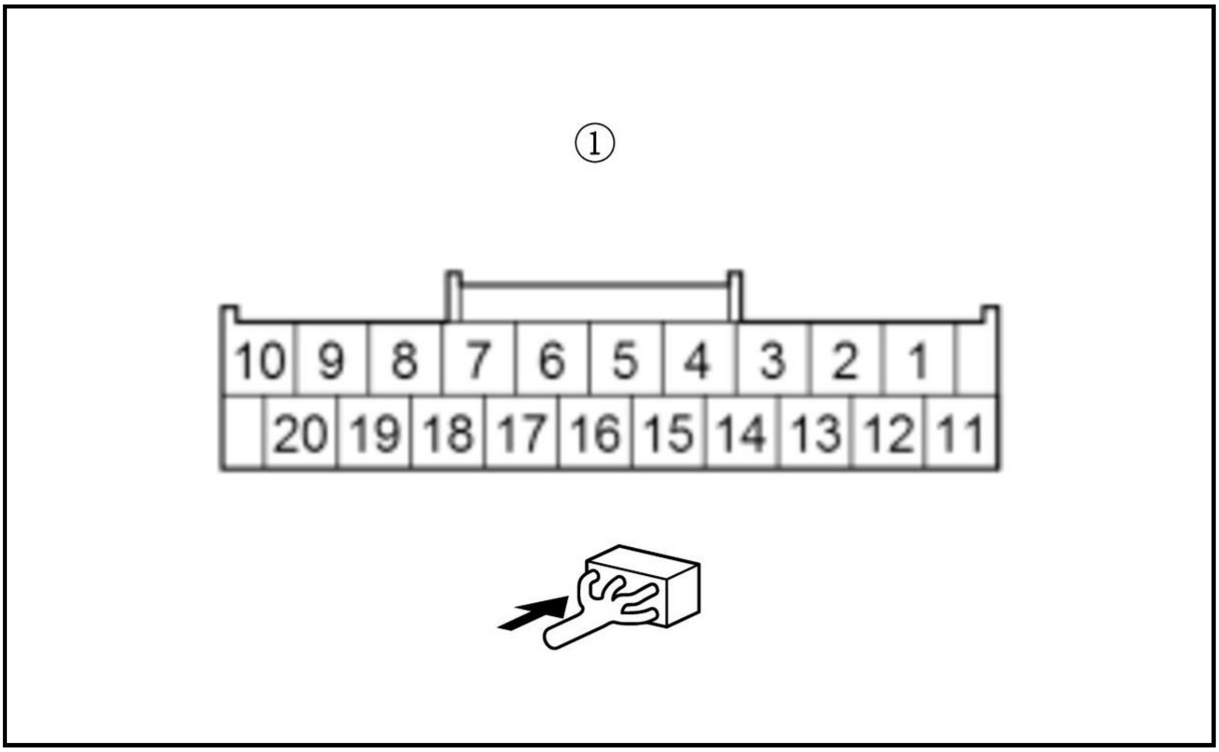
NO

The BUS-DATA wire is OK. Go to step 5.

5. Open wire check (BUS-DATA line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector A (32P): disconnected Climate control panel 20P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 29**
Test point 2	Climate control panel 20P connector (female terminals) No. 18: ①



Is there continuity?

YES

The BUS-DATA wire is not open. Go to step 6.

NO

Repair an open in the BUS-DATA wire.

6. Climate control panel check (substitution)

-1. Reconnect the following connector.

Climate control unit connector A (32P)

-2. **Substitute a known-good climate control panel** .

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-5. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-6. Check for DTCs.

DTC Description	DTC
B2964 Climate control unit lost communication with Front PANEL (climate control panel)	B

Is DTC B2964 or Error on the DTC screen D-B5 (climate control panel without display) or 93 (climate control panel with display) indicated?

YES

Replace the climate control unit .

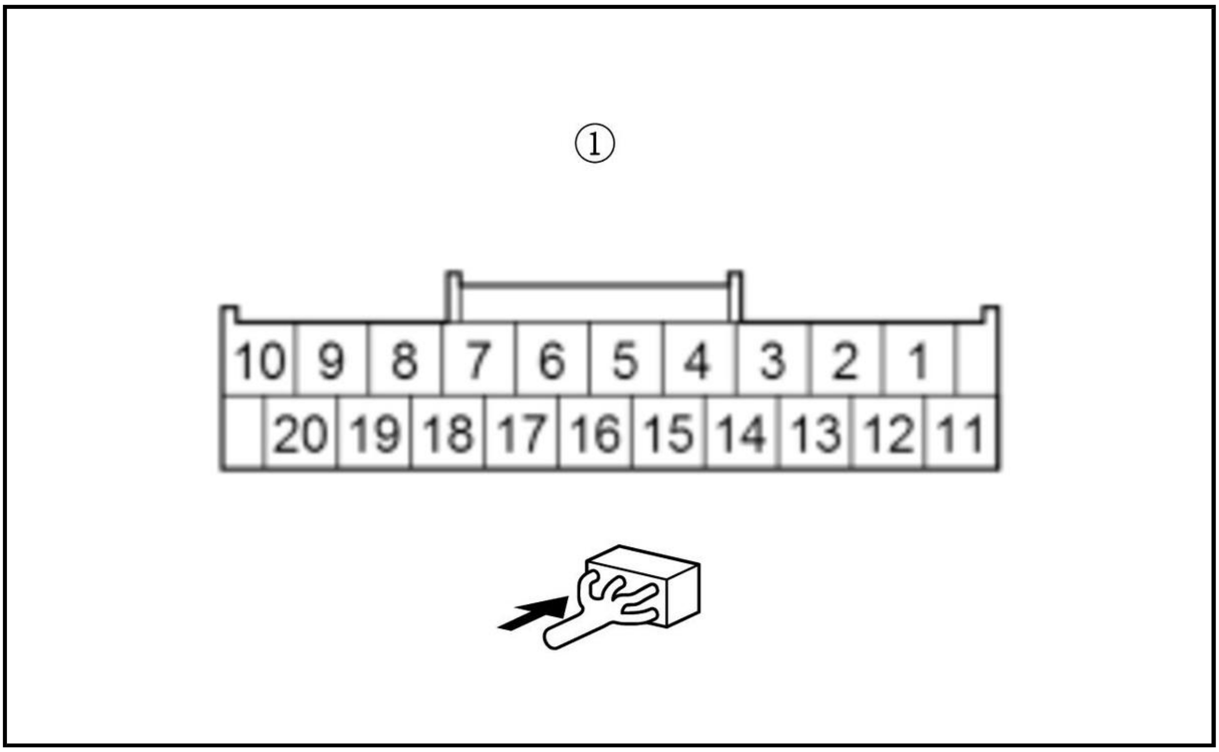
NO

Replace the original climate control panel .

7. Open wire check (IG2 A/C line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control panel 20P connector: disconnected
Test point 1	Climate control panel 20P connector (female terminals) No. 19: ①
Test point 2	Body ground



Is there battery voltage?

YES

Check for an open in the GND wire. If the wire is OK, check for poor ground at G402.

NO

Repair an open in the IG2 A/C wire.

DTC TROUBLESHOOTING: B2983 (B-B6), B2983 (57)

DTC B2983 or DTC screen B-B6 or DTC indicator 57 : A problem in the recirculation control motor circuit, linkage, door, or motor

DTC Description	DTC
B2983 A problem in the recirculation control motor circuit, linkage, door, or motor	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-4. Check for DTCs.

DTC Description	DTC
B2983 A problem in the recirculation control motor circuit, linkage, door, or motor	B

Is DTC B2983 or Error on the DTC screen B-B6 (climate control panel without display) or 57 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the recirculation control motor circuit.

2. Open wire check (M-REC line)

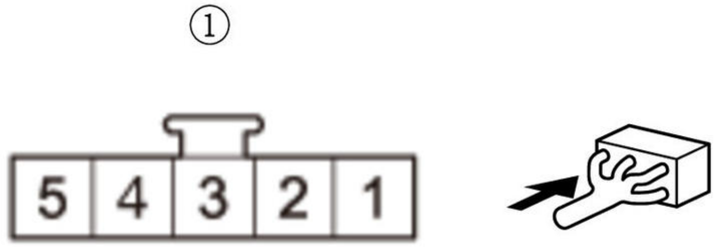
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Recirculation control motor 5P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 17**
Test point 2	Recirculation control motor 5P connector (female terminals) No. 5: ①



Is there continuity?

YES

The M-REC wire is not open. Go to step 3.

NO

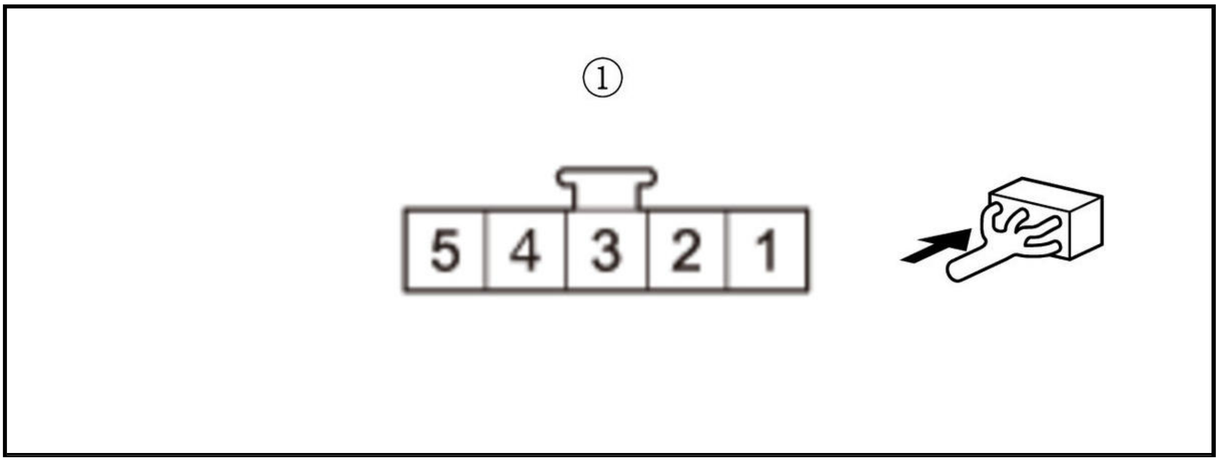
Repair an open in the M-REC wire.

3. Open wire check (M-FRS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 18**

Test point 2	Recirculation control motor 5P connector (female terminals) No. 4: ①



Is there continuity?

YES

The M-FRS wire is not open. Go to step 4.

NO

Repair an open in the M-FRS wire.

4. Shorted wire check (M-REC line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 17**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the M-REC wire.

NO

The M-REC wire is OK. Go to step 5.

5. Shorted wire check (M-FRS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 18**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the M-FRS wire.

NO

The M-FRS wire is OK. Go to step 6.

6. Recirculation control motor check

-1. **Test the recirculation control motor** .

Is the recirculation control motor OK?

YES

Replace the climate control unit .

NO

Replace the recirculation control motor , or repair the recirculation control linkage or door.

DTC TROUBLESHOOTING: B2986 (B-B4), B2986 (55)

DTC B2986 or DTC screen B-B4 or DTC indicator 55 : An open in the recirculation control motor circuit

DTC Description	DTC
B2986 An open in the recirculation control motor circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit** .

-4. Check for DTCs.

DTC Description	DTC
B2986 An open in the recirculation control motor circuit	B

Is DTC B2986 or Error on the DTC screen B-B4 (climate control panel without display) or 55 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the recirculation control motor circuit.

2. Determine possible failure area (RFD-P line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

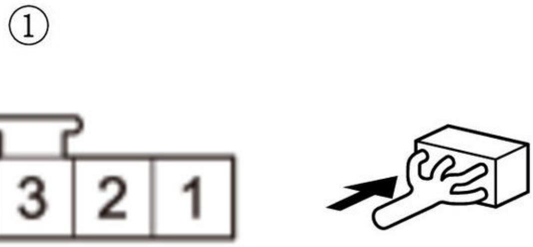
-2. Disconnect the following connector.

Recirculation control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

The RFD-P wire is OK. Go to step 3.

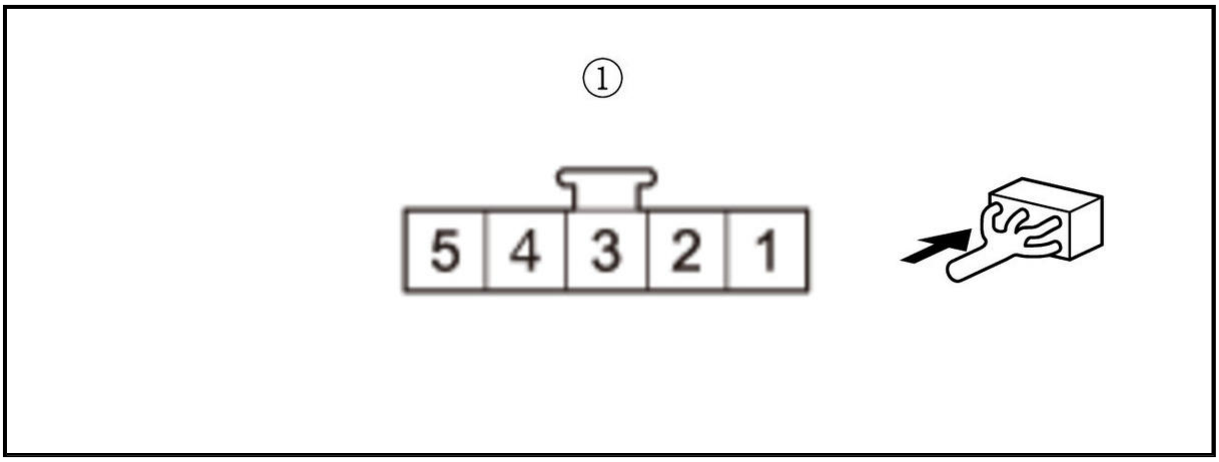
NO

Go to step 4.

3. Open wire check (SENS-COM line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 2: ①
Test point 2	Recirculation control motor 5P connector (female terminals) No. 1: ①



Is there about 5 V?

YES

Replace the recirculation control motor .

NO

Repair an open in the SENS-COM wire.

4. Open wire check (RFD-P line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	Climate control unit connector B (12P) No. 4
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the RFD-P wire.

NO

Replace the climate control unit .

DTC TROUBLESHOOTING: B2988 (D-B1), B2988 (D-B2), B2988 (61)

DTC B2988 or DTC screen D-B1 : An open in the A/C compressor variable capacity control solenoid circuit
DTC B2988 or DTC screen D-B2 : A short in the A/C Compressor variable capacity control solenoid circuit
DTC B2988 or DTC indicator 61 : A problem in the A/C compressor variable capacity control solenoid circuit

DTC Description	DTC
B2988 A problem in the A/C compressor variable capacity control solenoid circuit	B

DTCs (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit .

-4. Wait for at least 1 minute.

-5. Check for DTCs.

DTC Description	DTC
B2988 A problem in the A/C compressor variable capacity control solenoid circuit	B

Is DTC B2988 or Error on the DTC screen D-B1 (climate control panel without display) or D-B2 (climate control panel without display) or 61 (climate control panel with display) indicated?

YES

Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the A/C compressor variable capacity control solenoid circuit.

2. Open wire check (SOL OUT line)

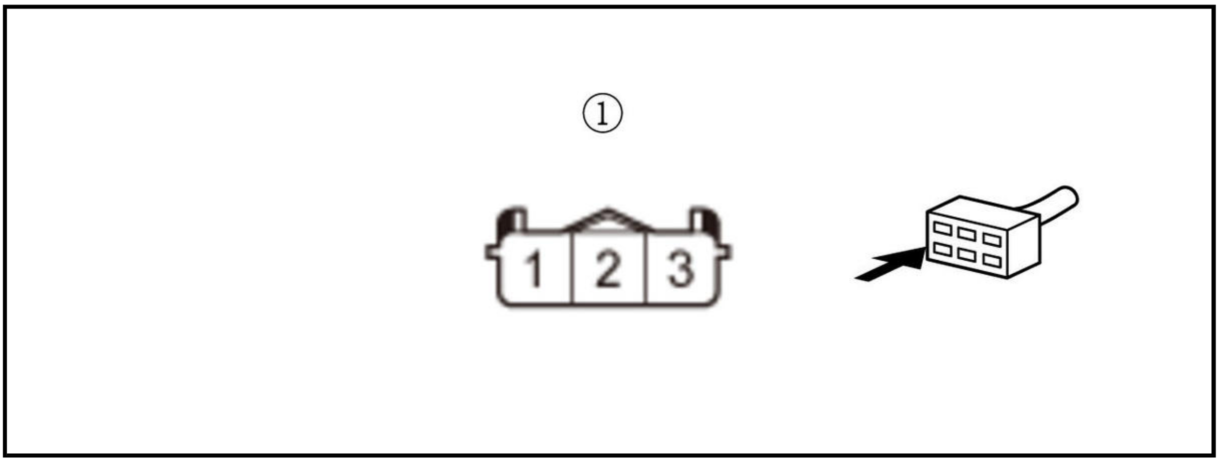
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector A (32P)
A/C compressor clutch 3P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	A/C compressor clutch 3P connector: disconnected
Test point 1	Climate control unit connector A (32P) No. 30
Test point 2	A/C compressor clutch 3P connector (female terminals) No. 2: ①



Is there continuity?

YES

The SOL OUT wire is not open. Go to step 3.

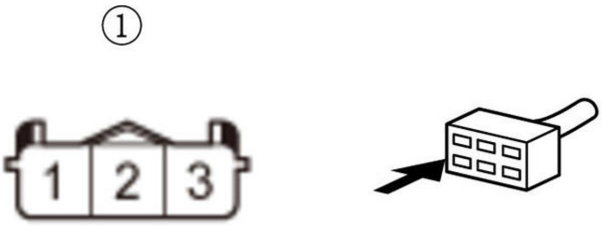
NO

Repair an open in the SOL OUT wire.

3. Open wire check (SOL IN line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	A/C compressor clutch 3P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 14**
Test point 2	A/C compressor clutch 3P connector (female terminals) No. 3: ①



Is there continuity?

YES

The SOL IN wire is not open. Go to step 4.

NO

Repair an open in the SOL IN wire.

4. Shorted wire check (SOL OUT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	A/C compressor clutch 3P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 30**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the SOL OUT wire.

NO

The SOL OUT wire is OK. Go to step 5.

5. Shorted wire check (SOL IN line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	A/C compressor clutch 3P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 14**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the SOL IN wire.

NO

The SOL IN wire is OK. Go to step 6.

6. A/C compressor variable capacity control solenoid check

-1. **Test the A/C compressor variable capacity control solenoid** .

Is the variable capacity control solenoid OK?

YES

Replace the climate control unit .

NO

Replace the A/C compressor .

DTC TROUBLESHOOTING: U1280 (I-A1), U1280 (80) (CLIMATE CONTROL UNIT)

DTC U1280 or DTC screen I-A1 or DTC indicator 80 : Communication bus line error (BUS-OFF)

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the climate control unit** .

-4. Wait for at least 6 seconds.

-5. Check for DTCs.

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	B

Is DTC U1280 or Error on the DTC screen I-A1 (climate control panel without display) or 80 (climate control panel with display) indicated?

YES

Go to body control module DTC U1280 troubleshooting .

NO

Intermittent failure, the system is OK at this time.

DTC TROUBLESHOOTING: U1281 (I-A3), U1281 (91), U128D (I-A2), U128D (83), U1290 (I-A6), U1290 (8F) (CLIMATE CONTROL UNIT)

DTC U1281 or DTC screen I-A3 or DTC indicator 91 : Climate Control Unit Lost Communication with MICU (body control module)**DTC U128D or DTC screen I-A2** : Climate Control Unit Lost communication with gauge control module **DTC U128D or DTC indicator 83** : Climate Control Unit Lost communication with gauge control module (VSP message)**DTC U1290 or DTC screen I-A6 or DTC indicator 8F** : Climate Control Unit Lost Communication With Seat Heater Control Unit (front)

NOTE:

- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the climate control unit.
- Refer to the DTC shown on the display, then inspect the connectors and terminals based on the instructions.

DTC Description	DTC
U1281 Climate Control Unit Lost Communication with MICU (body control module)	B
U128D Climate Control Unit Lost communication with gauge control module	B
U1290 Climate Control Unit Lost Communication With Seat Heater Control Unit (front)	B

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Do the Self-Diagnostic Function with the climate control unit .

-5. Check for DTCs.

DTC Description	DTC
U1281 Climate Control Unit Lost Communication with MICU (body control module)	B
U128D Climate Control Unit Lost communication with gauge control module	B
U1290 Climate Control Unit Lost Communication With Seat Heater Control Unit	B

Are any DTCs indicated?

YES

Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control units and the climate control unit.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Climate control unit connector A (32P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)
U1290	Front seat heater control unit 24P connector

-4. Check for continuity between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	**Climate control unit connector A (32P)**	No. 25	**Body control module connector B (36P)**	No. 20
	B-CAN_L		No. 8		No. 21
U128D	B-CAN_H	**Climate control unit connector A (32P)**	No. 25	**Gauge control module connector A (32P)**	No. 30
	B-CAN_L		No. 8		No. 31
U1290	B-CAN_H	**Climate control unit connector A (32P)**	No. 25	**Front seat heater control unit 24P connector**	No. 10
	B-CAN_L		No. 8		No. 9

Is there continuity?

YES

The B-CAN_H wire and B-CAN_L wire is OK.Refer to the DTC shown on the display, then substitute or replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	**Substitute a known-good body control module** , then recheck. If DTC U1281 goes away after substitution, **replace the original body control module** .
U128D	**Substitute a known-good gauge control module** , then recheck. If DTC U128D goes away after substitution, **replace the original gauge control module** .
U1290	**Substitute a known-good front seat heater control unit** , then recheck. If DTC U1290 goes away after substitution, **replace the original front seat heater control unit** .

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire between the climate control unit and the transmitting control unit.

DTC TROUBLESHOOTING INDEX

CLIMATE CONTROL SYSTEM DTC TROUBLESHOOTING INDEX (2020 2021)

DTC	Detection Item or Symptom	ECU	DTC Type
B120A	Climate Control Unit LIN Communication Bus Line Error	Climate control unit	Loss of communication
B121A	An open in the mode control motor circuit	Climate control unit	Signal error
B121B	A short in the mode control motor circuit	Climate control unit	Signal error
B121D*1	Humidity/In-Car Temperature Sensor Communication Error	Climate control unit	Signal error
B1220	A short in the recirculation control motor circuit	Climate control unit	Signal error
B1225*2	An open in the in-car temperature sensor circuit	Climate control unit	Signal error
B1226*2	A short in the in-car temperature sensor circuit	Climate control unit	Signal error
B1227	An open in the outside air temperature sensor circuit	Climate control unit	Signal error
B1228	A short in the outside air temperature sensor circuit	Climate control unit	Signal error
B1231	An open in the evaporator temperature sensor circuit	Climate control unit	Signal error
B1232	A short in the evaporator temperature sensor circuit	Climate control unit	Signal error
B1233	An open in the air mix control motor circuit (driver's)	Climate control unit	Signal error
B1234	A short in the air mix control motor circuit (driver's)	Climate control unit	Signal error
B1235	A problem in the air mix control motor circuit, linkage, door, or motor (driver's)	Climate control unit	Signal error
B1236	An open in the passenger's air mix control motor circuit	Climate control unit	Signal error
B1237	A short in the passenger's air mix control motor circuit	Climate control unit	Signal error
B1238	A problem in the passenger's air mix control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B123F	Automatic lighting control unit/sunlight sensor error	Climate control unit	Signal error
B1240	A problem in the mode control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B1241	A problem in the blower motor circuit	Climate control unit	Signal error
B2964	Climate control unit lost communication with front panel (climate control panel)	Climate control unit	Loss of communication
B2983	A problem in the recirculation control motor circuit, linkage, door, or motor	Climate control unit	Signal error
B2986	An open in the recirculation control motor circuit	Climate control	Signal error

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE CLIMATE CONTROL SYSTEM(CLIMATE CONTROL PANEL WITH DISPLAY)

How to Check for DTCs with the HDS

NOTE:

- There are three methods used to check for DTCs. The recommended method is to use the Honda Diagnostic System (HDS) with the appropriate software, plugged into the data link connector (DLC).
- The second method is to run the self-diagnostic function built into the climate control unit.
- The third method is to use B-CAN system diagnosis test mode A .

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC

3. Select BODY ELECTRICAL in the System Selection Menu.

4. Select HVAC/Climate control in the Body Electrical System Select.

5. Select DTCs in the HVAC/Climate Control Mode Menu.Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting. If no DTCs are indicated, do all system scan, then refer to symptom troubleshooting.**NOTE:**

- After troubleshooting, clear the DTCs with the HDS.
- For specific operations, refer to the user's manual that came with the HDS.

How to Use the Self-Diagnostic Function with the HDS

NOTE: This method is only available if the HDS can communicate with the climate control unit.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC.

3. Select BODY ELECTRICAL in the System Selection Menu.

4. Select HVAC/Climate Control in the Body Electrical System Select.

5. Select Inspection in the HVAC/Climate Control Mode Menu.

6. Select Climate Control Unit Self Test in the Inspection Menu.Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function without the HDS

Button

Button	Button Name
AUTO	AUTO button

Button	Button Name
	ON/OFF button
	REAR WINDOW DEFOGGER/MIRROR DEFOGGER * button

Button	Button Name
	RECIRCULATION button
	WINDSHIELD DEFROST button

*: With mirror defogger

The climate control unit has a self-diagnostic function. To run the self-diagnostic function, do the following:

1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

2. Press and hold the ON/OFF button, then within 10 seconds press and release the REAR WINDOW DEFOGGER/MIRROR DEFOGGER * button five times. Release the ON/OFF button.*: With mirror defoggerALL LCD segments come on for 2 seconds, then the self-diagnostic function begins.

NOTE:

- **The blower motor will run at various speeds regardless of what the panel is displaying.**
- **If there is any problem in the system, the temperature indicator flashes 88. Refer to checking for DTCs.**

- **If there is more than one DTC, they are displayed one at a time in sequence followed by a pause (all the display indicator segments illuminate) between the DTCs.**
- **If no DTCs are present, the temperature indicator will flash "no".**

Canceling the Self-Diagnostic Function

4. Turn the vehicle to the OFF (LOCK) mode to cancel the self-diagnostic function. After completing repair work, run the self-diagnostic function again to make sure that there are no other DTCs.

Checking for DTCs

The temperature indicator display indicates single or multiple DTCs. If no DTCs are present, the temperature indicator will flash "no".

DTC (Temperature Indicator Segments)	DTC	Detection Item
01	**B1225**	An open in the in-car temperature sensor circuit
02	**B1226**	A short in the in-car temperature sensor circuit
05	**B1227**	An open in the outside air temperature sensor circuit

*1: 1.5 L engine

*2: With front seat heater

DTC (Temperature Indicator Segments)	DTC	Detection Item
06	**B1228**	A short in the outside air temperature sensor circuit
09	**B1231**	An open in the evaporator temperature sensor circuit
0A	**B1232**	A short in the evaporator temperature sensor circuit
17	**B123F**	Automatic lighting control unit/sunlight sensor error
40	**B1233**	An open in the air mix control motor circuit
41	**B1234**	A short in the air mix control motor circuit
42	**B1235**	A problem in the air mix control motor circuit, linkage, door, or motor
49	**B121A**	An open in the mode control motor circuit
4A	**B121B**	A short in the mode control motor circuit
4b	**B1240**	A problem in the mode control motor circuit, linkage, door, or motor
55	**B2986**	An open in the recirculation control motor circuit
56	**B1220**	A short in the recirculation control motor circuit
57	**B2983**	A problem in the recirculation control motor circuit, linkage, door, or motor
59	**B1241**	A problem in the blower motor circuit
61 *1	**B2988**	A problem in the A/C compressor variable capacity control solenoid circuit
80	**U1280**	Communication bus line error (BUS-OFF)
83	**U128D**	Climate control unit lost communication with gauge control module (VSP message)
8A	**B120A**	Climate control unit LIN communication bus line error
8F *2	**U1290**	Climate control unit lost communication with seat heater control unit (front)
91	**U1281**	Climate control unit lost communication with MICU (body control module)

DTC (Temperature Indicator Segments)	DTC	Detection Item
93	B2964	Climate control unit lost communication with front panel (climate control panel)
C0	---	Climate control unit internal error
Cd	---	Unknown sunlight sensor type

*1: 1.5 L engine

*2: With front seat heater

How to Check for History DTCs

The climate control unit can record history DTCs. To read the history DTCs, do the following:

1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

2. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.While pressing and holding both the WINDSHIELD DEFROST and ON/OFF buttons, the display screen goes directly to the A/C Error Display shown.

NOTE:

- **If there is any problem in the system, the temperature indicator flashes 88. Refer to checking for DTCs.**
- **If there is more than one DTC, they are displayed one at a time in sequence followed by a pause (all the display indicator segments illuminate) between the DTCs.**
- **If no DTCs are present, the temperature indicator will flash "no".**

Canceling the Read History DTCs

4. Turn the vehicle to the OFF (LOCK) mode to cancel the history DTCs. After completing the repair work, clear the DTCs.

How to Clear the History DTCs

1. Turn the vehicle to the OFF (LOCK) mode.

2. Press and hold both the AUTO and WINDSHIELD DEFROST buttons, then turn the vehicle to the ON mode.

3. After about 5 seconds the windshield defrost indicator starts to blink, release the buttons.

4. Do the How to Check for History DTCs to verify DTCs have been cleared.

Displaying Sensor Inputs at the Climate Control Unit

The climate control unit has a mode that displays the sensor inputs it receives. This mode shows you what the climate control unit is receiving from each of the sensors, one at a time, and it can help you determine if a sensor is faulty.

Checks Before Using the Sensor Input Display Mode

1. Turn the vehicle to the ON mode, and check the recirculation door function; press the RECIRCULATION button to switch from FRESH to RECIRCULATE. The air volume and sound should change slightly.Set the TEMPERATURE CONTROL dial to the desired test temperature:

- "Lo" temperature setting will default to MAX COOL, VENT, and RECIRCULATE (A/C on) or FRESH (A/C off).
- "Hi" temperature setting will default to MAX HOT, HEAT, HEAT/DEF and FRESH.

3. Turn the vehicle to the OFF (LOCK) mode.

Run the Sensor Input Display Mode

1. Press and hold both the AUTO and RECIRCULATION buttons, then start the engine.

2. Release both buttons. The temperature indicator will flash the sensor number and then the value for that sensor. Record the value displayed.To advance to the next sensor, press the REAR WINDOW DEFOGGER/MIRROR DEFOGGER * button.*: With mirror defogger

NOTE:

- **The sensor values will be displayed in degrees Celsius (deg.C) or an alphanumeric code. Use the chart to convert the value to degrees Fahrenheit (deg.F).**
- **If the sensor value displays "Er", this indicates there is an open or short in the circuit or sensor. Check for DTCs using the HDS, or use the climate control self-diagnostic function.**
- **If necessary, compare the sensor input display to a known-good vehicle under the same test conditions.**
- **If the sensor displayed value is out of the normal range, refer to the sensor test or substitute a known-good sensor, and recheck.**
- **Unsupported items shall be skipped.**

Sensor	Item	Displayed Value
0	In-car temperature sensor	deg.C

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE CLIMATE CONTROL SYSTEM (CLIMATE CONTROL PANEL WITHOUT DISPLAY)

How to Check for DTCs with the HDS

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the vehicle and the climate control unit. If it does not, go to the DLC circuit troubleshooting

5. Select Body Electrical in the System Selection Menu.

6. Select HVAC in the Body Electrical.

7. Select DTCs in the Test Mode Menu. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting. If no DTCs are indicated, do all system scan, then refer to symptom troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function with the HDS

NOTE: This method is only available if the HDS can communicate with the climate control unit.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the vehicle and the climate control unit. If it does not, go to the **DLC circuit troubleshooting**

5. Select Body Electrical in the System Selection Menu.

6. Select HVAC in the Body Electrical.

7. Select Function Test in the Test Mode Menu.

8. Select Climate Control Unit Self Test in the Function Test. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function without the HDS

Button	Button Name
	AUTO button
	ON/OFF button

Button	Button Name
	REAR WINDOW DEFOGGER/MIRROR DEFOGGER button
	RECIRCULATION button

Button	Button Name
	WINDSHIELD DEFROST button

The climate control unit has a self-diagnostic function. To run the self-diagnostic function, do the following:

1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode. Press and hold the ON/OFF button, then within 10 seconds press and release the REAR WINDOW DEFOGGER/MIRROR DEFOGGER button five times. Release the ON/OFF button, then the self-diagnostic function begins.

NOTE:

- **The blower motor should run at various speeds when in the self-diagnostic mode.**
- **If there are any problems in the system, the A/C Error Display screen will indicate them. Select the previous/next icon to confirm the DTCs. To determine the meaning of the indication, refer to the table that follows.**
- **If there are no problems detected, The error status shows Normal, and The number of Errors indicates "0".**

How to Check for History DTCs

The climate control unit can record history DTCs. To read the history DTCs, do the following:

1. Turn the vehicle to the ON mode, then turn the vehicle to the OFF (LOCK) mode after confirming the A/C system is OFF.

2. Turn the vehicle to the ON mode.

3. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more. While pressing and holding both the WINDSHIELD DEFROST and ON/OFF buttons, the display screen goes directly to the A/C Error Display shown.

NOTE:

- **If there are any problems in the system, the A/C Error Display screen will indicate them. Select the previous/next icon to confirm the DTCs. To determine the meaning of the indication, refer to the table that follows.**
- **If there are no problems detected, The error status shows Normal, and The number of Errors indicates "0".**

Canceling the Read History DTCs

5. Turn the vehicle to the OFF (LOCK) mode to cancel reading the history DTCs. After completing the repair work, clear the DTCs.

How to Clear the History DTCs

1. Turn the vehicle to the ON mode, then turn the vehicle to the OFF (LOCK) mode after confirming the A/C system is OFF.

2. Turn the vehicle to the ON mode.

3. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.

4. While pressing and holding both the WINDSHIELD DEFROST and ON/OFF buttons, the display screen goes directly to the A/C Error Display shown, touch and hold the Error Clear icon for 5 seconds.

5. Do the How to Check for History DTCs to verify DTCs have been cleared.

Displaying Sensor Inputs at the Climate Control Unit

The climate control unit has a mode that displays the sensor inputs it receives. This mode shows you what the climate control unit is receiving from each of the sensors, one at a time, and it can help you determine if a sensor is faulty.

Checks Before Using the Sensor Input Display Mode

1. Turn the vehicle to the ON mode, and check the recirculation door function; press the RECIRCULATION button to switch from FRESH to RECIRCULATE. The air volume and sound should change slightly. Set the TEMPERATURE CONTROL button to the desired test temperature:

- "Lo" temperature setting will default to MAX COOL, VENT and RECIRCULATE (A/C on) or FRESH (A/C off).
- "Hi" temperature setting will default to MAX HOT, HEAT, HEAT/DEF, and FRESH.

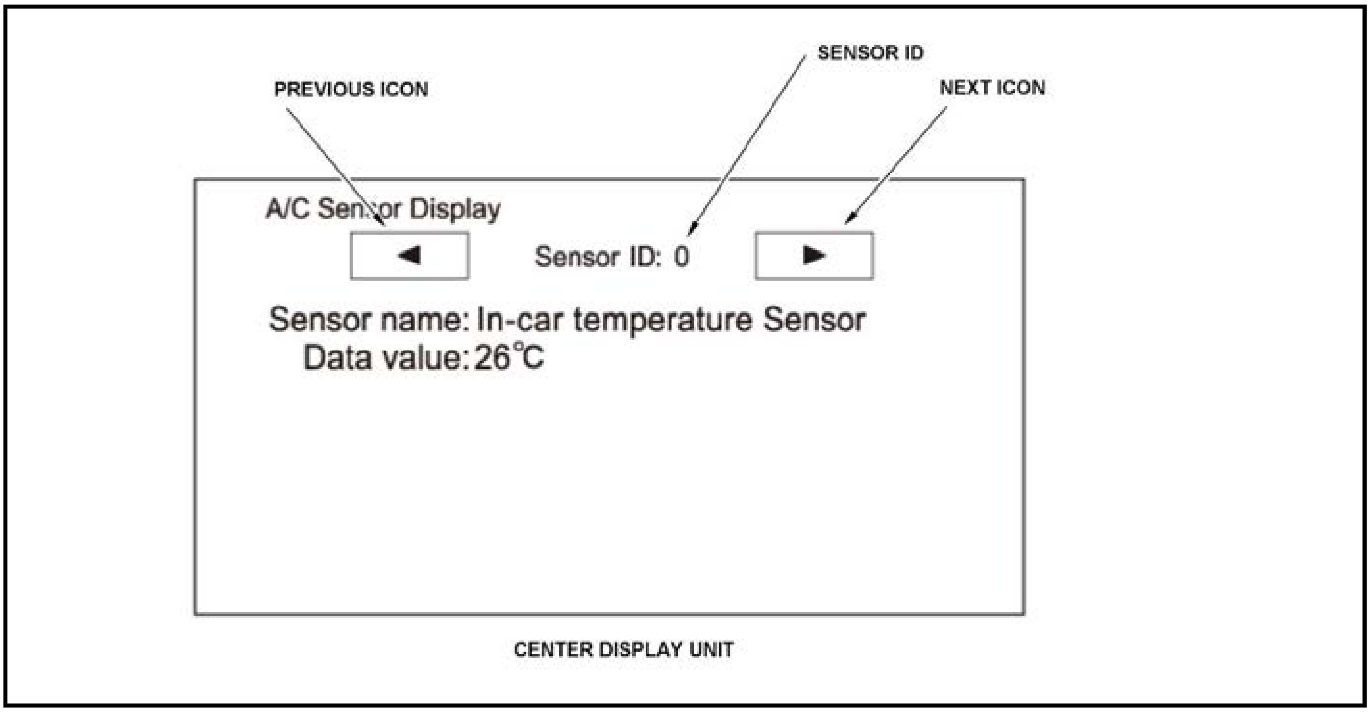
3. Turn the vehicle to the OFF (LOCK) mode.

Run the Sensor Input Display Mode

1. Turn the vehicle to the OFF (LOCK) mode.

2. Press and hold both the AUTO and RECIRCULATION buttons, then turn the vehicle to the READY TO DRIVE mode.

3. Release both buttons. The display screen goes directly to the A/C sensor display mode shown. The display screen indicates the sensor ID and then the value for that sensor.



Sensor ID: 0

Sensor name: In-car temperature Sensor
Data value: 26℃

4. To advance to the next sensor, touch the sensor ID previous/next icon or press the REAR WINDOW DEFOGGER/MIRROR DEFOGGER * button.*: With mirror defogger To cancel the sensor input display mode, press the AUTO button or turn the vehicle to the OFF (LOCK) mode.

NOTE:

- **The sensor values will be displayed in degrees Celsius (deg.C) or an alphanumeric code. Use the chart to convert the value to degrees Fahrenheit (deg.F).**
- **If the sensor value displays "Error", this indicates there is an open or short in the circuit or sensor. Check for DTCs using the HDS, or use the climate control self-diagnostic function.**
- **If necessary, compare the sensor input display to a known-good vehicle under the same test conditions.**
- **If the sensor displayed value is out of the normal range, refer to the sensor test or substitute a known-good sensor, and recheck.**
- **Unsupported items shall be skipped.**

Sensor ID	Sensor Name	Data Value Unit

HOW TO TROUBLESHOOT THE CLIMATE CONTROL SYSTEM (CLIMATE CONTROL PANEL WITH DISPLAY)

How to Check for DTCs with the HDS

1. Make sure the vehicle is in the OFF (LOCK) mode.

2. Connect the HDS to the DLC

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the vehicle and the climate control unit. If it does not, go to the DLC circuit troubleshooting

5. Select Body Electrical in the System Selection Menu.

6. Select HVAC in the Body Electrical.

7. Select DTCs in the Test Mode Menu. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting. If no DTCs are indicated, do all system scan, then refer to symptom troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function with the HDS

NOTE: This method is only available if the HDS can communicate with the climate control unit.

1. Make sure the vehicle is in the OFF (LOCK) mode.

2. Connect the HDS to the DLC

3. Turn the vehicle to the ON mode.

4. Make sure the HDS communicates with the vehicle and the climate control unit. If it does not, go to the DLC circuit troubleshooting

5. Select Body Electrical in the System Selection Menu.

6. Select HVAC in the Body Electrical.

7. Select Function Test in the Test Mode Menu.

8. Select Climate Control Unit Self Test in the Function Test. Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function without the HDS

Button	Button Name
AUTO	AUTO button
ON/ OFF	ON/OFF button

Button	Button Name
	REAR WINDOW DEFOGGER/MIRROR DEFOGGER button
	RECIRCULATION button

Button	Button Name
	WINDSHIELD DEFROST button

The climate control unit has a self-diagnostic function. To run the self-diagnostic function, do the following:

1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

2. Press and hold the ON/OFF button, then within 10 seconds press and release the REAR WINDOW DEFOGGER/MIRROR DEFOGGER button five times. Release the ON/OFF button. ALL LCD segments come on for 2 seconds, then the self-diagnostic function begins.

NOTE:

- **The blower motor will run at various speeds regardless of what the panel is displaying.**
- **If there is any problem in the system, the temperature indicator flashes "88". Refer to checking for DTCs.**
- **If there is more than one DTC, they are displayed one at a time in sequence followed by a pause (all the display indicator segments illuminate) between the DTCs.**
- **If no DTCs are present, the temperature indicator will flash "no".**

Canceling the Self-Diagnostic Function

4. Turn the vehicle to the OFF (LOCK) mode to cancel the self-diagnostic function. After completing repair work, run the self-diagnostic function again to make sure that there are no other DTCs.

Checking for DTCs

The temperature indicator display indicates single or multiple DTCs. If no DTCs are present, the temperature indicator will flash "no".

DTC (Temperature Indicator Segments)	DTC	Detection Item
05	B1227	An open in the outside air temperature sensor circuit
06	B1228	A short in the outside air temperature sensor circuit
09	B1231	An open in the evaporator temperature sensor circuit
0A	B1232	A short in the evaporator temperature sensor circuit

DTC (Temperature Indicator Segments)	DTC	Detection Item
17	**B123F**	Automatic lighting control unit/sunlight sensor error
40	**B1233**	An open in the air mix control motor circuit
41	**B1234**	A short in the air mix control motor circuit
42	**B1235**	A problem in the air mix control motor circuit, linkage, door, or motor
49	**B121A**	An open in the mode control motor circuit
4A	**B121B**	A short in the mode control motor circuit
4b	**B1240**	A problem in the mode control motor circuit, linkage, door, or motor
55	**B2986**	An open in the recirculation control motor circuit
56	**B1220**	A short in the recirculation control motor circuit
57	**B2983**	A problem in the recirculation control motor circuit, linkage, door, or motor
59	**B1241**	A problem in the blower motor circuit
68	**B296D**	Electric water pump communication fail
69	**B296E**	Electric water pump fail
80	**U1280**	Communication bus line error (BUS-OFF)
83	**U128D**	Climate control unit lost communication with gauge control module (VSP message)
89	**B121D**	Humidity/in-car temperature sensor communication error
8A	**B120A**	Climate control unit LIN communication bus line error
91	**U1281**	Climate control unit lost communication with MICU (body control module)
93	**B2964**	Climate control unit lost communication with front panel (climate control panel)
C0	---	Climate control unit internal error
C3	**B2990**	A problem in the A/C compressor driving circuit (A problem in the electric A/C compressor driving circuit)
C5	**B2998**	A problem in the A/C compressor driver (A problem in the electric A/C compressor driver)
C7	---	Electric A/C compressor lost communication
Cd	---	Unknown sunlight sensor type

How to Check for History DTCs

The climate control unit can record history DTCs. To read the history DTCs, do the following:

1. Turn the vehicle to the ON mode, then turn the vehicle to the OFF (LOCK) mode after confirming the A/C system is OFF.

2. Turn the vehicle to the ON mode.

3. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more. While pressing and holding both the WINDSHIELD DEFROST and ON/OFF buttons, the history DTCs will be indicated.

NOTE:

- **If there is any problem in the system, the temperature indicator flashes "88". Refer to checking for DTCs.**
- **If there is more than one DTC, they are displayed one at a time in sequence followed by a pause (all the display indicator segments illuminate) between the DTCs.**
- **If no DTCs are present, the temperature indicator will flash "no".**

Canceling the Read History DTCs

5. Turn the vehicle to the OFF (LOCK) mode to cancel the history DTCs. After completing the repair work, clear the DTCs.

How to Clear the History DTCs

1. Turn the vehicle to the OFF (LOCK) mode.

2. Press and hold both the AUTO and WINDSHIELD DEFROST buttons, then turn the vehicle to the ON mode.

3. After about 5 seconds the windshield defrost indicator starts to blink, release the buttons.

4. Do the How to Check for History DTCs to verify DTCs have been cleared.

Displaying Sensor Inputs at the Climate Control Unit

The climate control unit has a mode that displays the sensor inputs it receives. This mode shows you what the climate control unit is receiving from each of the sensors, one at a time, and it can help you determine if a sensor is faulty.

Checks Before Using the Sensor Input Display Mode

1. Turn the vehicle to the ON mode, and check the recirculation door function; press the RECIRCULATION button to switch from FRESH to RECIRCULATE. The air volume and sound should change slightly. Set the TEMPERATURE CONTROL dial to the desired test temperature:

- "Lo" temperature setting will default to MAX COOL, VENT, and RECIRCULATE (A/C on) or FRESH (A/C off).
- "Hi" temperature setting will default to MAX HOT, HEAT, HEAT/DEF and FRESH.

3. Turn the vehicle to the OFF (LOCK) mode.

Run the Sensor Input Display Mode

1. Turn the vehicle to the OFF (LOCK) mode.

2. Press and hold both the AUTO and RECIRCULATION buttons, then turn the vehicle to the READY TO DRIVE mode.

3. Release both buttons. The temperature indicator will flash the sensor number and then the value for that sensor. Record the value displayed.

4. To advance to the next sensor, press the REAR WINDOW DEFOGGER/MIRROR DEFOGGER button. To cancel the sensor input display mode, press the AUTO button or turn the vehicle to the OFF (LOCK) mode.

NOTE:

- **The sensor values will be displayed in degrees Celsius (deg.C) or an alphanumeric code. Use the chart to convert the value to degrees Fahrenheit (deg.F).**
- **If the sensor value displays "Er", this indicates there is an open or short in the circuit or sensor. Check for DTCs using the HDS, or use the climate control self-diagnostic function.**
- **If necessary, compare the sensor input display to a known-good vehicle under the same test conditions.**
- **If the sensor displayed value is out of the normal range, refer to the sensor test or substitute a known-good sensor, and recheck.**
- **Unsupported items shall be skipped.**

Sensor Number	Item	Displayed Value Unit
0	In-car temperature sensor	deg.C
1	Outside air temperature sensor	deg.C

Sensor Number	Item	Displayed Value Unit
2	Sunlight sensor	10 W/m 2
3	Engine coolant temperature	deg.C
4	Evaporator temperature sensor	deg.C
5	Humidity sensor	%
8	Air mix opening (low value indicates cooler air distribution, higher value indicates warmer air distribution)	% of opening
b	Mode control positioning	0.1 V
d	Recirculation control opening	% of opening
F	Vehicle speed (vehicle must be driven to display speed)	10 km/h
H	A/C compressor oil circulation	• Unfinished: 00 • Finished: 01
L	Sunlight sensor type	• Hard Wire: 00 • BCAN: 99 • Unknown: --
r	Electric compressor speed	100 rpm

DTC TROUBLESHOOTING

CLIMATE CONTROL SYSTEM DTC A-A4, CD

DTC screen A-A4 or DTC screen Cd : Unknown sunlight sensor type

*1: Climate control panel without display*2: Climate control panel with display

1. DTC check

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

   -4. Check for DTCs.

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	Â

   Is DTC B123F, Error on the DTC screen A-A3 (climate control panel without display), or DTC screen 17 (climate control panel with display) indicated?

   YES

   Go to climate control DTC B123F troubleshooting.

   NO

   Go to step 2.

2. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -2. Do the Self-Diagnostic Function with the climate control unit.

   -3. Check for DTCs.

   Is Error on the DTC screen A-A4 *1 or DTC screen Cd *2 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time.

3. Connector check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check connection of the following connectors.

Sunlight sensor 2P connector (with automatic wiper)
Automatic lighting control unit-sensor 5P connector (without automatic wiper)
Climate control unit connector A (32P)

   Are the connection and terminals OK?

YES

Replace the climate control unit .

NO

Repair the connections or terminals, then recheck.

CLIMATE CONTROL SYSTEM DTC D-B8, C7

DTC screen D-B8 or DTC screen C7 : Electric A/C Compressor Lost Communication

1. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -2. Do the Self-Diagnostic Function with the climate control unit.

   -3. Check for DTCs.

   Is Error on the DTC screen D-B8 or DTC screen C7 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. CAN gateway system DTC check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Connect the HDS to the DLC .

   -3. Turn the vehicle to the ON mode.

   -4. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
Â	Â

   Are any DTCs indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC(s) .

   NO

   Go to step 3.

3. Open wire check (F-CAN D_H line, F-CAN D_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

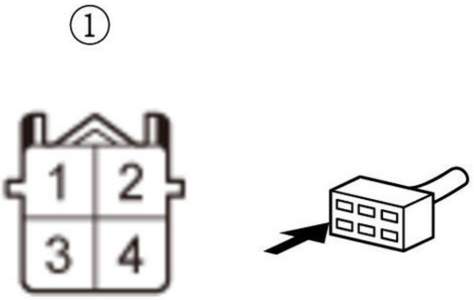
Electric A/C compressor 4P connector

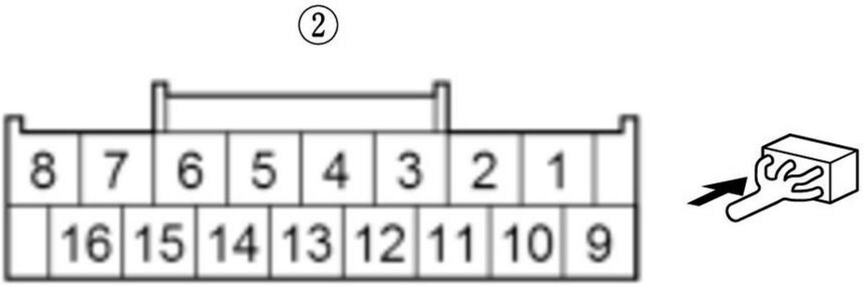
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Electric A/C compressor 4P connector: disconnected CAN gateway 16P connector: disconnected
Test point 1	Electric A/C compressor 4P connector (female terminals) No. 4: ①
Test point 2	CAN gateway 16P connector (female terminals) No. 7: ②

Test point 1	Electric A/C compressor 4P connector (female terminals) No. 3: ①
Test point 2	CAN gateway 16P connector (female terminals) No. 15: ②





Is there 1.0 Ω or less?

YES

Replace the electric A/C compressor .

NO

Repair an open in the F-CAN D_H wire or the F-CAN D_L wire between the electric A/C compressor and the CAN gateway.

CLIMATE CONTROL SYSTEM DTC I-A4

DTC screen I-A4 : Climate control unit lost communication with center display unit

NOTE: The DTC may be stored due to the grounding failure or the power source failure at the center display (the grounding inspection and the power source inspection on each control unit are required prior to this checking process).

1. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -2. Do the Self-Diagnostic Function with the climate control unit.

   -3. Check for DTCs.

   Is Error on the DTC screen I-A4 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for loose wires or poor connections.

2. Open wire check (B-CAN_H line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Audio unit connector A (24P) (without navigation)
Audio-navigation unit connector A (24P) (with navigation)
Climate control unit connector A (32P)

   -3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Audio unit connector A (24P) (without navigation): disconnected
	Audio-navigation unit connector A (24P) (with navigation): disconnected
	Climate control unit connector A (32P): disconnected

Test point 1	Audio unit connector A (24P) No. 14 (without navigation)
	Audio-navigation unit connector A (24P) No. 14 (with navigation)
Test point 2	Climate control unit connector A (32P) No. 25

   Is there 1.0 Ω or less?

   YES

   The B-CAN_H wire is OK. Go to step 3.

   NO

   Repair an open in the B-CAN_H wire.

3. Open wire check (B-CAN_L line)

   -1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Audio unit connector A (24P) (without navigation): disconnected
	Audio-navigation unit connector A (24P) (with navigation): disconnected
	Climate control unit connector A (32P): disconnected
Test point 1	**Audio unit connector A (24P) No. 24 (without navigation)**
	Audio-navigation unit connector A (24P) No. 24 (with navigation)
Test point 2	**Climate control unit connector A (32P) No. 8**

Is there 1.0 Ω or less?

YES: Without navigation

Replace the audio unit .

YES: With navigation

Replace the audio-navigation unit .

NO

Repair an open in the B-CAN_L wire.

CLIMATE CONTROL SYSTEM DTC I-B8, C0

DTC screen I-B8 or DTC screen C0 : Climate control unit internal error

1. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-2. **Do the Self-Diagnostic Function with the climate control unit**.

-3. Check for DTCs.

Is Error on the DTC screen I-B8 or DTC screen C0 indicated?

YES

Replace the climate control unit .

NO

Intermittent failure, the climate control unit is OK at this time.

DTC B120A (I-B4), B120A (8A)

DTC B120A, DTC screen I-B4, or DTC screen 8A : Climate Control Unit LIN Communication Bus Line Error

DTC Description	DTC
B120A Climate Control Unit LIN Communication Bus Line Error	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

-4. Check for DTCs.

DTC Description	DTC
B120A Climate Control Unit LIN Communication Bus Line Error	Â

Is DTC B120A, Error on the DTC screen I-B4 (climate control panel without display), or DTC screen 8A (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the climate control panel circuit.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D9

Is the fuse OK?

YES

Go to step 3.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. D9 fuse circuit.

3. Determine possible failure area (BUS-DATA line, IG2_A/C line)

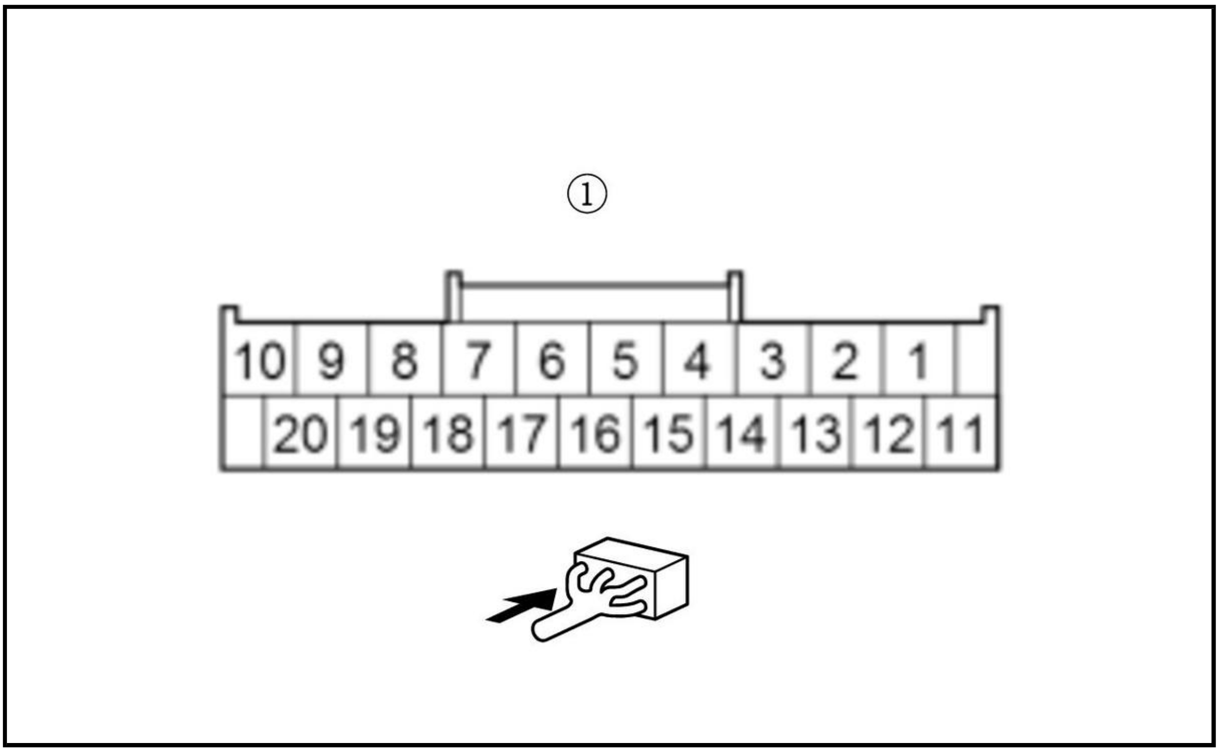
-1. Disconnect the following connector.

Climate control panel 20P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control panel 20P connector: disconnected
Test point 1	Climate control panel 20P connector (female terminals) No. 13: ①
Test point 2	Climate control panel 20P connector (female terminals) No. 19: ①



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (BUS-DATA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Climate control panel 20P connector: disconnected
Test point 1	Climate control unit connector A (32P) No. 29
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The BUS-DATA wire is not shorted. Go to step 5.

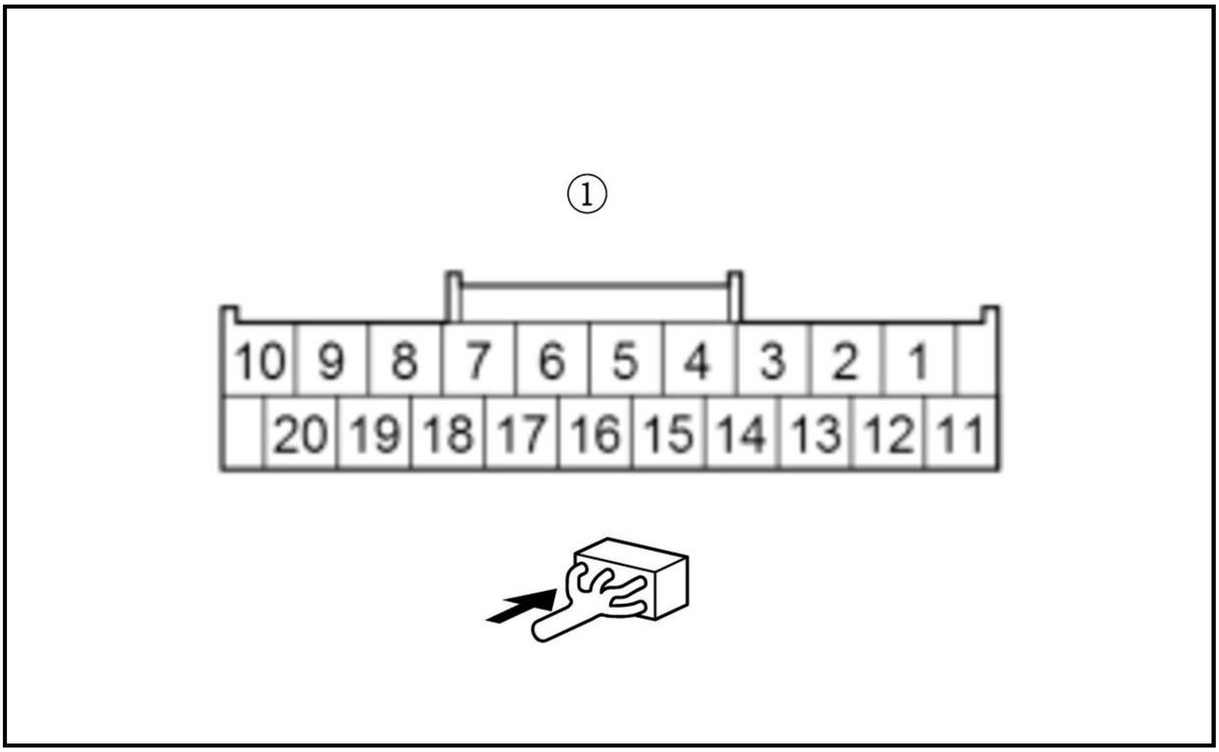
NO

Repair a short to ground in the BUS-DATA wire.

5. Open wire check (BUS-DATA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Climate control panel 20P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 29**
Test point 2	Climate control panel 20P connector (female terminals) No. 18: ①



Is there 1.0 Ω or less?

YES

The BUS-DATA wire is OK. Go to step 6.

NO

Repair an open in the BUS-DATA wire.

6. Climate control panel check

-1. Reconnect the following connector.

Climate control unit connector A (32P)

-2. **Substitute a known-good climate control panel** .

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-5. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-6. Check for DTCs.

DTC Description	DTC
B120A Climate Control Unit LIN Communication Bus Line Error	Â

Is DTC B120A, Error on the DTC screen I-B4 (climate control panel without display), or DTC screen 8A (climate control panel with display) indicated?

YES

Replace the climate control unit .

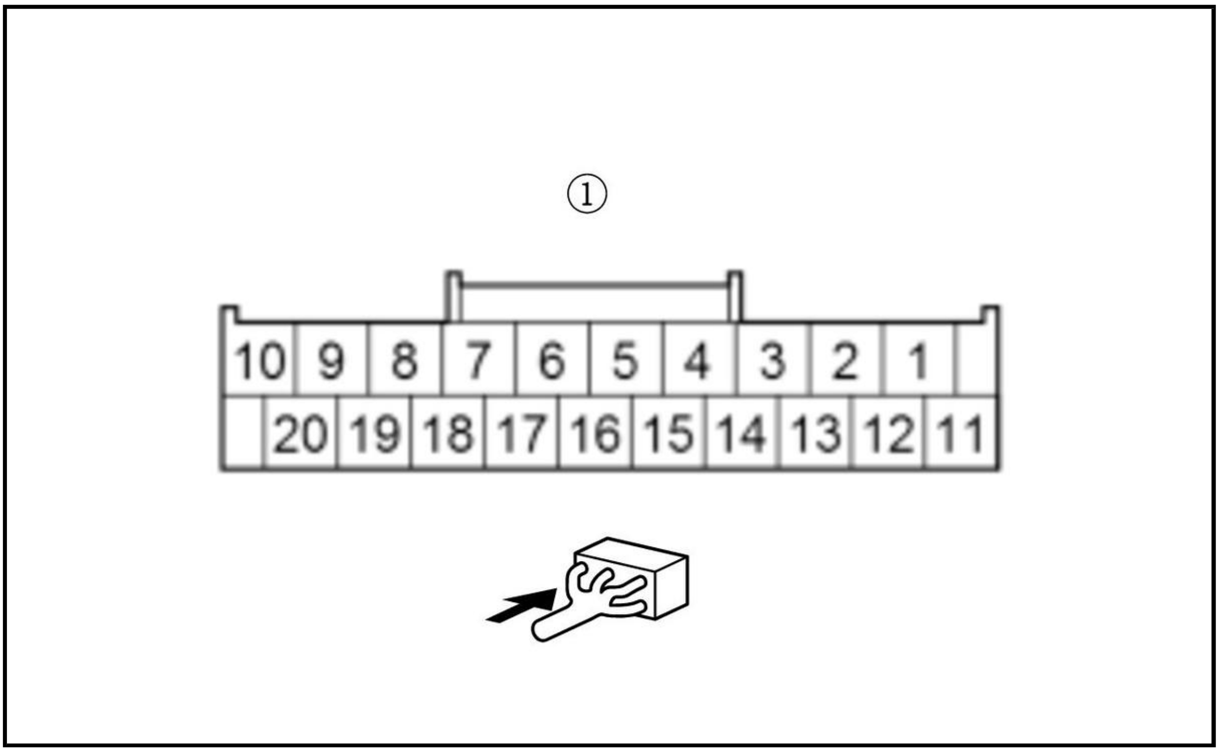
NO

Replace the original climate control panel .

7. Open wire check (IG2_A/C line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Climate control panel 20P connector: disconnected
Test point 1	Climate control panel 20P connector (female terminals) No. 19: ①
Test point 2	Body ground



Is there battery voltage?

YES

Check for an open in the GND wire between the climate control panel and body ground. If the wire is OK, check for poor ground at G402.

NO

Repair an open in the IG2_A/C wire.

DTC B121A (B-B1), B121A (49)

DTC B121A, DTC screen B-B1, or DTC screen 49 : An Open in the Mode Control Motor Circuit

DTC Description	DTC
B121A An open in the mode control motor circuit	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

   -4. Check for DTCs.

DTC Description	DTC
B121A An open in the mode control motor circuit	Â

   Is DTC B121A, Error on the DTC screen B-B1 (climate control panel without display), or DTC screen 49 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the mode control motor circuit.

2. Determine possible failure area (MDD-P line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

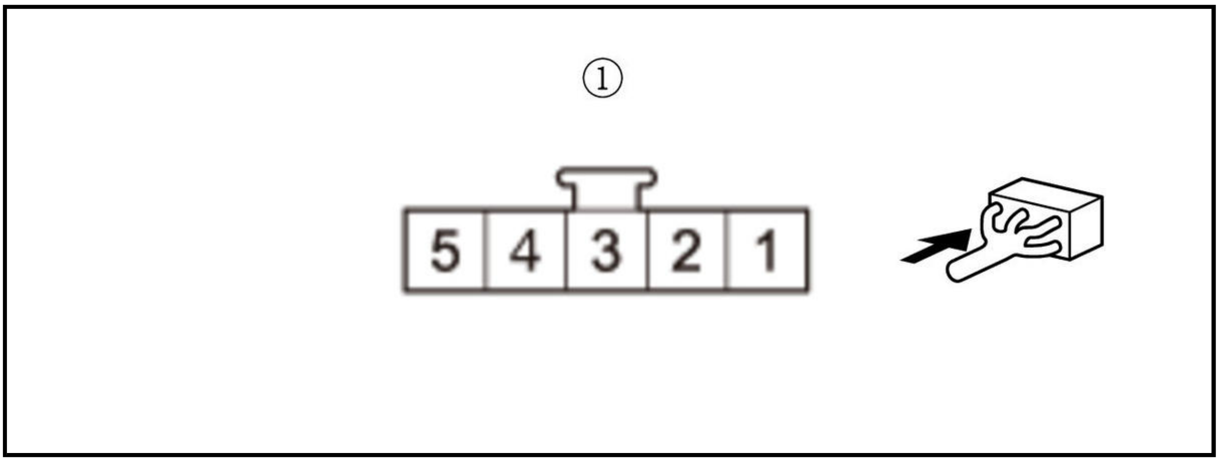
   -2. Disconnect the following connector.

Mode control motor 5P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

The MDD-P wire is OK. Go to step 3.

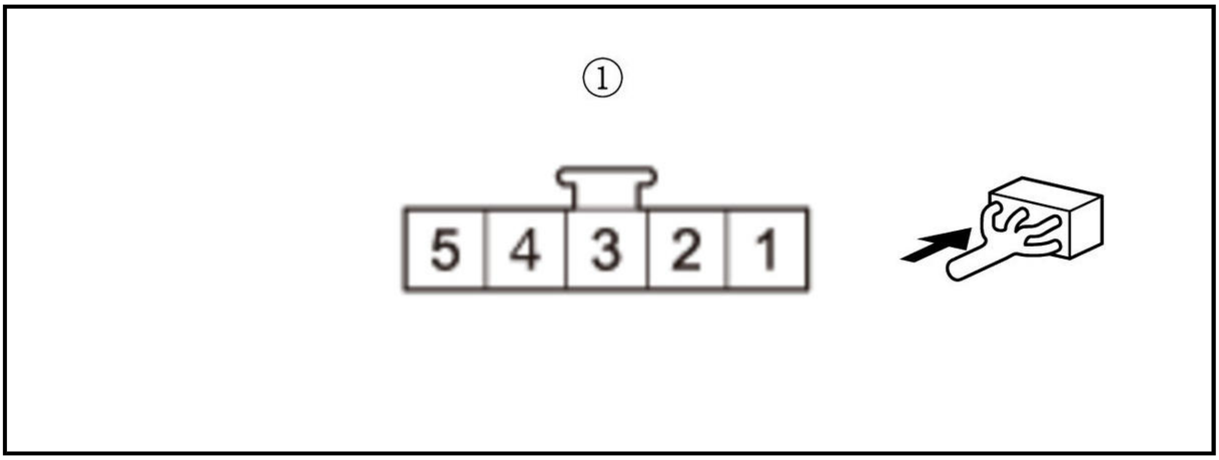
NO

Go to step 5.

3. Determine possible failure area (mode control motor, SENS-COM line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 1: ①
Test point 2	Mode control motor 5P connector (female terminals) No. 2: ①



Is there about 5 V?

YES

Replace the mode control motor .

NO

Go to step 4.

4. Open wire check (SENS-COM line)

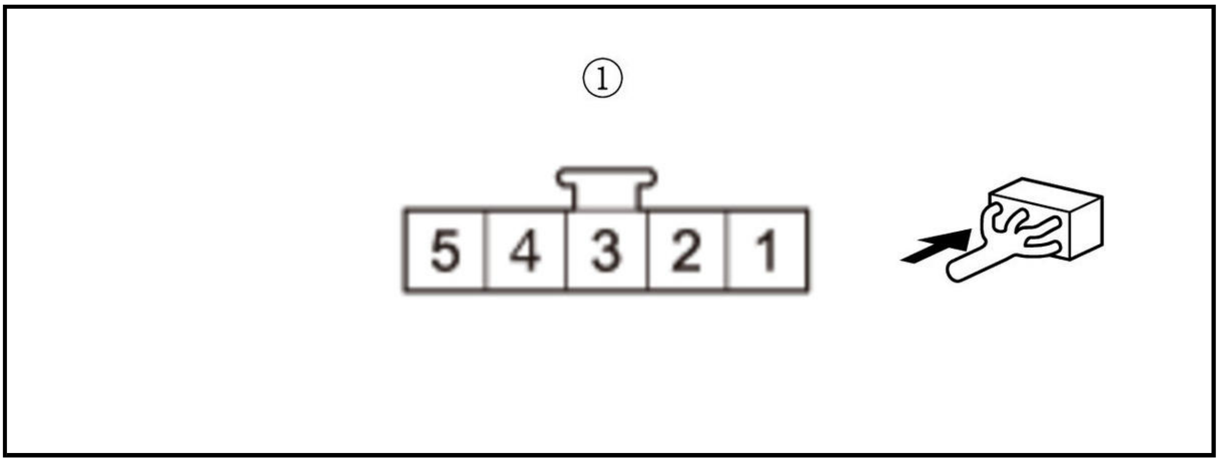
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Mode control motor 5P connector: disconnected
Â	Climate control unit connector B (24P): disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 1: ①
Test point 2	**Climate control unit connector B (24P) No. 10**



Is there 1.0 Ω or less?

YES

Replace the climate control unit .

NO

Repair an open in the SENS-COM wire.

5. Open wire check (MDD-P line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 5**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the MDD-P wire.

NO

Replace the climate control unit .

DTC B121B (B-B2), B121B (4A)

DTC B121B, DTC screen B-B2, or DTC screen 4A : A short in the mode control motor circuit

NOTE: If other short circuit DTCs are indicated at the same time, there may be an open or short to body ground in the power S5V circuit.

DTC Description	DTC
B121B A short in the mode control motor circuit	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

   -4. Check for DTCs.

DTC Description	DTC
B121B A short in the mode control motor circuit	Â

   Is DTC B121B, Error on the DTC screen B-B2 (climate control panel without display), or DTC screen 4A (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the mode control motor circuit.

2. Determine possible failure area (S5V line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

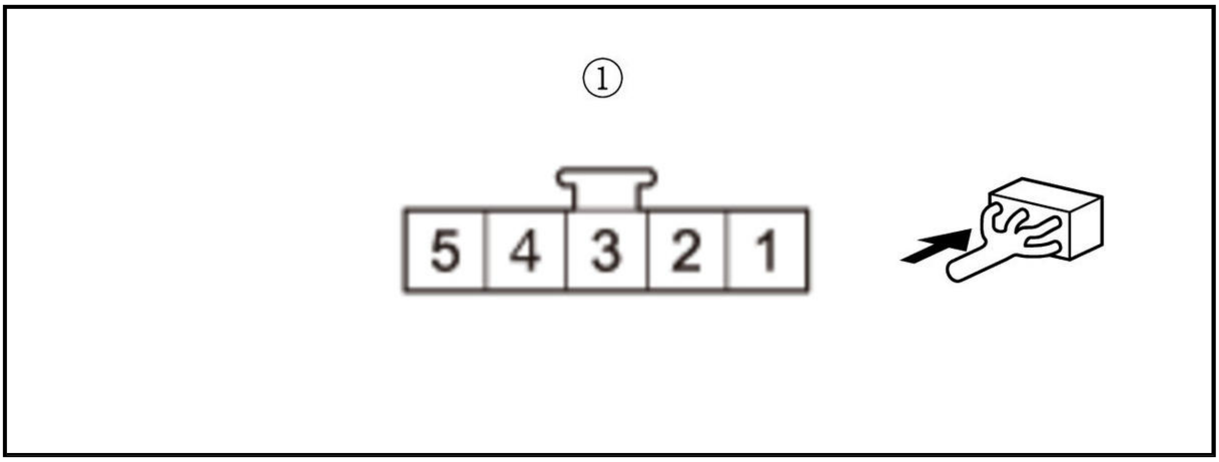
   -2. Disconnect the following connector.

Mode control motor 5P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The S5V wire is OK. Go to step 3.

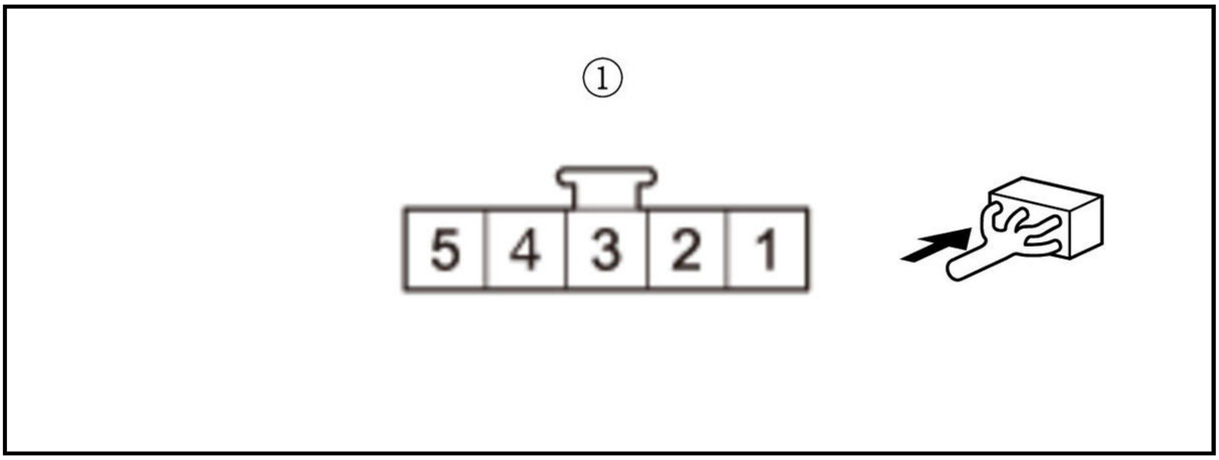
NO

Go to step 6.

3. Determine possible failure area (mode control motor, MDD-P line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the mode control motor .

NO

Go to step 4.

4. Shorted wire check (MDD-P line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 5**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The MDD-P wire is not shorted to body ground. Go to step 5.

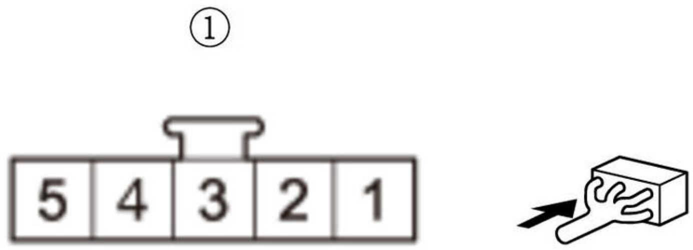
NO

Repair a short to body ground in the MDD-P wire.

5. Shorted wire check (MDD-P line to SENS-COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	Mode control motor 5P connector (female terminals) No. 1: ①
Test point 2	Mode control motor 5P connector (female terminals) No. 2: ①



Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short in the MDD-P wire to SENS-COM wire.

6. Open wire check (S5V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the S5V wire.

NO

The S5V wire is not open. Go to step 7.

7. Shorted wire check (S5V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short to body ground in the S5V wire.

DTC B121D (A-B6), B121D (89)

DTC B121D, DTC screen A-B6, or DTC indicator 89 : Humidity/In-Car Temperature Sensor Communication Error

DTC Description	DTC
B121D Humidity/in-car temperature sensor communication error	Â

DTC (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

-4. Check for DTCs.

DTC Description	DTC
B121D Humidity/in-car temperature sensor communication error	Â

Is DTC B121D, Error on the DTC screen A-B6 (climate control panel without display), or DTC indicator 89 (climate control panel with display) indicated?

YES: Climate control panel without display

The failure is duplicated. Go to step 2.

YES: Climate control panel with display

The failure is duplicated. Go to step 4.

NO

Intermittent failure. Check for loose wires or poor connections on the humidity/in-car temperature sensor circuit.

2. Climate control unit check 1

-1. Turn the vehicle to the OFF (LOCK) mode after confirming the A/C system is OFF.

-2. Disconnect the following connector.

Humidity/in-car temperature sensor 4P connector

-3. Turn the vehicle to the ON mode.

-4. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.

Is Normal on the DTC screen A-B7 indicated?

YES

Go to step 7.

NO

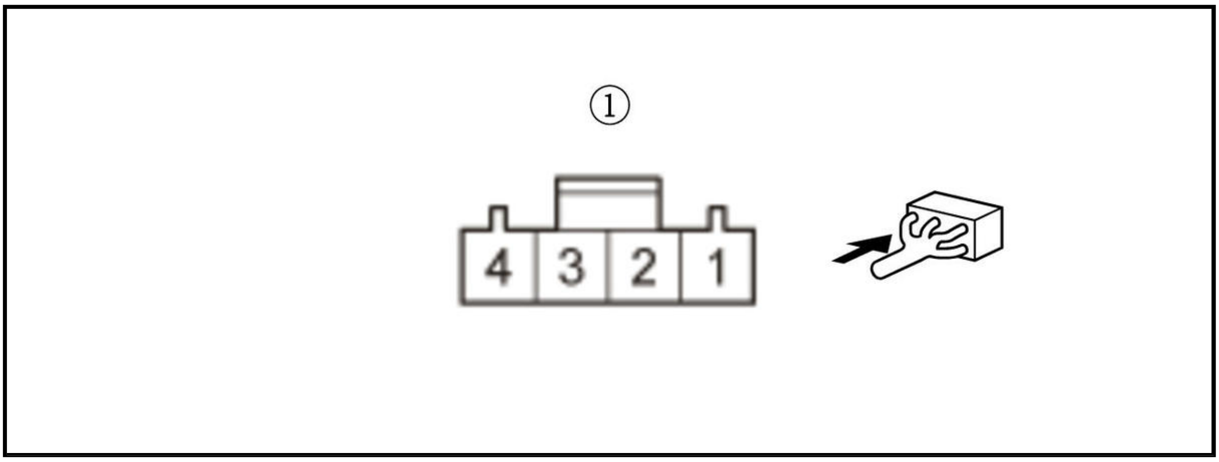
Go to step 3.

3. Climate control unit check 2

-1. Turn the vehicle to the OFF (LOCK) mode after confirming the A/C system is OFF.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Humidity/in-car temperature sensor 4P connector (female terminals) No. 2: ①
Terminal B	Humidity/in-car temperature sensor 4P connector (female terminals) No. 4: ①



-3. Turn the vehicle to the ON mode.

-4. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.

Is Normal on the DTC screen A-B7 indicated?

YES

Go to step 6.

NO

Go to step 8.

4. Climate control unit check 1

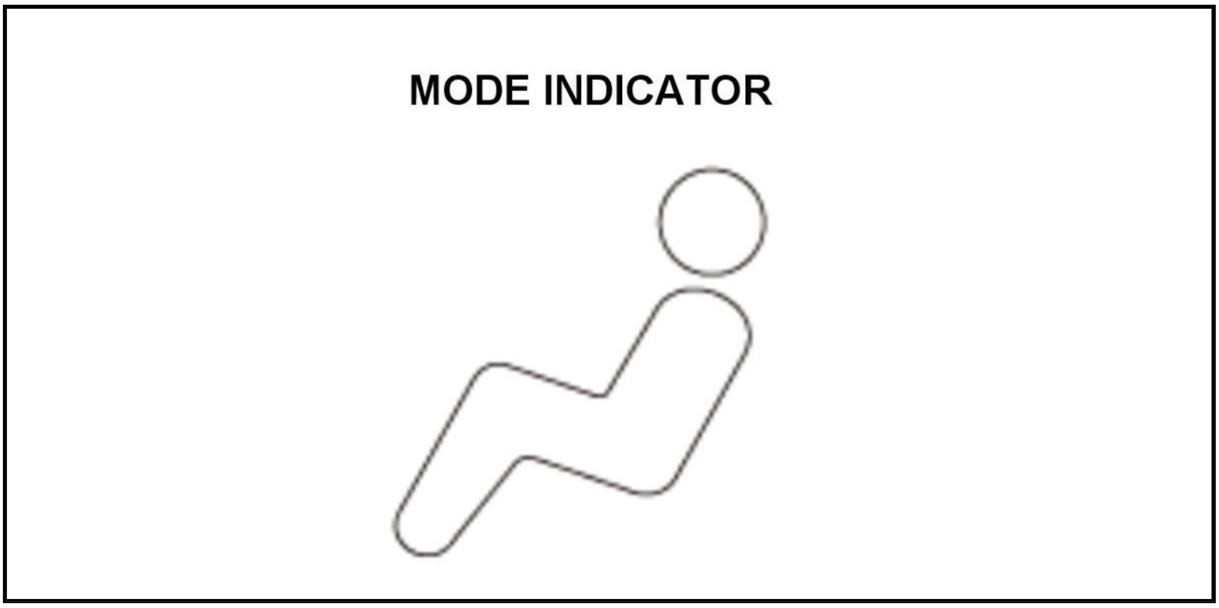
-1. Turn the vehicle to the OFF (LOCK) mode after confirming the A/C system is OFF.

-2. Disconnect the following connector.

Humidity/in-car temperature sensor 4P connector

-3. Turn the vehicle to the ON mode.

-4. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.



Does the MODE indicator turn on?

YES

Go to step 7.

NO

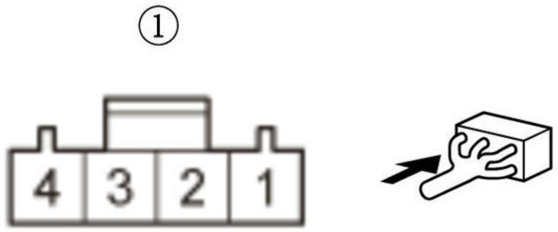
Go to step 5.

5. Climate control unit check 2

-1. Turn the vehicle to the OFF (LOCK) mode after confirming the A/C system is OFF.

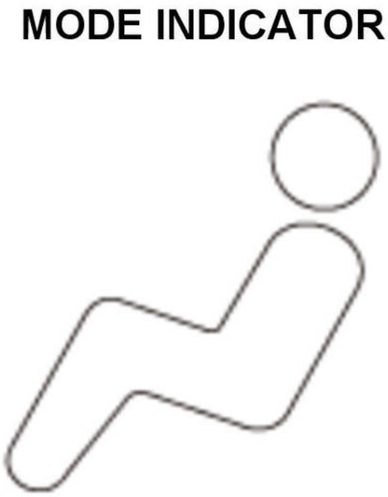
-2. Connect terminals A and B with a jumper wire.

Terminal A	Humidity/in-car temperature sensor 4P connector (female terminals) No. 2: ①
Terminal B	Humidity/in-car temperature sensor 4P connector (female terminals) No. 4: ①



-3. Turn the vehicle to the ON mode.

-4. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.



Does the MODE indicator turn on?

YES

Go to step 6.

NO

Go to step 8.

6. Determine possible failure area (humidity/in-car temperature sensor, others)

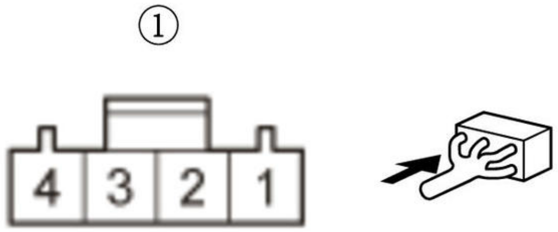
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	Humidity/in-car temperature sensor 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the humidity/in-car temperature sensor .

NO

Go to step 12.

7. Shorted wire check (HUM_DATA line to HUM_CLK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 7**
Test point 2	**Climate control unit connector A (32P) No. 24**

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short in the HUM_DATA wire to the HUM_CLK wire.

8. Open wire check (HUM_DATA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

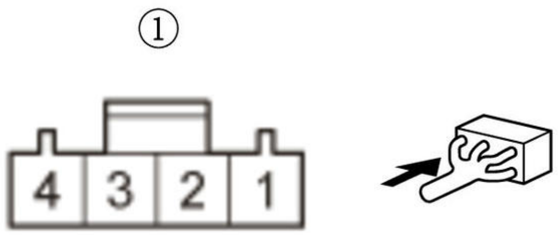
-2. Disconnect the jumper wire from the humidity/in-car temperature sensor.

-3. Disconnect the following connector.

Climate control unit connector A (32P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 7**
Test point 2	Humidity/in-car temperature sensor 4P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The HUM_DATA wire is not open. Go to step 9.

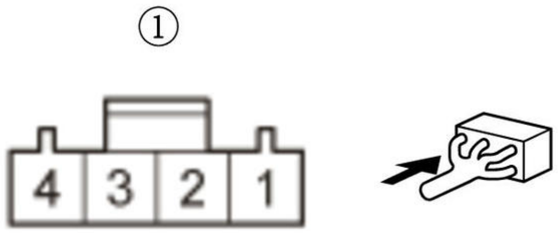
NO

Repair an open in the HUM_DATA wire.

9. Open wire check (HUM_CLK line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 24**
Test point 2	Humidity/in-car temperature sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The HUM_CLK wire is not open. Go to step 10.

NO

Repair an open in the HUM_CLK wire.

10. Shorted wire check (HUM_DATA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 7**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The HUM_DATA wire is OK. Go to step 11.

NO

Repair a short to body ground in the HUM_DATA wire.

11. Shorted wire check (HUM_CLK line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 24**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short to body ground in the HUM_CLK wire.

12. Open wire check (S 5V line)

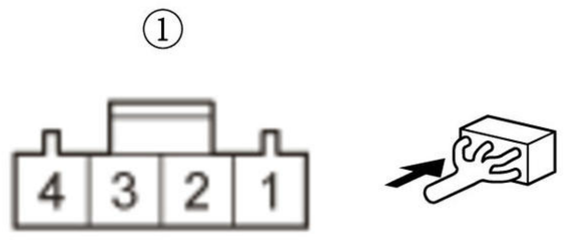
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 26**
Test point 2	Humidity/in-car temperature sensor 4P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The S 5V line is not open. Go to step 13.

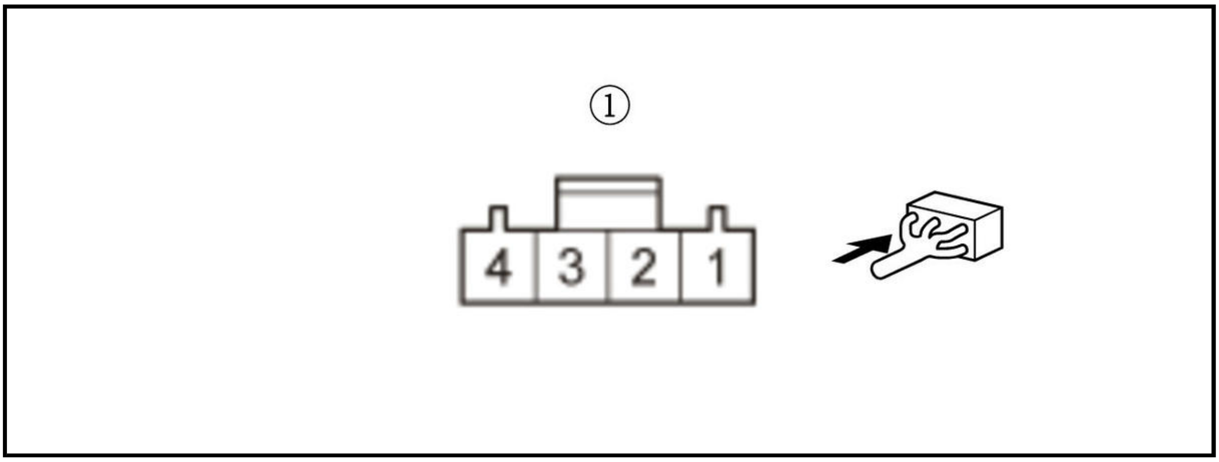
NO

Repair an open in the S 5V wire.

13. Open wire check (SENSOR_COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	Climate control unit connector A (32P) No. 12
Test point 2	Humidity/in-car temperature sensor 4P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The SENSOR_COM wire is OK. Go to step 14.

NO

Repair an open in the SENSOR_COM wire.

14. Shorted wire check (S 5V line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Humidity/in-car temperature sensor 4P connector: disconnected
Test point 1	Climate control unit connector A (32P) No. 26
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short to body ground in the S 5V wire.

DTC B1220 (B-B5), B1220 (56)

DTC B1220, DTC screen B-B5, or DTC screen 56 : A Short in the recirculation control motor circuit

NOTE: If other short circuit DTCs are indicated at the same time, there may be an open or short to body ground in the power S5V circuit.

DTC Description	DTC
B1220 A Short in the recirculation control motor circuit	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

   -4. Check for DTCs.

DTC Description	DTC
B1220 A Short in the recirculation control motor circuit	Â

   Is DTC B1220, Error on the DTC screen B-B5 (climate control panel without display), or DTC screen 56 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the recirculation control motor circuit.

2. Determine possible failure area (S5V line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

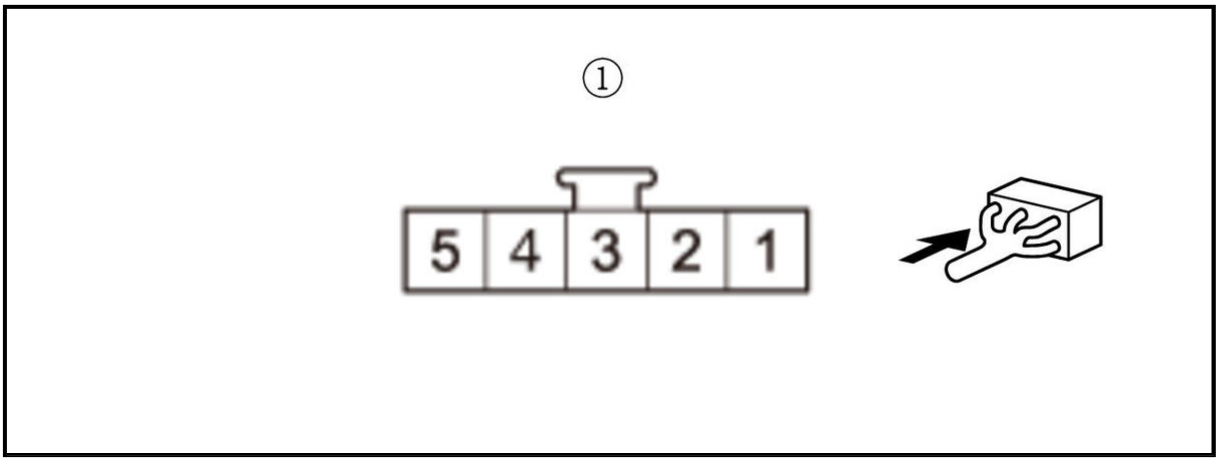
   -2. Disconnect the following connector.

Recirculation control motor 5P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The S5V wire is OK. Go to step 3.

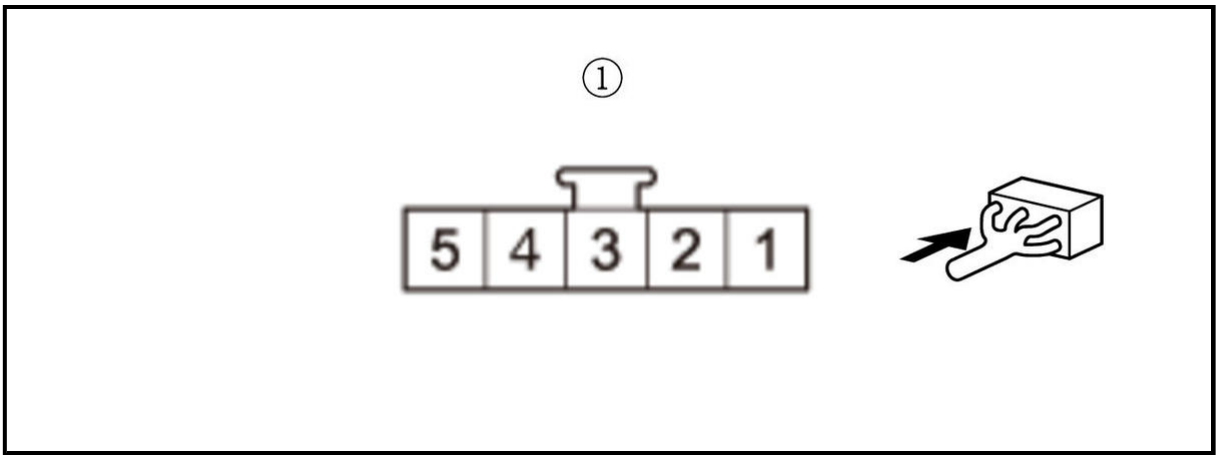
NO

Go to step 6.

3. Determine possible failure area (recirculation control motor, RFD-P line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the recirculation control motor .

NO

Go to step 4.

4. Shorted wire check (RFD-P line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 4**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The RFD-P wire is not shorted to body ground. Go to step 5.

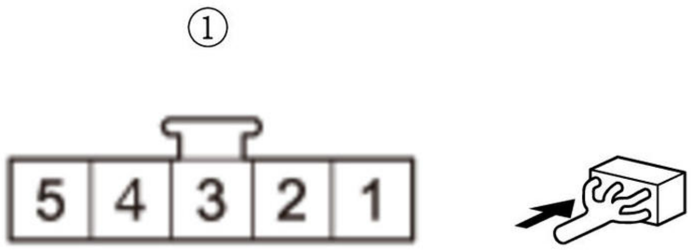
NO

Repair a short to body ground in the RFD-P wire.

5. Shorted wire check (RFD-P line to SENS-COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 1: ①
Test point 2	Recirculation control motor 5P connector (female terminals) No. 2: ①



Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short in the RFD-P wire to SENS-COM wire.

6. Open wire check (S5V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the S5V wire.

NO

The S5V wire is not open. Go to step 7.

7. Shorted wire check (S5V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short to body ground in the S5V wire.

DTC B1227 (A-A1), B1227 (05)

DTC B1227, DTC screen A-A1, or DTC screen 05 : An open in the outside air temperature sensor circuit

DTC Description	DTC
B1227 An open in the outside air temperature sensor circuit	Â

DTC (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-4. Check for DTCs.

DTC Description	DTC
B1227 An open in the outside air temperature sensor circuit	Â

Is DTC B1227, Error on the DTC screen A-A1 (climate control panel without display), or DTC screen 05 (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the outside air temperature sensor circuit.

2. Open wire check (TAM line)

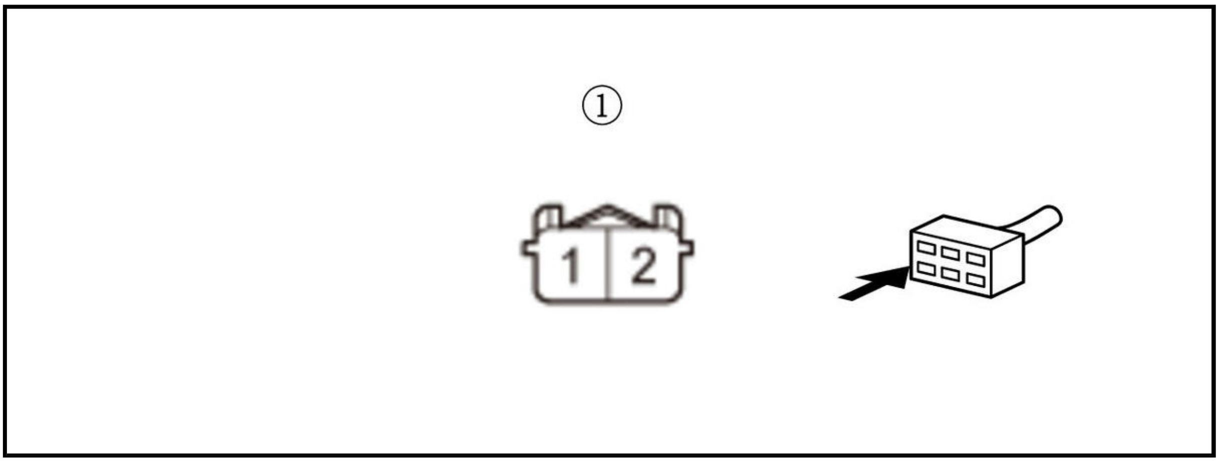
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector A (32P)
Outside air temperature sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 11**
Test point 2	Outside air temperature sensor 2P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The TAM wire is not open. Go to step 3.

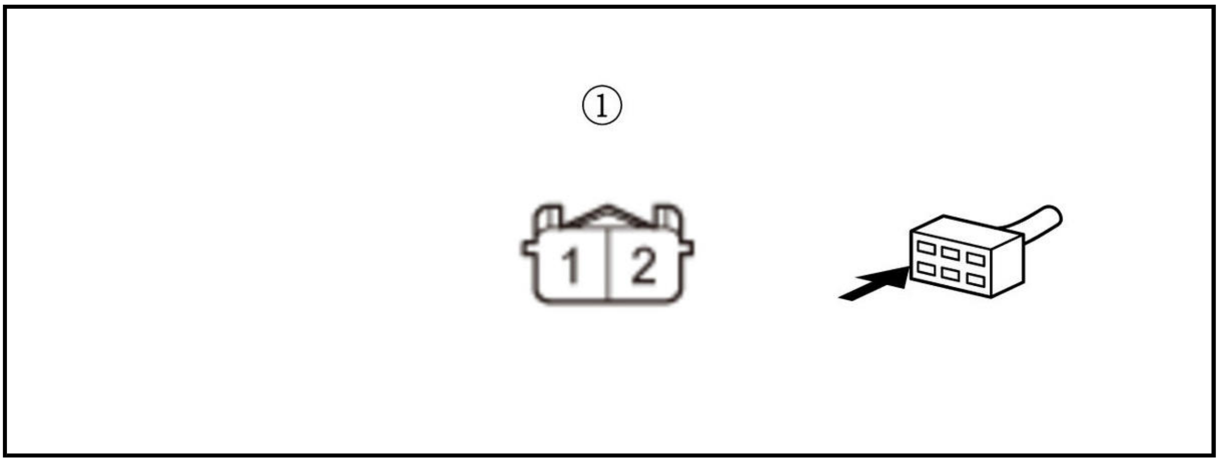
NO

Repair an open in the TAM wire.

3. Open wire check (SENSOR_COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 12**
Test point 2	Outside air temperature sensor 2P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The SENSOR_COM wire is OK. Go to step 4.

NO

Repair an open in the SENSOR_COM wire.

4. Shorted wire check (TAM line to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 11**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the TAM wire.

NO

The TAM wire is OK. Go to step 5.

5. Outside air temperature sensor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Test the outside air temperature sensor .

   Is the outside air temperature sensor OK?

   YES

   Replace the climate control unit .

   NO

   Replace the outside air temperature sensor .

DTC B1228 (A-A2), B1228 (06)

DTC B1228, or DTC screen A-A2, or DTC screen 06 : A short in the outside air temperature sensor circuit

DTC Description	DTC
B1228 A short in the outside air temperature sensor circuit	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

   -4. Check for DTCs.

DTC Description	DTC
B1228 A short in the outside air temperature sensor circuit	Â

   Is DTC B1228, Error on the DTC screen A-A2 (climate control panel without display), or DTC screen 06 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the outside air temperature sensor circuit.

2. Shorted wire check (TAM line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

Climate control unit connector A (32P)
Outside air temperature sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 11**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The TAM wire is not shorted. Go to step 3.

NO

Repair a short to body ground in the TAM wire.

3. Shorted wire check (TAM line to SENSOR_COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Outside air temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 11**
Test point 2	**Climate control unit connector A (32P) No. 12**

Is there 1 MΩ or more?

YES

The TAM wire and the SENSOR_COM wire are OK. Go to step 4.

NO

Repair a short in the TAM wire to the SENSOR_COM wire.

4. Outside air temperature sensor check

-1. **Test the outside air temperature sensor** .

Is the outside air temperature sensor OK?

YES

Replace the climate control unit .

NO

Replace the outside air temperature sensor .

DTC B1231 (A-A5), B1231 (09)

DTC B1231, DTC screen A-A5, or DTC screen 09 : An open in the evaporator temperature sensor circuit

DTC Description	DTC
B1231 An open in the evaporator temperature sensor circuit	Â

DTC (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

-4. Check for DTCs.

DTC Description	DTC
B1231 An open in the evaporator temperature sensor circuit	Â

Is DTC B1231, Error on the DTC screen A-A5 (climate control panel without display), or DTC screen 09 (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the evaporator temperature sensor circuit.

2. Open wire check (TEVA line)

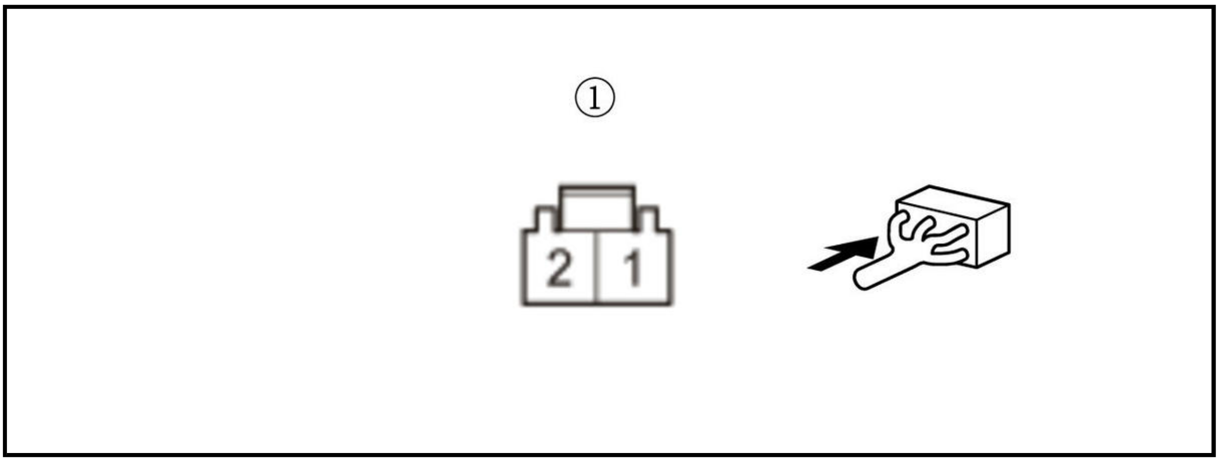
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Evaporator temperature sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Evaporator temperature sensor 2P connector: disconnected
Test point 1	Climate control unit connector B (24P) No. 8
Test point 2	Evaporator temperature sensor 2P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The TEVA wire is not open. Go to step 3.

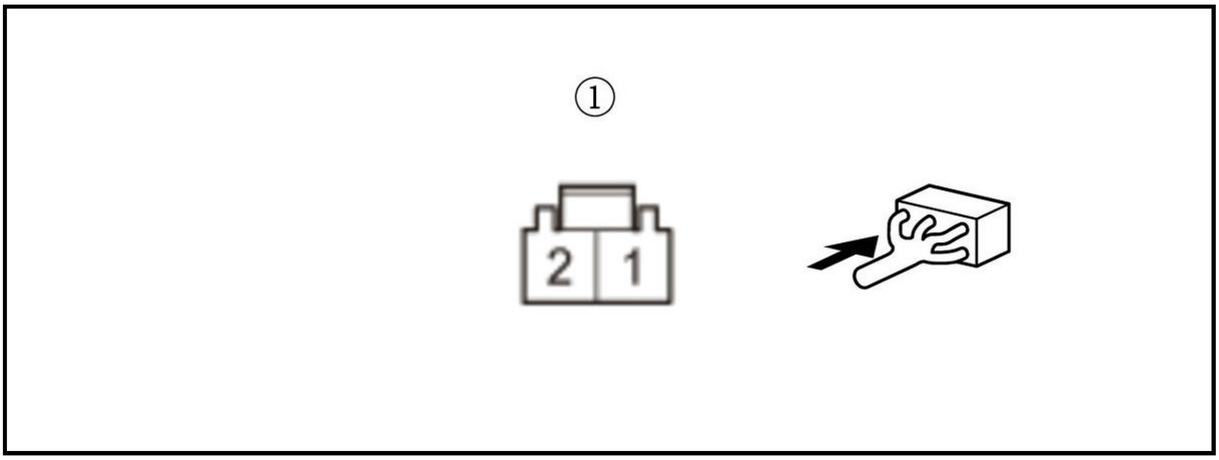
NO

Repair an open in the TEVA wire.

3. Open wire check (SENS-COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Evaporator temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 10**
Test point 2	Evaporator temperature sensor 2P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The SENS-COM wire is OK. Go to step 4.

NO

Repair an open in the SENS-COM wire.

4. Shorted wire check (TEVA line to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control unit connector B (24P): disconnected
	Evaporator temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 8**
Test point 2	Body ground

Is there any voltage?

YES

Repair a short to power in the TEVA wire.

NO

The TEVA wire is OK. Go to step 5.

5. Evaporator temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Test the evaporator temperature sensor** .

Is the evaporator temperature sensor OK?

YES

Replace the climate control unit .

NO

Replace the evaporator temperature sensor .

DTC B1232 (A-A6), B1232 (0A)

DTC B1232, DTC screen A-A6, or DTC screen 0A : A short in the evaporator temperature sensor circuit

DTC Description	DTC
B1232 A short in the evaporator temperature sensor circuit	Â

DTC (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-4. Check for DTCs.

DTC Description	DTC
B1232 A short in the evaporator temperature sensor circuit	Â

Is DTC B1232, Error on the DTC screen A-A6 (climate control panel without display), or DTC screen 0A (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the evaporator temperature sensor circuit.

2. Shorted wire check (TEVA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Evaporator temperature sensor 2P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Evaporator temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 8**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The TEVA wire is not shorted. Go to step 3.

NO

Repair a short to body ground in the TEVA wire.

3. Shorted wire check (TEVA line to SENS-COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Evaporator temperature sensor 2P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 8**
Test point 2	**Climate control unit connector B (24P) No. 10**

Is there 1 MΩ or more?

YES

The TEVA wire and the SENS-COM wire are OK. Go to step 4.

NO

Repair a short in the TEVA wire to the SENS-COM wire.

4. Evaporator temperature sensor check

-1. Test the evaporator temperature sensor .

Is the evaporator temperature sensor OK?

YES

Replace the climate control unit .

NO

Replace the evaporator temperature sensor .

DTC B1233 (B-A1), B1233 (40)

DTC B1233, DTC screen B-A1, or DTC screen 40 : An open in the air mix control motor circuit (driver's)

DTC Description	DTC
B1233 An open in the air mix control motor circuit (driver's)	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

-4. Check for DTCs.

DTC Description	DTC
B1233 An open in the air mix control motor circuit (driver's)	Â

Is DTC B1233, Error on the DTC screen B-A1 (climate control panel without display), or DTC screen 40 (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO: Without dual zone climate control

Intermittent failure. Check for loose wires or poor connections on the air mix control motor circuit.

NO: With dual zone climate control

Intermittent failure. Check for loose wires or poor connections on the driver's air mix control motor circuit.

2. Determine possible failure area (AMD-P-DR line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Air mix control motor 5P connector (without dual zone climate control)

Driver's air mix control motor 5P connector (with dual zone climate control)

-3. Turn the vehicle to the ON mode.

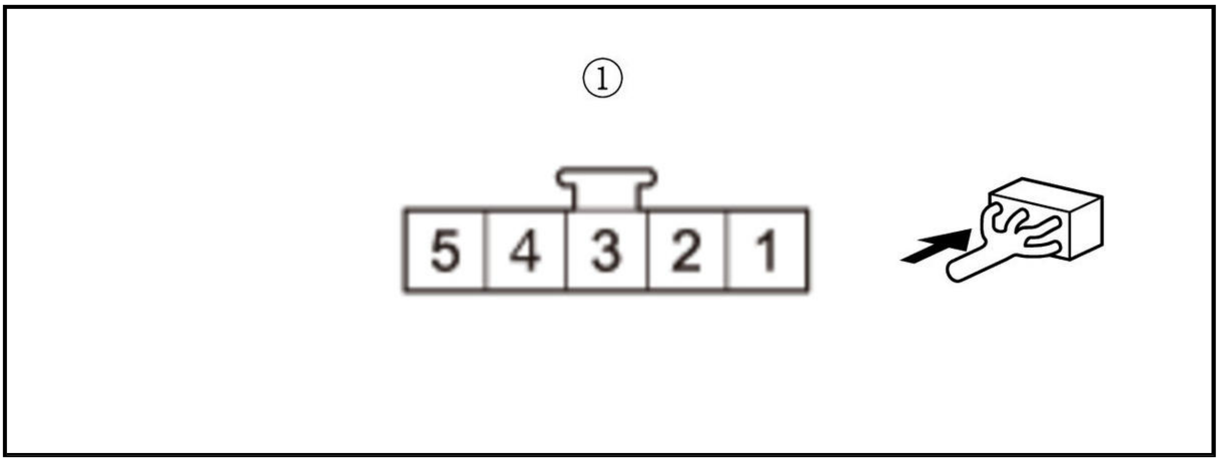
-4. Measure the voltage between test points 1 and 2.

Without dual zone climate control

Test condition	Vehicle ON mode Air mix control motor 5P connector: disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground

With dual zone climate control

Test condition	Vehicle ON mode Driver's air mix control motor 5P connector: disconnected
Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

The AMD-P-DR wire is OK. Go to step 3.

NO

Go to step 5.

3. Determine possible failure area (air mix control motor (Without dual zone climate control), driver's air mix control motor (With dual zone climate control), SENS-COM line)

-1. Measure the voltage between test points 1 and 2.

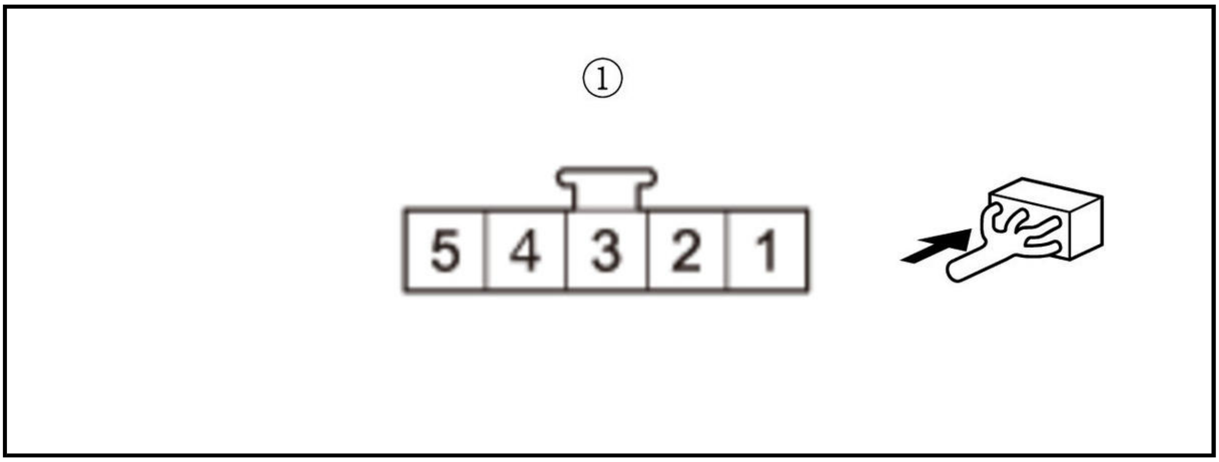
Without dual zone climate control

Test condition	Vehicle ON mode Air mix control motor 5P connector: disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 1: ①

Test point 2	Air mix control motor 5P connector (female terminals) No. 2: ①

With dual zone climate control

Test condition	Vehicle ON mode Driver's air mix control motor 5P connector: disconnected
Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Driver's air mix control motor 5P connector (female terminals) No. 3: ①



Is there about 5 V?

YES: Without dual zone climate control

Replace the air mix control motor .

YES: With dual zone climate control

Replace the driver's air mix control motor .

NO

Go to step 4.

4. Open wire check (SENS-COM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

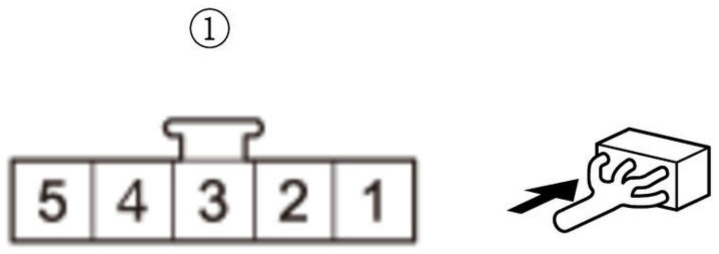
-3. Measure the resistance between test points 1 and 2.

Without dual zone climate control

Test condition	Vehicle OFF (LOCK) mode Air mix control motor 5P connector: disconnected
Â	Climate control unit connector B (24P): disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 1: ①
Test point 2	**Climate control unit connector B (24P) No. 10**

With dual zone climate control

Test condition	Vehicle OFF (LOCK) mode
	Driver's air mix control motor 5P connector: disconnected
Â	Climate control unit connector B (24P): disconnected
Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 3: ①
Test point 2	Climate control unit connector B (24P) No. 10



Is there 1.0 Ω or less?

YES

Replace the climate control unit .

NO

Repair an open in the SENS-COM wire.

5. Open wire check (AMD-P-DR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Air mix control motor 5P connector (without dual zone climate control): disconnected
	Driver's air mix control motor 5P connector (with dual zone climate control): disconnected
Test point 1	Climate control unit connector B (24P) No. 2
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the AMD-P-DR wire.

NO

Replace the climate control unit .

DTC B1234 (B-A2), B1234 (41)

DTC B1234, DTC screen B-A2, or DTC screen 41 : A short in the air mix control motor circuit (driver's)

NOTE: If other short circuit DTCs are indicated at the same time, there may be an open or short to body ground in the S5V circuit.

DTC Description	DTC
B1234 A short in the air mix control motor circuit (driver's)	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

   -4. Check for DTCs.

DTC Description	DTC
B1234 A short in the air mix control motor circuit (driver's)	Â

   Is DTC B1234, Error on the DTC screen B-A2 (climate control panel without display), or DTC screen 41 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO: Without dual zone climate control

   Intermittent failure. Check for loose wires or poor connections on the air mix control motor circuit.

   NO: With dual zone climate control

   Intermittent failure. Check for loose wires or poor connections on the driver's air mix control motor circuit.

2. Determine possible failure area (S5V line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Air mix control motor 5P connector (without dual zone climate control)
Driver's air mix control motor 5P connector (with dual zone climate control)

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

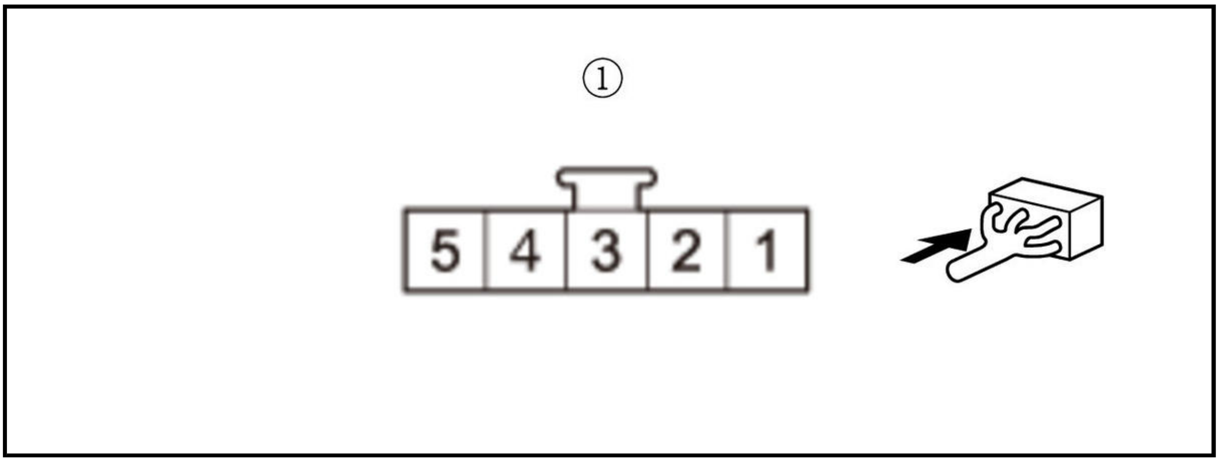
   Without dual zone climate control

Test condition	Vehicle ON mode
	Air mix control motor 5P connector: disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground

With dual zone climate control

Test condition	Vehicle ON mode
	Driver's air mix control motor 5P connector: disconnected
Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 1: ①

Test point 2	Body ground



Is there about 5 V?

YES: Without dual zone climate control

The S5V wire is OK. Go to step 3.

YES: With dual zone climate control

The S5V wire is OK. Go to step 4.

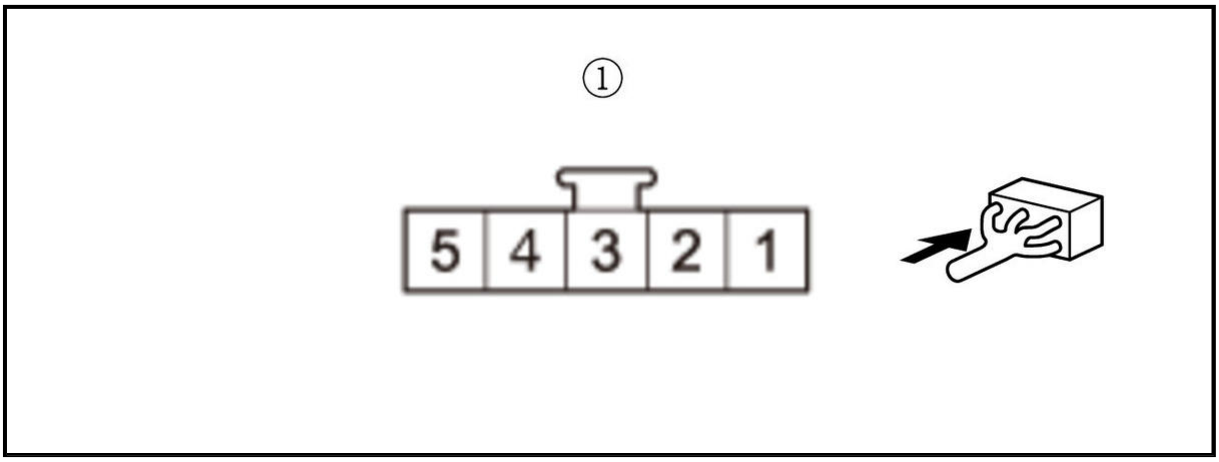
NO

Go to step 8.

3. Determine possible failure area (air mix control motor, AMD-P-DR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Air mix control motor 5P connector: disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the air mix control motor .

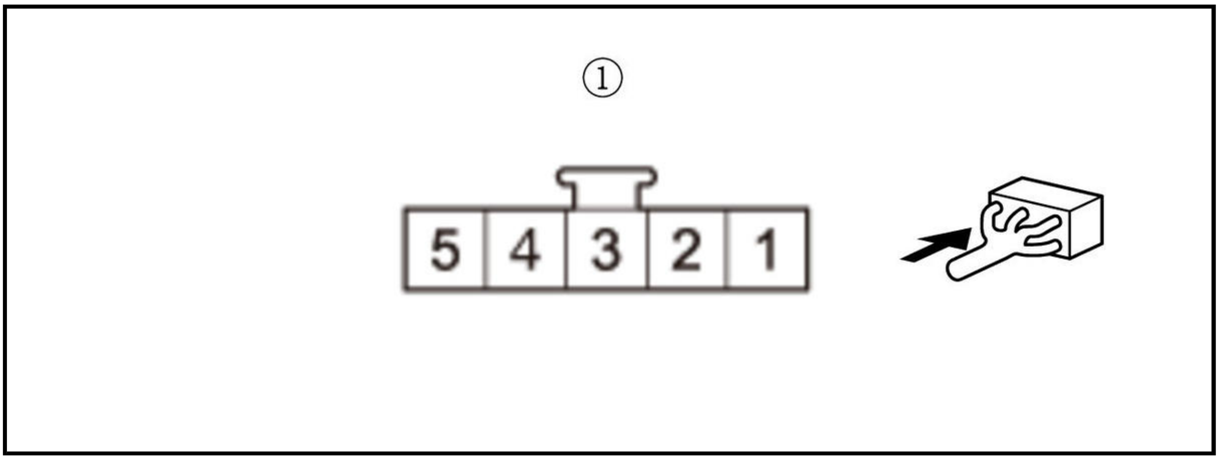
NO

Go to step 5.

4. Determine possible failure area (driver's air mix control motor, AMD-P-DR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Driver's air mix control motor 5P connector: disconnected
Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the driver's air mix control motor .

NO

Go to step 5.

5. Shorted wire check (AMD-P-DR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector (without dual zone climate control): disconnected
	Driver's air mix control motor 5P connector (with dual zone climate control): disconnected
Test point 1	**Climate control unit connector B (24P) No. 2**
Test point 2	Body ground

Is there 1 MΩ or more?

YES: Without dual zone climate control

The AMD-P-DR wire is not shorted to body ground. Go to step 6.

YES: With dual zone climate control

The AMD-P-DR wire is not shorted to body ground. Go to step 7.

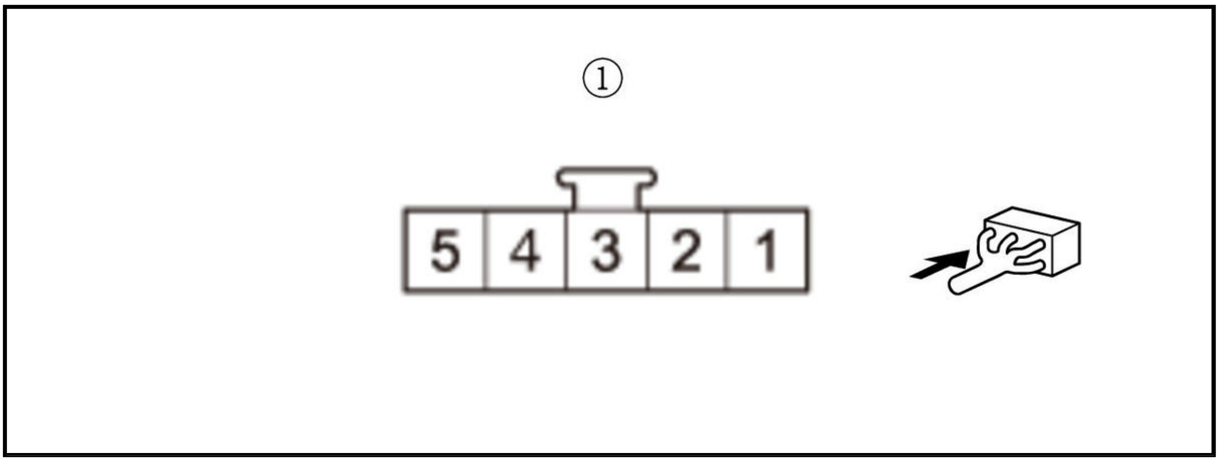
NO

Repair a short to ground in the AMD-P-DR wire.

6. Shorted wire check (AMD-P-DR line to SENS-COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector (without dual zone climate control): disconnected
	Driver's air mix control motor 5P connector (with dual zone climate control): disconnected
Test point 1	Air mix control motor 5P connector (female terminals) No. 1: ①
Test point 2	Air mix control motor 5P connector (female terminals) No. 2: ①



Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

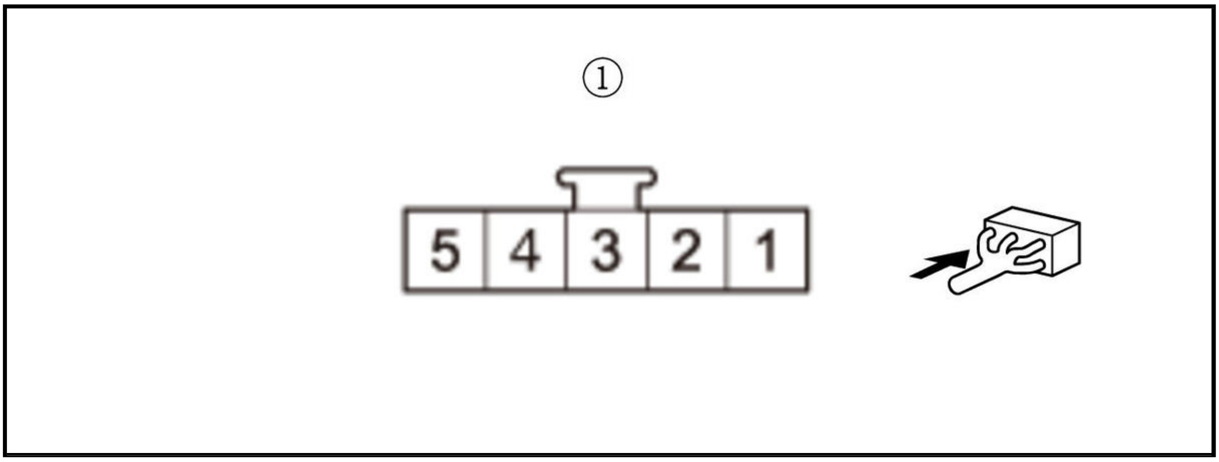
Repair a short in the AMD-P-DR wire to SENS-COM wire.

7. Shorted wire check (AMD-P-DR line to SENS-COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector (without dual zone climate control): disconnected
	Driver's air mix control motor 5P connector (with dual zone climate control): disconnected

Test point 1	Driver's air mix control motor 5P connector (female terminals) No. 1: ①
Test point 2	Driver's air mix control motor 5P connector (female terminals) No. 2: ①



Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short in the AMD-P-DR wire to SENS-COM wire.

8. Open wire check (S5V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Air mix control motor 5P connector (without dual zone climate control): disconnected
	Driver's air mix control motor 5P connector (with dual zone climate control): disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**

Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the S5V wire.

NO

Go to step 9.

9. Shorted wire check (S5V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Air mix control motor 5P connector (without dual zone climate control): disconnected Driver's air mix control motor 5P connector (with dual zone climate control): disconnected
Test point 1	**Climate control unit connector B (24P) No. 1**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short to ground in the S5V wire.

DTC B1235 (B-A3), B1235 (42)

DTC B1235, DTC screen B-A3, or DTC screen 42 : A problem in the air mix control motor circuit, linkage, door, or motor (driver's)

DTC Description	DTC
B1235 A problem in the air mix control motor circuit, linkage, door, or motor (driver's)	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-4. Check for DTCs.

DTC Description	DTC
B1235 A problem in the air mix control motor circuit, linkage, door, or motor (driver's)	Â

Is DTC B1235, Error on the DTC screen B-A3 (climate control panel without display), or DTC screen 42 (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO: Without dual zone climate control

Intermittent failure. Check for loose wires or poor connections on the air mix control motor circuit.

NO: With dual zone climate control

Intermittent failure. Check for loose wires or poor connections on the driver's air mix control motor circuit.

2. Open wire check (M-HOT-DR line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Air mix control motor 5P connector (without dual zone climate control)
Driver's air mix control motor 5P connector (with dual zone climate control)

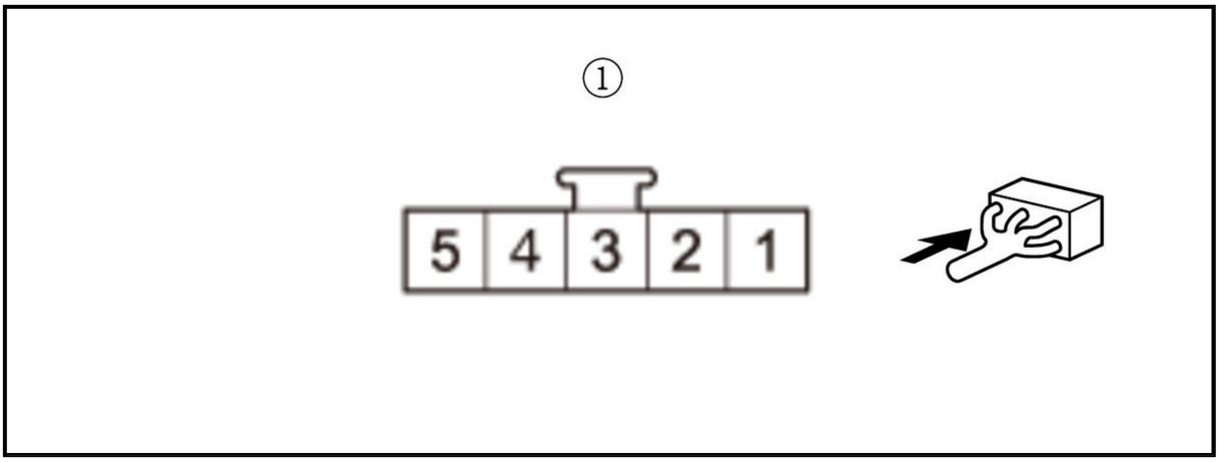
-3. Measure the resistance between test points 1 and 2.

Without dual zone climate control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 13**
Test point 2	Air mix control motor 5P connector (female terminals) No. 5: ①

With dual zone climate control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 13**
Test point 2	Driver's air mix control motor 5P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The M-HOT-DR wire is not open. Go to step 3.

NO

Repair an open in the M-HOT-DR wire.

3. Open wire check (M-COOL-DR line)

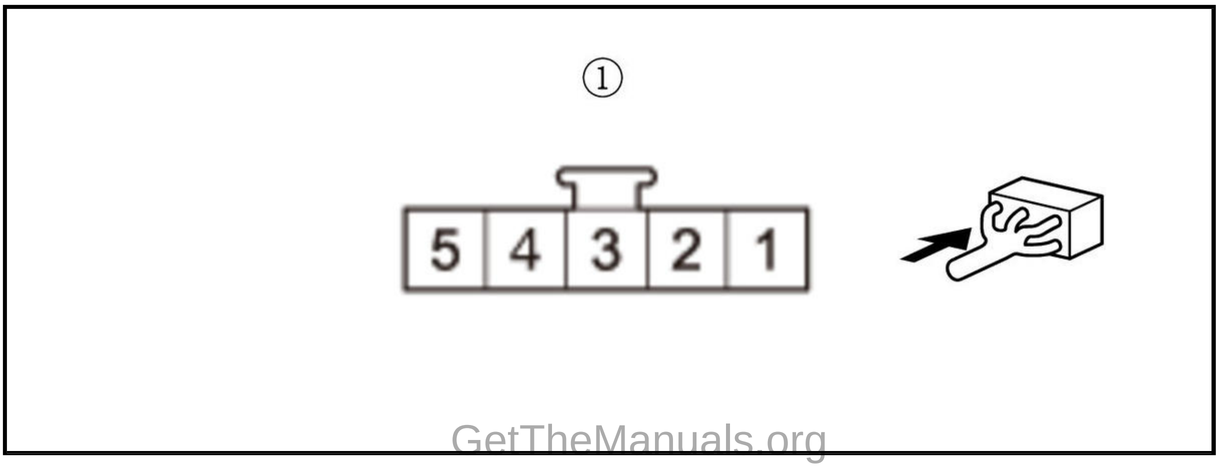
-1. Measure the resistance between test points 1 and 2.

Without dual zone climate control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 14**
Test point 2	Air mix control motor 5P connector (female terminals) No. 4: ①

With dual zone climate control

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Driver's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 14**
Test point 2	Driver's air mix control motor 5P connector (female terminals) No. 5: ①



Is there 1.0 Ω or less?

YES

The M-COOL-DR wire is not open. Go to step 4.

NO

Repair an open in the M-COOL-DR wire.

4. Shorted wire check (M-HOT-DR line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Air mix control motor 5P connector (without dual zone climate control): disconnected Driver's air mix control motor 5P connector (with dual zone climate control): disconnected
Test point 1	**Climate control unit connector B (24P) No. 13**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The M-HOT-DR wire is OK. Go to step 5.

NO

Repair a short to ground in the M-HOT-DR wire.

5. Shorted wire check (M-COOL-DR line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Air mix control motor 5P connector (without dual zone climate control): disconnected Driver's air mix control motor 5P connector (with dual zone climate control) : disconnected
Test point 1	**Climate control unit connector B (24P) No. 14**
Test point 2	Body ground

Is there 1 MΩ or more?

YES: Without dual zone climate control

The M-COOL-DR wire is OK. Go to step 6.

YES: With dual zone climate control

The M-COOL-DR wire is OK. Go to step 7.

NO

Repair a short to ground in the M-COOL-DR wire.

6. Air mix control motor check

-1. **Test the air mix control motor** .

Is the air mix control motor OK?

YES

Replace the climate control unit .

NO

Replace the air mix control motor , or repair the air mix control linkage or door.

7. Driver's air mix control motor check

-1. **Test the driver's air mix control motor** .

Is the driver's air mix control motor OK?

YES

Replace the climate control unit .

NO

Replace the driver's air mix control motor , or repair the driver's air mix control linkage or door.

DTC B1236 (B-A4)

DTC B1236 or DTC screen B-A4 : An open in the passenger's air mix control motor circuit

DTC Description	DTC
B1236 An open in the passenger's air mix control motor circuit	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-4. Check for DTCs.

DTC Description	DTC
B1236 An open in the passenger's air mix control motor circuit	Â

Is DTC B1236 or Error on the DTC screen B-A4 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the passenger's air mix control motor circuit.

2. Determine possible failure area (AMD-P-AS line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

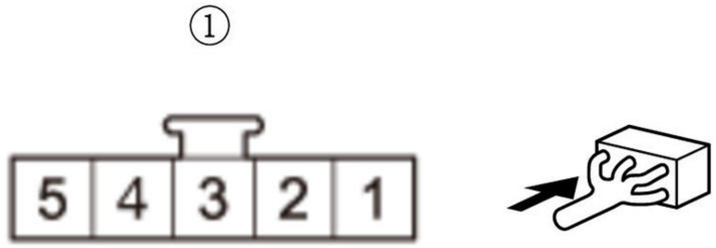
-2. Disconnect the following connector.

Passenger's air mix control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

The AMD-P-AS wire is OK. Go to step 3.

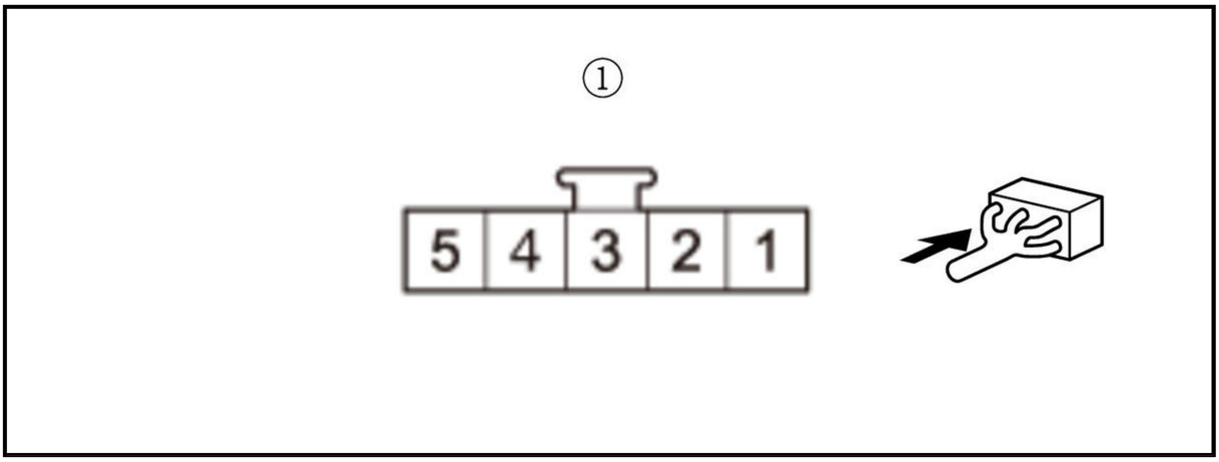
NO

Go to step 5.

3. Determine possible failure area (passenger's air mix control motor, SENS-COM line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 1: ①
Test point 2	Passenger's air mix control motor 5P connector (female terminals) No. 2: ①



Is there about 5 V?

YES

Replace the passenger's air mix control motor .

NO

Go to step 4.

4. Open wire check (SENS-COM line)

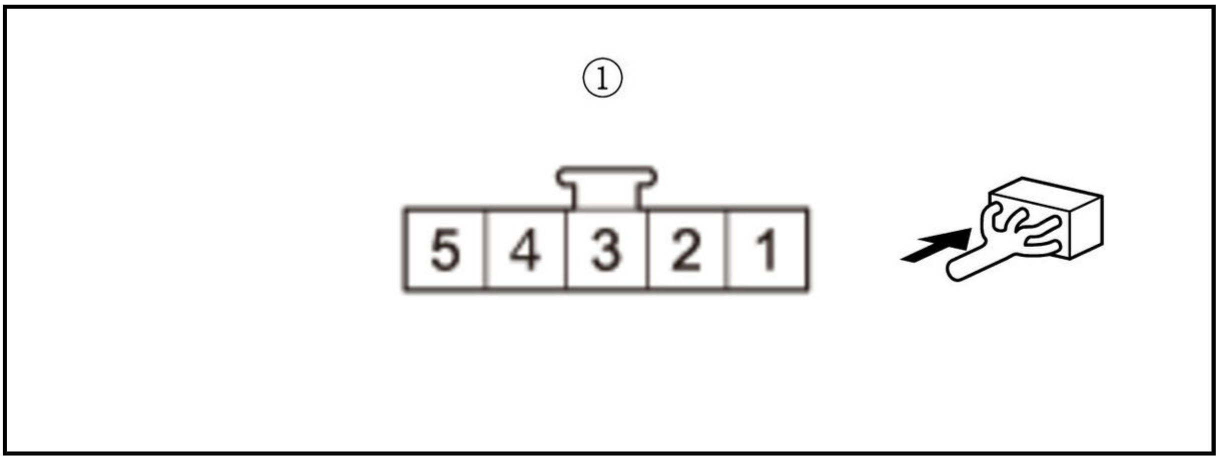
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Passenger's air mix control motor 5P connector: disconnected
Â	Climate control unit connector B (24P): disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 1: ①
Test point 2	**Climate control unit connector B (24P) No. 10**



Is there 1.0 Ω or less?

YES

Replace the climate control unit .

NO

Repair an open in the SENS-COM wire.

5. Open wire check (AMD-P-AS line)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 3**
Test point 2	Body ground

   Is there about 5 V?

   YES

   Repair an open in the AMD-P-AS wire.

   NO

   Replace the climate control unit .

DTC B1237 (B-A5)

DTC B1237 or DTC screen B-A5 : A Short in the Passenger's Air Mix Control Motor Circuit

NOTE: If other short circuit DTCs are indicated at the same time, there may be an open or short to body ground in the power S5V circuit.

DTC Description	DTC
B1237 A short in the passenger's air mix control motor circuit	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

   -4. Check for DTCs.

DTC Description	DTC
B1237 A short in the passenger's air mix control motor circuit	Â

   Is DTC B1237 or Error on the DTC screen B-A5 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the passenger's air mix control motor circuit.

2. Determine possible failure area (S5V line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

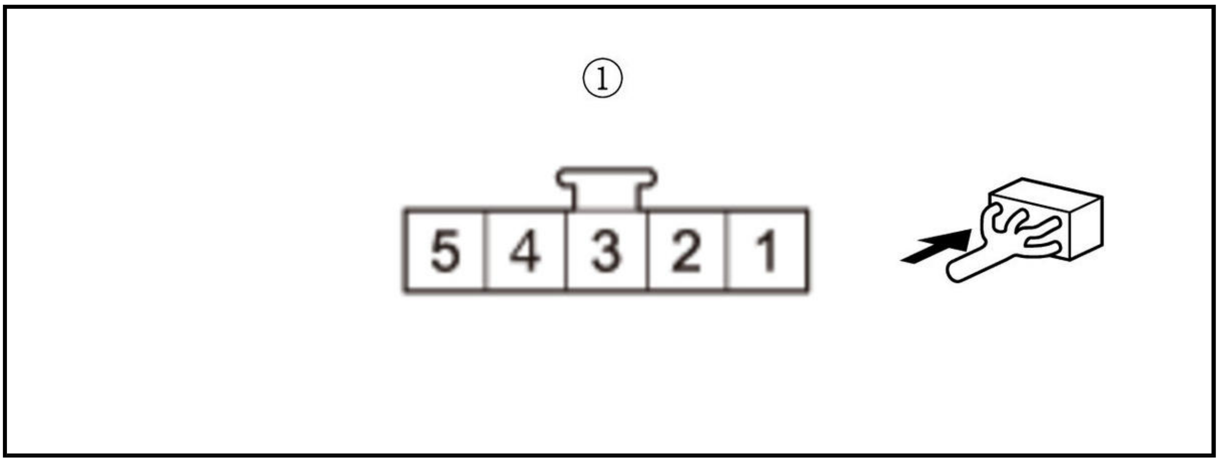
-2. Disconnect the following connector.

Passenger's air mix control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there about 5 V?

YES

The S5V wire is OK. Go to step 3.

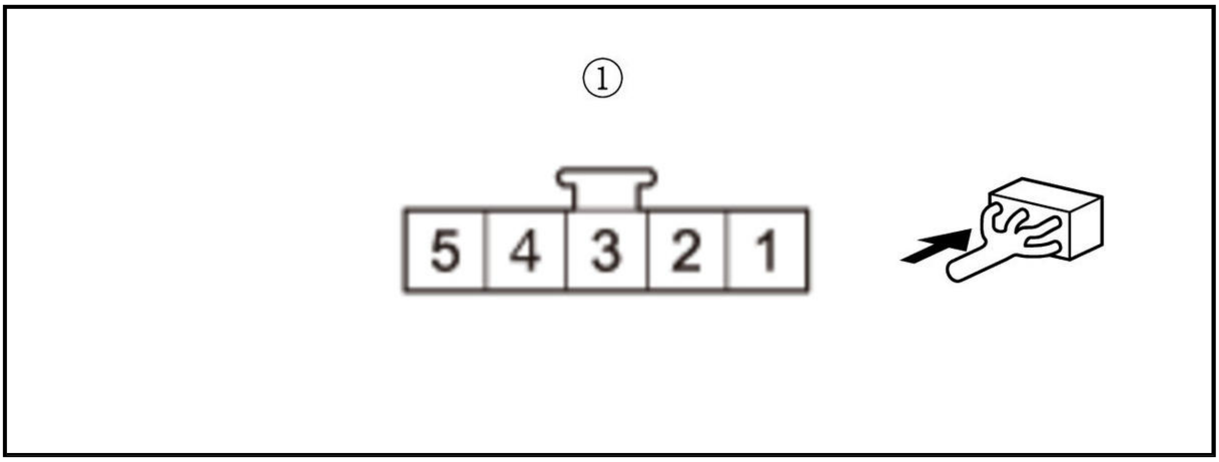
NO

Go to step 6.

3. Determine possible failure area (passenger's air mix control motor, AMD-P-AS line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

Replace the passenger's air mix control motor .

NO

Go to step 4.

4. Shorted wire check (AMD-P-AS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 3**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The AMD-P-AS wire is not shorted to body ground. Go to step 5.

NO

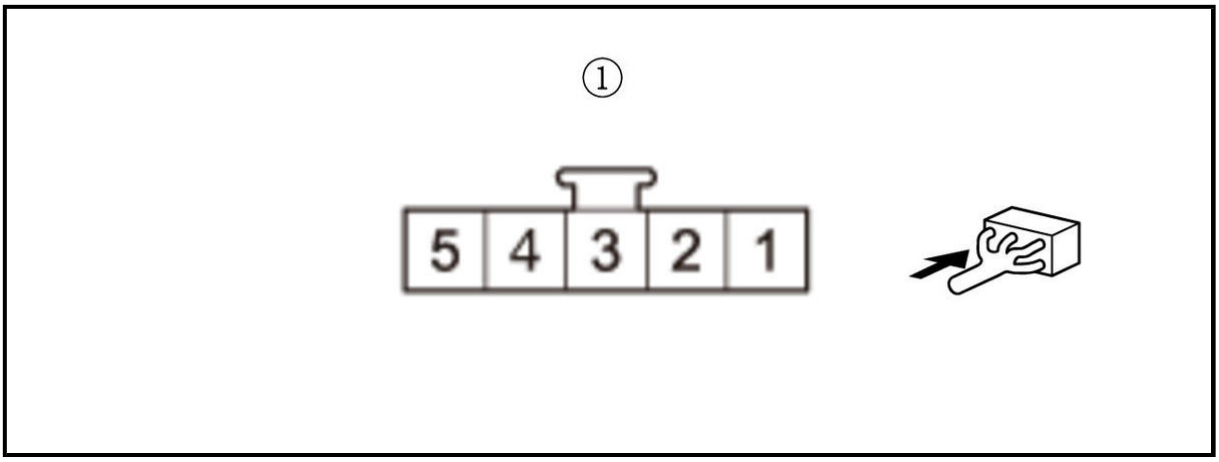
Repair a short to body ground in the AMD-P-AS wire.

5. Shorted wire check (AMD-P-AS line to SENS-COM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	Passenger's air mix control motor 5P connector (female terminals) No. 1: ①

Test point 2	Passenger's air mix control motor 5P connector (female terminals) No. 2: ①



Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short in the AMD-P-AS wire to SENS-COM wire.

6. Open wire check (S5V line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Passenger's air mix control motor 5P connector: disconnected
Test point 1	Climate control unit connector B (24P) No. 1
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the S5V wire.

NO

The S5V wire is not open. Go to step 7.

7. Shorted wire check (S5V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Passenger's air mix control motor 5P connector: disconnected

Test point 1	Climate control unit connector B (24P) No. 1
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Replace the climate control unit .

NO

Repair a short to body ground in the S5V wire.

DTC B1238 (B-A6)

DTC B1238 or DTC screen B-A6 : A problem in the passenger's air mix control motor circuit, linkage, door, or motor

DTC Description	DTC
B1238 A problem in the passenger's air mix control motor circuit, linkage, door, or motor	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

-4. Check for DTCs.

DTC Description	DTC
B1238 A problem in the passenger's air mix control motor circuit, linkage, door, or motor	Â

Is DTC B1238 or Error on the DTC screen B-A6 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the passenger's air mix control motor circuit.

2. Open wire check (M-HOT-AS line)

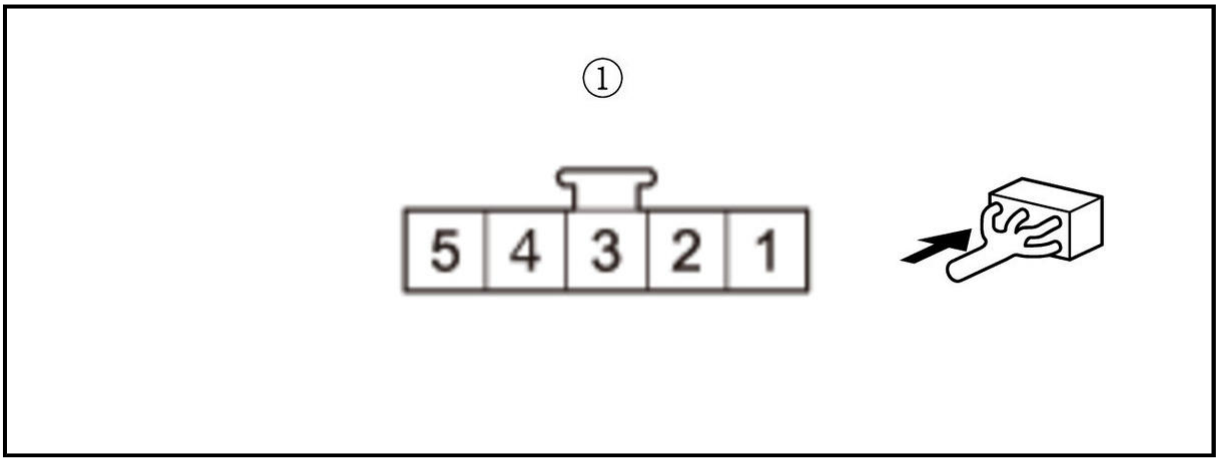
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Passenger's air mix control motor 5P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 15**
Test point 2	Passenger's air mix control motor 5P connector (female terminals) No. 5: ①



Is there 1.0 Ω or less?

YES

The M-HOT-AS wire is not open. Go to step 3.

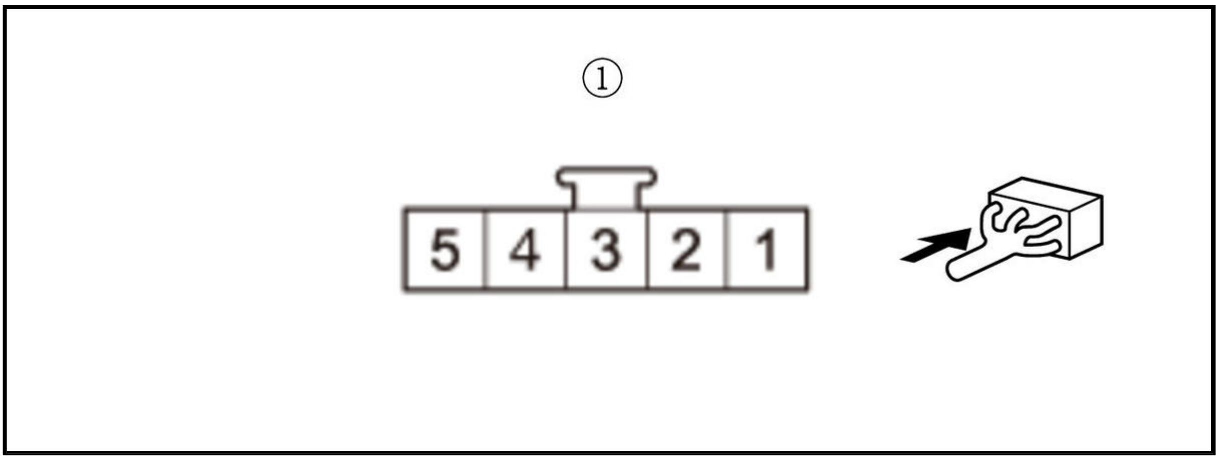
NO

Repair an open in the M-HOT-AS wire.

3. Open wire check (M-COOL-AS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control unit connector B (24P): disconnected Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 16**
Test point 2	Passenger's air mix control motor 5P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The M-COOL-AS wire is not open. Go to step 4.

NO

Repair an open in the M-COOL-AS wire.

4. Shorted wire check (M-HOT-AS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 15**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The M-HOT-AS wire is OK. Go to step 5.

NO

Repair a short to body ground in the M-HOT-AS wire.

5. Shorted wire check (M-COOL-AS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Passenger's air mix control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 16**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The M-COOL-AS wire is OK. Go to step 6.

NO

Repair a short to body ground in the M-COOL-AS wire.

6. Passenger's air mix control motor check

-1. **Test the passenger's air mix control motor check** .

Is the passenger's air mix control motor OK?

YES

Replace the climate control unit .

NO

Replace the passenger's air mix control motor , or repair the passenger's air mix control linkage or door.

DTC B123F (A-A3), B123F (17)

DTC B123F, DTC screen A-A3, or DTC screen 17 : Automatic lighting control unit/sunlight sensor error

NOTE: Check for DTCs. If a DTC U1280, Error on the DTC screen I-A1 *1, or DTC screen 80 *2 indicated, troubleshoot this DTC first.

*1: Climate control panel without display

*2: Climate control panel with display

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

   -4. Check for DTCs.

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	Â

   Is DTC B123F, Error on the DTC screen A-A3 (climate control panel without display), or DTC screen 17 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Equipment check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Confirm the vehicle have an automatic wiper system.

   Does the wiper/washer switch have an AUTO position?

   YES

   Go to step 3.

   NO

   Go to step 8.

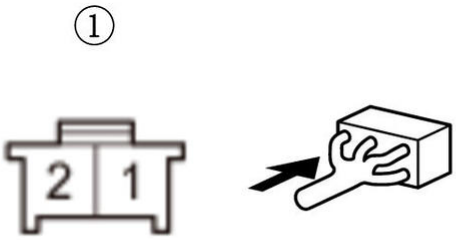
3. Open wire check (TSUN line)

-1. Disconnect the following connectors.

Climate control unit connector A (32P)
Sunlight sensor 2P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 10**
Test point 2	Sunlight sensor 2P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The TSUN wire is not open. Go to step 4.

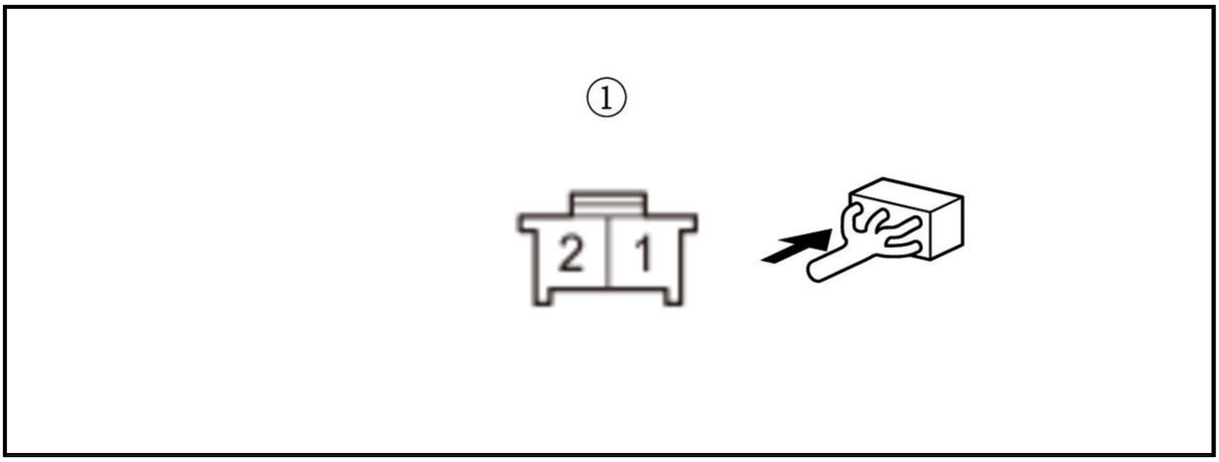
NO

Repair an open in the TSUN wire.

4. Open wire check (SENSOR_COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 12**
Test point 2	Sunlight sensor 2P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The SENSOR_COM wire is OK. Go to step 5.

NO

Repair an open in the SENSOR_COM wire.

5. Shorted wire check (TSUN line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	Climate control unit connector A (32P) No. 10
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The TSUN wire is not shorted. Go to step 6.

NO

Repair a short to body ground in the TSUN wire.

6. Shorted wire check (TSUN line to SENSOR_COM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Sunlight sensor 2P connector: disconnected
Test point 1	Climate control unit connector A (32P) No. 10
Test point 2	Climate control unit connector A (32P) No. 12

Is there 1 MΩ or more?

YES

The TSUN wire and the SENSOR_COM wire are OK. Go to step 7.

NO

Repair a short in the TSUN wire to the SENSOR_COM wire.

7. Sunlight sensor check

-1. Reconnect the following connectors.

Climate control unit connector A (32P)
Sunlight sensor 2P connector

-2. **Test the sunlight sensor** .

Is the sunlight sensor OK?

YES

Replace the climate control unit .

NO

Replace the sunlight sensor .

8. Fuse check:**NOTE:** Check for DTCs. If a DTC U1280, Error on the DTC screen I-A1 *1, or DTC indicator 80 *2 indicated, troubleshoot the DTC first.-1.

Check the following fuse.

Fuse	**No. A18**

Is the fuse OK?

YES

Go to step 9.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. A18 fuse circuit.

9. Determine possible failure area (B-CAN lines, others)

-1. Disconnect the following connector.

Automatic lighting control unit-sensor 5P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 3**
Test point 2	**Automatic lighting control unit-sensor 5P connector No. 4**

Is there battery voltage?

YES

Go to step 10.

NO

Go to step 13.

10. Open wire check (B-CAN_H line)

-1. Disconnect the following connector.

Climate control unit connector A (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
	Climate control unit connector A (32P): disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 1**
Test point 2	**Climate control unit connector A (32P) No. 25**

Is there 1.0 Ω or less?

YES

The B-CAN_H wire is OK. Go to step 11.

NO

Repair an open in the B-CAN_H wire.

11. Open wire check (B-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
	Climate control unit connector A (32P): disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 2**
Test point 2	**Climate control unit connector A (32P) No. 8**

Is there 1.0 Ω or less?

YES

The B-CAN_L wire is OK. Go to step 12.

NO

Repair an open in the B-CAN_L wire.

12. DTC check

-1. Reconnect the following connectors.

Automatic lighting control unit-sensor 5P connector
Climate control unit connector A (32P)

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-4. Wait for at least 8 seconds.

-5. Do the Self-Diagnostic Function with the climate control unit.

-6. Check for DTCs.

DTC Description	DTC
B123F Automatic lighting control unit/sunlight sensor error	Â
U128D Climate Control Unit Lost communication with gauge control module	Â

Are DTC B123F, Error on the DTC screen A-A3 *1, or DTC screen 17 *2 and DTC U128D, Error on the DTC screen I-A2 *1, or DTC screen 83 *2 indicated?

YES

Replace the climate control unit .

NO

Replace the automatic lighting control unit-sensor .

13. Open wire check (+B_BACK_UP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Automatic lighting control unit-sensor 5P connector: disconnected
Test point 1	**Automatic lighting control unit-sensor 5P connector No. 4**
Test point 2	Body ground

Is there battery voltage?

YES

Check for an open in the GND wire between the automatic lighting control unit-sensor and body ground. If the wire is OK, check for poor ground at G402.

NO

Repair an open in the +B_BACK_UP wire.

DTC B1240 (B-B3), B1240 (4B)

DTC B1240, DTC screen B-B3, or DTC screen 4b : A problem in the mode control motor circuit, linkage, door, or motor

DTC Description	DTC
B1240 A problem in the mode control motor circuit, linkage, door, or motor	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

-4. Check for DTCs.

DTC Description	DTC
B1240 A problem in the mode control motor circuit, linkage, door, or motor	Â

Is DTC B1240, Error on the DTC screen B-B3 (climate control panel without display), or DTC screen 4b (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the mode control motor circuit.

2. Open wire check (M-DEF line)

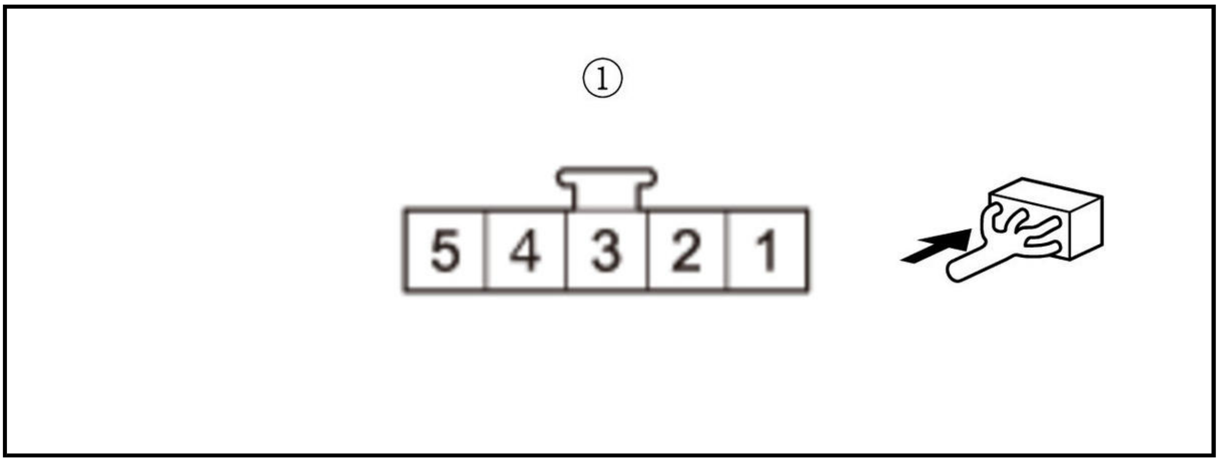
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Mode control motor 5P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 20**
Test point 2	Mode control motor 5P connector (female terminals) No. 5: ①



Is there 1.0 Ω or less?

YES

The M-DEF wire is not open. Go to step 3.

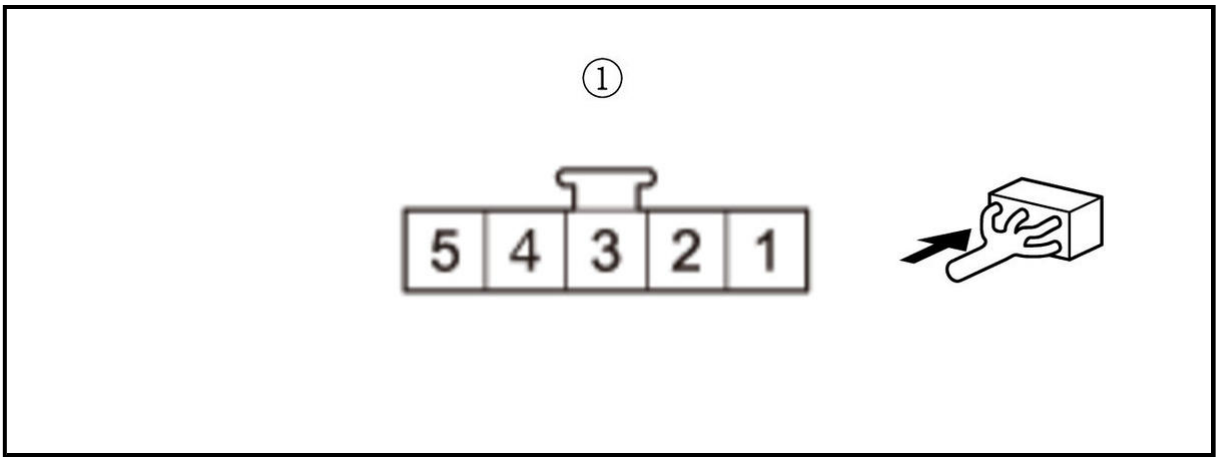
NO

Repair an open in the M-DEF wire.

3. Open wire check (M-VENT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 19**
Test point 2	Mode control motor 5P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The M-VENT wire is not open. Go to step 4.

NO

Repair an open in the M-VENT wire.

4. Shorted wire check (M-DEF line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 20**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The M-DEF wire is OK. Go to step 5.

NO

Repair a short to body ground in the M-DEF wire.

5. Shorted wire check (M-VENT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	Climate control unit connector B (24P): disconnected
	Mode control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 19**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The M-VENT wire is OK. Go to step 6.

NO

Repair a short to body ground in the M-VENT wire.

6. Mode control motor check

-1. **Test the mode control motor** .

Is the mode control motor OK?

YES

Replace the climate control unit .

NO

Replace the mode control motor , or repair the mode control linkage or door.

DTC B1241 (D-A1), B1241 (59)

DTC B1241, DTC screen D-A1, or DTC screen 59 : A problem in the blower motor circuit

DTC Description	DTC
B1241 A problem in the blower motor circuit	Â

DTC (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-4. Check for DTCs.

DTC Description	DTC
B1241 A problem in the blower motor circuit	Â

Is DTC B1241, Error on the DTC screen D-A1 (climate control panel without display), or DTC screen 59 (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the blower motor circuit.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A3-1**

Is the fuse OK?

YES

Go to step 3.

NO

Replace the fuse, and recheck. If fuse blows again, repair a short in the No. A3-1 fuse circuit.

3. Blower motor power circuit check

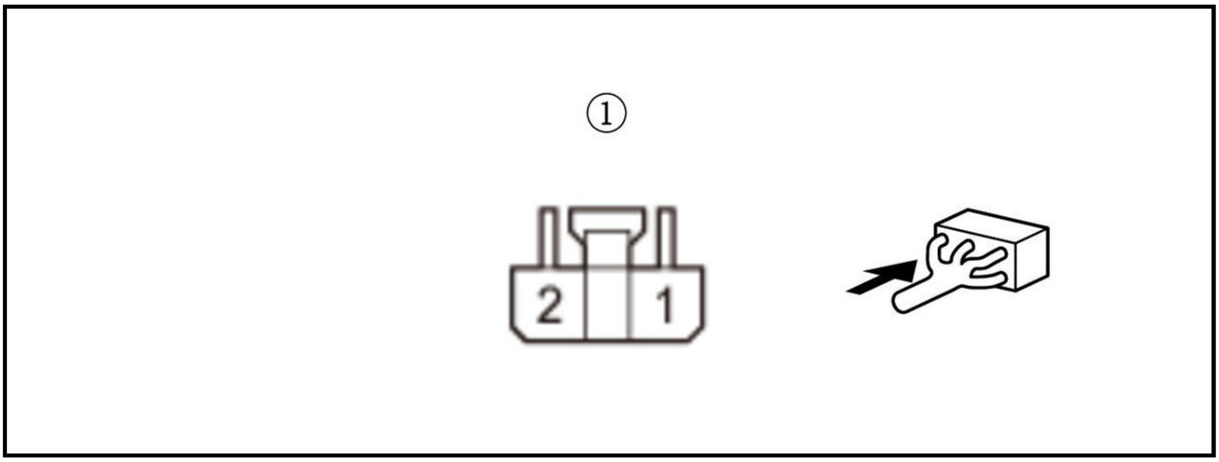
-1. Disconnect the following connector.

Blower motor 2P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Blower motor 2P connector: disconnected
Test point 1	Blower motor 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 12.

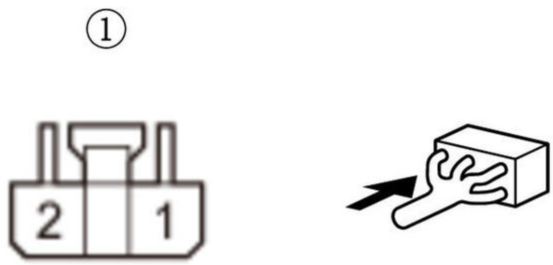
4. Blower motor operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reconnect the blower motor 2P connector.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Blower motor 2P connector (female terminals) No. 1: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

Does the blower motor run at high speed?

YES

Go to step 5.

NO

Replace the blower motor .

5. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

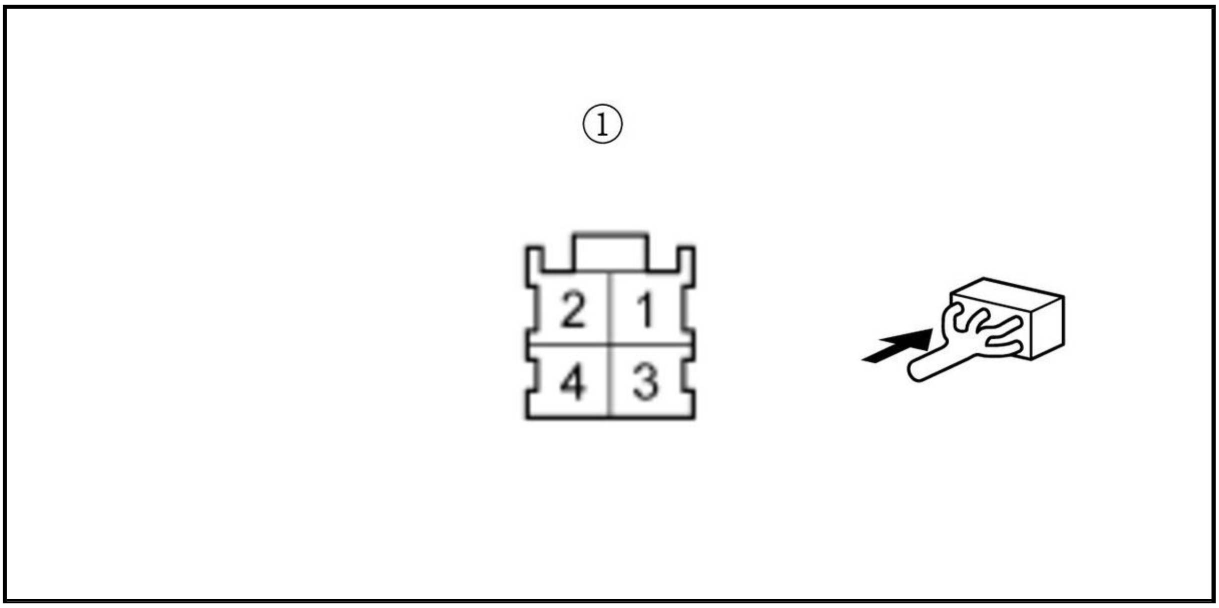
-2. Remove the jumper wire from the blower motor 2P connector.

-3. Disconnect the following connector.

Power transistor 4P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power transistor 4P connector: disconnected
Test point 1	Power transistor 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 6.

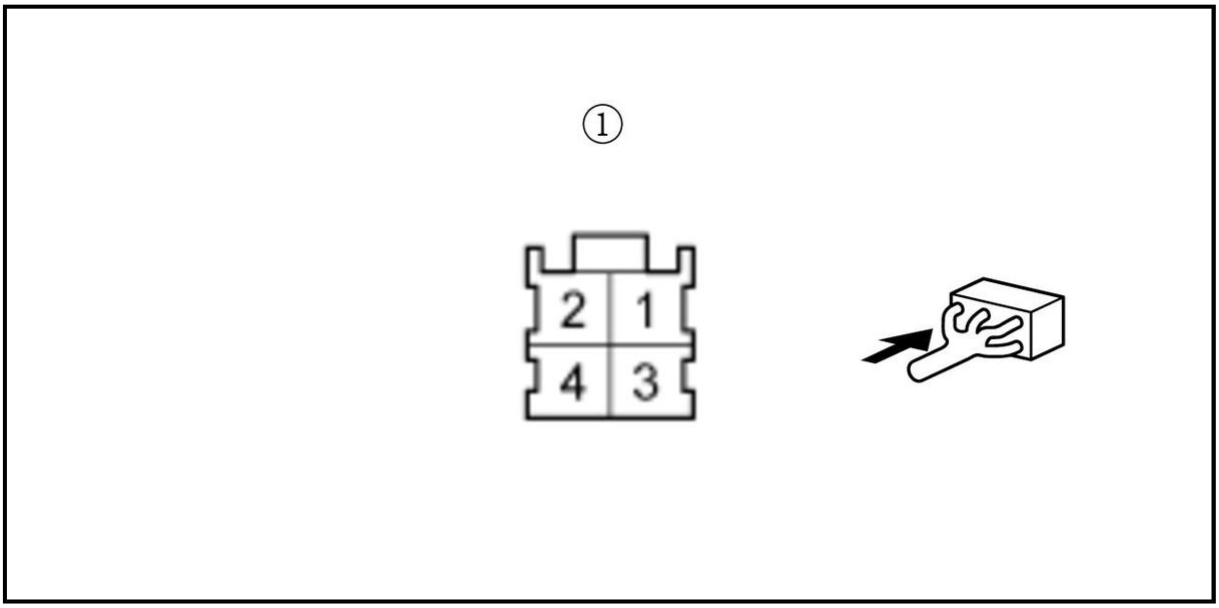
NO

Check for an open in the GND wire. If the wire is OK, check for poor ground at G251.

6. Open wire check (BLW-M line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Power transistor 4P connector (female terminals) No. 1: ①
Terminal B	Power transistor 4P connector (female terminals) No. 2: ①



-2. Turn the vehicle to the ON mode.

Does the blower motor run at high speed?

YES

The BLW-M wire is OK. Go to step 7.

NO

Repair an open in the BLW-M wire.

7. Shorted wire check (BLW-V line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire from the power transistor 4P connector.

-3. Disconnect the following connector.

Climate control unit connector B (24P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Power transistor 4P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 12**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The BLW-V wire is not shorted. Go to step 8.

NO

Repair a short to body ground in the BLW-V wire.

8. Shorted wire check (BLW-G line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Power transistor 4P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 11**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The BLW-G wire is not shorted. Go to step 9.

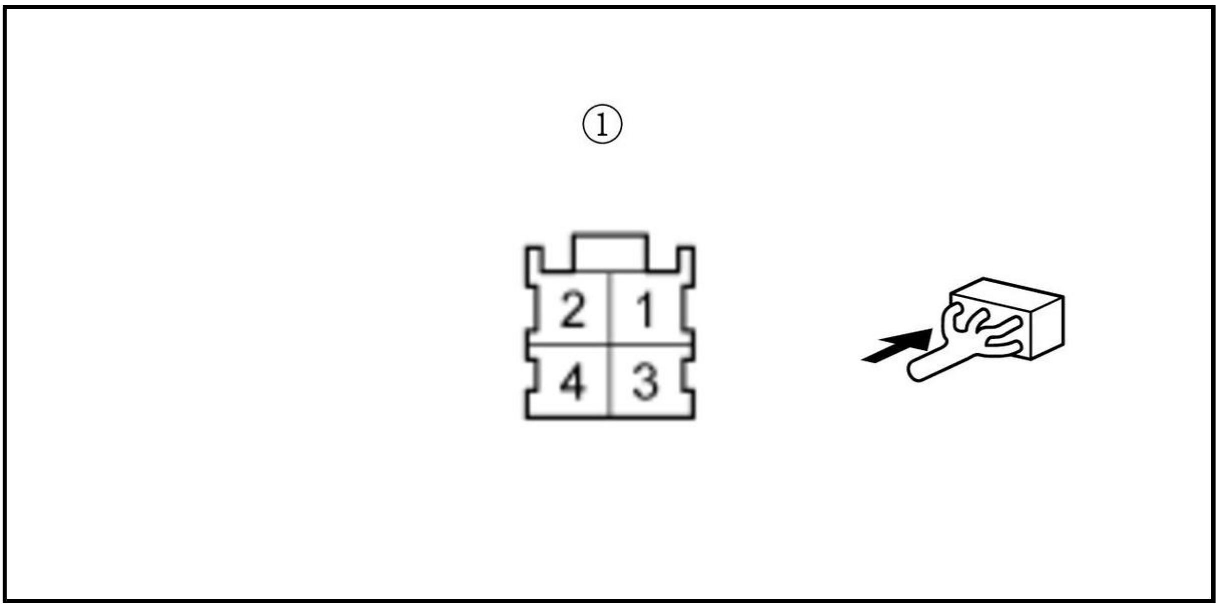
NO

Repair a short to body ground in the BLW-G wire.

9. Open wire check (BLW-V line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Power transistor 4P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 12**
Test point 2	Power transistor 4P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The BLW-V wire is OK. Go to step 10.

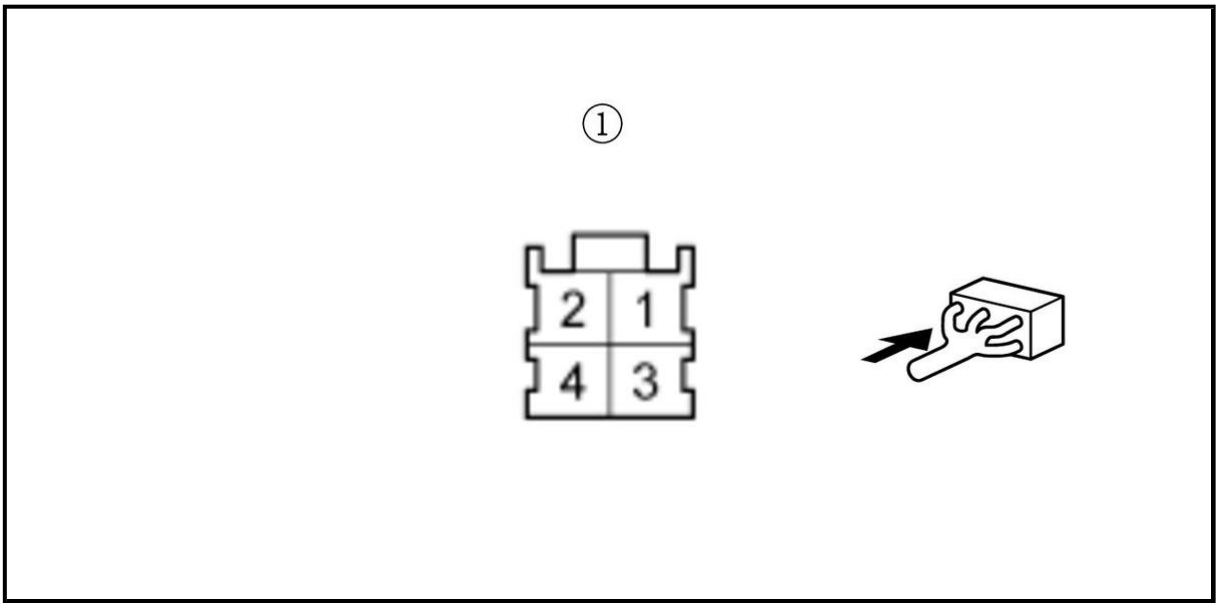
NO

Repair an open in the BLW-V wire.

10. Open wire check (BLW-G line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Power transistor 4P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 11**
Test point 2	Power transistor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The BLW-G wire is OK. Go to step 11.

NO

Repair an open in the BLW-G wire.

11. Power transistor check

    -1. **Test the power transistor** .

    Is the power transistor OK?

    YES

    Replace the climate control unit .

    NO

    Replace the power transistor .

    NOTE: If the power transistor is faulty, check the blower motor for damage. If necessary, **replace the blower motor** .

12. Front blower motor relay check

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Remove the front blower motor relay from the under-hood fuse/relay box, and **test it** .

    Is the relay OK?

    YES

    Go to step 13.

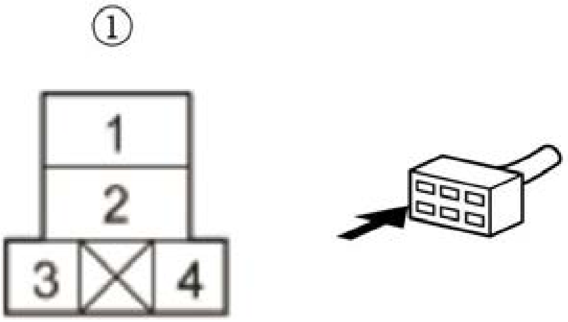
    NO

    Replace the front blower motor relay.

13. Open wire check (+B_HTR_MTR line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front blower motor relay: disconnected
Test point 1	Front blower motor relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_HTR_MTR wire is OK. Go to step 14.

NO

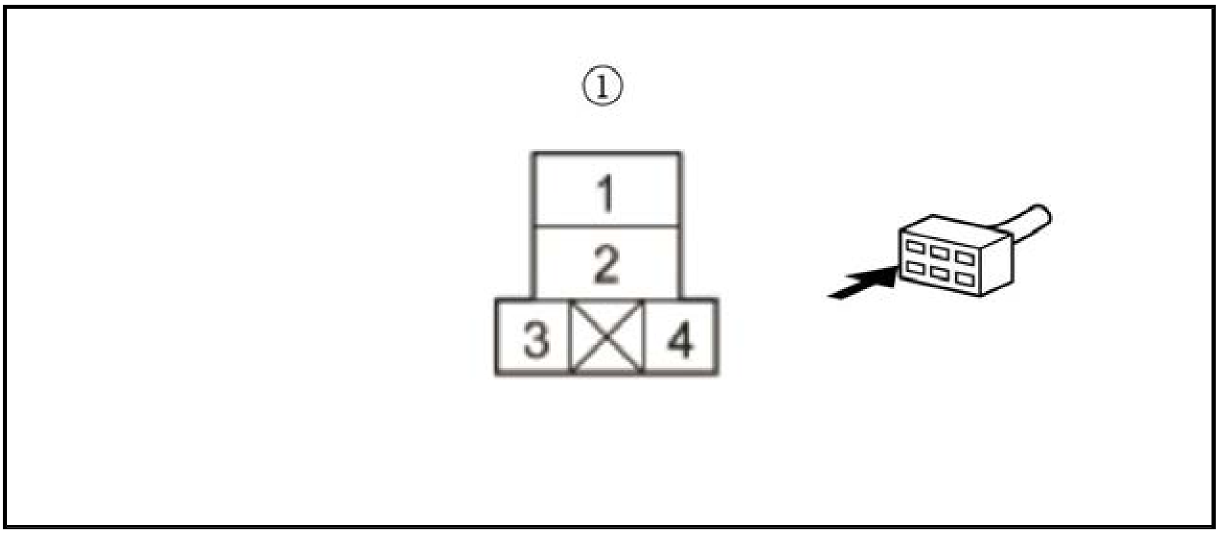
Replace the under-hood fuse/relay box .

14. Open wire check (IG2_A/C line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Front blower motor relay: disconnected
Test point 1	Front blower motor relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG2_A/C wire is OK. Go to step 15.

NO

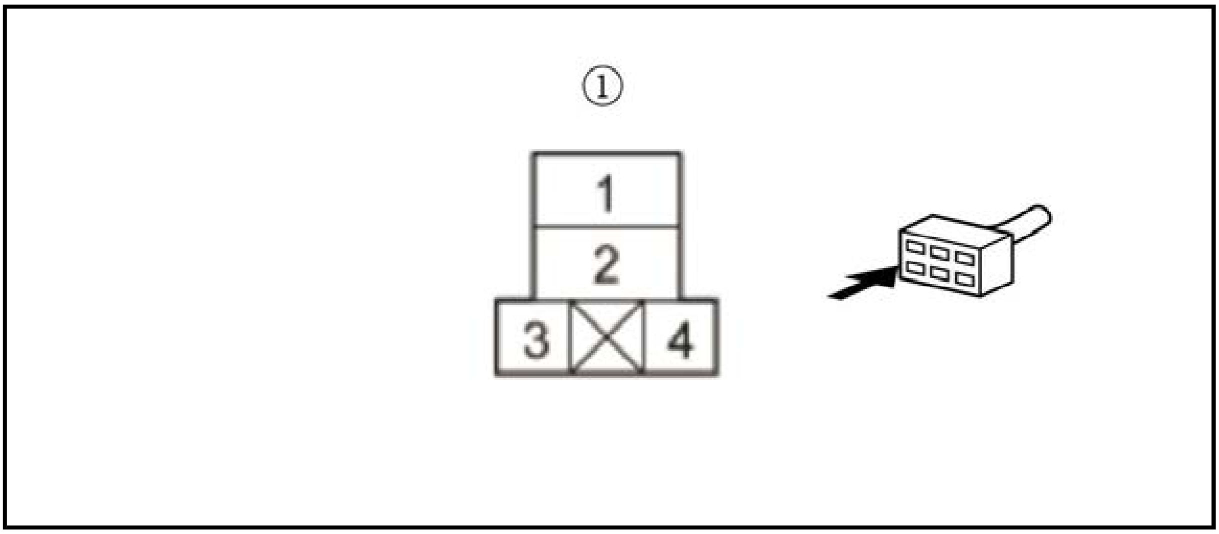
Repair an open in the IG2_A/C wire.

15. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front blower motor relay: disconnected
Test point 1	Front blower motor relay 4P socket (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

Repair an open in the BLOWER MTR/BLW-RLY(OUT) wire between the front blower motor relay and the blower motor.

NO

Check for an open in the GND wire. If the wire is OK, check for poor ground at G351.

DTC B2964 (I-B5), B2964 (93)

DTC B2964, DTC screen I-B5, or DTC screen 93 : Climate control unit lost communication with Front PANEL (Climate Control Panel)

DTC Description	DTC
B2964 Climate control unit lost communication with Front PANEL	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

   -4. Check for DTCs.

DTC Description	DTC
B2964 Climate control unit lost communication with Front PANEL	Â

   Is DTC B2964, Error on the DTC screen I-B5 (climate control panel without display), or DTC screen 93 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the climate control panel circuit.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. D9

   Is the fuse OK?

   YES

   Go to step 3.

   NO

   Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. D9 fuse circuit.

3. Determine possible failure area (BUS-DATA line, IG2_A/C line)

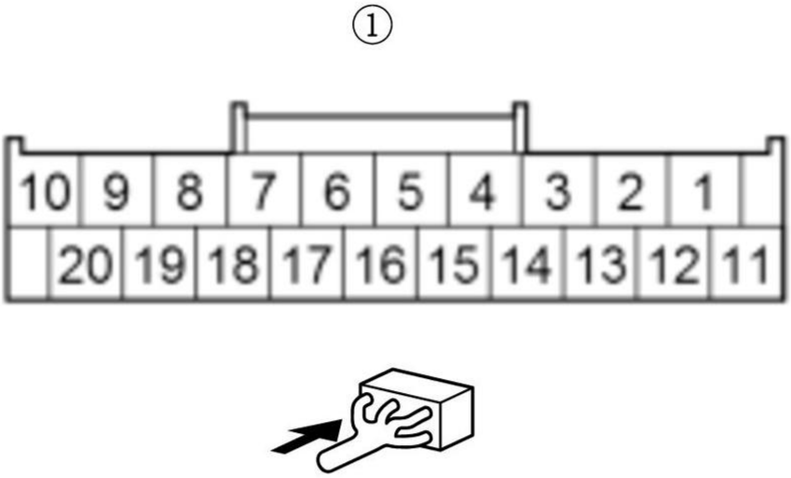
   -1. Disconnect the following connector.

Climate control panel 20P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control panel 20P connector: disconnected
Test point 1	Climate control panel 20P connector (female terminals) No. 13: ①
Test point 2	Climate control panel 20P connector (female terminals) No. 19: ①



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 7.

4. Shorted wire check (BUS-DATA line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Climate control panel 20P connector: disconnected

Test point 1	**Climate control unit connector A (32P) No. 29**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The BUS-DATA wire is not shorted. Go to step 5.

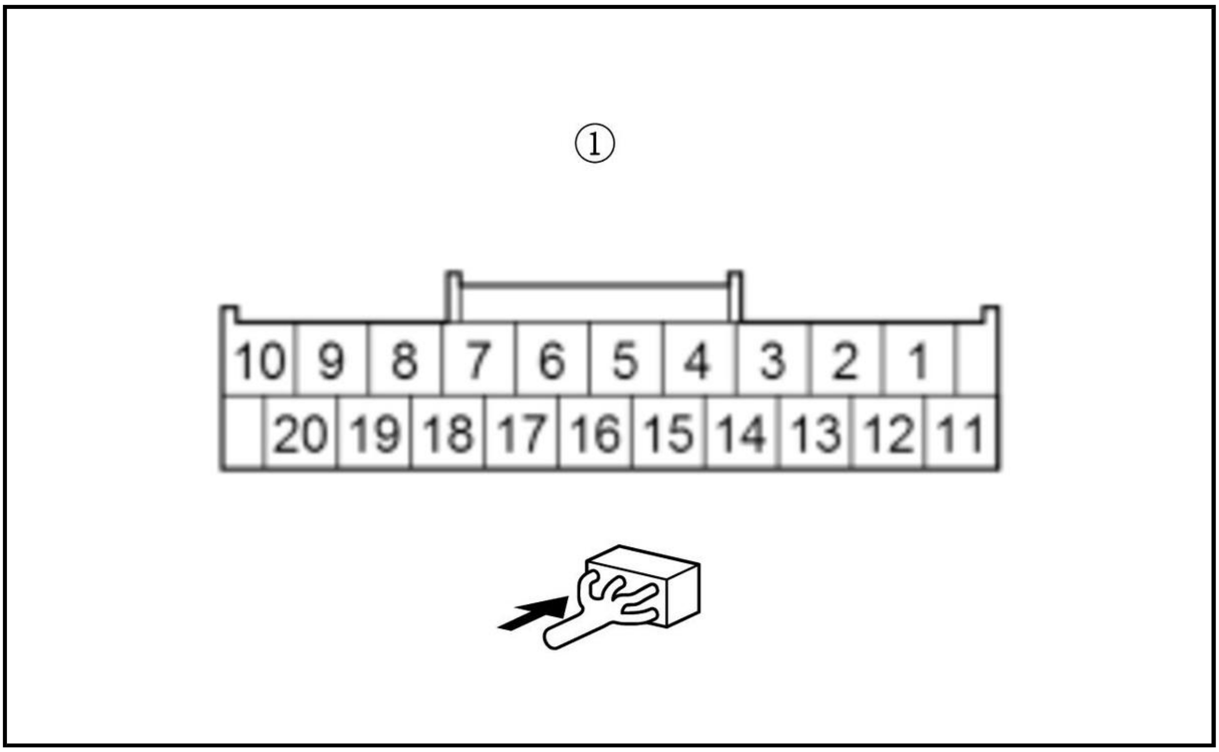
NO

Repair a short to body ground in the BUS-DATA wire.

5. Open wire check (BUS-DATA line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Climate control panel 20P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 29**
Test point 2	Climate control panel 20P connector (female terminals) No. 18: ①



Is there 1.0 Ω or less?

YES

The BUS-DATA wire is OK. Go to step 6.

NO

Repair an open in the BUS-DATA wire.

6. Climate control panel check (substitution)

-1. Reconnect the following connector.

Climate control unit connector A (32P)

-2. **Substitute a known-good climate control panel** .

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-5. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-6. Check for DTCs.

DTC Description	DTC
B2964 Climate control unit lost communication with Front PANEL	Â

Is DTC B2964 or Error on the DTC screen I-B5 indicated?

YES

Replace the climate control unit .

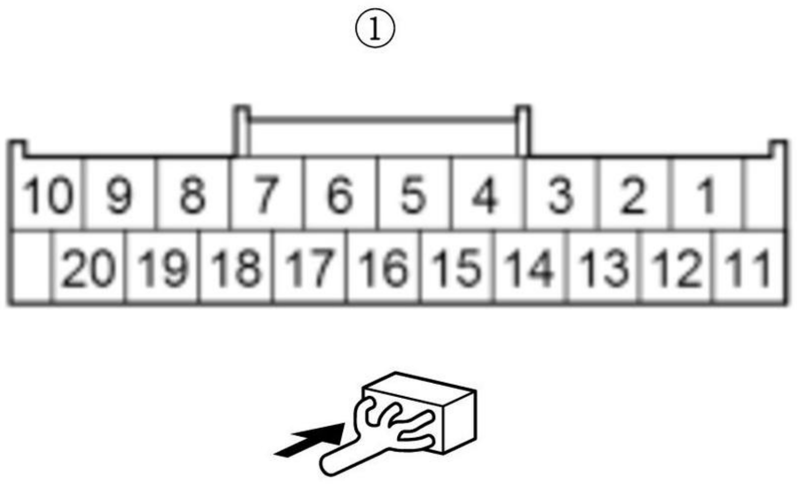
NO

Replace the original climate control panel .

7. Open wire check (IG2_A/C line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Climate control panel 20P connector: disconnected
Test point 1	Climate control panel 20P connector (female terminals) No. 19: ①
Test point 2	Body ground



Is there battery voltage?

YES

Check for an open in the GND wire. If the wire is OK, check for poor ground at G402.

NO

Repair an open in the IG2_A/C wire.

DTC B296E (D-A3), B296E (69)

DTC B296E, DTC screen D-A3, or DTC screen 69 : Electric heater coolant Pump Fail

DTC Description	DTC
B296E Electric heater coolant Pump Fail	Â

DTC (AC)

1. Problem verification 1

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -3. Display audio type: Set the A/C icon and the fan control icon or the fan control button to ON.

   Color audio type: Set the A/C button and the fan control button to ON.

   -4. Wait for at least 30 seconds.

   -5. Do the Self-Diagnostic Function with the HDS or the climate control unit.

   -6. Check for the climate control unit DTCs.

DTC Description	DTC
B296E Electric heater coolant Pump Fail	Â

   Is DTC B296E, Error on the DTC screen D-A3 (climate control panel without display), or DTC screen 69 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time.

2. Problem verification 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Bleed air from engine coolant .

   -3. Clear the DTCs with the HDS.

   -4. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

   -5. Display audio type: Set the A/C icon and the fan control icon or the fan control button to ON.

   Color audio type: Set the A/C button and the fan control button to ON.

-6. Wait for at least 30 seconds.

-7. Do the Self-Diagnostic Function with the HDS or the climate control unit.

-8. Check for the climate control unit DTCs.

DTC Description	DTC
B296E Electric heater coolant Pump Fail	Â

Is DTC B296E, Error on the DTC screen D-A3 (climate control panel without display), or DTC screen 69 (climate control panel with display) indicated?

YES

Replace the electric heater coolant pump , and recheck. If the DTC detected, replace the climate control unit .

NO

A DTC is stored due to air trapping, the system is OK at this time.

DTC B2983 (B-B6), B2983 (57)

DTC B2983, DTC screen B-B6, or DTC screen 57 : A problem in the recirculation control motor circuit, linkage, door, or motor

DTC Description	DTC
B2983 A problem in the recirculation control motor circuit, linkage, door, or motor	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the HDS or the climate control unit.

-4. Check for DTCs.

DTC Description	DTC
B2983 A problem in the recirculation control motor circuit, linkage, door, or motor	Â

Is DTC B2983, Error on the DTC screen B-B6 (climate control panel without display), or DTC screen 57 (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the recirculation control motor circuit.

2. Open wire check (M-REC line)

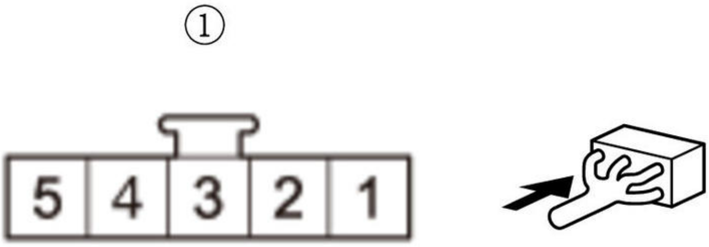
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Climate control unit connector B (24P)
Recirculation control motor 5P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 17**
Test point 2	Recirculation control motor 5P connector (female terminals) No. 5: ①



Is there 1.0 Ω or less?

YES

The M-REC wire is not open. Go to step 3.

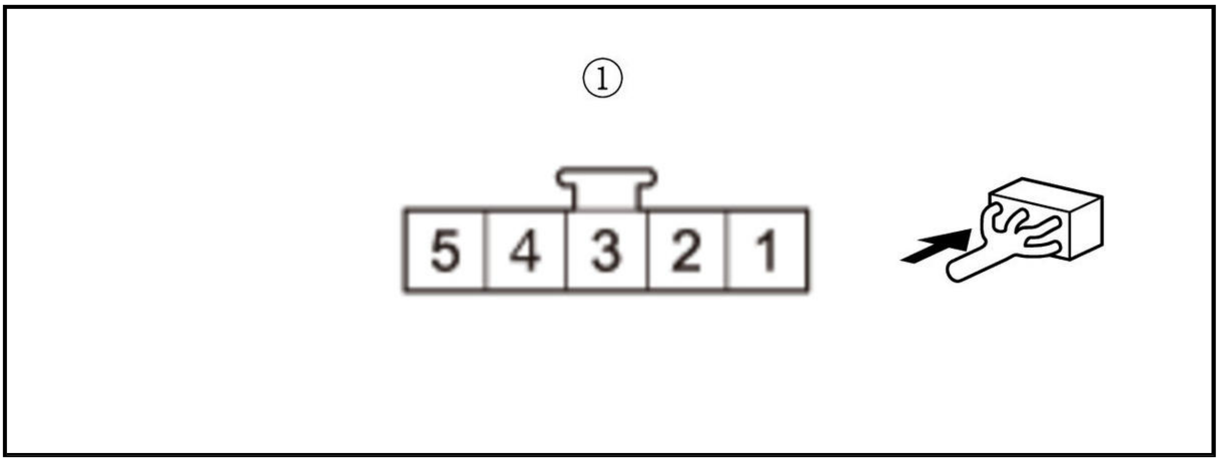
NO

Repair an open in the M-REC wire.

3. Open wire check (M-FRS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 18**
Test point 2	Recirculation control motor 5P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The M-FRS wire is not open. Go to step 4.

NO

Repair an open in the M-FRS wire.

4. Shorted wire check (M-REC line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 17**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The M-REC wire is OK. Go to step 5.

NO

Repair a short to body ground in the M-REC wire.

5. Shorted wire check (M-FRS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector B (24P): disconnected
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (24P) No. 18**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The M-FRS wire is OK. Go to step 6.

NO

Repair a short to body ground in the M-FRS wire.

6. Recirculation control motor check

-1. **Test the recirculation control motor** .

Is the recirculation control motor OK?

YES

Replace the climate control unit .

NO

Replace the recirculation control motor , or repair the recirculation control linkage or door.

DTC B2986 (B-B4), B2986 (55)

DTC B2986, DTC screen B-B4, or DTC screen 55 : An open in the recirculation control motor circuit

DTC Description	DTC
B2986 An open in the recirculation control motor circuit	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-4. Check for DTCs.

DTC Description	DTC
B2986 An open in the recirculation control motor circuit	Â

Is DTC B2986, Error on the DTC screen B-B4 (climate control panel without display), or DTC screen 55 (climate control panel with display) indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure. Check for loose wires or poor connections on the recirculation control motor circuit.

2. Determine possible failure area (RFD-P line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

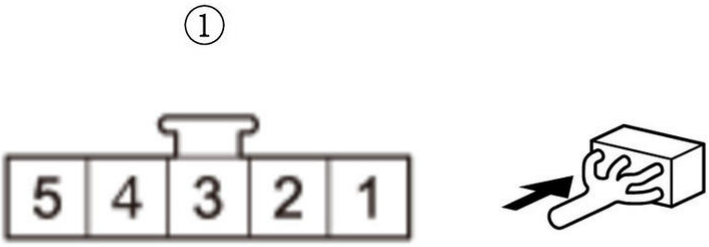
-2. Disconnect the following connector.

Recirculation control motor 5P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there about 5 V?

YES

The RFD-P wire is OK. Go to step 3.

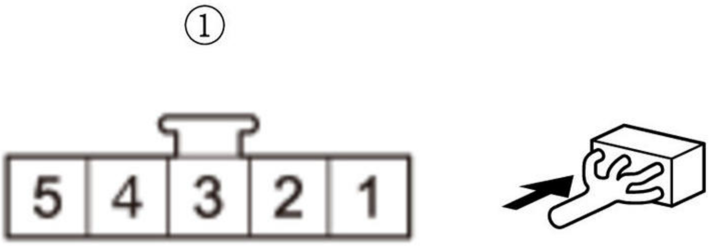
NO

Go to step 5.

3. Determine possible failure area (recirculation control motor, SENS-COM line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 1: ①
Test point 2	Recirculation control motor 5P connector (female terminals) No. 2: ①



Is there about 5 V?

YES

Replace the recirculation control motor .

NO

Go to step 4.

4. Open wire check (SENS-COM line)

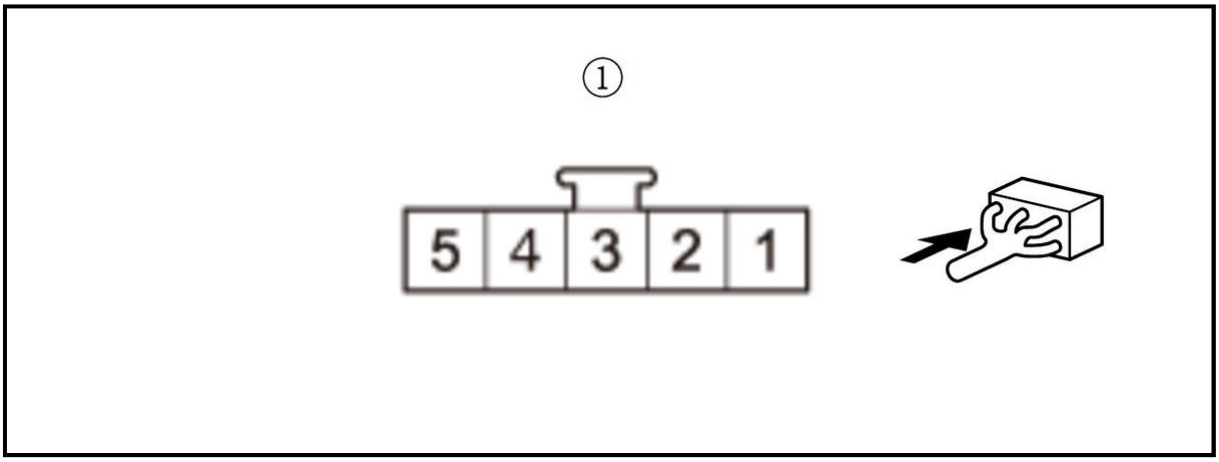
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Climate control unit connector B (24P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Recirculation control motor 5P connector: disconnected
Â	Climate control unit connector B (24P): disconnected
Test point 1	Recirculation control motor 5P connector (female terminals) No. 1: ①
Test point 2	**Climate control unit connector B (24P) No. 10**



Is there 1.0 Ω or less?

YES

Replace the climate control unit .

NO

Repair an open in the SENS-COM wire.

5. Open wire check (RFD-P line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Recirculation control motor 5P connector: disconnected
Test point 1	**Climate control unit connector B (12P) No. 4**
Test point 2	Body ground

Is there about 5 V?

YES

Repair an open in the RFD-P wire.

NO

Replace the climate control unit .

DTC B2990 (D-B6), B2990 (C3)

DTC B2990, DTC screen D-B6, or DTC screen C3 : A problem in the A/C compressor driving circuit (A Problem in the Electric A/C Compressor Driving Circuit)

DTC Description	DTC
B2990 A problem in the A/C compressor driving circuit	Â

DTC (AC)

1. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode and then the READY TO DRIVE mode.

   -3. Without dual zone climate control: Set the A/C button and the temperature control dial to MAX COOL.

   With dual zone climate control: Set the A/C icon and the driver's and the passenger's temperature control dial to MAX COOL.

   -4. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

   -5. Check for DTCs.

DTC Description	DTC
B2990 A problem in the A/C compressor driving circuit	Â

   Is DTC B2990, Error on the DTC screen D-B6 (climate control panel without display), or DTC screen C3 (climate control panel with display) indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure. Check for loose wires or poor connections on the electric A/C compressor circuit.

2. Determine possible failure area (electric A/C compressor driver, others)

   -1. Check for DTCs.

DTC Description	DTC
B2998 A problem in the A/C compressor driver	Â

   Is DTC B2998, Error on the DTC screen D-B7 (climate control panel without display), or DTC screen C5 (climate control panel with display) indicated?

   YES

Go to climate control DTC B2998 troubleshooting.

NO

Go to step 3.

3. Electric powertrain system DTC check

-1. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0AE1 HV Battery Precharge Contactor Circuit	Â	Â	Â

Is DTC P0AE1 indicated?

YES

Go to battery condition monitor module DTC P0AE1 troubleshooting .

NO

Go to step 4.

4. Electric A/C compressor fuse (30 A) check

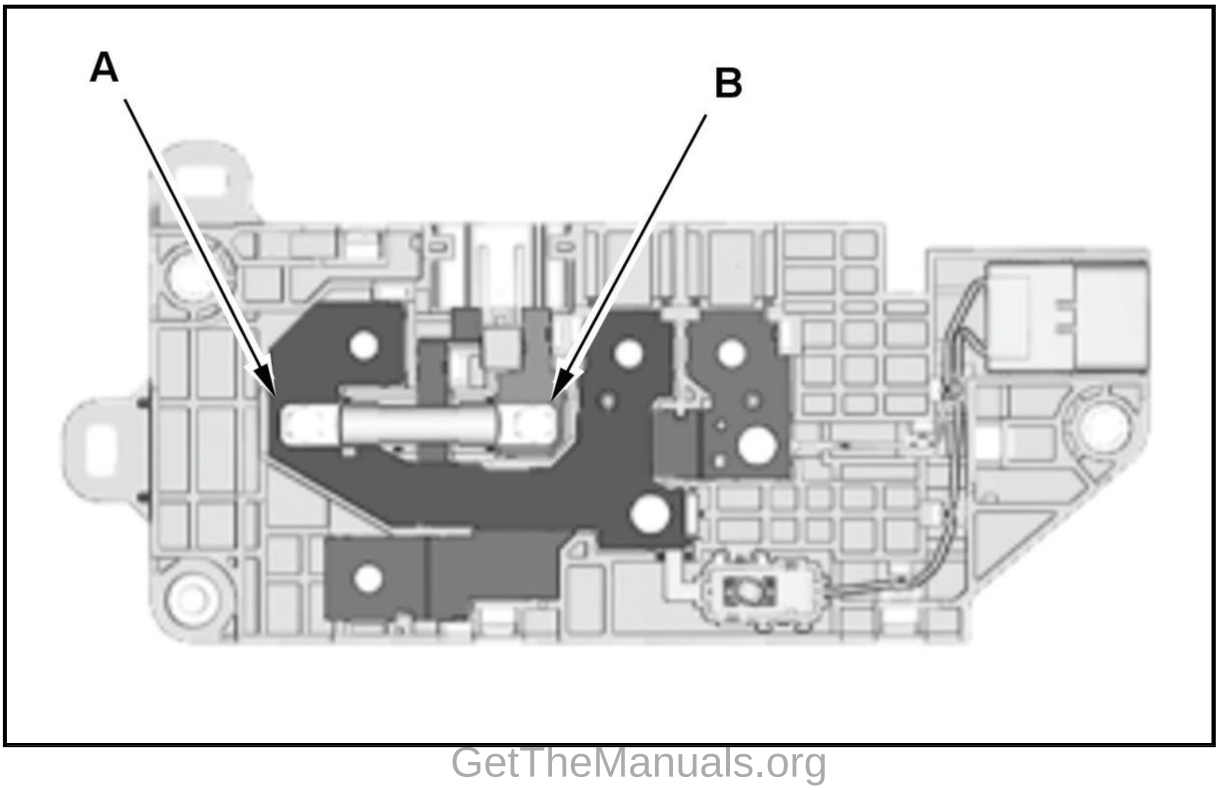
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Do the 12 volt battery terminal disconnection procedure .

-3. Remove the service plug and the IPU cover .

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
Test point 1	Electric A/C compressor fuse (30 A) terminal (A)
Test point 2	Electric A/C compressor fuse (30 A) terminal (B)



Is there continuity?

YES

Replace the subjunction board .

NO

Replace the electric A/C compressor fuse (30 A) .

DTC B2998 (D-B7), B2998 (C5)

DTC B2998, DTC screen D-B7, or DTC screen C5 : A problem in the A/C compressor driver (A Problem in the Electric A/C Compressor Driver)

DTC Description	DTC
B2998 A problem in the A/C compressor driver	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. **Do the Self-Diagnostic Function with the HDS or the climate control unit**.

-4. Check for DTCs.

DTC Description	DTC
B2998 A problem in the A/C compressor driver	Â

Is DTC B2998, Error on the DTC screen D-B7 (climate control panel without display), or DTC screen C5 (climate control panel with display) indicated?

YES

Replace the electric A/C compressor .

NO

Intermittent failure. Check for loose wires or poor connections on the electric A/C compressor circuit.

DTC U1280 (I-A1), U1280 (80) (CLIMATE CONTROL UNIT)

DTC U1280, DTC screen I-A1, or DTC screen 80 : Communication bus line error (BUS-OFF)

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	Â

DTC (AC)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Do the Self-Diagnostic Function with the climate control unit.

-4. Wait for at least 6 seconds.

-5. Check for DTCs.

DTC Description	DTC
U1280 Communication bus line error (BUS-OFF)	Â

Is DTC U1280, Error on the DTC screen I-A1 (climate control panel without display), or DTC screen 80 (climate control panel with display) indicated?

YES

The failure is duplicated. **Go to body control module DTC U1280 troubleshooting** .

NO

Intermittent failure, the system is OK at this time.

DTC U1281 (I-A3), U1281 (91), U128D (I-A2), U128D (83), U1290 (I-A6), U1290 (8F) (CLIMATE CONTROL UNIT)

DTC U1281, DTC screen I-A3, or DTC screen 91 : Climate Control Unit Lost Communication with MICU (body control module)

DTC U128D or DTC screen I-A2 : Climate Control Unit Lost communication with gauge control module

DTC U128D or DTC indicator 83 : Climate Control Unit Lost Communication with Gauge Control Module (VSP Message)

DTC U1290 or DTC screen I-A6 : Climate Control Unit Lost Communication With Seat Heater Control Unit (Front)

NOTE:

- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the climate control unit.
- Refer to the DTC shown on the display, then inspect the connectors and terminals based on the instructions.

DTC Description	DTC
U1281 Climate Control Unit Lost Communication with MICU (body control module)	Â
U128D Climate Control Unit Lost communication with gauge control module	Â
U1290 Climate Control Unit Lost Communication With Seat Heater Control Unit	Â

DTC (AC)

1. Problem verification

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

-3. Wait for at least 6 seconds.

-4. Do the Self-Diagnostic Function with the climate control unit.

-5. Check for DTCs.

DTC Description	DTC
U1281 Climate Control Unit Lost Communication with MICU (body control module)	Â
U128D Climate Control Unit Lost communication with gauge control module	Â
U1290 Climate Control Unit Lost Communication With Seat Heater Control Unit	Â

Are any DTCs indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control units and the climate control unit.

2. Open wire check (B-CAN_H line, B-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the receiving control unit connector.

Climate control unit connector A (32P)

-3. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U1281	Body control module connector B (36P)
U128D	Gauge control module connector A (32P)
U1290	Front seat heater control unit 24P connector

-4. Measure the resistance between the receiving control unit and the transmitting control unit on the B-CAN_H circuit and the B-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U1281	B-CAN_H	Climate control unit connector A (32P)	No. 25	Body control module connector B (36P)	No. 20
	B-CAN_L		No. 8		No. 21
U128D	B-CAN_H	Climate control unit connector A (32P)	No. 25	Gauge control module connector A (32P)	No. 30
	B-CAN_L		No. 8		No. 31

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U1290	B-CAN_H	Climate control unit connector A (32P)	No. 25	Front seat heater control unit 24P connector	No. 10
	B-CAN_L		No. 8		No. 9

Is there 1.0 Ω or less?

YES

The B-CAN_H wire and B-CAN_L wire is OK.Refer to the DTC shown on the display, then substitute or replace the control unit based on the instructions (see table).

DTC	Operation for transmitting control unit
U1281	**Substitute a known-good body control module** , then recheck. If DTC U1281 goes away after substitution, **replace the original body control module** .
U128D	**Substitute a known-good gauge control module** , then recheck. If DTC U128D goes away after substitution, **replace the original gauge control module** .
U1290	**Substitute a known-good front seat heater control unit** , then recheck. If DTC U1290 goes away after substitution, **replace the original front seat heater control unit** .

NO

Repair an open in the B-CAN_H wire and/or the B-CAN_L wire between the climate control unit and the transmitting control unit.

REMOVAL & INSTALLATION TEST

AIR MIX CONTROL MOTOR/MODE CONTROL MOTOR/RECIRCULATION CONTROL MOTOR REMOVAL, INSTALLATION, AND TEST

Special Tools Required

Image	Description/Tool Number
	Backprobe Set 07SAZ-001000A

Removal and Installation

SRS components are located near the mode control motor and the recirculation control motor. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

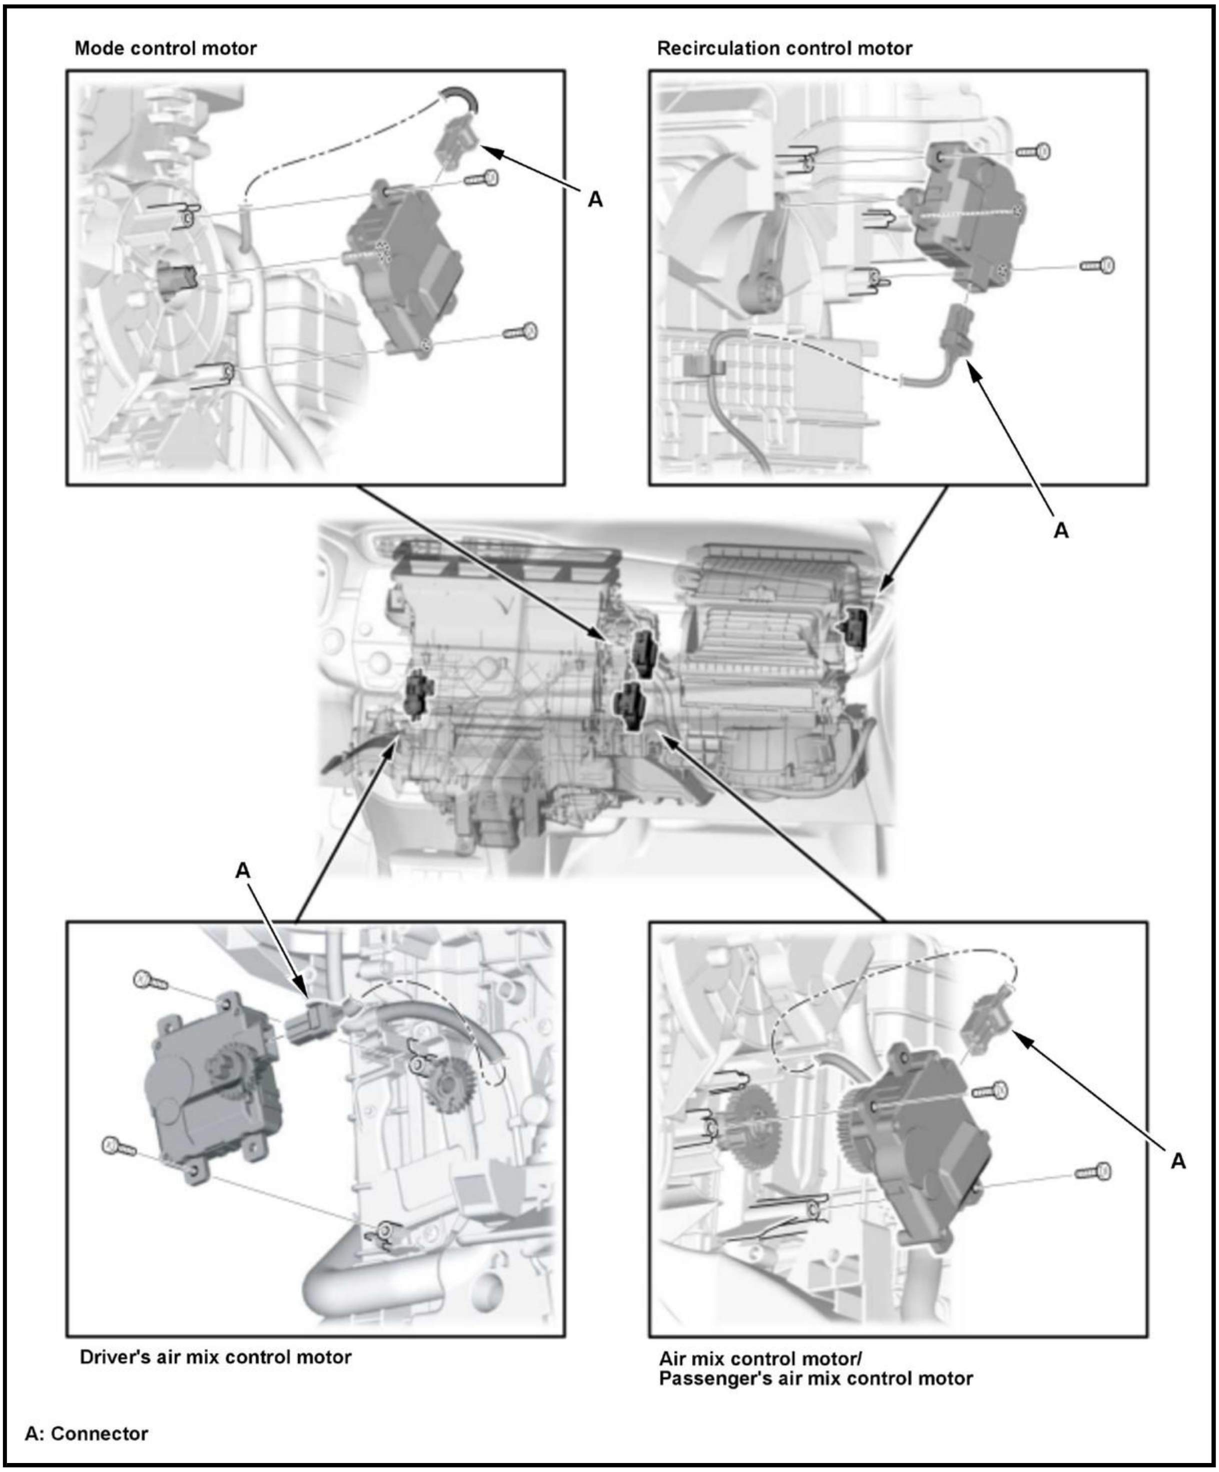
- Set the VENT position before removing the mode control motor.
- Set the FRESH position before removing the recirculation control motor.
- Set the MAX COOL position before removing the air mix control motor.
- Unless otherwise indicated, illustrations used in the procedure are for LHD model.

1. Part Removal For Motor Access

Remove Parts	Remove Control Motor				
	Air mix control motor *1	Driver's Air Mix Control Motor *2	Passenger's Air Mix Control Motor *2	Mode Control Motor	Recirculation Control Motor
Passenger's Dashboard Undercover - Remove	[1]	---	[1]	[1]	[1]
Glove Box	[2]	---	[2]	[2]	[2]
Driver's Dashboard Undercover - Remove (For some models)	---	[1]	---	---	---

*1: Without dual zone control*2: With dual zone control

2. Motors Location



Mode control motor
Recirculation control motor
A
A
A
A
Driver's air mix control motor
Air mix control motor/
Passenger's air mix control motor
A: Connector

3. All Removed Parts - Install

Air mix control motor/Passenger's air mix control motor  **Driver's air mix control motor** 	1. Install the parts in the reverse order of removal, and note these items: • Before installation, make sure the door and linkage move smoothly. • When you install the air mix control motor (A), align the air mix control motor with the gear, then install the motor. • When you install the driver's air mix control motor (B), align the driver's air mix control motor with the gear, then install the motor. • When you install the passenger's air mix control motor (C), align the passenger's air mix control motor with the gear, then install the motor.

Test

SRS components are located near the mode control motor and the recirculation control motor. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: Before testing the motor, check for **climate control DTCs** .

1. Part Removal For Motor Access

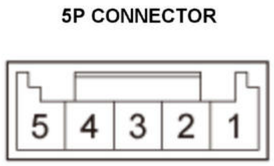
   NOTE: Numbers in table indicate parts removal order.

Remove Parts	Test Control Motor				
	Air mix control motor *1	Driver's Air Mix Control Motor *2	Passenger's Air Mix Control Motor *2	Mode Control Motor	Recirculation Control Motor
Passenger's Dashboard Undercover - Remove	[1]	---	[1]	[1]	[1]
Glove Box	[2]	---	[2]	[2]	[2]
Driver's Dashboard Undercover - Remove (For some models)	---	[1]	---	---	---

*1: Without dual zone control*2: With dual zone control

2. Connector Type

The diagram below details the motor connector design used on this vehicle.



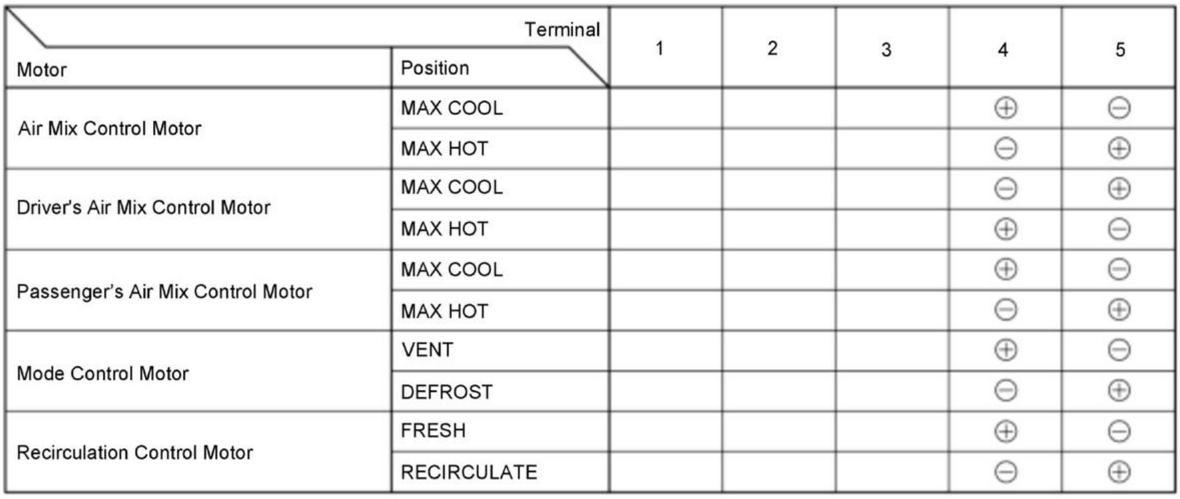
Appearance and structure of the actual connectors may vary depending on the model.

3. Air Mix Control Motor, Driver's Air Mix Control Motor, Passenger's Air Mix Control Motor, Mode Control Motor and Recirculation Control Motor - Test

1. Disconnect the connector for necessary inspections.

NOTE: **Incorrectly applying power and ground to the HVAC control motors will damage it. Follow the instructions carefully.**

2. Test the motor in each direction by connecting a 12 volt battery power and ground at the connector according to the table. The motor should run smoothly, then stop. As soon as the motor stops, disconnect the 12 volt battery power immediately.

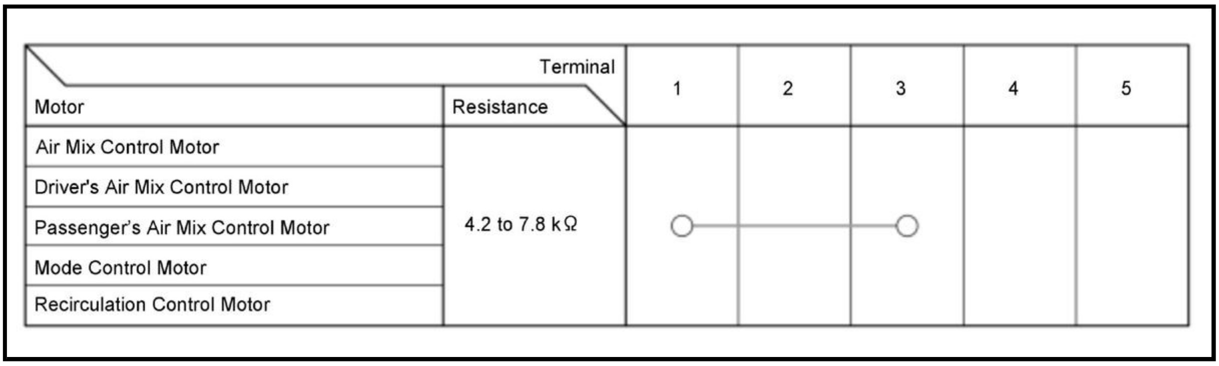


Motor	Position \ Terminal	1	2	3	4	5
Air Mix Control Motor	MAX COOL				⊕	⊖
	MAX HOT				⊖	⊕
Driver's Air Mix Control Motor	MAX COOL				⊖	⊕
	MAX HOT				⊕	⊖
Passenger's Air Mix Control Motor	MAX COOL				⊕	⊖
	MAX HOT				⊖	⊕
Mode Control Motor	VENT				⊕	⊖
	DEFROST				⊖	⊕
Recirculation Control Motor	FRESH				⊕	⊖
	RECIRCULATE				⊖	⊕

3. If any of the HVAC control motors did not run in step 2, remove it, then check the control linkage and door for smooth movement.

- If the linkage and doors move smoothly, go to step 4.
- If the linkage or door sticks or binds, repair them as needed.

4. Measure the resistance between terminals according to the table.

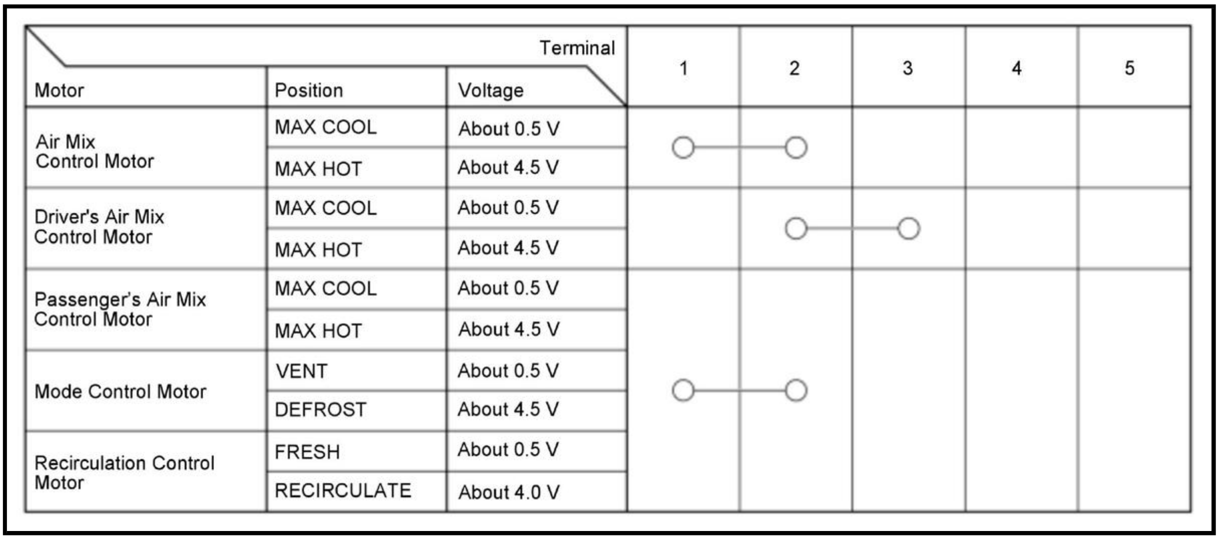


Motor	Resistance \ Terminal	1	2	3	4	5
Air Mix Control Motor	4.2 to 7.8 kΩ	○	—	○		
Driver's Air Mix Control Motor						
Passenger's Air Mix Control Motor						
Mode Control Motor						
Recirculation Control Motor						

5. Reconnect the connector, which was removed in the step 1.

6. Turn the vehicle to the ON mode.

7. Using the backprobe set, measure the voltage between terminals according to the table.



Motor	Position	Voltage \ Terminal	1	2	3	4	5
Air Mix Control Motor	MAX COOL	About 0.5 V	○	○			
	MAX HOT	About 4.5 V					
Driver's Air Mix Control Motor	MAX COOL	About 0.5 V		○	○		
	MAX HOT	About 4.5 V					
Passenger's Air Mix Control Motor	MAX COOL	About 0.5 V	○	○			
	MAX HOT	About 4.5 V					
Mode Control Motor	VENT	About 0.5 V					
	DEFROST	About 4.5 V					
Recirculation Control Motor	FRESH	About 0.5 V					
	RECIRCULATE	About 4.0 V					

8. If either the resistance or the voltage readings are not as specified, replace the faulty motor.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

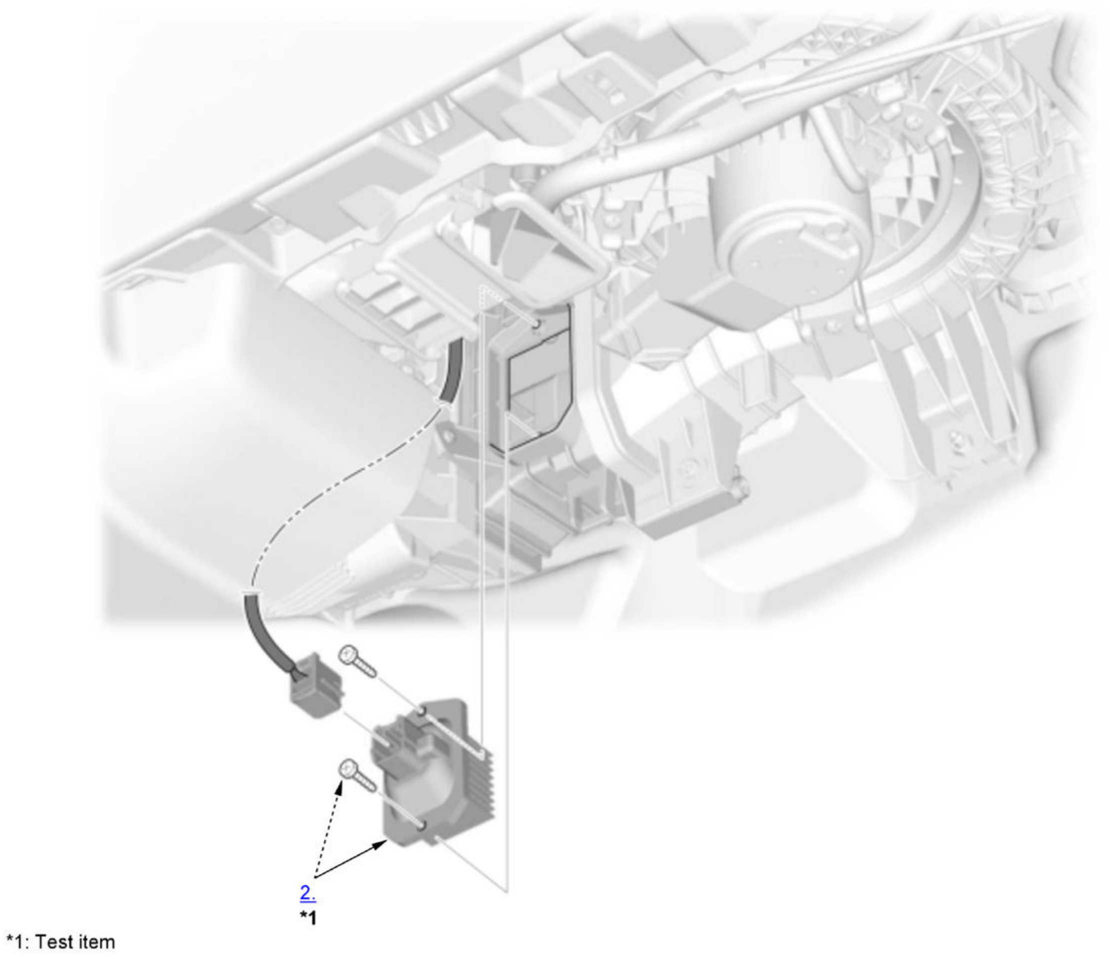
B

BLOWER POWER TRANSISTOR REMOVAL, INSTALLATION, AND TEST

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1



1. **Passenger's Dashboard Undercover - Remove**
2. Power Transistor - Remove
3. All Removed Parts - Install
    1. Install the parts in the reverse order of removal.

B

Test

NOTE: Before testing the power transistor, check for **climate control DTCs** .

1. Power Transistor - Test

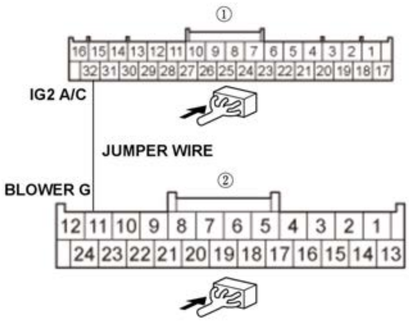
	1. Disconnect the power transistor connector. 2. Measure the resistance between terminals (male terminals) No. 1 and No. 3 of the power transistor. It should be about 1.5 kΩ.:

- If the resistance is within the specifications, go to step 3.
- If the resistance is not within the specifications, replace the power transistor.

NOTE:

Also check the blower motor for binding. Power transistor failure can be caused by a defective blower motor.

3. Reconnect the power transistor connector.



①
16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1
32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17
IG2 A/C
JUMPER WIRE
②
BLOWER G
12 11 10 9 8 7 6 5 4 3 2 1
24 23 22 21 20 19 18 17 16 15 14 13

4. Disconnect the following connectors.

- Climate control unit connector A (32P)
- Climate control unit connector B (24P)

5. Connect climate control unit connector A (32P) terminal (female terminals) No. 32:

①

and climate control unit connector B (24P) terminal (female terminals) No. 11:

②

with a jumper wire.

6. Turn the vehicle to the ON mode.

7. Check that the blower motor runs.

- If the blower motor does not run, replace the power transistor.

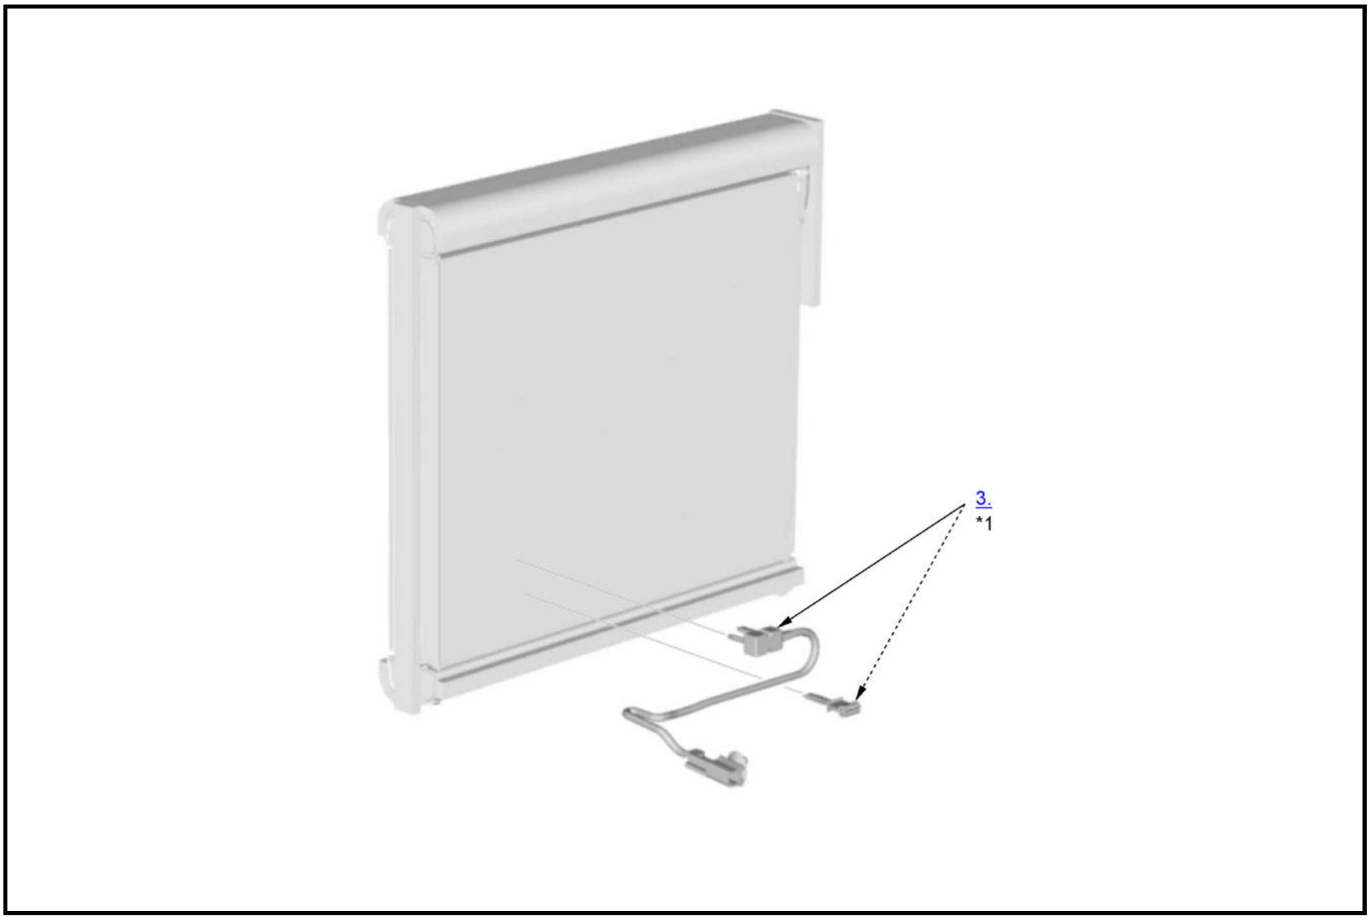
  NOTE: A faulty blower motor can cause the power transistor to fail. Before replacing the power transistor, check the blower motor for binding, and **replace the blower motor if necessary**.

	- If the blower motor runs, the power transistor is OK.

EVAPORATOR TEMPERATURE SENSOR REMOVAL, INSTALLATION, AND TEST(WITH COLD STORAGE EVAPORATOR) (2020 2021)

Removal and Installation

1



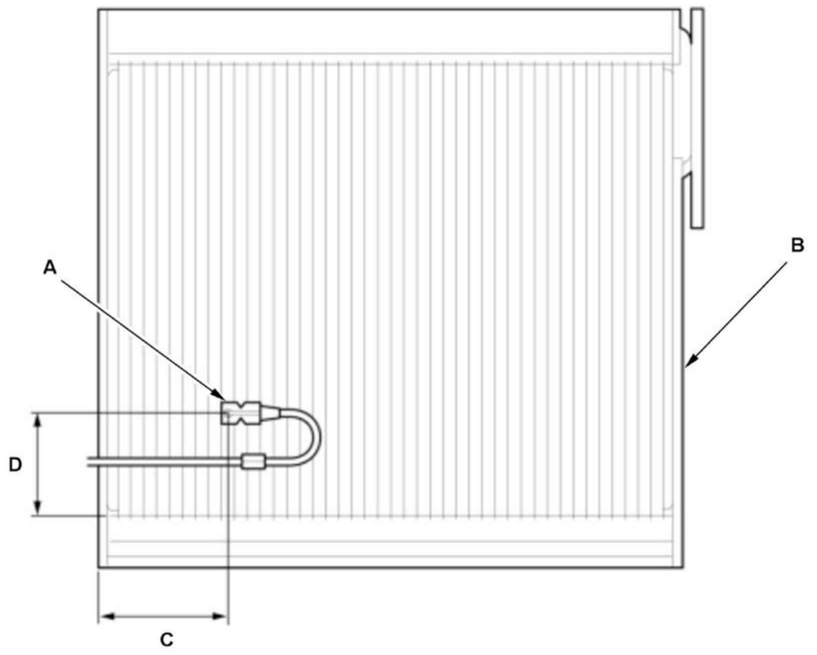
*1	Test item

1. **HVAC Unit - Remove**
2. **Evaporator Core - Remove**
3. Evaporator Temperature Sensor - Remove
4. All Removed Parts - Install

1. Install the evaporator temperature sensor (A) in the evaporator core (B). Refer to the following position list.

B	C	D *
	Row	**mm (in)**
Factory-Preset Position	9th	25 (0.98)
New Position	9th	15 (0.59)

*: Measure from end of aluminum evaporator tank.



Test

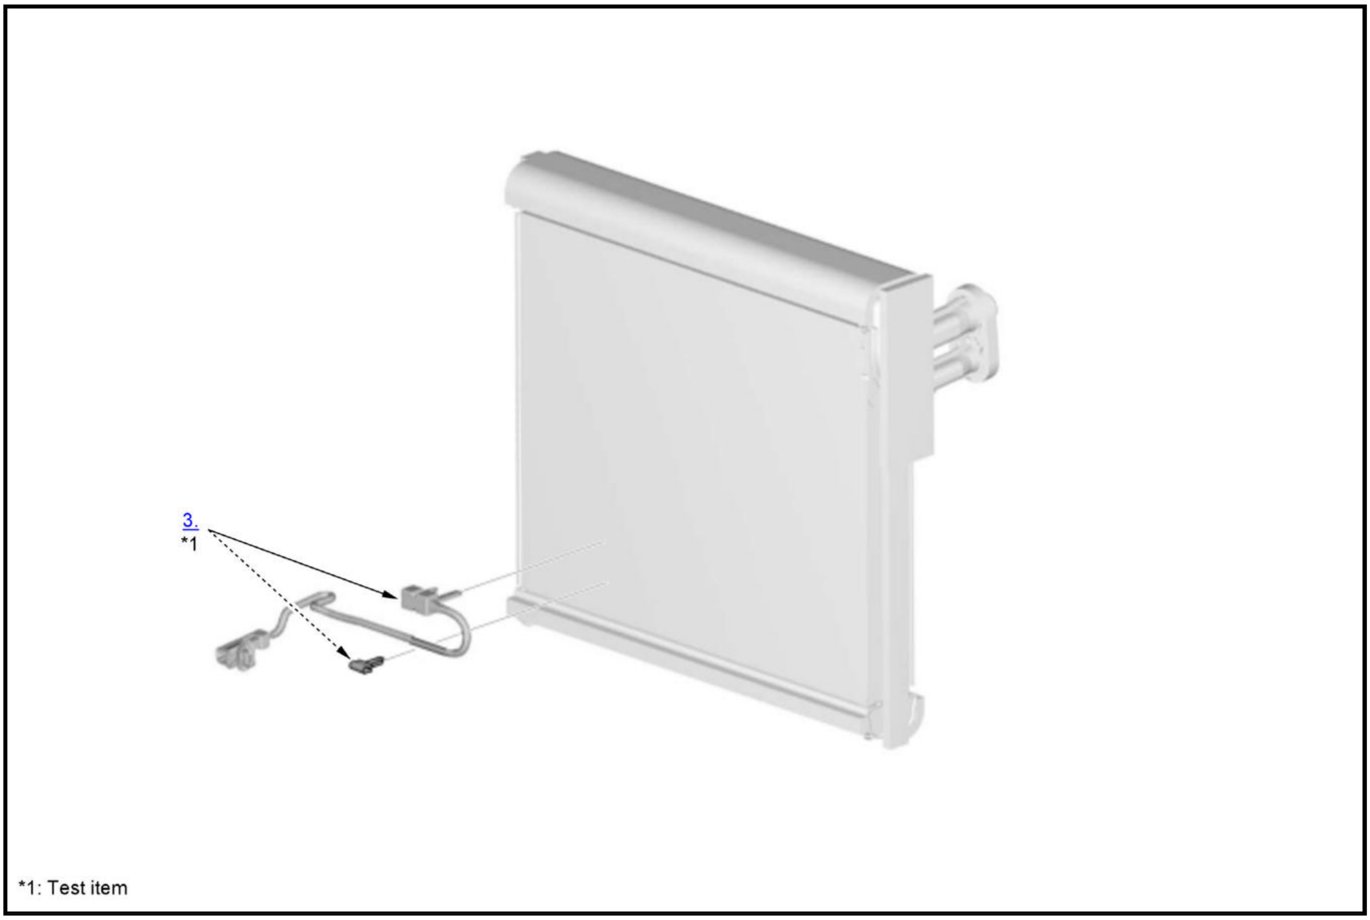
1. Evaporator Temperature Sensor - Test

 	1. Dip the sensor in ice water, and measure the resistance between terminals No. 1 and No. 2. 2. Then pour warm water on the sensor, and check for a change in resistance. 3. Compare the resistance readings with the specifications shown in the graph; the resistance should be within the specifications. 4. If the resistance is not as specified, replace the evaporator temperature sensor.

EVAPORATOR TEMPERATURE SENSOR REMOVAL, INSTALLATION, AND TEST(WITHOUT COLD STORAGE EVAPORATOR)

Removal and Installation

1

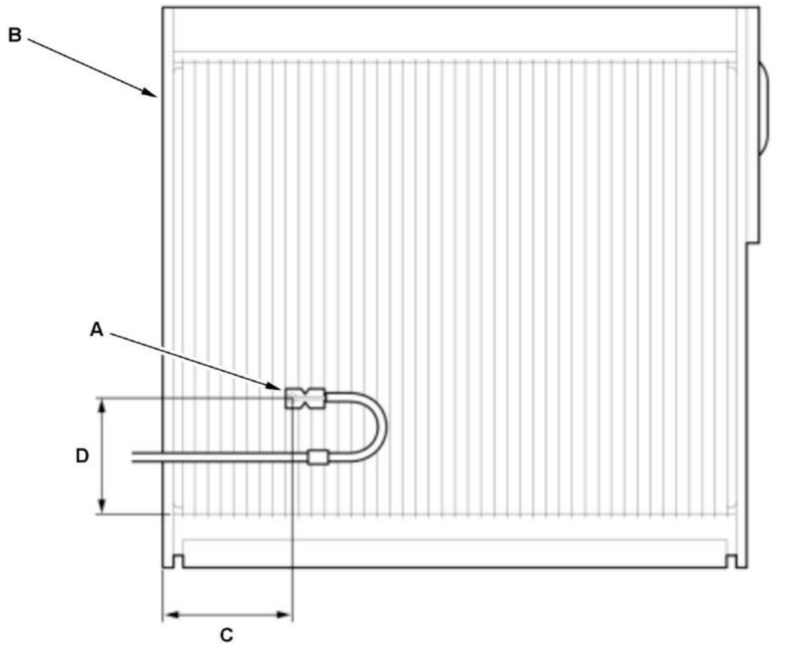


1. HVAC Unit - Remove
2. Evaporator Core - Remove
3. Evaporator Temperature Sensor - Remove
4. All Removed Parts - Install

   1. Install the evaporator temperature sensor (A) in the evaporator core (B). Refer to the following position list.

B	C	D *
	Row	mm (in)
Factory-Preset Position	9rd	50 (1.97)
New Position	10nd	50 (1.97)

*: Measure from end of aluminum evaporator tank.



Test

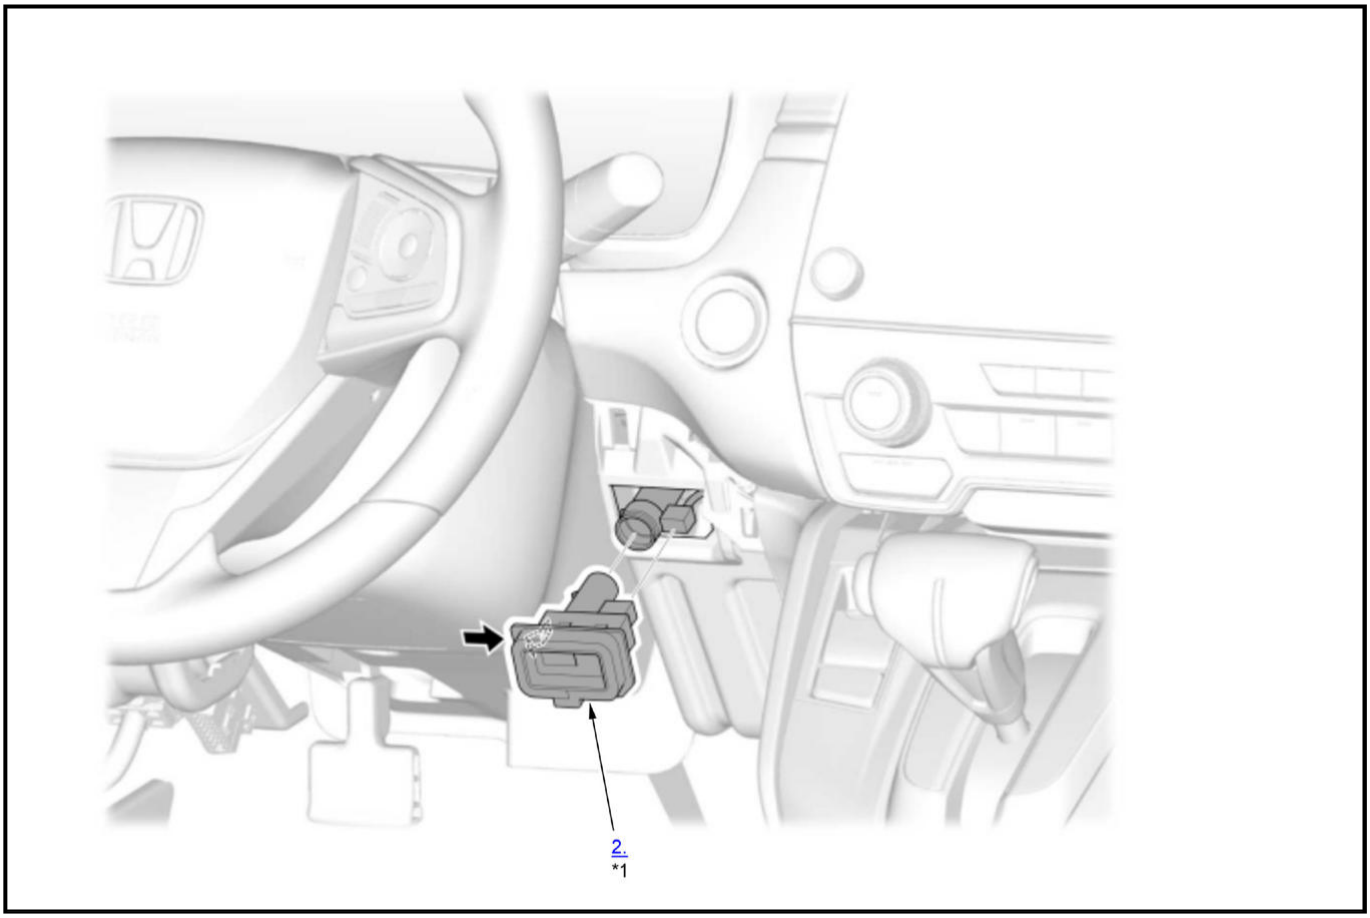
1. Evaporator Temperature Sensor - Test

 	1. Dip the sensor in ice water, and measure the resistance between terminals No. 1 and No. 2. 2. Then pour warm water on the sensor, and check for a change in resistance. 3. Compare the resistance readings with the specifications shown in the graph; the resistance should be within the specifications. 4. If the resistance is not as specified, replace the evaporator temperature sensor.

HUMIDITY/IN-CAR TEMPERATURE SENSOR REMOVAL, INSTALLATION, AND TEST (2020 2021)

Removal and Installation

1



*1	Test item

1. **Driver's Dashboard Lower Cover - Remove**
2. Humidity/In-Car Temperature Sensor - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

B

Test

NOTE:

- Before testing the sensor, **check for climate control DTCs** .
- The climate control unit receives humidity (%) data via digital signal.
- The climate control unit receives in-car temperature (deg.C) data via digital signal.

1. Humidity/In-Car Temperature Sensor - Test

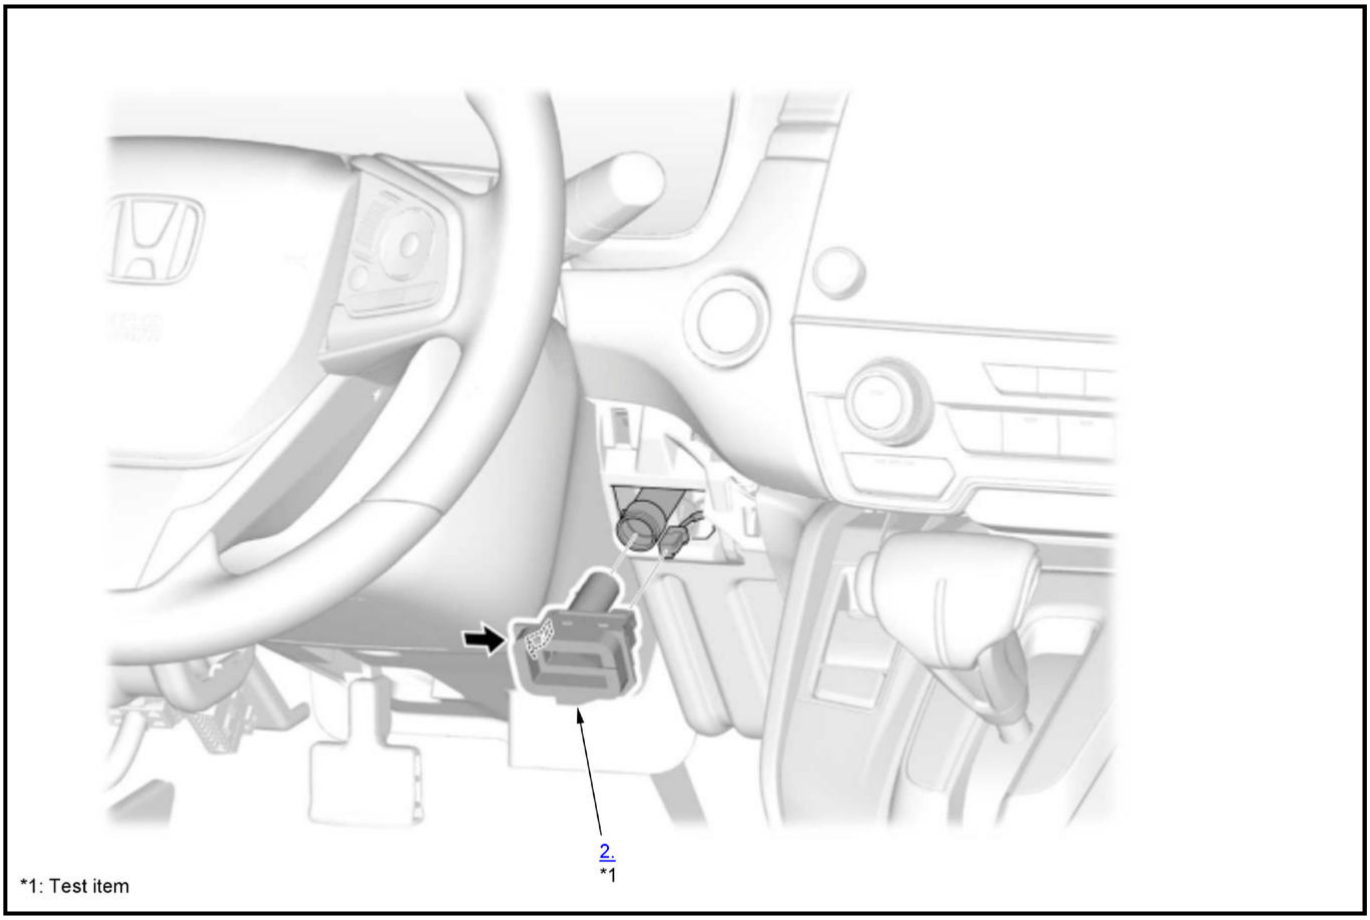
   1. **Refer to "Run the Sensor Input Display Mode" in General Troubleshooting Information under How to Troubleshoot the Climate Control System** .

B

IN-CAR TEMPERATURE SENSOR REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



1. **Driver's Dashboard Lower Cover - Remove**
2. In-Car Temperature Sensor - Remove
3. All Removed Parts - Install
    1. Install the parts in the reverse order of removal.

B

Test

NOTE: Before testing the sensor, check for **climate control DTCs** .

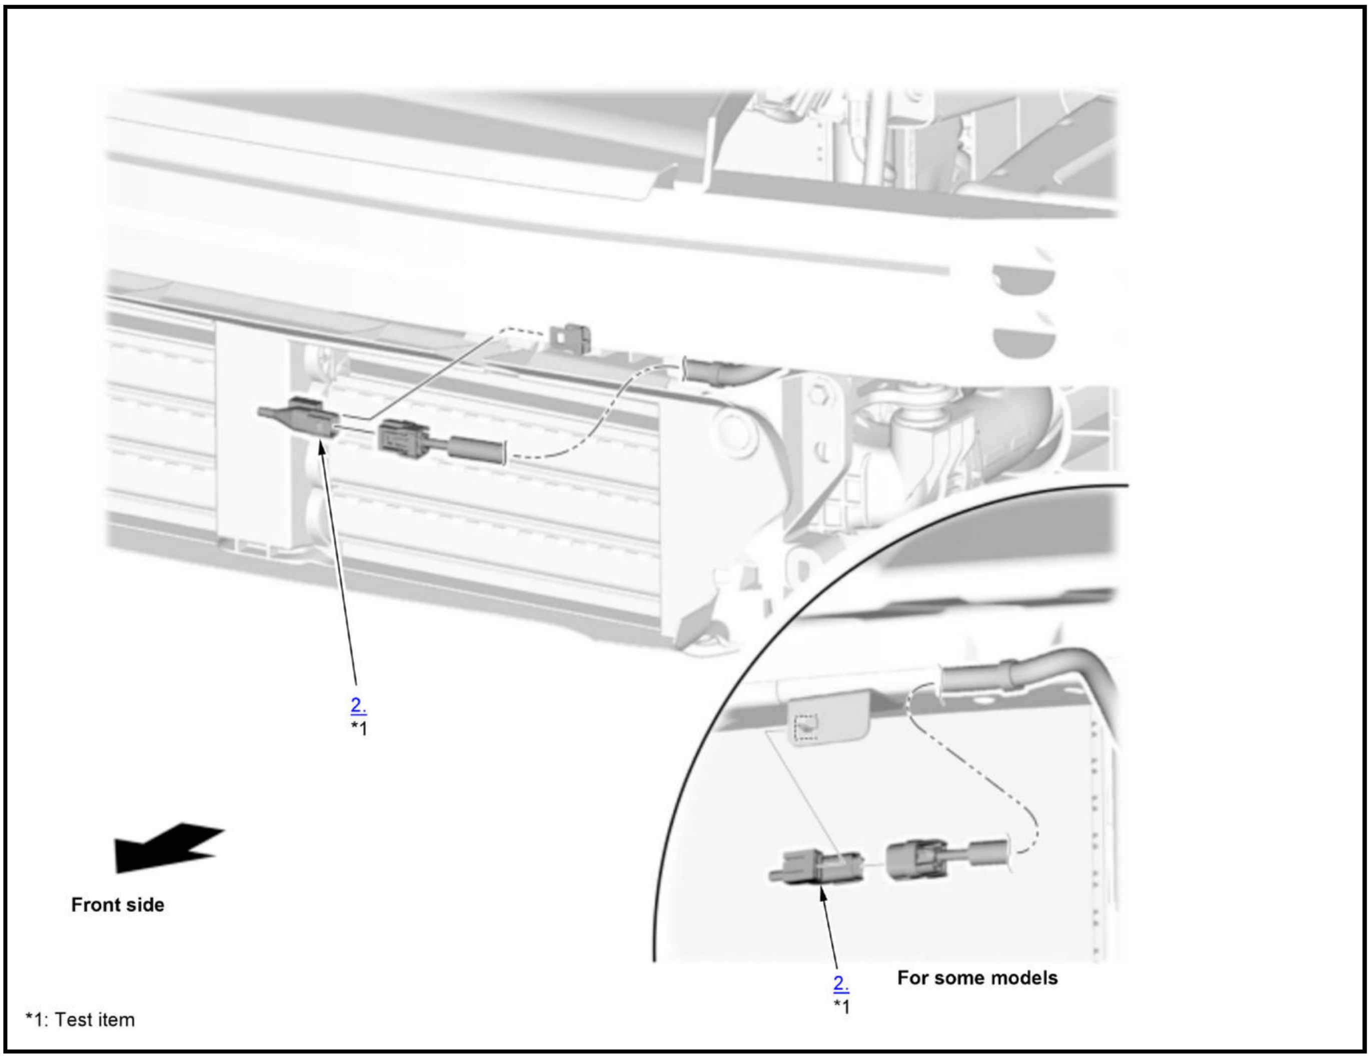
1. In-Car Temperature Sensor - Test

	1. Test the in-car temperature sensor while holding it in front of the dashboard center vent. - Measure the resistance with the system set to MAX COOL. - Measure the resistance with the system set to MAX HOT. 2. Compare the resistance readings with the specifications shown in the graph, the resistance should be within the specifications. 3. If the resistance is not as specified, replace the in-car temperature sensor.

OUTSIDE AIR TEMPERATURE SENSOR REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1



2.
*1
Front side
2.
*1
For some models
*1: Test item

1. **Front Bumper - Remove**
2. Outside Air Temperature Sensor - Remove
3. All Removed Parts - Install

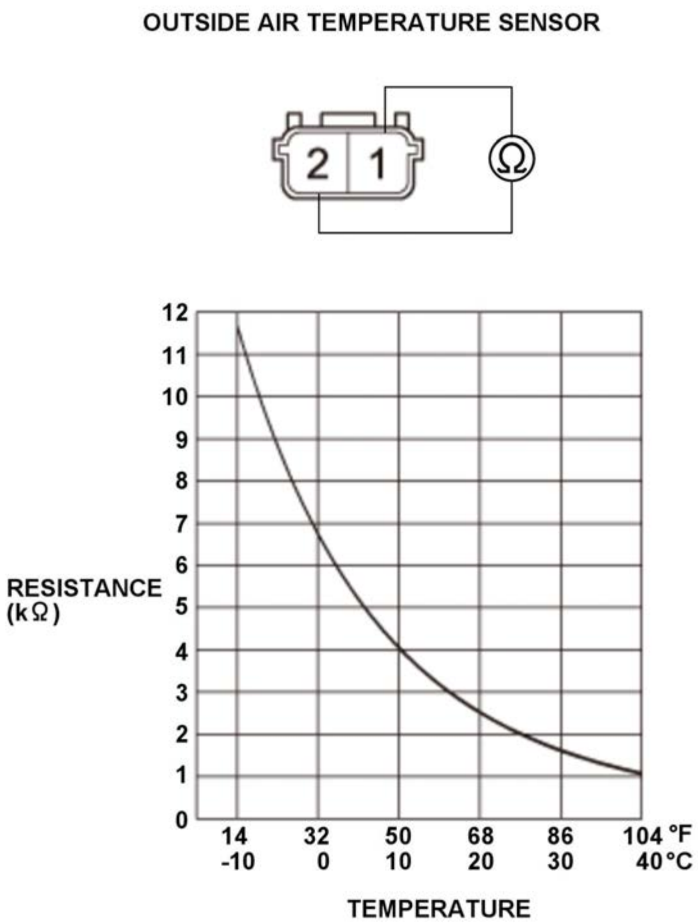
   1. Install the parts in the reverse order of removal.

B

Test

NOTE: Before testing the sensor, check for **climate control DTCs** .

1. Outside Air Temperature Sensor - Test



1. Dip the sensor in ice water, and measure the resistance between terminals No. 1 and No. 2.

2. Then pour warm water on the sensor, and check for a change in resistance.

3. Compare the resistance readings with the specifications shown in the graph, the resistance should be within the specifications.

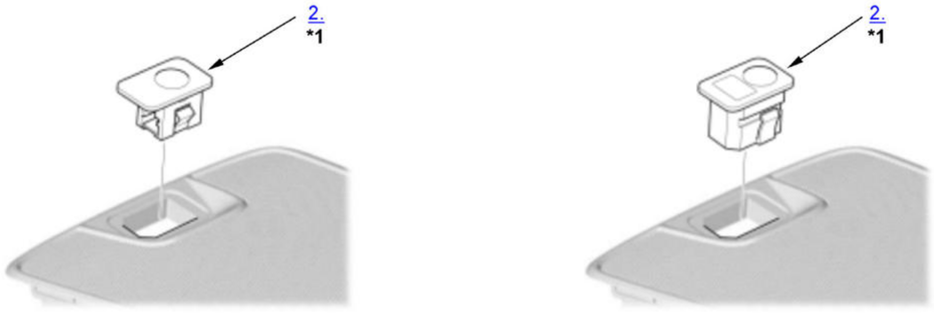
4. If the resistance is not as specified, replace the outside air temperature sensor.

SUNLIGHT SENSOR REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE: Be careful not to damage the sunlight sensor and the dashboard.

1



Without automatic lighting

With automatic lighting

*1: Test item

1. Dashboard Center Panel - Remove
2. Sunlight Sensor - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

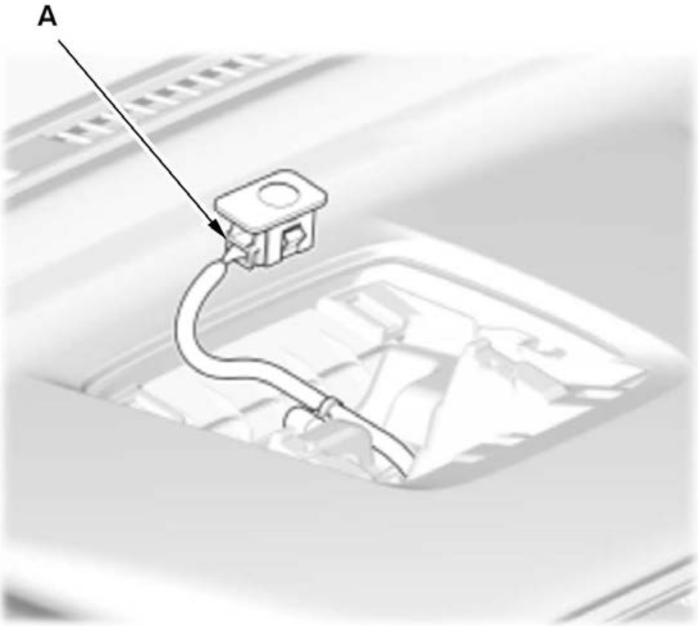
B

Test

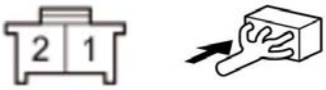
NOTE:

- Before testing the sensor, check for climate control DTCs .
- The sunlight sensor with automatic lighting cannot be test. If no DTC indicated, the sunlight sensor is OK.

1. Sunlight Sensor - Test



1. Connect the sunlight sensor connector (A).



Sensor	Voltage	1	2
	Terminal		
Sunlight Sensor	About 3.56V or less*	○	○

*: 3.56V condition is no sunlight or the sensor coverd up. If sunlight, voltage is less than 3.56V.

2. Turn the vehicle to the ON mode.

3. Measure the voltage between terminals according to the table.

NOTE:

The voltage readings will not change under the light of a flashlight or a fluorescent lamp.

4. If the voltage is not as specified, replace the sunlight sensor.

REMOVAL AND INSTALLATION

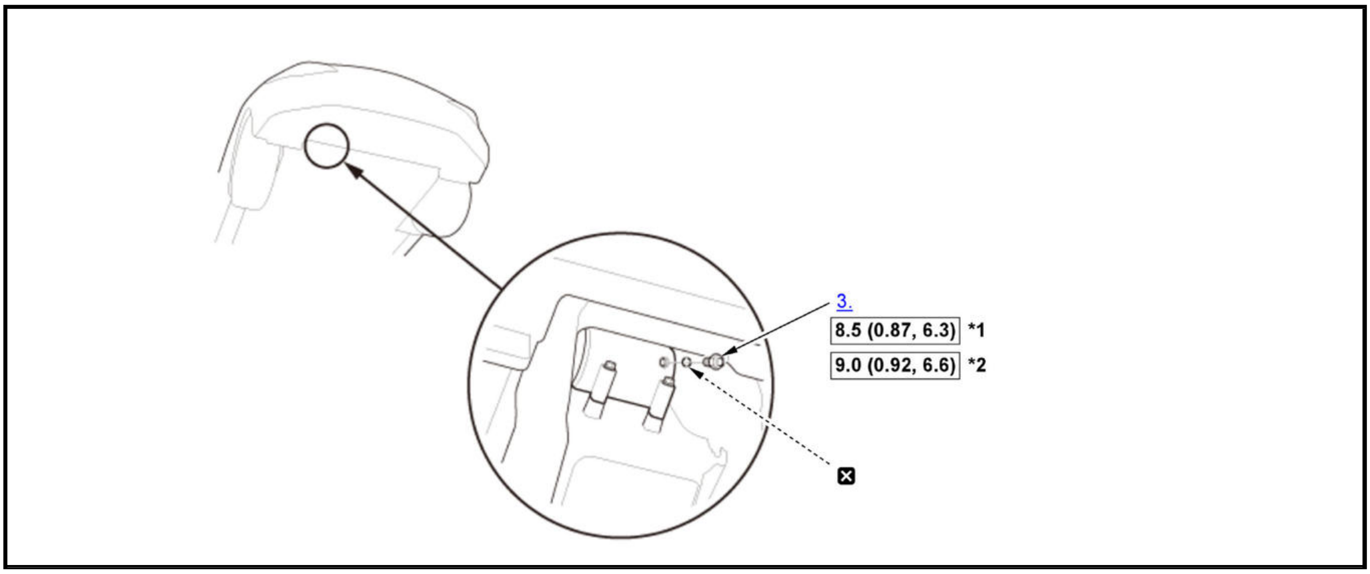
A/C COMPRESSOR RELIEF VALVE REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- If the A/C compressor relief valve released refrigerant to the atmosphere, determine and correct the cause of the excessive system pressure, then replace the relief valve.
- Plug the opening to keep moisture and foreign material from entering the system, and the A/C compressor oil from running out.

1



☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	1.5 L engine
*2	2.4 L engine

1. **A/C Refrigerant - Recover**
2. **Front Engine Undercover Lid - Remove**
3. A/C Compressor Relief Valve - Remove
4. All Removed Parts - Install

    1. Install the parts in the reverse order of removal, and note these items:

        - If the A/C compressor relief valve released refrigerant to the atmosphere, determine and correct the cause of the excessive system pressure, then replace the relief valve.
        - Clean the mating surfaces.
        - A new O-ring should be used at each fitting. Prior to installation, apply a thin coat of the same **refrigerant oil** used in the A/C compressor. Be sure to use the correct O-ring for refrigerant types to avoid leakage.
        - **Charge the system with the specified amount of refrigerant** .

B

A/C COMPRESSOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- Do not install the A/C compressor into a system unless you are completely sure that the system is free of contamination. Installing the A/C compressor into a contaminated system can result in premature A/C compressor failure. **Refer to the A/C System Contamination Inspection** .
- If the A/C compressor is marginally operable, run the engine at idle speed, and let the air conditioning work for a few minutes, then shut the engine off.

3. **Front Subframe Brace - Remove**
4. **Drive Belt - Remove**
5. Discharge Hose - Disconnect
6. Suction Hose - Disconnect
7. A/C Compressor - Remove
8. All Removed Parts - Install
    1. Install the parts in the reverse order of removal, and note these items:
        - Inspect the A/C lines for any signs of contamination.
        - If you are installing a new A/C compressor, you must **calculate the amount of refrigerant oil** to be removed from it. A new A/C compressor comes with a full charge of oil.
        - A new O-ring should be used at each fitting. Prior to installation, apply a thin coat of the same **refrigerant oil** used in the A/C compressor. Be sure to use the correct O-ring for refrigerant types to avoid leakage.
        - To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other kinds of **refrigerant oils** .

- Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
- Do not spill the refrigerant oil on the vehicle, because it may damage painted surfaces. If refrigerant oil contacts the paint, wash it off with water immediately.
- Be careful not to damage the radiator fins when installing the A/C compressor and the fan shroud.
- To avoid damage to the radiator, cover it with cardboard after removing the fan shroud.
- **Charge the system with the specified amount of refrigerant** .

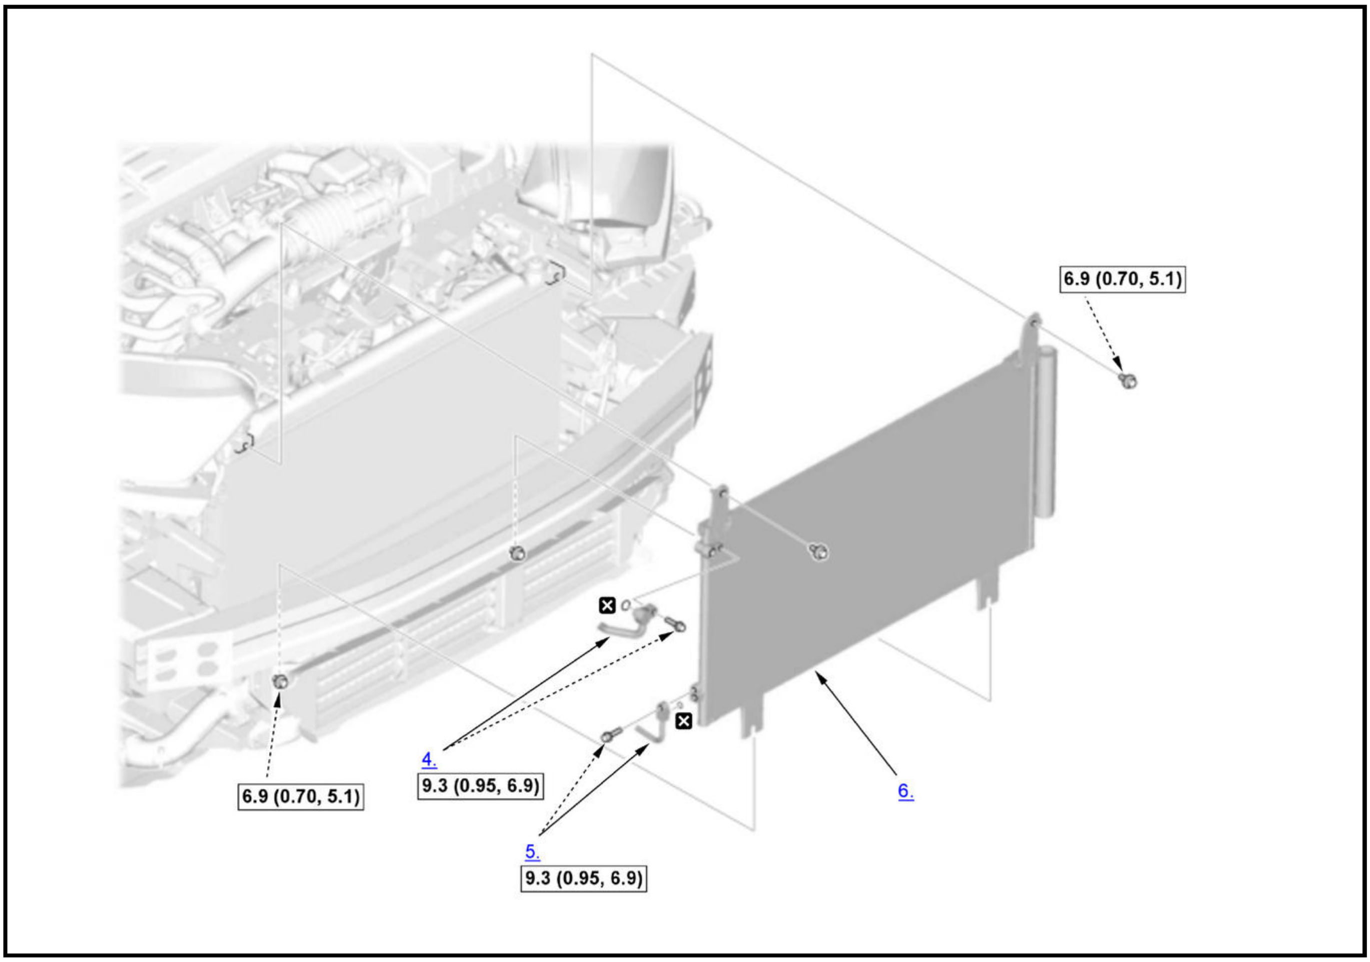
B

A/C CONDENSER REMOVAL AND INSTALLATION

Removal and Installation

NOTE: Be careful not to damage the radiator and A/C condenser fins, and receiver line when removing the A/C condenser.

1



☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. 12 Volt Battery Terminal - Disconnect
2. A/C Refrigerant - Recover
3. Engine Coolant - Drain
4. A/C Lines - Remove

   NOTE: Take care not to damage or bend the fuel lines or the brake lines.

   B

5. Heater Hoses - Remove

   NOTE:

   - Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.
   - Note the layout of the hoses.

   B

6. Heater Unit Mounting Nut - Remove

   NOTE: Take care not to damage or bend the fuel lines or the brake lines.

   B

7. Dashboard/Steering Hanger Beam - Remove

8. Drain Hose - Disconnect
9. Rear Vent Duct - Remove
10. HVAC Unit - Remove
11. All Removed Parts - Install

    1. Install the parts in the reverse order of removal, and note these items:

        - Do not interchange the inlet and outlet heater hoses, and install the hose clamps securely.
        - Make sure that there is no coolant leakage.
        - Make sure that there is no air leakage.
        - Make sure that there is no refrigerant leakage.
        - **Do the 12 volt battery terminal reconnection procedure** .
        - **Refill the radiator with engine coolant, and bleed the air from the cooling system** .
        - A new O-ring should be used at each fitting. Prior to installation, apply a thin coat of the same **refrigerant oil** used in the A/C compressor. Be sure to use the correct O-ring for refrigerant types to avoid leakage.
        - **Charge the system with the specified amount of refrigerant** .

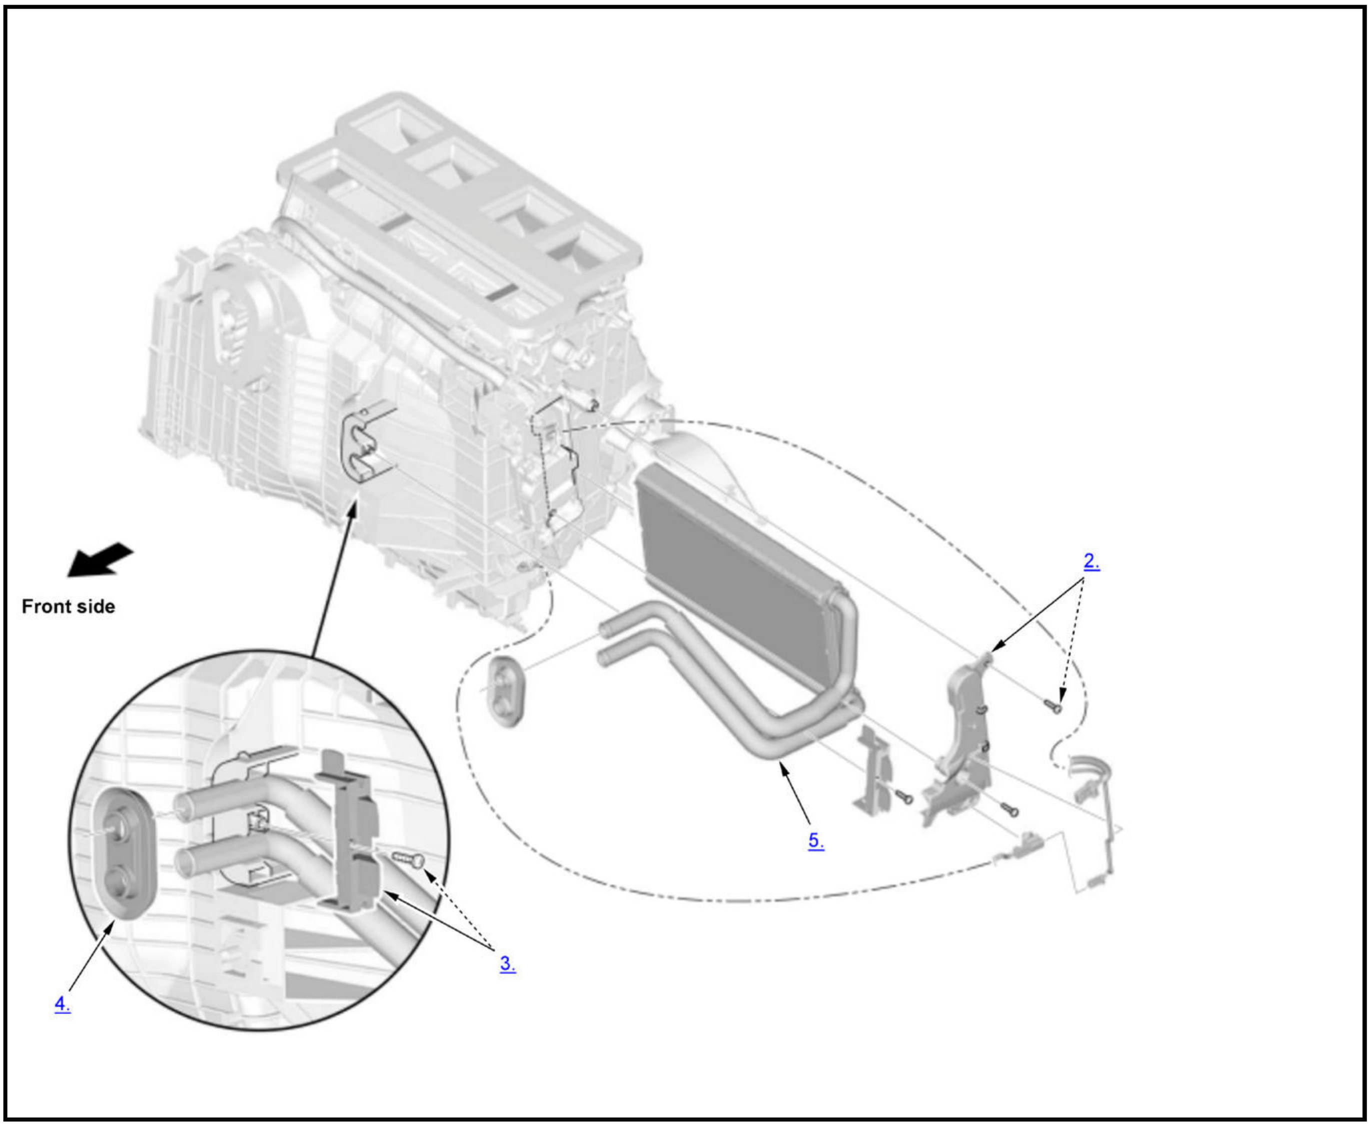
B

HEATER UNIT/CORE REMOVAL AND INSTALLATION

Removal and Installation

NOTE: Be careful not to damage the heater core.

1



1. HVAC Unit - Remove
2. Heater Core Cover - Remove
3. Heater Pipe Bracket - Remove
4. Grommet - Remove
5. Heater Core - Remove
6. All Removed Parts - Install
    1. Install the parts in the reverse order of removal.

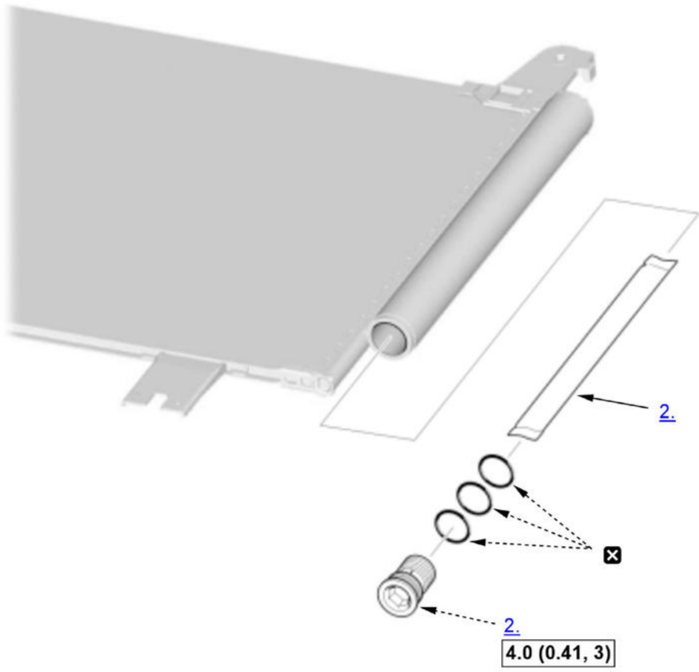
NOTE: **Make sure that there is no air leakage.**

B

RECEIVER/DRYER DESICCANT REMOVAL AND INSTALLATION

Removal and Installation

1



☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **A/C Condenser - Remove**
2. Desiccant - Remove
3. All Removed Parts - Install

   1. Install the parts in the reverse order of removal, and note these items:

      - Install the desiccant as quickly as possible to prevent the system from absorbing moisture from the air.
      - If you are installing a new desiccant, add **refrigerant oil** .
      - Replace the O-rings with new ones, and apply a thin coat of **refrigerant oil** before installing them.
      - Install the cap to the specified torque. It is made of resin and can be easily stripped.

☒	Replace

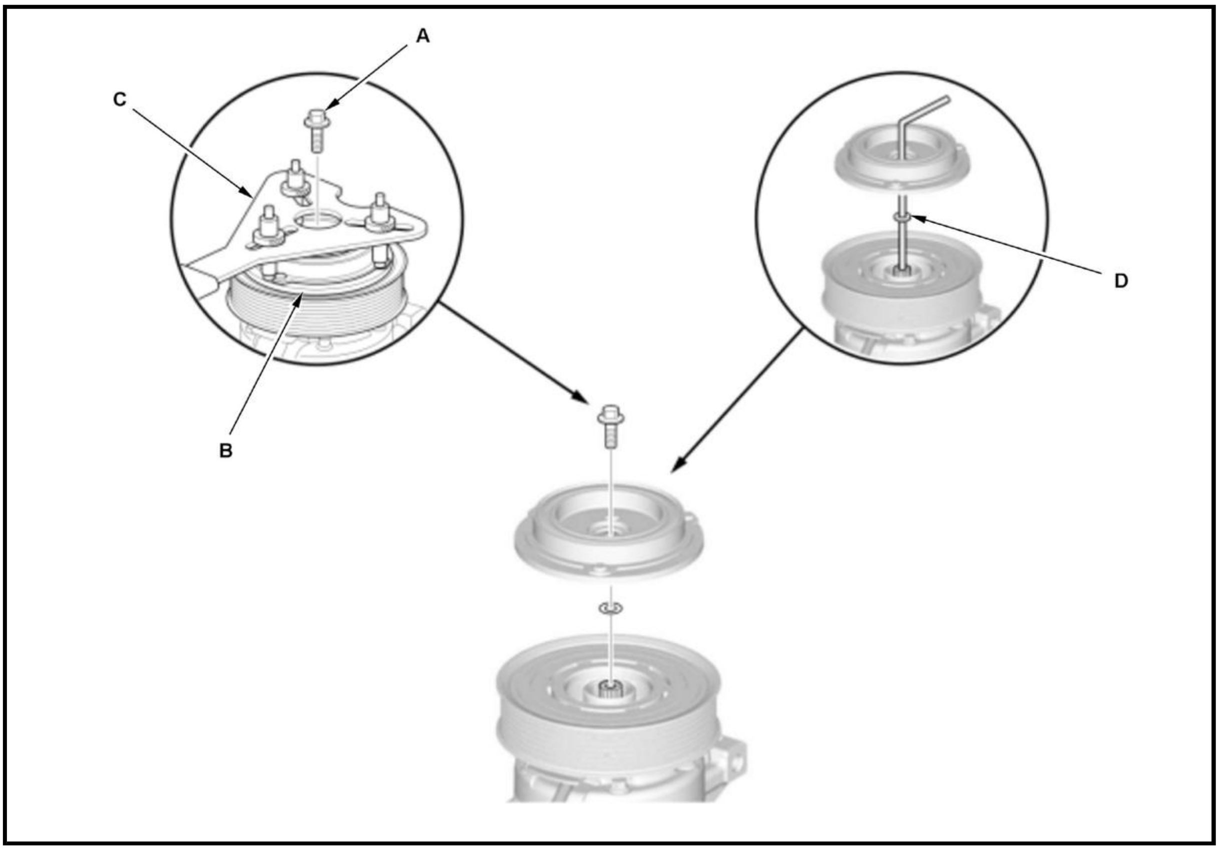
1. A/C Compressor Armature Plate - Remove
    1. Remove the center bolt (A) while holding the armature plate (B) with the A/C clutch holder (C).



2. Remove the armature plate and the shim(s) (D).

NOTE:

- **1.5 L engine: The shims are available in three thicknesses: 0.3 mm, 0.4 mm, and 0.5 mm.**
- **2.4 L engine: The shims are available in seven thicknesses: 0.7 mm, 0.8 mm, 0.9 mm, 1.0 mm, 1.1 mm, 1.2 mm, and 1.3 mm.**
- **Do not pry on the armature plate with screwdrivers or similar tools. Prying damages the armature plate and the pulley.**
- **Inspect the armature plate and pulley friction surfaces for wear. If there is excessive wear, roughness, or scoring, replace the clutch set.**
- **If traces of refrigerant oil is found around the compressor, replace the A/C compressor.**

2. A/C Compressor Pulley - Remove

 **1.5 L engine** **2.4 L engine** 	1. Remove the pulley (A). **NOTE:** - **Do not hammer or pry on the pulley to remove it. Using a hammer damages the A/C compressor. If the pulley is difficult to remove, use a commercially available pulley removing tool. Make sure the jaws of the pulling tool engage the back face of the pulley, not the pulley grooves.** - **Be careful not to damage the pulley or the A/C compressor.**

3. A/C Compressor Field Coil - Remove

NOTE: Inspect the friction surfaces and the compressor shaft hub for excess oil. If excess oil is present, and it is not from the engine, then the compressor shaft seal is leaking. Replace the A/C compressor.

B

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal, and note these items:

- When replacing the field coil, **check that the new coil has the correct resistance** .
- Measure the clearance between the pulley and the armature plate all the way around. If the clearance is not within specified limits, remove the armature plate and add or remove shims as needed to increase or decrease clearance.
- Install the field coil with the wire side facing down, and align the boss on the field coil with the hole in the A/C compressor.
- If the clutch surface is oil soaked, check the compressor front seal for leakage. Installing a new clutch assembly on a leaking compressor will damage the new clutch assembly friction surfaces.
- Clean the pulley and the A/C compressor friction surfaces with contact cleaner or other non-petroleum solvent.
- Install new snap rings, note the installation direction, and make sure they are fully seated in the grooves.
- Make sure that the pulley turns smoothly after it's reassembled.
- Route and clamp the wires properly to prevent damage by the pulley.
- After reinstallation, cycle the A/C compressor clutch approximately 20 times by running the engine at 1, 500-2, 000 rpm and setting the A/C system to MAX COOL. This procedure seats the clutch sliding surfaces, and increases clutch torque capacity.

B

REMOVAL AND INSTALLATION

HEATED STEERING WHEEL CONTROL UNIT REMOVAL AND INSTALLATION

Removal And Installation

SRS Components Are Located In This Area. Review The SRS Component Locations And The Precautions And Procedures Before Doing Repairs Or Service.

1. Driver's Airbag - Remove
2. Heated Steering Wheel Control Unit - Remove
3. All Remove Parts - Install

1. Install The Parts In The Reverse Order Of Removal.

REMOVAL, INSTALLATION & TEST

CLIMATE CONTROL SYSTEM (INTERIOR) REMOVAL, INSTALLATION, AND TEST

Removal and Installation

WARNING: **Do not apply current when core is removed.**

- **To prevent electrocution because current will flow through the whole PTC heater core.**
- **If any foreign material is stuck, an odor/smell, smoke or fire could occur.**

SRS components are located near the mode control motor and the recirculation control motor. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

- Make sure you review the A/C service tips and precautions before doing repairs or servicing.
- Although a numbered sequence is shown, the parts can be removed independently of each other.
- Review the A/C refrigerant oil replacement before doing repairs or service.
- Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.
- Apply compressor oil when installing O-rings.
- If the packings and seals are damaged or torn, replace it with a new one.
- Install the parts in the reverse order of removal method if there is no special instruction.

Note for Sunlight Sensor (Automatic Lighting Control Unit-Sensor)

- Be careful not to damage the sunlight sensor (automatic lighting control unit-sensor) and the dashboard.

Note for Air Mix Control Motor

- Set the MAX COOL (Lo) position before removing the air mix control motor.

Note for Driver's Air Mix Control Motor

- Set to the MAX COOL (Lo) position before removing the driver's air mix control motor.

Note for Passenger's Air Mix Control Motor

- Set to the MAX COOL (Lo) position before removing the passenger's air mix control motor.

Note for Mode Control Motor

- Set the VENT ( ) position before removing the mode control motor.

Note for Recirculation Control Motor

- Set the FRESH position before removing the recirculation control motor.

Note for HVAC Unit

- Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the auxiliary electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.
- Note the layout of the hoses.

Note for Heater Core

- The pipe portion of the heater core can be easily bend. When removing the heater core, grab the core side of the pipe.
- Make sure the heater core fins do not have any deformation, damage, or rust.

Note for Evaporator Core

- Be careful not to damage the evaporator core.

*2	With dual zone climate control

1. Climate Control Panel - Remove

   Note for installation

   Run the self-diagnostic function to confirm that there are no problems in the system .

2. Sunlight Sensor - Remove
   1. Remove the dashboard center panel .
   2. Remove the sunlight sensor.
3. Humidity/In-Car Temperature Sensor (with climate control) - Remove
   1. Remove the driver's dashboard lower cover .
   2. Remove the humidity/in-car temperature sensor.
4. Mode Control Motor - Remove
   1. Remove the following items:
      - Passenger's dashboard undercover

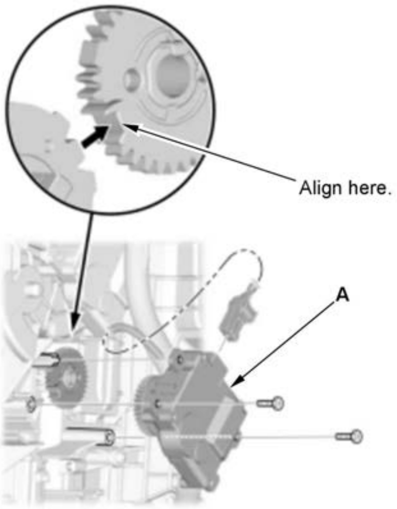
- **Glove box**

2. Remove the mode control motor.

Note for installation

- Before installation, make sure the door and linkage move smoothly.
- After installation, **do the Self-Diagnostic Function with the HDS or the climate control unit** .

5. Air Mix Control Motor, Passenger's Air Mix Control Motor - Remove



1. Remove the following items:
   - **Passenger's dashboard undercover**
   - **Glove box**

2. Without dual zone climate control: Remove the air mix control motor.

With dual zone climate control: Remove the passenger's air mix control motor.

Note for installation

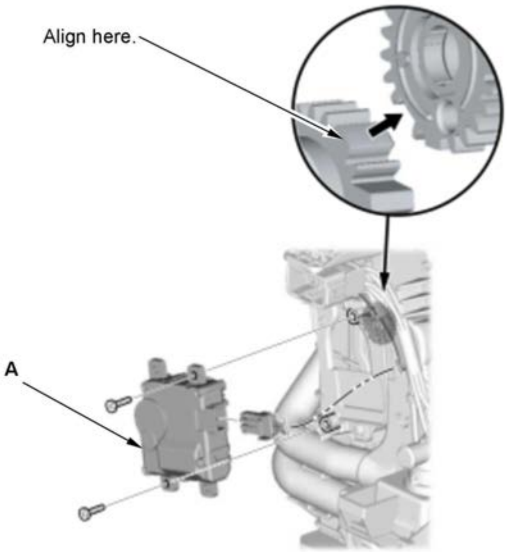
- Make sure the door lever moves smoothly before installation.
- When you install the air mix control motor (A), align the air mix control motor with the gear, then install the motor.
- After installation, **do the Self-Diagnostic Function with the HDS or the climate control unit** .

6. Power Transistor - Remove

1. **Remove the passenger's dashboard undercover** .

2. Remove the power transistor.

7. Driver's Air Mix Control Motor - Remove



1. **Remove the driver's dashboard undercover** .
2. Remove the driver's air mix control motor.

Note for installation

- Make sure the door lever moves smoothly before installation.
- When you install the air mix control motor (A), align the air mix control motor with the gear, then install the motor.
- After installation, **do the Self-Diagnostic Function with the HDS or the climate control unit** .

8. PTC Heater Core - Remove

    1. Remove the following items:

        - **Driver's dashboard lower cover**
        - **Driver's front console cover**
        - Aspirator hose
        - Aspirator
        - Driver's heater duct
        - **CAN gateway**

    2. Remove the PTC heater core.

9. Recirculation Control Motor - Remove

    1. Remove the following items:

        - **Passenger's dashboard undercover**
        - **Glove box**

    2. Remove the recirculation control motor.

    Note for installation

    - Before installation, make sure the door and linkage move smoothly.
    - After installation, **do the Self-Diagnostic Function with the HDS or the climate control unit** .

10. Dust and Pollen Filter - Remove

    1. Open and hang the glove box down.

    2. Remove the lid.

    3. Remove the dust and pollen filter.

    NOTE: Do not clean the dust and pollen filter.

    Note for installation Install the dust and pollen filter with the AIR FLOW arrow mark pointed down.

11. Blower Motor - Remove

    1. **Remove the passenger's dashboard undercover** .

    2. Remove the blower motor.

12. Climate Control Unit - Remove

    1. **Remove the glove box** .

    2. Remove the climate control unit.

    Note for installation

    - Before installation, make sure the door and linkage move smoothly.
    - After installation, **run the self-diagnostic function to confirm that there are no problems in the system** .

13. Blower Unit - Remove

1. **Remove the glove box** .

2. Remove the blower unit.

14. HVAC Unit - Remove

1. Before removing the HVAC unit, do the following procedures:

- **Recover the refrigerant** .
- **Disconnect the 12 volt battery negative terminal** .
- **Drain the engine coolant** .

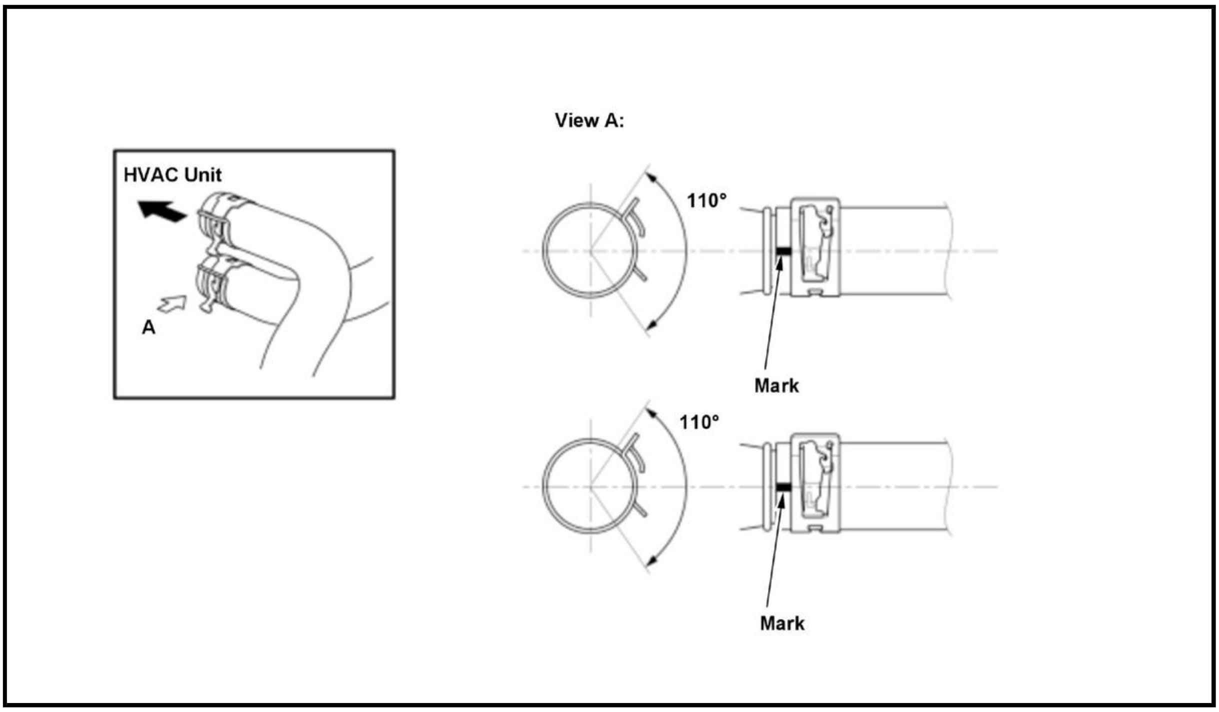
2. **Remove the dashboard/steering hanger beam** .

3. Remove the HVAC unit.

Note for installation

- **Refer to Under-Hood side for A/C lines installation torque**.
- Make sure the hose clamps are positioned as shown.
- Make sure the hose clamps is in the position of its range shown.

Heater hose



15. Heater Core - Remove

1. Remove the following items:

-1. HVAC unit

-2. Grommet

-3. Heater core cover

-4. Heater pipe bracket

2. Remove the heater core.

16. Evaporator Core - Remove

1. Remove the following items:

-1. HVAC unit

-2. Blower unit

-3. Heater core

-4. Driver's air mix control motor and bracket (with dual zone climate control)

-5. Expansion valve

-6. Evaporator case

2. Remove the evaporator core.

Note for installation

- If you are installing a new evaporator core, add the **appropriate refrigerant oil for the A/C compressor which installed to the vehicle** .
- **Refer to Under-Hood side for expansion valve installation torque**.

17. Evaporator Temperature Sensor - Remove

1. Remove the evaporator core.

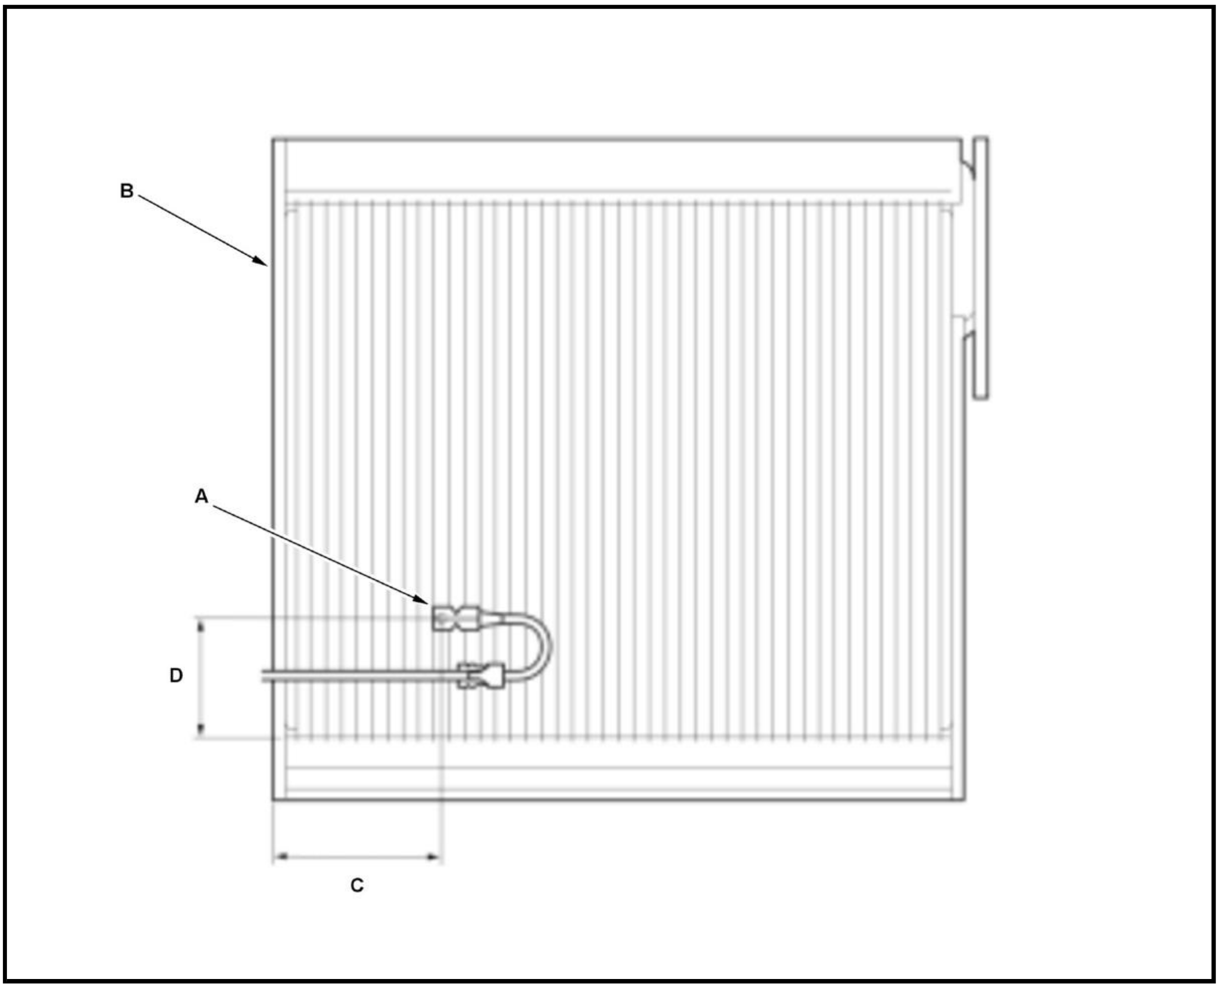
2. Remove the evaporator temperature sensor.

Note for installation

Install the evaporator temperature sensor (A) in the evaporator core (B). Refer to the following position list.

B	C	D *
	Row	mm (in)
Factory-Preset Position	9th	50 (1.97)
New Position	10th	50 (1.97)

*: Measure from end of aluminum evaporator tank.



Test

SRS components are located near the mode control motor and the recirculation control motor. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: Before testing the each item, check for **climate control DTCs** .

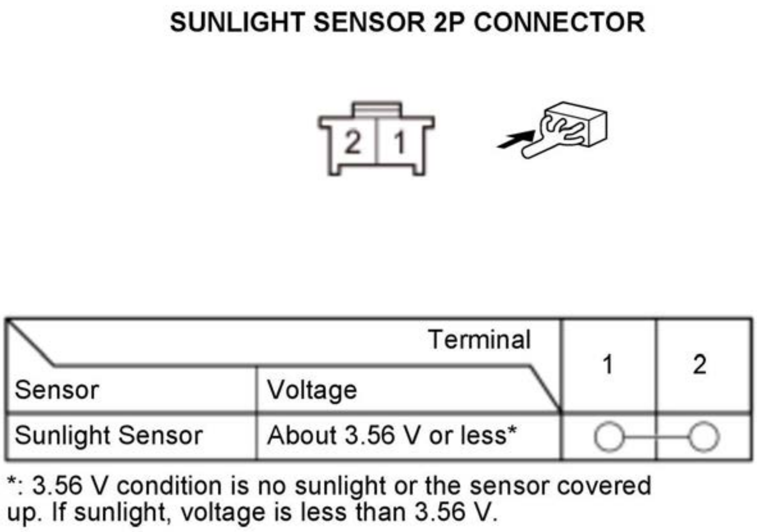
Note for Sunlight Sensor

- The sunlight sensor (automatic lighting control unit-sensor) 5P connector type cannot be tested. Therefore, if no DTC is indicated, the sensor is normal.

Note for Humidity/In-Car Temperature Sensor

- The climate control unit receives humidity (%) data via digital signal.
- The climate control unit receives in-car temperature (B°C) data via digital signal.

1. Sunlight Sensor - Test



Sensor	Voltage	Terminal 1	2
Sunlight Sensor	About 3.56 V or less*	○	○

*: 3.56 V condition is no sunlight or the sensor covered up. If sunlight, voltage is less than 3.56 V.

1. Remove the sunlight sensor.

NOTE: Do not disconnect the connector.

2. Turn the vehicle to the ON mode.

3. Measure the voltage between terminals according to the table.

NOTE: The voltage readings will not change under the light of a flashlight or a fluorescent lamp.

4. If the voltage is not as specified, replace the sunlight sensor.

2. Humidity/In-Car Temperature Sensor - Test

1. Refer to "Run the Sensor Input Display Mode" in General Troubleshooting Information under How to Troubleshoot the Climate Control System .

3. Air Mix Control Motor, Driver's Air Mix Control Motor, Passenger's Air Mix Control Motor, Mode Control Motor, Recirculation Control Motor and Water Valve Control Motor - Test

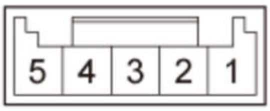
NOTE: For locations or names of each motor, refer to Component Location Index .

1. Remove the following items:

Motor	Glove Box Removal	Driver's Dashboard Undercover Removal	Passenger's Dashboard Undercover Removal
Air Mix Control Motor (Without dual zone climate control)	○	---	○
Driver's Air Mix Control Motor (With dual zone climate control)	---	○	---
Passenger's Air Mix Control Motor (With dual zone climate control)	○	---	○
Mode Control Motor	○	---	○
Recirculation Control Motor	○	---	○

2. Disconnect the connector for necessary inspections.

The diagram below details the motor connector design used on this vehicle.



CAUTION: **Incorrectly applying power and ground to the HVAC control motors will damage it. Follow the instructions carefully.**

3. Test the motor in each direction by connecting a 12 volt battery power and ground at the connector according to the table. The motor should run smoothly, then stop. As soon as the motor stops, disconnect the 12 volt battery power immediately.

Motor	Position \ Terminal	1	2	3	4	5
Air Mix Control Motor	MAX COOL (Lo)				⊕	⊖
	MAX HOT (Hi)				⊖	⊕
Driver's Air Mix Control Motor	MAX COOL (Lo)				⊖	⊕
	MAX HOT (Hi)				⊕	⊖
Passenger's Air Mix Control Motor	MAX COOL (Lo)				⊕	⊖
	MAX HOT (Hi)				⊖	⊕
Mode Control Motor	VENT ( )				⊕	⊖
	DEFROST ( )				⊖	⊕
Recirculation Control Motor	FRESH ( )				⊕	⊖
	RECIRCULATE ( )				⊖	⊕

4. If any of the HVAC control motors did not run in step 2, remove it, then check the control linkage and door for smooth movement.

- If the linkage and doors move smoothly, go to step 4.
- If the linkage or door sticks or binds, repair them as needed.

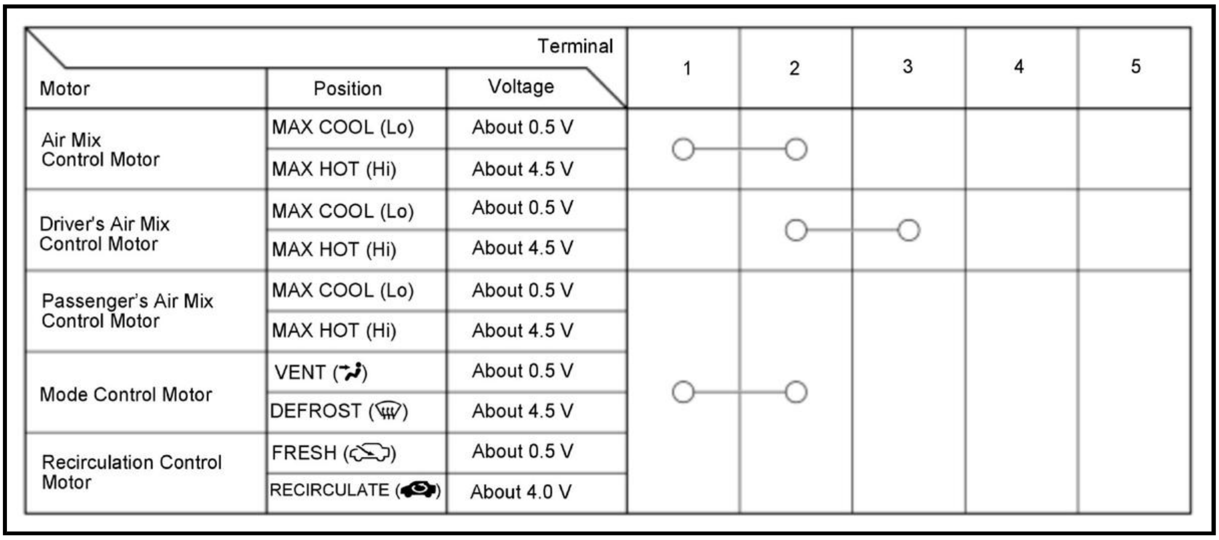
5. Measure the resistance between terminals according to the table.

Motor	Resistance \ Terminal	1	2	3	4	5
Air Mix Control Motor	4.2 to 7.8 kΩ	○	—	○		
Driver's Air Mix Control Motor						
Passenger's Air Mix Control Motor						
Mode Control Motor						
Recirculation Control Motor	3.5 to 6.5 kΩ	○	—	○		

6. Reconnect the connector which was removed in the step 1.

7. Turn the vehicle to the ON mode.

8. Measure the voltage between terminals according to the table.

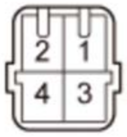


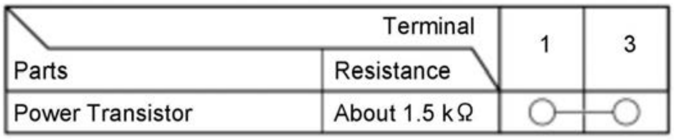
Motor	Position	Terminal / Voltage	1	2	3	4	5
Air Mix Control Motor	MAX COOL (Lo)	About 0.5 V	○	○			
	MAX HOT (Hi)	About 4.5 V					
Driver's Air Mix Control Motor	MAX COOL (Lo)	About 0.5 V		○	○		
	MAX HOT (Hi)	About 4.5 V					
Passenger's Air Mix Control Motor	MAX COOL (Lo)	About 0.5 V	○	○			
	MAX HOT (Hi)	About 4.5 V					
Mode Control Motor	VENT	About 0.5 V					
	DEFROST	About 4.5 V					
Recirculation Control Motor	FRESH	About 0.5 V					
	RECIRCULATE	About 4.0 V					

9. If either the resistance or the voltage readings are not as specified, replace the faulty motor.

4. Power Transistor - Test

POWER TRANSISTOR 4P CONNECTOR





Parts	Terminal / Resistance	1	3
Power Transistor	About 1.5 kΩ	○	○

1. **Remove the passenger's dashboard undercover**

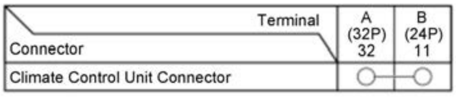
2. Disconnect the power transistor connector.

3. Measure the resistance between terminals according to the table.

- If the resistance is within the specifications, go to step 4.
- If the resistance is not within the specifications, replace the power transistor.

  NOTE: Also check the blower motor. Power transistor failure can be caused by a defective blower motor.

4. Reconnect the power transistor connector.



Connector	Terminal	A (32P) 32	B (24P) 11
Climate Control Unit Connector		○	○

5. Disconnect the following connectors:

- Climate control unit connector A (32P)
- Climate control unit connector B (24P)

6. Refer to **Climate Control Unit Connector for Inputs and Outputs** and connect terminals with a jumper wire according to the table.

7. Turn the vehicle to the ON mode.

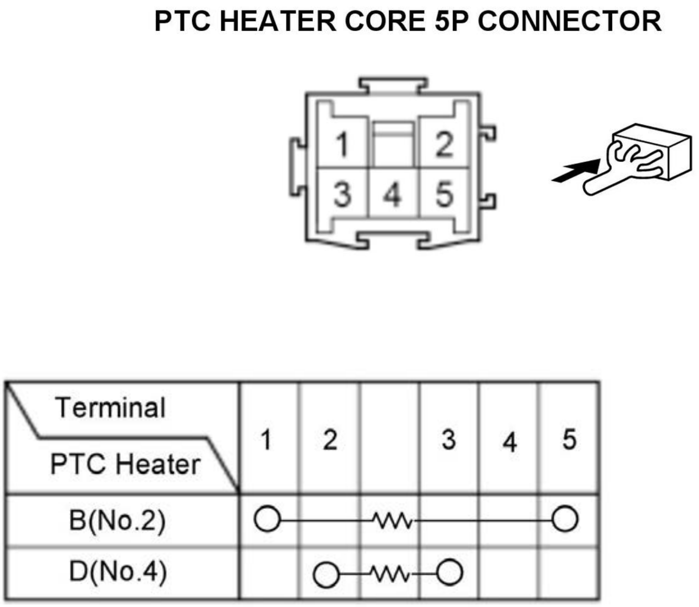
8. Check that the blower motor runs.

- If the blower motor does not run, replace the power transistor.

  NOTE: A faulty blower motor can cause the power transistor to fail. Before replacing the power transistor, check the blower motor for binding, and replace the blower motor if necessary.

- If the blower motor runs, the power transistor is OK.

5. PTC Heater Core - Test



Terminal / PTC Heater	1	2		3	4	5
B(No.2)	○		∿			○
D(No.4)		○	∿	○		

1. **Remove the driver's dashboard lower cover**

2. Disconnect the PTC heater 5P connector.

3. Check for continuity between terminals according to the table.

4. If the continuity is not as specified, replace the PTC heater core.

6. Evaporator Temperature Sensor - Test

	1. Remove the evaporator temperature sensor. 2. Dip the sensor in ice water, and measure the resistance between terminals No. 1 and No. 2. 3. Then pour warm water on the sensor, and check for a change in resistance. 4. Compare the resistance readings with the specifications shown in the graph; the resistance should be within the specifications. 5. If the resistance is not as specified, replace the evaporator temperature sensor.

CLIMATE CONTROL SYSTEM (UNDER-HOOD) REMOVAL, INSTALLATION, AND TEST

Removal and Installation

WARNING:

- **The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.**
- **Wear insulated gloves and use insulated tools to protect you from electrical shock. When removing or installing high voltage items, always use them. Wrap the high voltage items with insulating tape after removing.**

  Please be careful when you see ⚠ on the illustration.

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain service precautions before doing repairs or service.

NOTE:

- Make sure you review the A/C service tips and precautions before doing repairs or servicing.
- Although a numbered sequence is shown, the parts can be removed independently of each other.
- Review the A/C refrigerant oil replacement before doing repairs or service.
- Plug or cap the lines immediately after disconnecting them to avoid moisture and dust contamination.
- Apply compressor oil when installing O-rings.
- Install the parts in the reverse order of removal unless otherwise specified.

Note for Electric Heater Coolant Pump

- Engine coolant will run out when the hoses are disconnected; drain it into a clean drip pan. Be sure not to let coolant spill on the auxiliary electrical parts or the painted surfaces. If any coolant spills, rinse it off immediately.
- Note the layout of the hoses.

Note for Electric A/C Compressor

- The electric A/C compressor is a high-voltage system. The high voltage cables and their covers are identified by orange coloring. The safety labels are attached to high voltage and other related parts. You must be familiar with the electrical powertrain before working around it. Make sure you have read the Service Precautions in the electrical powertrain section before doing repairs or service.
- Wear insulated gloves and use insulated tools to protect you from electrical shock.

Note for Electric A/C Compressor Relief Valve

- If the electric A/C compressor relief valve released refrigerant to the atmosphere, determine and correct the cause of the excessive system pressure, then replace the relief valve.
- Plug the opening to keep moisture and foreign material from entering the system, and the electric A/C compressor oil from running out.

Note for A/C Condenser

- Be careful not to damage the radiator fins, the A/C condenser fins, and the receiver line when removing the A/C condenser.

Procedure

*1	Test item

1. Expansion Valve - Remove
    1. [Recover the refrigerant from the A/C system]() .

    2. Remove the expansion valve.
2. Electric Heater Coolant Pump - Remove

    1. **Drain the engine coolant** .

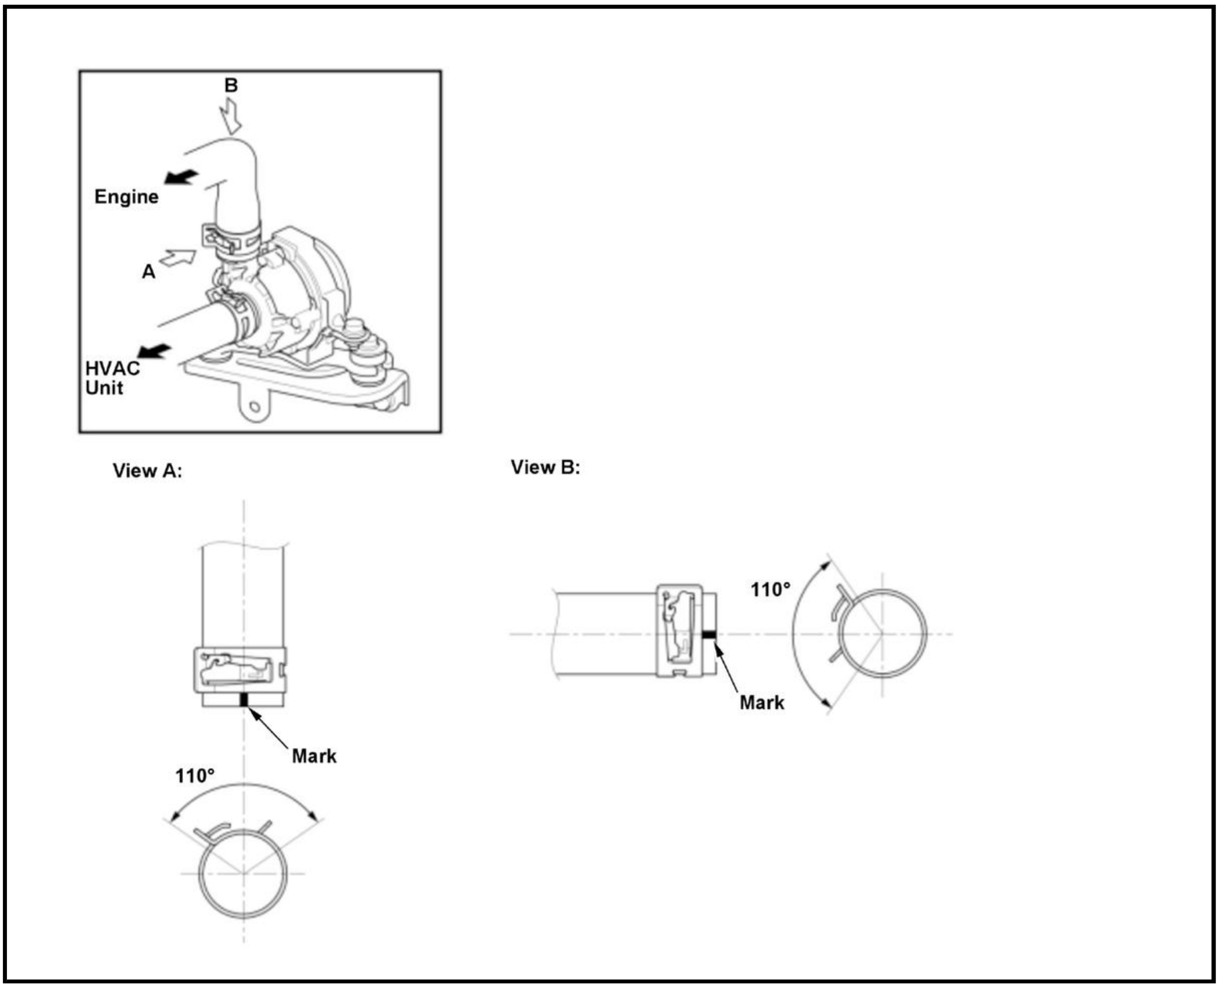
    2. **Remove the engine undercover** .

    3. Remove the electric heater coolant pump.

    Note for installation

    - Make sure the hose clamp is positioned as shown.
    - Make sure the hose clamp is in the position of its range shown.
    - Make sure that there is no engine coolant leakage.

    Heater hose



3. Electric A/C Compressor - Remove

    1. Before removing the electric A/C compressor, do the following procedures:

        - **Turning off the service plug** .
        - **Recover the refrigerant** .

    2. **Remove the front engine undercover** .

    3. Remove the electric A/C compressor.

    Note for installation

- Do not install the electric A/C compressor into a system unless you are completely sure that the system is free of contamination. Installing the electric A/C compressor into a contaminated system can result in premature electric A/C compressor failure. **Refer to A/C System Contamination Inspection** .
- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- If you are installing a new electric A/C compressor, **you must calculate the amount of refrigerant oil to be removed from it** . A new electric A/C compressor comes with a full charge of oil.

4. Electric A/C Compressor Relief Valve - Remove

    1. **Recover the refrigerant from the A/C system** .

    2. **Remove the front engine undercover lid** .

    3. Remove the electric A/C compressor relief valve.

5. A/C Condenser - Remove

    1. **Recover the refrigerant from the A/C system** .

    2. **Remove the shutter grille** .

    3. Remove the A/C condenser.

    Note for installation If you are installing a new A/C condenser, **add the appropriate refrigerant oil for the electric A/C compressor which installed to the vehicle** .

6. Desiccant - Remove

    1. **Recover the refrigerant from the A/C system**

    2. Remove the A/C condenser.

    3. Remove the desiccant.

    Note for installation

    - Install the desiccant as quickly as possible to prevent the system from absorbing moisture from the air.
    - If you are installing a new desiccant, **add the appropriate refrigerant oil for the electric A/C compressor which installed to the vehicle** .
    - Install the cap to the specified torque. It is made of resin and can be easily stripped.

7. A/C Pressure Sensor - Remove

    1. **Recover the refrigerant from the A/C system** .

    2. Remove the A/C pressure sensor.

    NOTE: Hold the A/C pressure sensor block with a wrench to prevent damaging the discharge hose, then remove and install the A/C pressure sensor.

8. Outside Air Temperature Sensor - Remove

    1. **Remove the front bumper** .

    2. Remove the outside air temperature sensor.

Test

NOTE: Before testing the each item, **check for climate control DTCs** .

1. Outside Air Temperature Sensor - Test

	1. **Remove the front bumper** 2. Remove the outside air temperature sensor. 3. Dip the sensor in ice water, and measure the resistance between terminals No. 1 and No. 2. 4. Then pour warm water on the sensor, and check for a change in resistance. 5. Compare the resistance readings with the specifications shown in the graph, the resistance should be within the specifications. 6. If the resistance is not as specified, replace the outside air temperature sensor.

HEATED STEERING WHEEL SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: The heated steering wheel switch is a part of the ACC combination switch, and it cannot be replaced by itself.

1. **ACC Combination Switch - Remove**
2. All Remove Parts - Install

1. Install the parts in the reverse order of removal.

Test

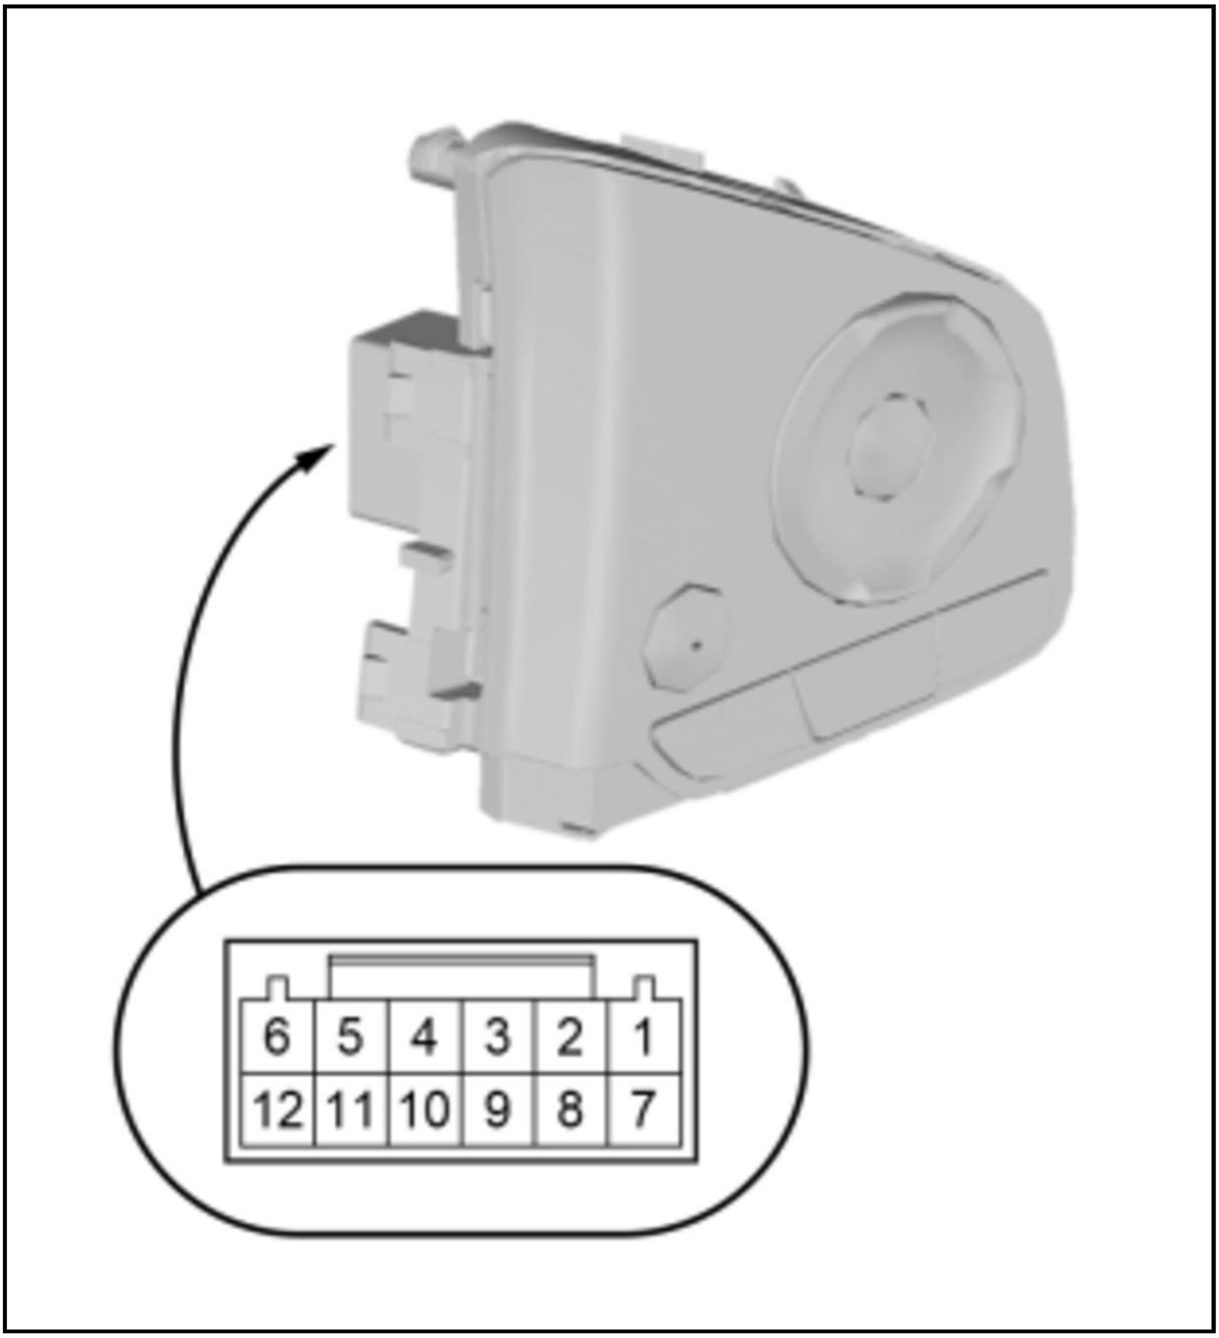
1. Heated Steering Wheel Switch - Test

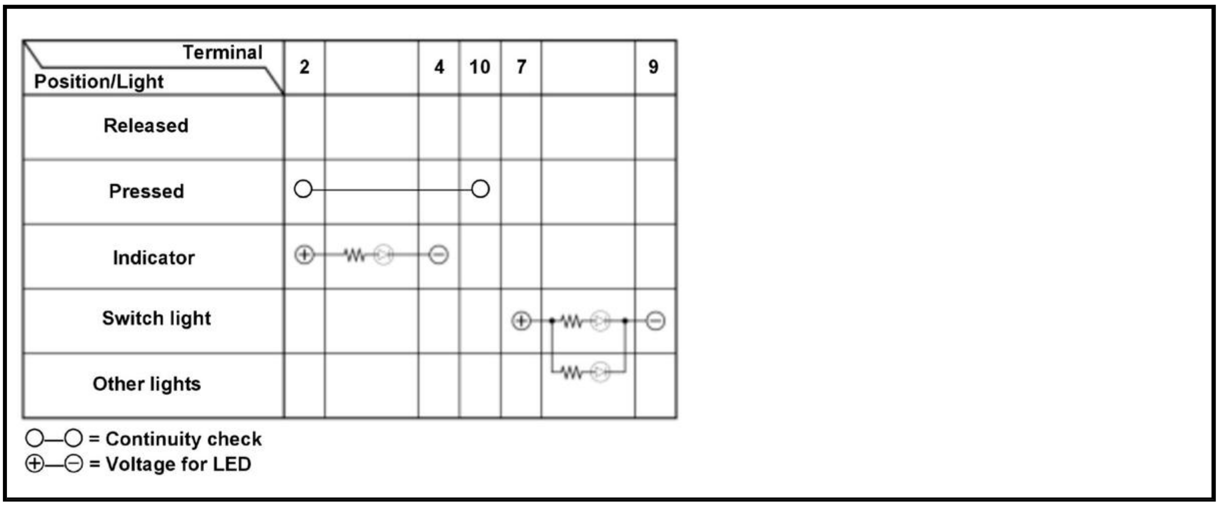
   1. Check for continuity between the terminals in each switch position according to the table.

   NOTE:

   - When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.

- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).





Terminal Position/Light	2		4	10	7		9
Released							
Pressed	○	—	—	○			
Indicator	⊕	—W—⊳—	⊖				
Switch light					⊕	—W—⊳—	⊖
Other lights						—W—⊳—	

○—○ = Continuity check

⊕—⊖ = Voltage for LED

2. If the result is not as specified, replace the heated steering wheel switch.

REPLACEMENT

A/C REFRIGERANT OIL REPLACEMENT (1234YF)

*Available through the Honda Tool and Equipment Program; call 888-424-6857.

Special Tools Required

Image	D
	R-1234yf POE Oil In

Replacement

NOTE: How to read the torque specifications .

1. A/C Refrigerant Oil - Replace

1.5 L engine

Recommended POE oil: RL85HM
P/N 38899-RLV-A01: 40 m L(1 1/3 fl oz)

2.4 L engine

Recommended POE oil: DENSO ND-OIL 14
NOTE: Although the refrigerant oil information is listed on the under-hood air conditioning information label, always use the recommended refrigerant oil listed in this service manual.
P/N 38899-50Z-G01: 40 m L(1 1/3 fl oz)

It is important to have the correct amount of refrigerant oil in the A/C system to ensure proper lubrication of the A/C compressor. Too little oil damages the A/C c
the system, and can produce high vent temperatures.

- To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
- Use the refrigerant oil immediately after opening the container, and dispose of any unused oil. The oil rapidly absorbs moisture, which damages its electrica
- Do not spill the refrigerant oil on the vehicle, because it may damage painted surfaces. If refrigerant oil contacts the paint, wash it off with water immediate

Add the recommended refrigerant oil in the amount listed if you replace any of the following parts:

Parts	Oil Amount
A/C condenser	**25 mL (5/6 fl oz)**
Evaporator	**40 mL (1 1/3 fl oz)**
Line or hose	**10 mL (1/3 fl oz)**
Desiccant	**10 mL (1/3 fl oz)**
Leakage repair	**25 mL (5/6 fl oz)**
A/C compressor	**77-103 mL (2 3/5-3 1/2 fl oz) *1**
	95-107 mL (3 1/5-3 3/5 fl oz) *2

*1: 1.5 L engine*2: 2.4 L engine

1.5 L engine

2. A/C Compressor Oil - Adjustment

1. Cover the pulley and clutch with plastic bag to prevent from spilling the oil.

A/C REFRIGERANT OIL REPLACEMENT(134A)

*Available through the Honda Tool and Equipment Program; call 888-424-6857.

Special Tools Required

Image	I
	PAG Oil Injector R

Replacement

NOTE: How to read the torque specifications .

1. A/C Refrigerant Oil - Replace

   Recommended PAG oil: DENSO ND-OIL 8

   P/N 38897-PR7-A01AH: 120 mL (4 fl oz)

   It is important to have the correct amount of refrigerant oil in the A/C system to ensure proper lubrication of the A/C compressor. Too little oil damages the A/C c
   the system, and can produce high vent temperatures.

   - To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
   - Immediately after using the oil, reinstall the cap on the container, and seal it to avoid moisture absorption.
   - Do not spill the refrigerant oil on the vehicle, because it may damage painted surfaces. If refrigerant oil contacts the paint, wash it off with water immediate

   Add the recommended refrigerant oil in the amount listed if you replace any of the following parts:

Parts	Oil Amount
A/C condenser	**25 mL (5/6 fl oz)**
Evaporator	**40 mL (1 1/3 fl oz)**
Line or hose	**10 mL (1/3 fl oz)**
Desiccant	**10 mL (1/3 fl oz)**
Leakage repair	**25 mL (5/6 fl oz)**

   *1: 1.5 L engine*2: 2.4 L engine

Parts	Oil Amount
A/C compressor	**77-103 mL (2 3/5-3 1/2 fl oz) *1**
	95-107 mL (3 1/5-3 3/5 fl oz) *2

*1: 1.5 L engine*2: 2.4 L engine

A/C REFRIGERANT RECOVERY/EVACUATION/CHARGING (1234YF)

*These tools are available through the Honda Tool and Equipment Program; call 888-424-6857.

Special Tools Required

Image	Description/
	R-1234yf A/C Recover/Recycle/Recharge Ma
	R-1234yf POE Oil Injector ROB18470*

Procedure

WARNING:

- Compressed air mixed with the HFO-1234yf (R-1234yf) forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test HFO-1234yf (R-1234yf) service equipment or vehicle air conditioning systems.

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

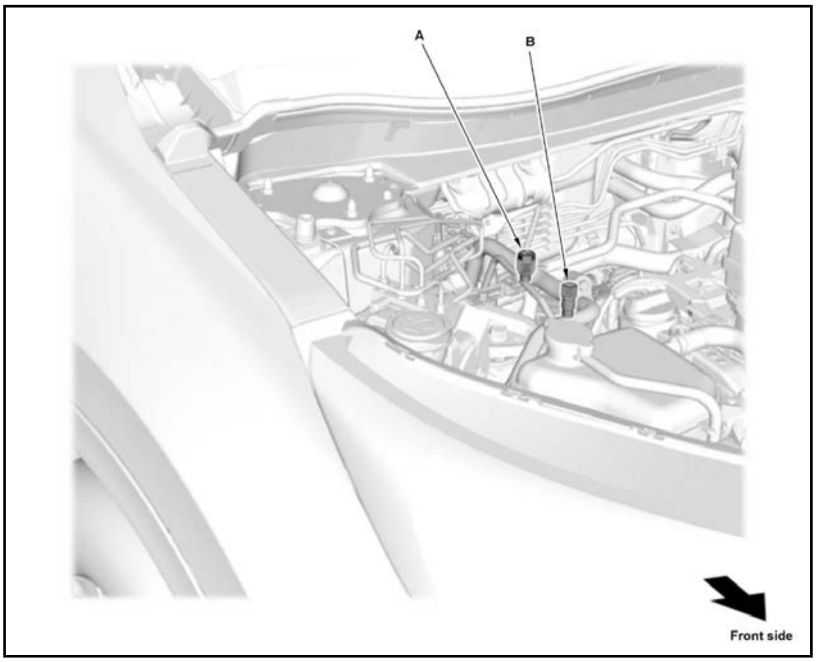
NOTE:

- If accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.
- Do not allow moisture to contaminate the A/C system oil. Moisture in the oil is difficult to remove, and it can damage the A/C compressor.
- Using an electronic vacuum gauge may decrease the required evacuation time because you can measure actual moisture level with this tool.
- Air conditioning refrigerant is poisonous. If ingested, get medical attention immediately.

When an A/C System has been opened to the atmosphere, such as during installation or repair, it must be evacuated using an A/C recover/recycle/recharge machine. If tl receiver/dryer or the desiccant, drain the **refrigerant oil**, and add fresh oil. Then evacuate the system for several hours before charging it.

1. A/C Recover/Recycle/Recharge Machine - Connect

   1. Connect an A/C recover/recycle/recharge machine to the high-pressure service port (A) and the low-pressure service port (B), as shown, following the equipme



2. A/C Refrigerant - Recover

   1. Recover the refrigerant from the A/C system.

   2. Measure the amount of **refrigerant oil**

   removed from the A/C system after the recovery process is completed. Be sure to put the same amount of new **refrigerant oil** back into the A/C system before ch

   B

3. A/C System - Evacuate

   1. Evacuate the system. The vacuum pump should run for a minimum of 30 minutes or until the moisture vacuum test passes, to eliminate all moisture from the sy mmHg, -27.55 inHg) for at least 30 minutes, or the moisture vacuum test passes, close all valves, and turn off the vacuum pump.

   2. If the suction gauge does not reach approximately -93.3 kPa (-700 mmHg, -27.55 inHg) in 15 minutes or the moisture vacuum test fails, there is probably a lea leaks.

   B

4. **A/C Refrigerant Leak Check**
5. A/C Refrigerant - Charge

   1. Charge the system with the specified amount of R-1234yf refrigerant. Do not overcharge the system; the A/C compressor will be damaged.Select the appropriat recover/recycle/recharge machine.

   1.5 L engine

Refrigerant Capacity:
435 to 485 g
15.34 to 17.11 oz
0.435 to 0.485 kg
0.959 to 1.069 lbs

   2.4 L engine

Refrigerant Capacity:
415 to 465 g
14.64 to 16.40 oz
0.415 to 0.465 kg
0.915 to 1.025 lbs

A/C REFRIGERANT RECOVERY/EVACUATION/CHARGING (134A)

*Available through the Honda Tool and Equipment Program; call 888-424-6857.The tool ROB14777 is only required if you are not using the ROB48920T A/C recover/ (compact electronic) vacuum gauge.

Special Tools Required

Image	Description/Tool
	Compact Electronic Vacuum Gauge Robinair ROB1477
	R134a A/C Automatic Recover/Recycle/Recharge Machi
	PAG Oil Injector Robinair ROB18480*

Procedure

WARNING:

- Compressed air mixed with the R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

NOTE:

- If accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.
- Do not allow moisture to contaminate the A/C system oil. Moisture in the oil is difficult to remove, and it can damage the A/C compressor.

- Using a thermistor (compact electronic) vacuum gauge may decrease the required evacuation time because you can measure actual moisture level with this tool.
- Air conditioning refrigerant is poisonous. If ingested, get medical attention immediately.

A more efficient way to measure moisture removal is with a special tool called a thermistor (compact electronic) vacuum gauge, measuring vacuum levels in microns. T recover/recycle/recharge machine has a built-in thermistor (compact electronic) vacuum gauge. If you are using a different A/C recover/recycle/recharge machine, a sep

Connect the tool according to the manufacturers instructions and allow the vacuum pump to run until the gauge reads 750 microns.

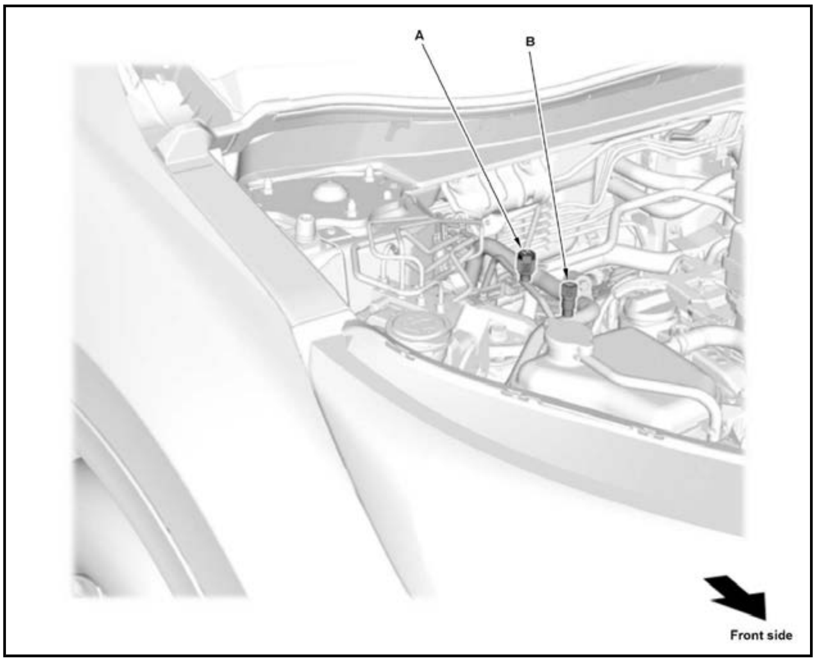
Shut off and isolate the vacuum pump, then observe the gauge reading:

- If the vacuum level remains stable at 750 microns for at least three minutes, all moisture in the system has been removed.
- A slow increase in the micron reading means there is still moisture boiling out of the system. Restart the vacuum pump and continue evacuating.
- A quick increase of micron levels indicates a leak is present in the system or your service equipment. Determine the cause and correct the leak before continuing.

When an A/C System has been opened to the atmosphere, such as during installation or repair, it must be evacuated using an A/C recover/recycle/recharge machine. If tl receiver/dryer or the desiccant, drain the **refrigerant oil**, and add fresh oil. Then evacuate the system for several hours before charging it.

1. A/C Recover/Recycle/Recharge Machine - Connect

   1. Connect an A/C recover/recycle/recharge machine to the high-pressure service port (A) and the low-pressure service port (B), as shown, following the equipme



2. A/C Refrigerant - Recover

   1. Recover the refrigerant from the A/C system.

   2. Measure the amount of **refrigerant oil**

   removed from the A/C system after the recovery process is completed. Be sure to put the same amount of new **refrigerant oil** back into the A/C system before ch:

B

3. A/C System - Evacuate

   1. Evacuate the system. The vacuum pump should run for a minimum of 30 minutes or until the moisture vacuum test passes, to eliminate all moisture from the sy mmHg, -27.55 inHg) for at least 30 minutes, or the moisture vacuum test passes, close all valves, and turn off the vacuum pump.

   2. If the suction gauge does not reach approximately -93.3 kPa (-700 mmHg, -27.55 inHg) in 15 minutes or the moisture vacuum test fails, there is probably a leal leaks.

B

4. **A/C Refrigerant - Leak Check**
5. A/C Refrigerant - Charge

   1. Charge the system with the specified amount of R-134a refrigerant. Do not overcharge the system; the A/C compressor will be damaged. Select the appropriate recover/recycle/recharge machine.

1.5 L engine

DESCRIPTION & OPERATION

A/C SYSTEM DESCRIPTION

The air conditioning system regulates temperature air outlet by mixing cold and warm air in an appropriate ratio. The heater core and evaporator core are installed in the mode control damper. The blower unit is composed of a blower motor, the recirculation control damper and the dust and pollen filter. The blower unit is connected to th

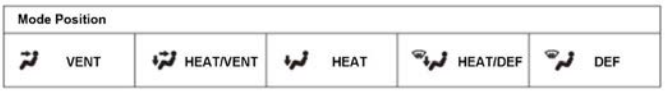
Climate Control



Mode Position				
VENT	HEAT/VENT	HEAT	HEAT/DEF	DEF

The climate control system transmits appropriate signals to each motor based on the information (sunlight, humidity, in-car temperature, outside air temperature) receiv

- Air Mix Control Motor: The system controls the temperature of air coming into the cabin by the air mix control motor adjusting the air mix control damper positi air.
- Mode Control Motor: The system directs the airflow to the specified area by the mode control motor switching the mode control damper position to the "VENT",
- Recirculation Control Motor: The recirculation control motor switches the recirculation control damper position to the "FRESH" or "RECIRCULATION".

- BLOWER MOTOR: The blower motor changes the air volume based on the voltage adjusted by the blower power transistor.

The climate control unit optimizes these controls in order to maintain passenger comfort.

Relationship Between Vent (Air Outlet) Temperature and Actual In-Car Temperature

The climate control unit can automatically control vent temperature (air mix position), blower motor speed, blower intake, and A/C compressor operation to raise or low customer's setting temperature. The actual vent outlet temperature largely depends upon the difference between the in-car temperature sensor reading and the customer's

Warm-Up Control

If heating is desired, and there is no available heat due to low engine coolant temperature, the climate control unit will slow the fan speed to avoid ventilating cold air. T speed as the engine coolant temperature rises.

The conditions that this control becomes effective are as follows:

- Fan speed "AUTO"
- Air outlet position "AUTO", "HEAT", or "HEAT/DEF"
- Outside air temperature is less than 68B°F (20B°C)
- Engine coolant temperature sensor is normal.
- Engine coolant temperature is less than 131B°F (55B°C)

Low Engine Coolant Temperature Control

When the engine coolant temperature is low, the climate control system changes an air outlet position to the "DEF". When the engine coolant temperature increases, the outlet air temperature automatically.

Relationship Between Vehicle Speed and Blower Intake Mode

Because the air resistance is different between fresh air and recirculated air, the volume of air coming through the vents would be different if the fan speed was constant "FRESH", the fresh air flow increases as the vehicle speed increases. The climate control unit regulates the fan speed so that the air volume is the same when "FRESH"

A/C Control

To prevent the evaporator from freezing, the climate control unit switches the A/C compressor ON and OFF based on the evaporator temperature sensor value. While in automatically varies the A/C compressor operation time based on the evaporator temperature sensor value, as well as the outside air temperature.

MAX Control

When the temperature setting is adjusted to "MAX COOL (Lo)" or "MAX HOT (Hi)", the climate control unit overrides automatic control and defaults to the following

- MAX COOL

  "RECIRC", "VENT", blower fan maximum speed, and A/C system ON.

- MAX HOT

  "FRESH", "HEAT*", blower fan maximum speed, and A/C system ON.*: If the sensor information indicates that the windshield may fog, the air outlet switches t

Customize Function

How to Change the Set Temperature (Climate Control Panel with Display)

The climate control unit has a function to change the set temperature +2.7B°F (+1.5B°C) or -2.7B°F (-1.5B°C) in case customers feel the temperature is too warm or too

NOTE: Verify that the climate control and A/C system is working properly before enabling the customize function to offset the set temperature.

- Turn the vehicle to the ON mode, then based on the desired temperature change, set the temperature condition on the temperature control dial according to the tab
- Turn the climate control system OFF then turn the vehicle to the OFF (LOCK) mode.
- Depending on desired setting change, press and hold the pair of buttons according to the table.
- While holding the buttons, turn the vehicle to the ON mode.
- Keep the buttons pressed for 10 seconds.

Setting	Temperature Condition	Buttons		
+2.7B°F (+1.5B°C) Change	Hi			or

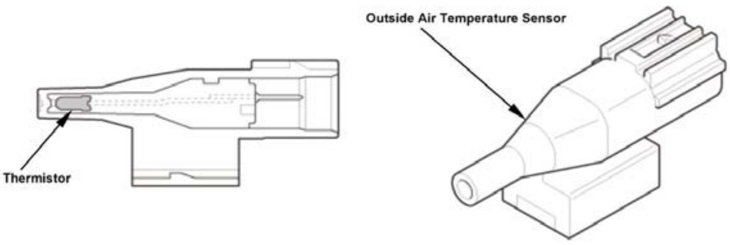
A/C SYSTEM DESCRIPTION - COMPONENTS (2017 2018 2019)

Outside Air Temperature Sensor

The outside air temperature sensor is installed on the front side of the vehicle, behind the front bumper. The outside air temperature sensor uses a sensor that decreases r unit calculates the outside air temperature based on the information received from the outside air temperature sensor.

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

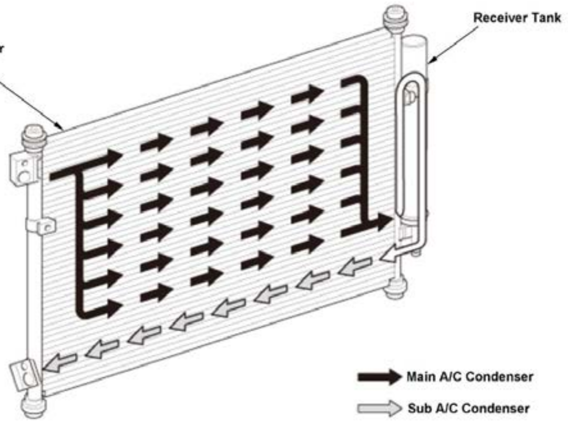


A/C Condenser

The condenser and receiver/dryer are integrated. The main A/C condenser changes the high pressure and temperature refrigerant vapor from the electric A/C compresso the refrigerant to release heat to the outside air. The receiver/dryer acts as a reservoir of liquid refrigerant for the expansion valve. It also removes debris and moisture fr pressure and temperature liquid refrigerant even further to improve A/C performance.

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

Sub Cool Cycle Condenser System

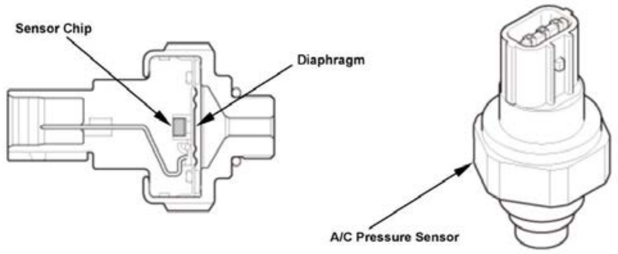


A/C Pressure Sensor

The A/C pressure sensor is attached to the receiver line on the outlet side of the A/C condenser. The sensor's output voltage changes in response to changes in A/C disch
used to drive the A/C compressor. The PCM also controls the radiator fan and A/C condenser fan. When the A/C system pressure rises to the upper limit, or decreases to
protect the system.

- Upper limit: 2, 950 kPa (30.08 kgf/cm 2, 427.9 psi)
- Lower limit: 196 kPa (2.00 kgf/cm 2, 28.4 psi)
- High speed fans switch point: 1, 600 kPa (16.32 kgf/cm 2, 232.1 psi)

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.



A/C Compressor

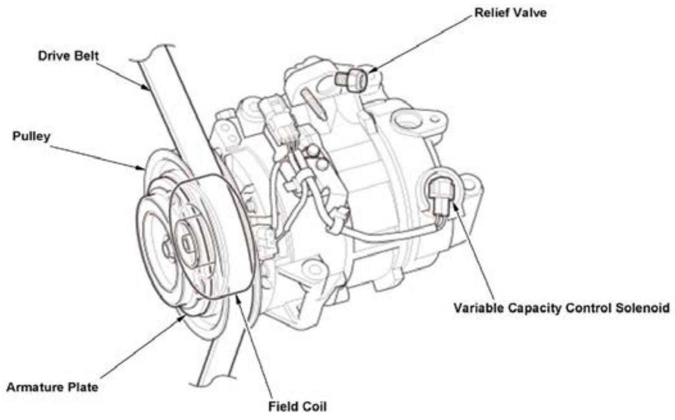
The A/C compressor is a pump that compresses refrigerant. It is driven by the engine accessory drive belt. When the compressor clutch is OFF, the pulley and armature
operate. When the compressor clutch is ON, the field coil is energized, creating a strong magnetic field. This magnetic field locks the pulley and armature plate together
becomes a high pressure and temperature vapor that is sent to the A/C condenser.

The A/C compressor has a mechanical relief valve, and the valve opens when refrigerant pressure exceeds the rated value. It cannot be reused, and should be replaced.

Variable Capacity Control (1.5 L Engine)

The climate control unit operates the variable capacity control solenoid on the A/C compressor. The solenoid controls the cooling capacity by adjusting the flow of refri
control unit determines the solenoid circuit's current flow based on the outside air temperature sensor, the in-car temperature sensor, and solar radiation values.

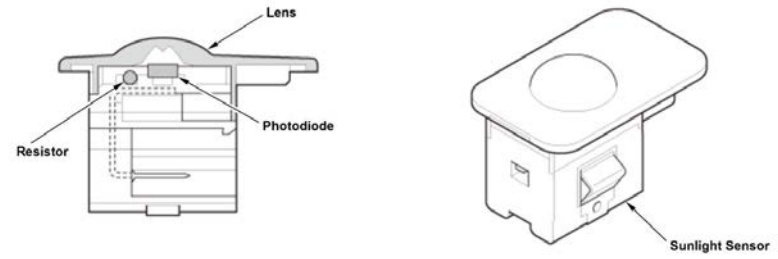
NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.



Sunlight Sensor

The sunlight sensor is attached to the upper face of the dashboard. The sunlight sensor uses a photodiode-type optical sensor which changes current in proportion to the
information of the sunlight sensor.

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.



Lens
Photodiode
Resistor
Sunlight Sensor

Evaporator Temperature Sensor

The evaporator temperature sensor is a clip-type thermistor, with a sensing element that is directly mounted to the evaporator core fins. The sensor is connected to the cl temperature. The A/C compressor and fans are cycled off briefly if the temperature approaches the freezing point of water. If the evaporator temperature goes too low, th causing restricted evaporator airflow and poor A/C performance.

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

CHECK

A/C COMPRESSOR CLUTCH CHECK

Check

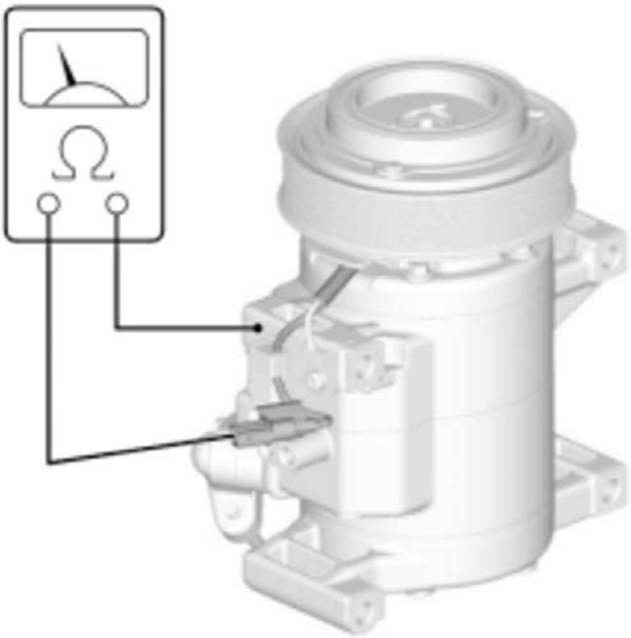
1. A/C Compressor Clutch Clearance - Check

 	1. Check the armature plate (A) for discoloration, peeling, or other dama 2. Check the pulley (B) bearing play and drag by rotating the pulley by l Replace the clutch set with a new one if it is noisy, has excessive play/dr faces. **NOTE:** **The pulley and the armature plate were mated at the factory by a burnishing operation. Always replace the pulley and the plate as a set. Replacing only one part of the clutch set will cause clutch slippage.**
 	3. Measure the clearance between the pulley (A) and the armature pla specified limits, **remove the armature plate** and add or remove shim NOTE: - 1.5 L engine: The shims are available in three thicknesses: 0.3 - 2.4 L engine: The shims are available in seven thicknesses: 0.7 mm.

Clearance
1.5 L engine: 0.30-0.60 mm (0.012-0.023 in)
2.4 L engine: 0.35-0.65 mm (0.014-0.025 in)

2. A/C Compressor Clutch Field Coil - Check

 **1.5 L engine** **2.4 L engine**	1. Measure the resistance o specifications, **replace the**



Field Coil Resistance
1.5 L engine: 3.35-3.61 Ω at 68B°F (20B°C)
2.4 L engine: 4.926-5.446 Ω at 68B°F (20B°C)

3. A/C Compressor Clutch Oil Leak Check

1. **Remove the armature plate** , and inspect the armature plate and pulley friction surface for wear. If there is excessive wear, roughness, or scoring, **replace the**
2. Inspect the friction surfaces and the A/C compressor shaft hub for excess oil. If excess oil is present and it is not from the engine or other system, the A/C comp
compressor .

A/C REFRIGERANT LEAK CHECK (134A)

*These tools are available through the Honda Tool and Equipment Program; call 888-424-6857.

Special Tools Required

OPTIMAX Jr™ A/C Leak Detection Kit for Honda and Acura Vehicles	OPTIMAX Jr. A/C Leak Detection Kit TRP124893

Check

WARNING:

- Compressed air mixed with the R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.
- Do not operate the leak detector near flammable vapors. Its sensor operates at high temperatures, and could ignite the vapors, resulting in personal injury and/or d

NOTE:

- If accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.
- Check the system for leaks using an R-134a refrigerant leak detector with an accuracy of 14 g (0.49 oz) per year or better.

Leak Detector Usage Tips (Refer to the Operator's Manual for complete operating instructions)

- Position the vehicle in a wind-free work area. This will aid in detecting small leaks.
- When using the leak detector for the first time, allow it to warm up for 2 minutes with the probe in a clean atmosphere. This lets the temperature sensor in the dete
- The calibration check should be done in the "Search 2" mode. Once that is done, the other check modes do not need calibrating.
- When leak checking through the HVAC module drain hose, avoid drawing water into the probe. Water can damage the internal pump and sensor.
- Avoid creasing the flexible probe extension. Creases can restrict air flow and give false readings.
- Because the detector recalibrates itself for ambient gases, it may be necessary to move the detector away from the leak to clear the sensor. Once the sensor has cle
- When removing the clear probe tip, be careful not to lose the flow ball.
- R-134a is heavier than air; always check below and to the sides of all potential leak sources.
- Halogen leak detectors are sensitive to chemicals: windshield washing solutions, solvents/cleaners, and some vehicle adhesives. Keep these chemicals out of the a

Fluorescent Dye Usage Tips

- Use only Tracer-Stick single dose fluorescent dye capsules from TracerlineB®. Other dyes contain solvents that may contaminate the refrigerant oil, leading to co
- Adding excessive amounts of dye can damage the A/C compressor.
- PAG oil is water soluble, so condensation on the evaporator core or the refrigerant lines may wash the PAG oil and fluorescent dye away from the actual leak. Co module drain.
- After checking and repairing leaks, thoroughly clean any residual dye from the areas where leaks were found. Use GLO-AWAY dye cleaner, from Tracerline ® instructions on the bottle). Residual dye stains can cause misdiagnosis of any future A/C system leaks.
- If any refrigerant dye contacts an exterior paint surface, remove it by doing this:
-
  - -

    Carefully wash the affected surfaces to remove any dirt, and to prevent paint scratching.

  - -

    Mix water and isopropyl alcohol in a 50/50 mixture. Soak a soft 100 % cotton towel with the water/alcohol mixture, and place the cloth on the affected area

  - -

    After removing the dye with the water/alcohol-soaked cloth, carefully wash the affected areas, and check that there is no remaining dye.

1. **A/C Recover/Recycle/Recharge Machine - Connect**
2. **A/C Refrigerant - Recover**
3. **A/C System - Evacuate**
4. **A/C Refrigerant - Charge**
5. A/C Refrigerant - Leak Check

   1. With the engine OFF, use a leak detector first to detect the leak source. Follow a continuous path in order to ensure that you will not miss any possible leaks. Te

Possible Leak Area	Diagnostic Procedure with the Leak Detector	Notes
Service ports	• Check the service ports with caps installed • If the detector "sniffs" a leak, use fluorescent dye to confirm it	When capping the service ports, ensure that the seals on the port caps the caps are tight. The caps are used as the final seals in the system
A/C condenser	If the detector "sniffs" a leak, use fluorescent dye to confirm it	• Check for joints or connections coated with oily dust • Check for damaged and corroded areas • Check all fittings, couplings, brazed/welded areas and areas aro • Move the probe slowly (1 in./second or less), and keep it withir component being checked. This maximizes the chance of detec • If you detect a leak, blow compressed air over the area, then rec large leaks, cleaning the area with compressed air may help you source
Evaporator	• Check at the evaporator drain hose • Check at the passenger's side vent and turn the blower on at low speed	B
A/C lines	• Wiggle the rubber hoses when checking crimped metal ends • If the detector "sniffs" a leak, use fluorescent dye to confirm it	• Check all fittings, couplings, pressure switches, brazed/welded attachment points on A/C lines and components • Check for damaged and corroded areas • Move the probe slowly (1 in./second or less), and keep it withir component being checked. This maximizes the chance of detec

   2. If a leak could not be found with the detector, do the following: close the quick coupler valves, then disconnect the quick couplers from the vehicle service port

   3. Attach the universal connect set from the Optimax Jr. Leak Detection Kit to the service valve fitting. Close the control valve (the black knob on the connect set)

   4. Attach the A/C recover/recycle/recharge machine low pressure hose quick coupler to the service valve fitting, and open the quick coupler valve. Evacuate the co machine vacuum pump, then close the quick coupler valve.

   5. Detach the universal connect set, and install a Tracer-StickB® dye capsule between the connect set and the service valve fitting (see the manufacturer's instruct

6. Attach the quick coupler on the universal connect set to the low pressure service port on the vehicle. Attach the A/C recover/recycle/recharge machine low side recover/recycle/recharge machine low pressure hose quick coupler valve, but do not open the control valve.

7. Start the engine, and set the A/C system to maximum cooling. Open the control valve to let refrigerant and the dye enter the A/C system through the low pressu StickB® dye capsule is empty.

8. Run the engine and A/C system for 15 minutes to thoroughly circulate the dye. Then shut the engine off, and inspect the following areas of the system for leaks

NOTE:

- **Check for leaks in a dark work area, and use the UV light and the special glasses from the leak check kit. Other UV lig dye.**
- **Small leaks may take up to 1 week of vehicle operation (with normal A/C use) to become visible.**

Possible Leak Area	Diagnostic Procedure with Infrared Leak Detector or Fluorescent Dye
Service ports	If a leak is found, replace the cap/O-ring seal or A/C line as needed
A/C lines	• Use a permanent marker pen to circle the leak area • If a leak is found, **remove and replace the A/C line**
A/C condenser	• If a leak is found, **remove the A/C condenser** • Determine whether leak is in the A/C condenser or the dryer desiccant • Use a permanent marker pen to circle the leak area • **Replace either the dryer desiccant** or **the A/C condenser** , depending upon which is leaking
A/C compressor	• Check for leaks at all of the A/C compressor joints, the clutch center, the A/C compressor front housing bolts, and the scroll bolts on the back of the A/C compressor • If a leak is found, use a permanent marker pen to circle the leak area • If the A/C compressor relief valve appears to be leaking, determine whether the leak is coming from the relief valve, or the joint between the A/C compressor casing and the valve. If the leak is from the relief valve, check the A/C system pressures, and refer to the **pressure test table in the A/C system test**. If the leak is from the casing/valve joint, **replace the A/C compressor relief valve** • If the leak is coming from the suction hose and/or discharge hose fittings on the A/C compressor, clean the A/C fittings and replace the suction/discharge fitting O-rings • For all other A/C compressor leaks, **remove and replace the A/C compressor**
Evaporator	• Start checking for evaporator leaks by illuminating the evaporator drain tube area • If a leak is found, **remove the evaporator core** • Determine whether leak is from evaporator or expansion valve • Use a permanent marker pen to circle leak area • **Replace the expansion valve** or **the evaporator core** , depending upon which is leaking

INPUT TEST

HEATED STEERING WHEEL CONTROL UNIT INPUT TEST

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

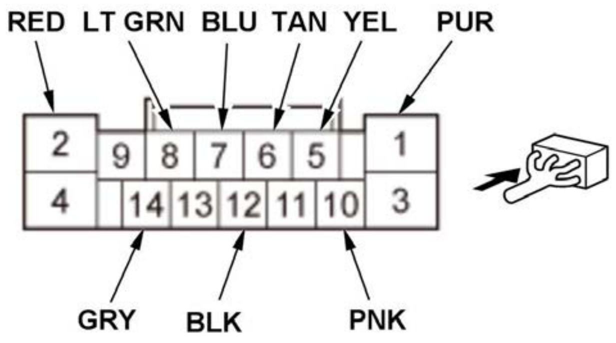
NOTE:

- Make sure the fuses associated with the system is OK.
- After testing, clear the SRS control unit DTCs.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the heated steering wheel control unit 14P connector.

Heated Steering Wheel Control Unit 14P Connector (female terminals)



Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.

- If the terminals are OK, go to step 4.

With the connector still disconnected, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possibl
8	LT GRN	Disconnect the audio remote-HFL switch 12P connector	Check for continuity between terminal No. 8, and audio remote-HFL switch 12P connector terminal No. 11: There should be continuity.	An open in th

7	BLU	Disconnect the steering heater 4P connector	Check for continuity between terminal No. 7 and steering wheel heater 4P connector terminal No. 4: There should be continuity.	An open or h

Reconnect the connector, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, **replace the heated steering wheel control unit** .

Cavity	Wire	Test condition	Test: Desired result	Possible
2	RED	Vehicle ON mode	Measure the voltage to ground: There should be battery voltage.	• Faulty h • Faulty c • An open
12	BLK	In all power modes	Measure the voltage to ground:There should be less than 0.2 V.	• Faulty a • Faulty c • An open
1	PUR	Disconnect the steering wheel heater 4P connector, vehicle ON mode, and heated steering wheel switch ON	Measure the voltage to ground: There should be battery voltage.	A short to grou
6	TAN	Disconnect the steering wheel heater 4P connector, vehicle ON mode, and heated steering wheel switch ON	Measure the voltage to ground: There should be 5 V.	A short to grou
514	YELGRY	Vehicle ON mode, and heated steering wheel switch pressed	Measure the voltage between terminals No. 5 and No. 14:There should be less than 0.2 V.	• Faulty h • An open
		Vehicle ON mode, and heated steering wheel switch released	Measure the voltage between terminals No. 5 and No. 14:There should be battery voltage.	• Faulty h • A short t
10	PNK	Vehicle ON mode	Connect to ground with a jumper wire:The heated steering wheel switch indicator should come on.	• Faulty h • An open

TROUBLESHOOTING

A/C SIGNAL CIRCUIT TROUBLESHOOTING(1.5 L ENGINE)

A/C Signal Circuit Troubleshooting

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   DTC (PGM-FI)

   Are any Pending or Confirmed DTCs indicated?

   YES

   Go to the indicated DTCs troubleshooting.

   NO

   Go to step 2.

2. A/C compressor clutch condition check

   -1. Start the engine, and let it idle.

   -2. Turn the blower switch on.

   -3. Turn the A/C switch on.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
A/C CLUTCH	ON	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Do the A/C system test.

3. A/C system check

   -1. **Check the A/C system**.

   Does the A/C system operate?

   YES

   The A/C system circuit is OK.

   NO

   Go to step 4.

4. A/C compressor clutch circuit check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Activate the A/C CLUTCH in the INSPECTION MENU with the HDS.

   A/C CLUTCH

   Is there a clicking noise from the A/C compressor clutch?

   YES

   The A/C compressor clutch circuit is OK. **Do the A/C system test**.

   NO

   Go to step 5.

5. Open wire check (ACC/A/C MG CLUTCH RLY CL- line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. Disconnect the following connector.

PCM connector E (80P)

   -4. Exit the SCS mode with the HDS.

   -5. Turn the vehicle to the ON mode.

   -6. Connect terminals A and B with a jumper wire.

Terminal A	**PCM connector E (80P) No. 31**
Terminal B	Body ground

   Is there a clicking noise from the A/C compressor clutch?

   YES

   The ACC/A/C MG CLUTCH RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or
   symptom/indication goes away and the PCM was substituted, **replace the original PCM** .

   NO

   Check for poor connections or loose terminals at the A/C compressor clutch relay and the PCM. If the connections and terminals are OK, check the A/C compress
   MG CLUTCH RLY CL- wire between the PCM (E31) and the A/C compressor clutch relay, or other parts in the A/C systems.

A/C SIGNAL CIRCUIT TROUBLESHOOTING(2.4 L ENGINE) (2017 2018 2019)

A/C Signal Circuit Troubleshooting

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

DTC (PGM-FI)

Are any Pending or Confirmed DTCs indicated?

YES

Go to the indicated DTCs troubleshooting.

NO

Go to step 2.

2. A/C compressor clutch condition check

-1. Start the engine, and let it idle.

-2. Turn the blower switch on.

-3. Turn the A/C switch on.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
A/C CLUTCH	ON	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Do the A/C system test.

3. A/C system check

-1. **Check the A/C system**.

Does the A/C system operate?

YES

The A/C system circuit is OK.

NO

Go to step 4.

4. A/C compressor clutch circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Activate the A/C CLUTCH in the INSPECTION MENU with the HDS.

A/C CLUTCH

Is there a clicking noise from the A/C compressor clutch?

YES

The A/C compressor clutch circuit is OK. **Do the A/C system test**.

NO

Go to step 5.

5. Open wire check (A/C MG CLUTCH RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Exit the SCS mode with the HDS.

-5. Turn the vehicle to the ON mode.

-6. Connect terminals A and B with a jumper wire.

Terminal A	**PCM connector A (51P) No. 13**

Terminal B	Body ground

Is there a clicking noise from the A/C compressor clutch?

YES

The A/C MG CLUTCH RLY CL- wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substit** symptom/indication goes away and the PCM was substituted, **replace the original PCM** .

NO

Check for poor connections or loose terminals at the A/C compressor clutch relay and the PCM. If the connections and terminals are OK, check the A/C compress CLUTCH RLY CL- wire between the PCM (A13) and the A/C compressor clutch relay, or other parts in the A/C systems.

DIAGNOSIS

A/C DIAGNOSTIC PROCESS

When a customer presents an A/C concern, do the following procedure to identify the cause of the problem.

Confirm the type of concern.

- If a customer complains about an A/C performance problem, go to step 2.
- If a customer complains about an A/C noise problem, **do the A/C system noise check** .

2. **Do the A/C system inspection** and repair any problems. If no problems are found, go to step 3.**Recover the refrigerant from the A/C system** and measure the refrig recovery/recycling/charging station.

- If the refrigerant charge is within specifications, go to step 5.
- If the refrigerant charge is significantly under specifications, go to step 4.
- If the refrigerant charge is significantly over specifications, go to step 5.

4. **Do the Refrigerant Leak Check** and repair any leaks. If no leaks are found, go to step 5.**Evacuate and recharge the system** and **do the A/C system test**.

- If vent temperature or suction/discharge pressures are within specifications, the repair is confirmed and the A/C diagnostic process is complete.
- If vent temperature or suction/discharge pressures are not within specifications, a problem may still exist. Return to step 2, and recheck your test procedures.

BLEEDING

DRIVE BELT AUTO-TENSIONER AIR BLEEDING (1.5 L ENGINE)

Bleeding

1. **Drive Belt - Remove**

   NOTE: After the drive belt is removed, remove the pin from the drive belt auto-tensioner.

2. Drive Belt Auto-Tensioner - Air Bleed

	1. Attach a socket wrench to the drive belt auto-tensioner from above the engine. Sl the direction shown, the full length of its stroke, then slowly (at least 3 seconds) mo length of its stroke. Repeat this operation three times.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

TEST

A/C COMPRESSOR VARIABLE CAPACITY CONTROL SOLENOID TEST

Test

1. A/C Compressor Variable Capacity Control Solenoid - Test

	1. Measure the resistance between A/C compressor clut 3. If the resistance is not within specifications, **replace t**

Variable Capacity Control Solenoid Resistance:	**9.6-11.6 Ω at 68B°F (20B°C)**

A/C SYSTEM TEST (1234YF)

*Available through the Honda Tool and Equipment Program; call 888-424-6857.

Special Tools Required

	Throttle Pedal Depressor Tool B240B*

Test

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

The performance test will help determine if the A/C system is operating within specifications.

NOTE:

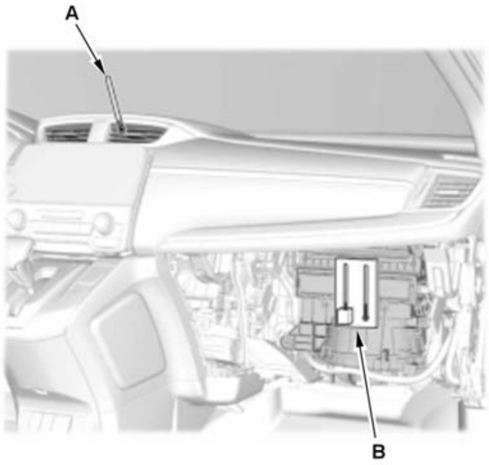
- If accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

Performance Test

1. A/C System - Inspect
    1. **Do the A/C system inspection**, and correct any problems found.

    B

2. **Refrigerant Recovery/Recycling/Charging Station - Connect**
3. **Glove Box - Remove**
4. A/C System - Test



1. Determine the relative humidity and air temperature.

2. Insert a thermometer (A) in the dashboard center vent.

3. Place a hygro-thermometer (B) near the blower unit's recirculation inlet duct

4. Test conditions:

- The blower intake temperature must be at least 68B°F (20B°C).
- Move the vehicle out of direct sunlight and let it cool down to the surrou vehicle to cool it down more quickly.
- Open the hood.
- Open the front doors.
- Apply the parking brake.
- Shift the vehicle to P, N position/mode, or Neutral.
- Start the engine.
- Set the A/C system to the following conditions.
-
    - -

      A/C: ON
    - -

      Temperature control: MAX COOL
    - -

      Mode control: VENT
    - -

      Recirculation control: RECIRCULATE
    - -

      Fan control: Max
- Using the throttle pedal depressor tool to run the engine at a steady 1, 50
- No driver or passengers in the vehicle.

5. Inspect the A/C components for the following conditions:

- A/C compressor clutch not engaged.
- Abnormal frost areas.
- Unusual noises.

If you observe any of these conditions, **refer to the Symptom Troubleshootin**

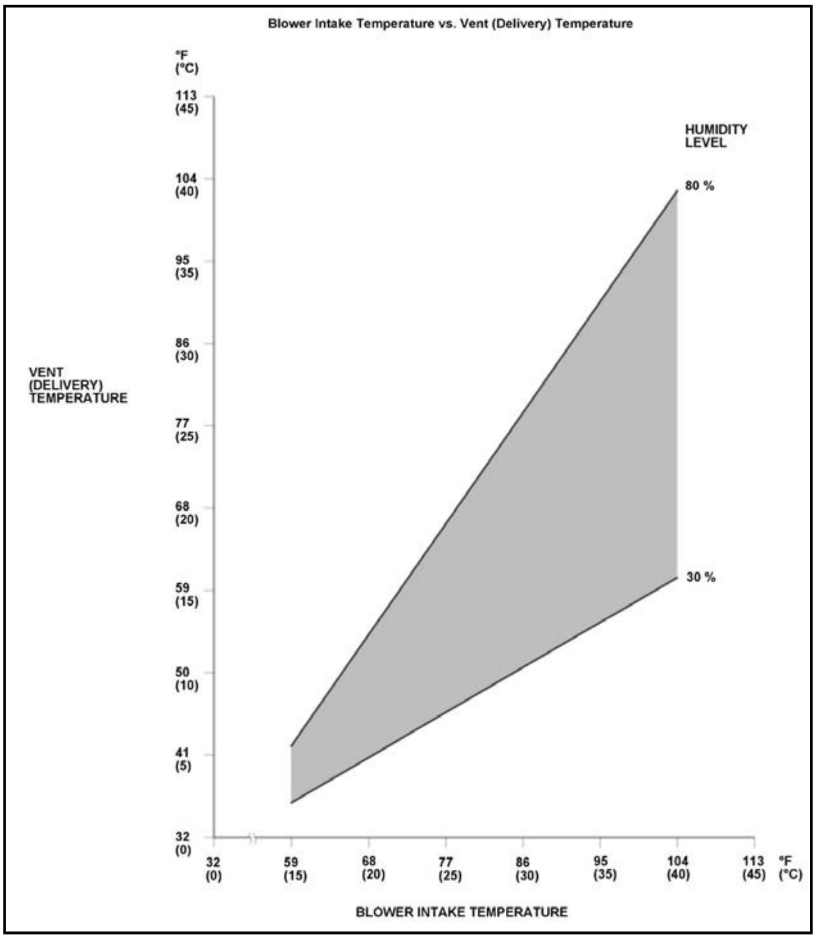
6. After running the air conditioning for 10 minutes under the test conditions, r center vent, the blower intake temperature near the blower unit, and the discha

7. To complete the vent (delivery)/blower intake temperature chart:

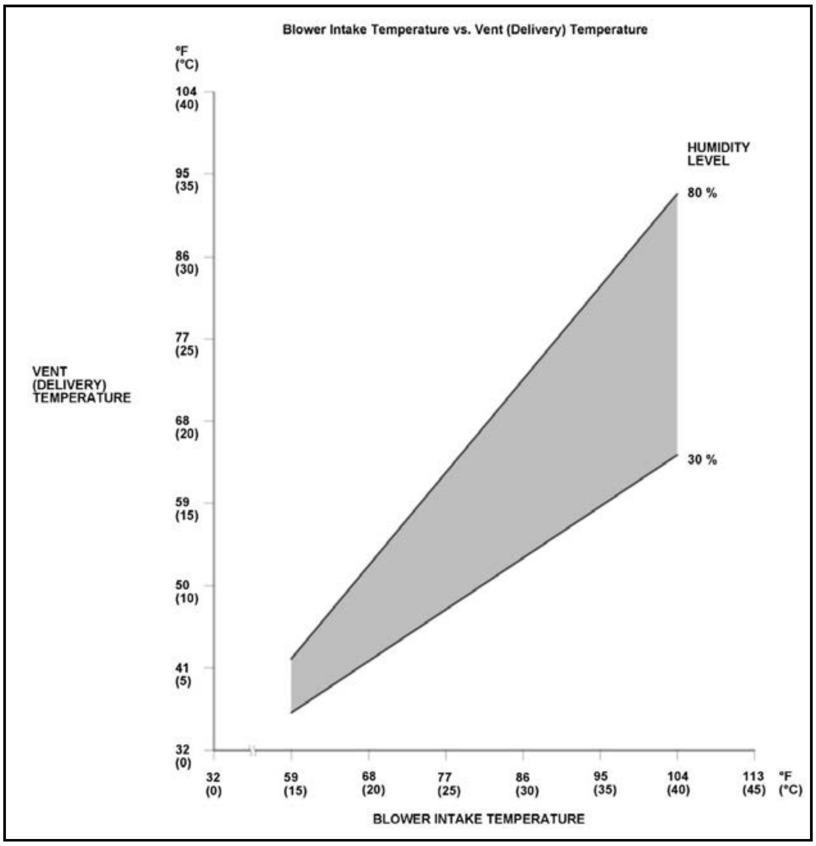
- Mark the vent (delivery) temperature on the vertical line.
- Mark the blower intake temperature on the bottom line.
- Draw a vertical line from the blower intake temperature mark.
- Draw a horizontal line from the vent (delivery) temperature mark until it intersects the vertical line.

NOTE: The vent (delivery) temperature and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the n

1.5 L engine



2.4 L engine

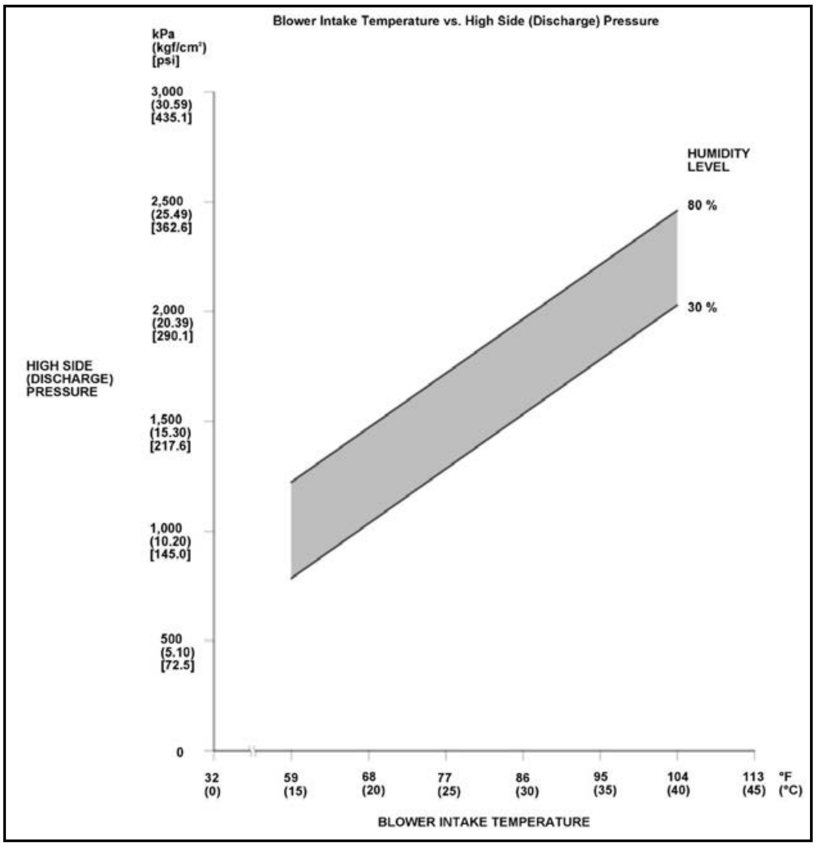


8. To complete the high side (discharge) pressure/blower intake temperature chart:

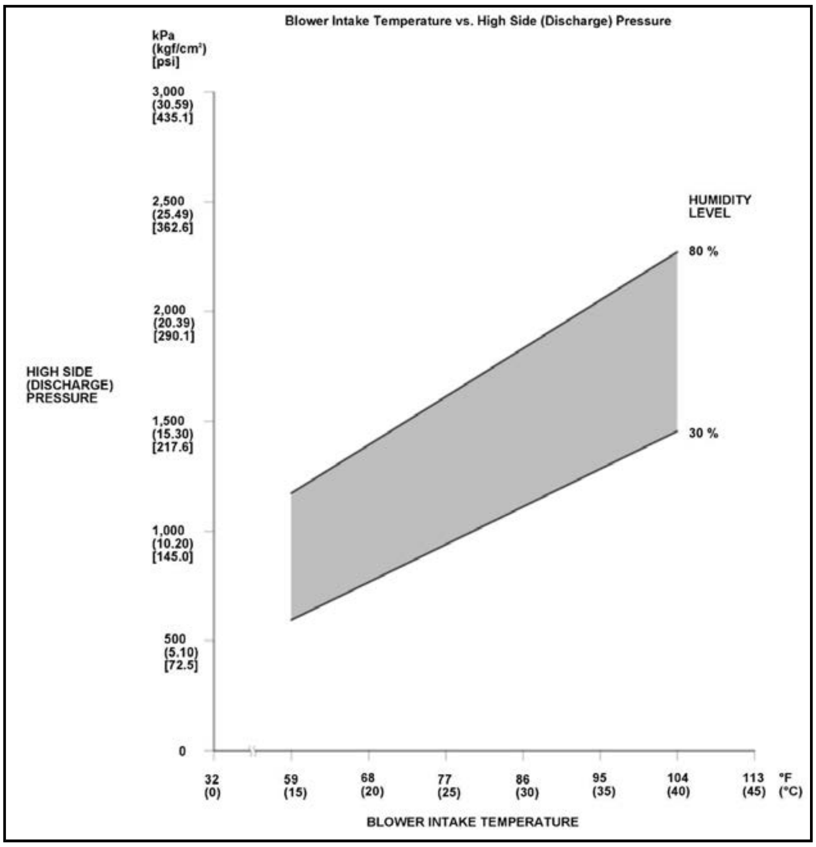
- Mark the high side (discharge) pressure on the vertical line.
- Mark the blower intake temperature on the bottom line.
- Draw a vertical line from the blower intake temperature mark.
- Draw a horizontal line from the high side (discharge) pressure mark until it intersects the vertical line.

NOTE: The high side (discharge) pressure and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the

1.5 L engine



2.4 L engine

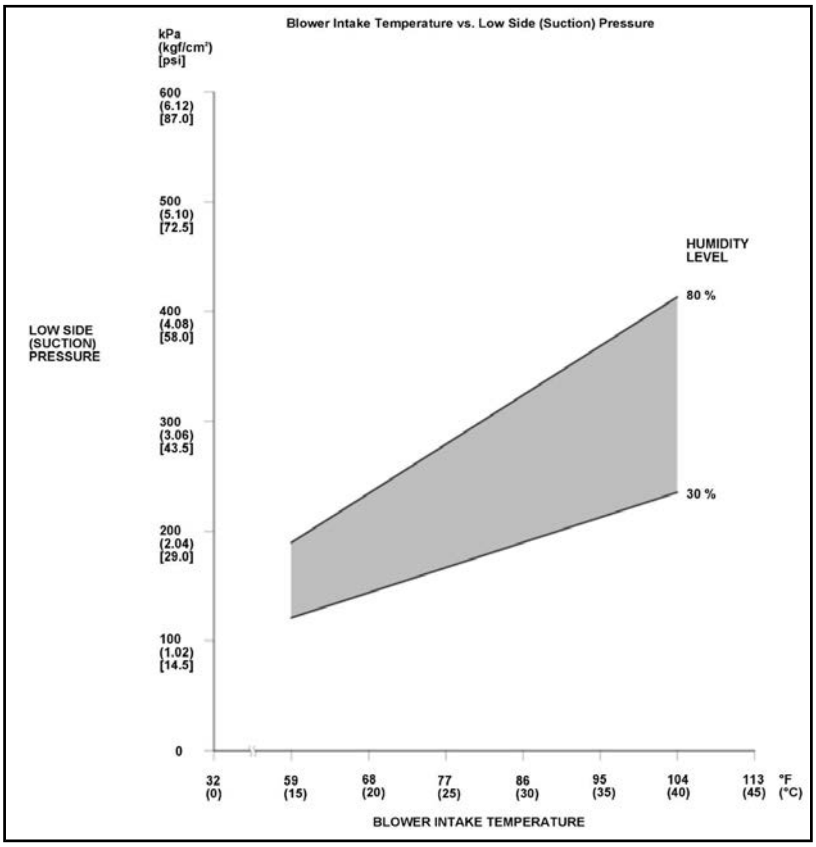


9. To complete the low side (suction) pressure/blower intake temperature chart:

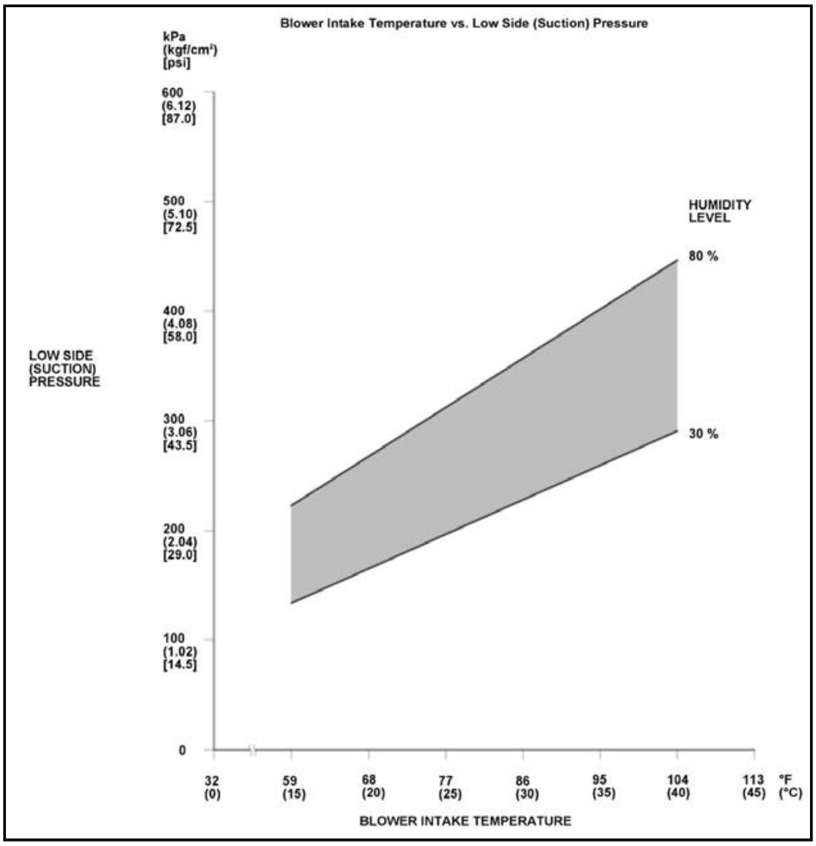
- Mark the low side (suction) pressure along the vertical line.
- Mark the blower intake temperature along the bottom line.
- Draw a vertical line from the blower intake temperature mark.
- Draw a horizontal line from the low side (suction) pressure mark until it intersects the vertical line.

NOTE: The low side (suction) pressure and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the ne

1.5 L engine



2.4 L engine



Pressure Test

5. A/C System Pressure - Test

Test results	Related symptoms	
Driver and passenger's side A/C vent temperatures may vary by approximately 20B°F (11B°C) or more	Suction pressure may be low	• Low refri • Expansion
	Driver's or passenger's air mix door DTCs present	One air mix doo

Test results	Related symptoms	
Discharge pressure abnormally High	Discharge pressure reduced when A/C condenser cooled with water spray	Significant refri
	• Restricted/weak airflow through A/C condenser	• Dirty A/C

Test results	Related symptoms	
	With doors open, fresh air selected and cooling fan run on high speed, temperature drop across A/C condenser inlet to outlet is less than about 9B°F (5B°C)	Debris be Radiator a
Discharge pressure abnormally Low	Suction and discharge pressures equalize rapidly after stopping A/C compressor Suction pressure higher than normal	Faulty A/C com
Suction pressure abnormally Low	Weak or insufficient airflow across evaporator	Restricted blow
	Suction pressure varies from near normal to a vacuum, as moisture freezes in expansion valve orifice	Moisture Faulty ex
	Reduced airflow from vents Vent temperature is very low	Evaporato Faulty eva Faulty ex on positio
Suction pressure abnormally High	Lack of slight suction pressure variation at 1, 500 rpm when "Recirculated" airflow is switched to "Fresh Air" Discharge pressure near normal	Expansion valv
Suction and Discharge pressures abnormally High	Sheet of paper does not stick to front of A/C condenser surface with cooling fans on With doors open, fresh air selected and cooling fan run on high speed, temperature drop across A/C condenser inlet to outlet is less than about 9B°F (5B°C)	Radiator and/or reversed
	A/C compressor clutch remains engaged during off cycle Pressure relief valve may open	Insufficie A/C comp problem Excessive
Suction and Discharge pressures abnormally Low	Suction line from expansion valve to A/C compressor is not cold	Excessively low
	Lack of slight suction pressure variation at 1, 500 rpm when "Recirculated" airflow is switched to "Fresh Air"	Expansion valv opening sufficie
	More than 18-29B°F (10-16B°C) temperature drop across A/C condenser inlet to outlet pipes	Blocked or restr lines/componen
	Significant temperature difference along high or low side A/C lines or components **NOTE:** Some restrictions may not show up until 3, 000 rpm	Restriction in A temperatures to

Test results	Related symptoms	
Suction pressure High and Discharge pressure Low	Excessive A/C compressor noise Pressures equalize quickly and noise after A/C compressor turns off	A/C compressor contamination)
Suction and Discharge pressures slightly Low	Vent temperature too high	Slightly lc Excessive
	Static pressures high with A/C system equalized. (After engine is off 4-12 hours)	Air/Non-c Contamin

A/C SYSTEM TEST (134A)

Test

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

The performance test will help determine if the A/C system is operating within specifications.

NOTE:

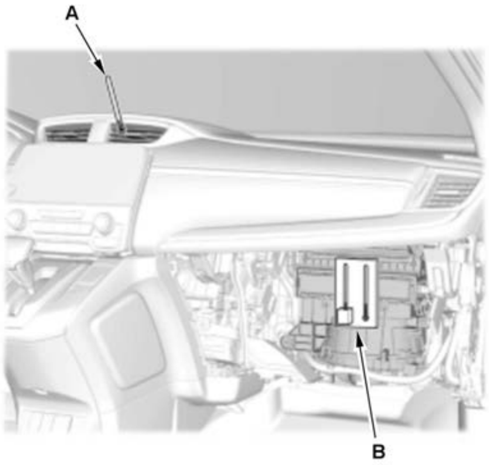
- If accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

Performance Test

1. A/C System - Inspect
    1. **Do the A/C system inspection**, and correct any problems found.

    B

2. **Refrigerant Recovery/Recycling/Charging Station - Connect**
3. **Glove Box - Remove**
4. A/C System - Test



1. Determine the relative humidity and air temperature.

2. Insert a thermometer (A) in the dashboard center vent.

3. Place a hygro-thermometer (B) near the blower unit's recirculation inlet duc

4. Test conditions:

- The blower intake temperature must be at least 68B°F (20B°C).
- Move the vehicle out of direct sunlight and let it cool down to the surrou vehicle to cool it down more quickly.
- Open the hood.
- Open the front doors.
- Apply the parking brake.
- Shift the vehicle to P, N position/mode, or Neutral.
- Start the engine.
- Set the A/C system to the following conditions.
-
  - -

    A/C: ON

  - -

    Temperature control: MAX COOL

  - -

    Mode control: VENT

  - -

    Recirculation control: RECIRCULATE

  - -

    Fan control: Max

- Using the throttle pedal depressor tool to run the engine at a steady 1, 50
- No driver or passengers in the vehicle.

5. Inspect the A/C components for the following conditions:

- A/C compressor clutch not engaged.
- Abnormal frost areas.
- Unusual noises.

If you observe any of these conditions, **refer to the Symptom Troubleshootin**

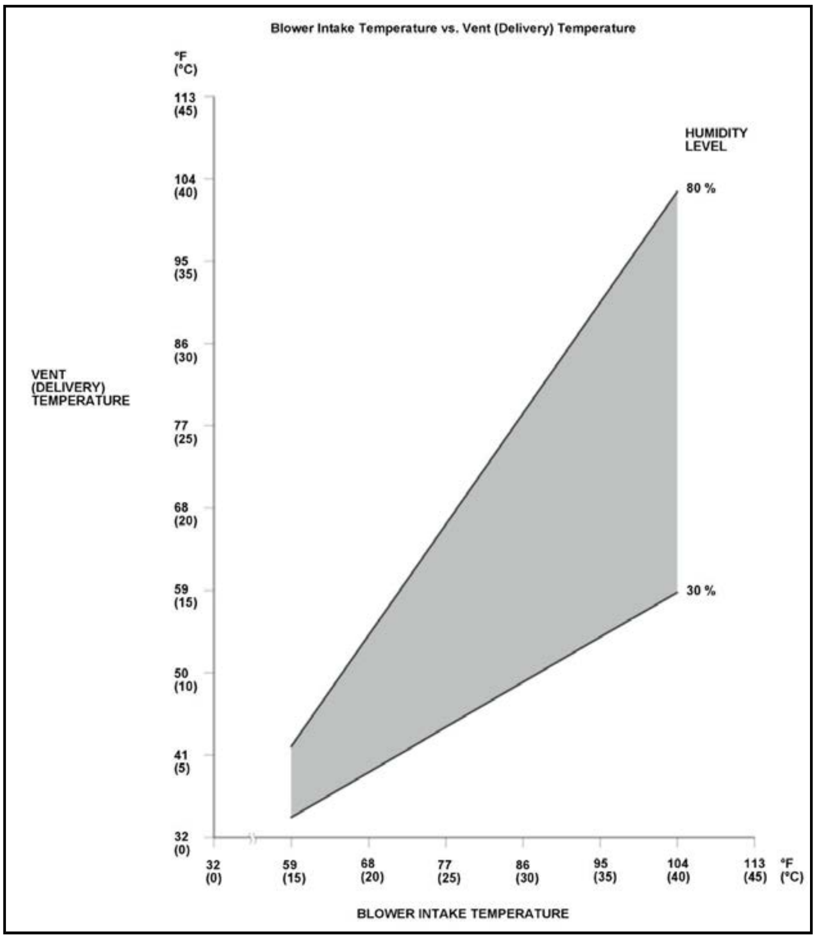
6. After running the air conditioning for 10 minutes under the test conditions, r center vent, the blower intake temperature near the blower unit, and the discha

7. To complete the vent (delivery)/blower intake temperature chart:

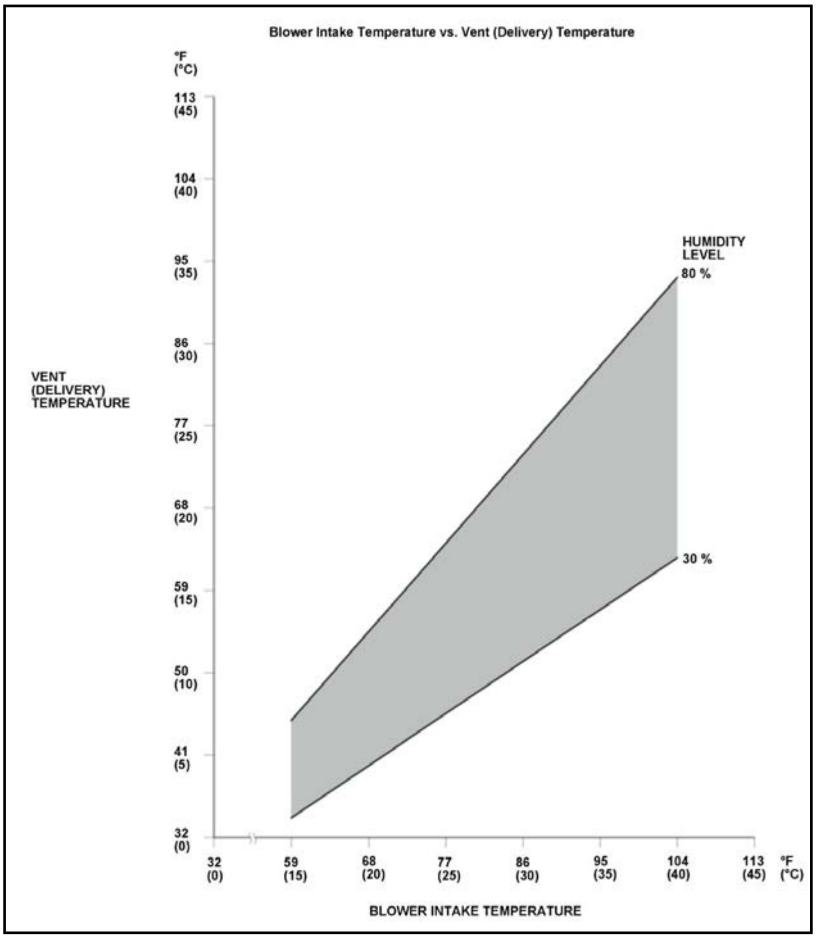
- Mark the vent (delivery) temperature on the vertical line.
- Mark the blower intake temperature on the bottom line.
- Draw a vertical line from the blower intake temperature mark.
- Draw a horizontal line from the vent (delivery) temperature mark until it intersects the vertical line.

NOTE: The vent (delivery) temperature and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the n

1.5 L engine



2.4 L engine



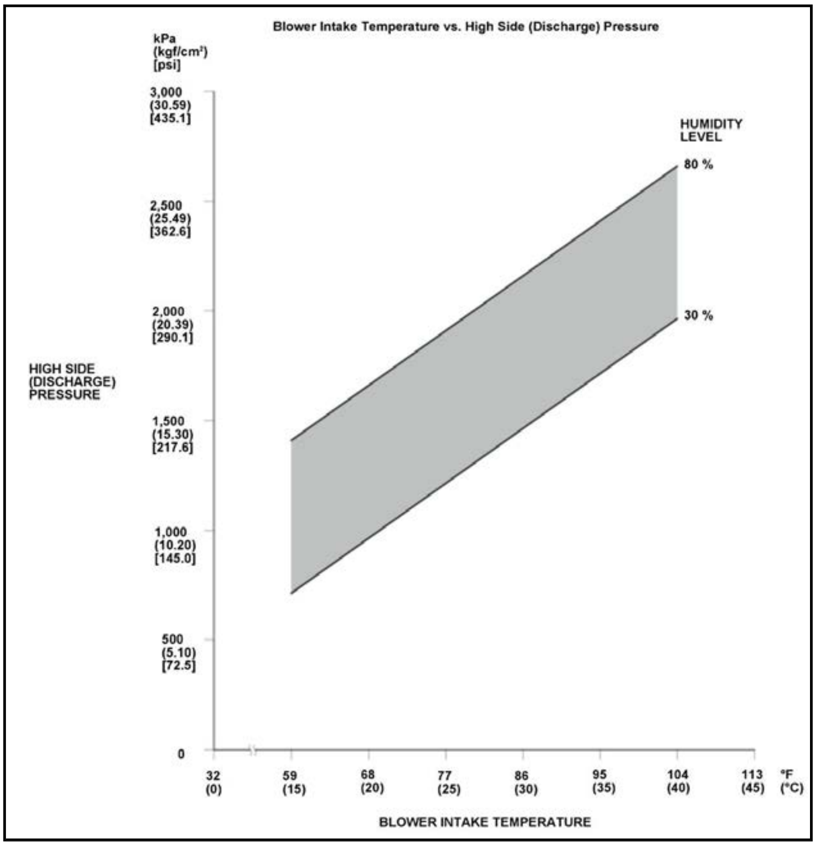
8. To complete the high side (discharge) pressure/blower intake temperature chart:

- Mark the high side (discharge) pressure on the vertical line.
- Mark the blower intake temperature on the bottom line.
- Draw a vertical line from the blower intake temperature mark.

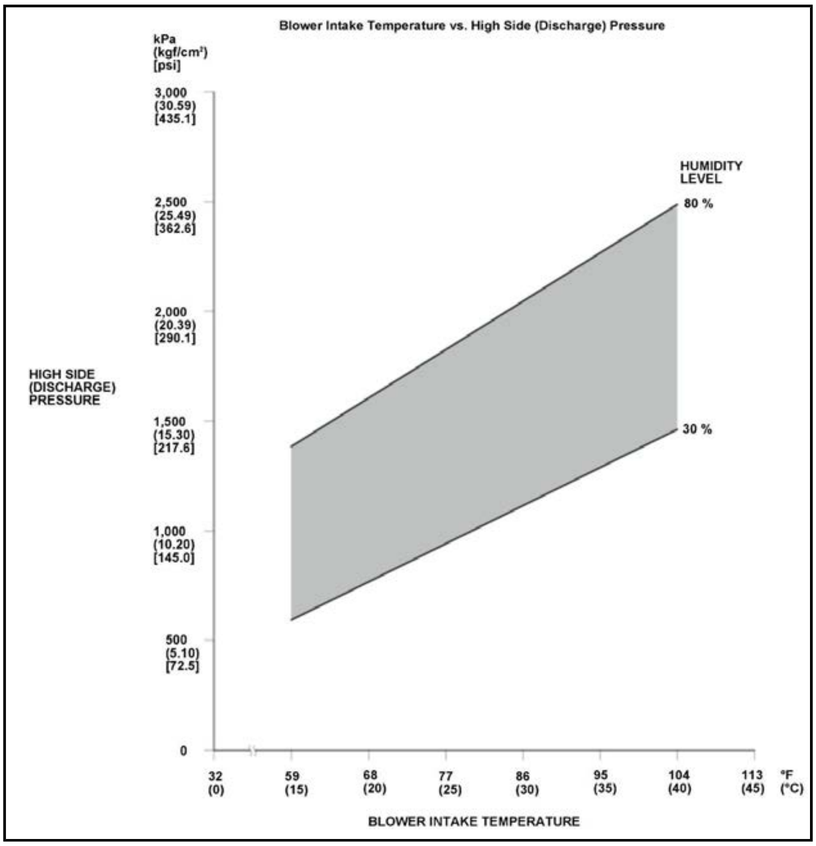
- Draw a horizontal line from the high side (discharge) pressure mark until it intersects the vertical line.

NOTE: The high side (discharge) pressure and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the

1.5 L engine



2.4 L engine



9. To complete the low side (suction) pressure/blower intake temperature chart:

- Mark the low side (suction) pressure along the vertical line.
- Mark the blower intake temperature along the bottom line.
- Draw a vertical line from the blower intake temperature mark.
- Draw a horizontal line from the low side (suction) pressure mark until it intersects the vertical line.

NOTE: The low side (suction) pressure and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the ne

	Significant temperature difference along high or low side A/C lines or components **NOTE:** Some restrictions may not show up until 3, 000 rpm	Restriction in A temperatures to

Test results	Related symptoms	
Suction pressure High and Discharge pressure Low	• Excessive A/C compressor noise • Pressures equalize quickly and noise after A/C compressor turns off	A/C compressor contamination)
Suction and Discharge pressures slightly Low	Vent temperature too high	• Slightly l • Excessive
	Static pressures high with A/C system equalized. (After engine is off 4-12 hours)	• Air/Non- • Contamin

RADIATOR AND A/C CONDENSER FAN MOTOR TEST

Test

1. Fan Motor - Test

	1. Disconnect the cc condenser fan moto 2. Test each motor b to terminal No. 2. 3. If a motor fails to .

INSPECTION

A/C SYSTEM CONTAMINATION INSPECTION

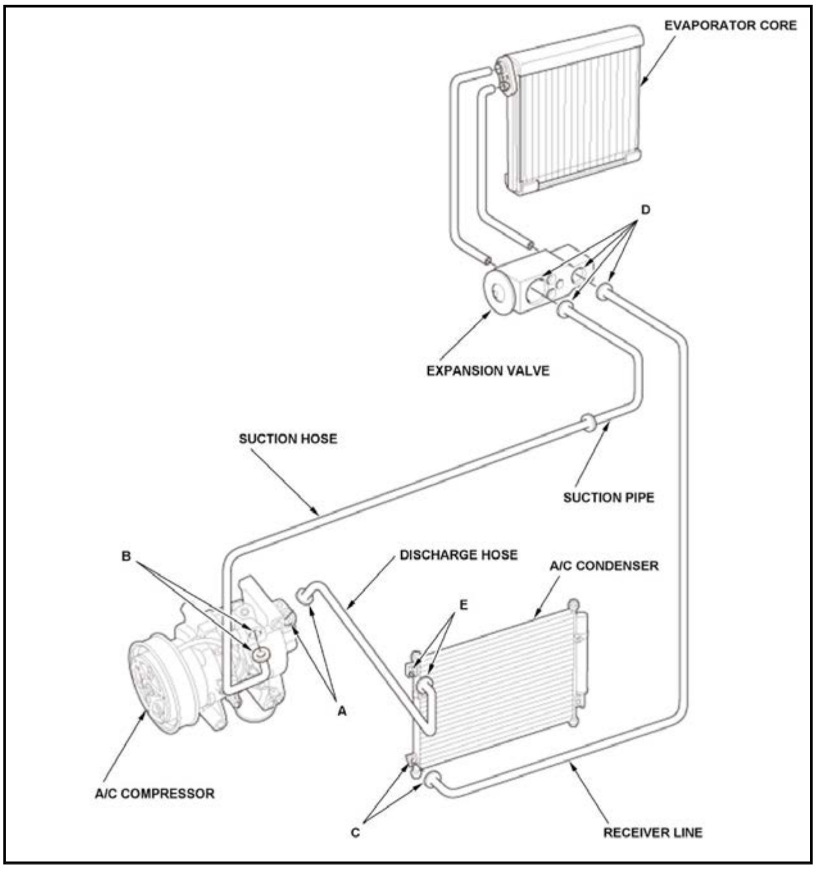
Inspection

NOTE:

- If the A/C compressor failure is diagnosed, always use this inspection to check the extent of contamination in the A/C system.
- The parts illustrations are sample. External appearance may vary from model to model.

1. A/C System Contamination - Inspect

   Remove a part from the related parts as described in the table. Then, swab inside the part with a cotton swab to see if there is metal, dark grey or black residue.



EVAPORATOR CORE

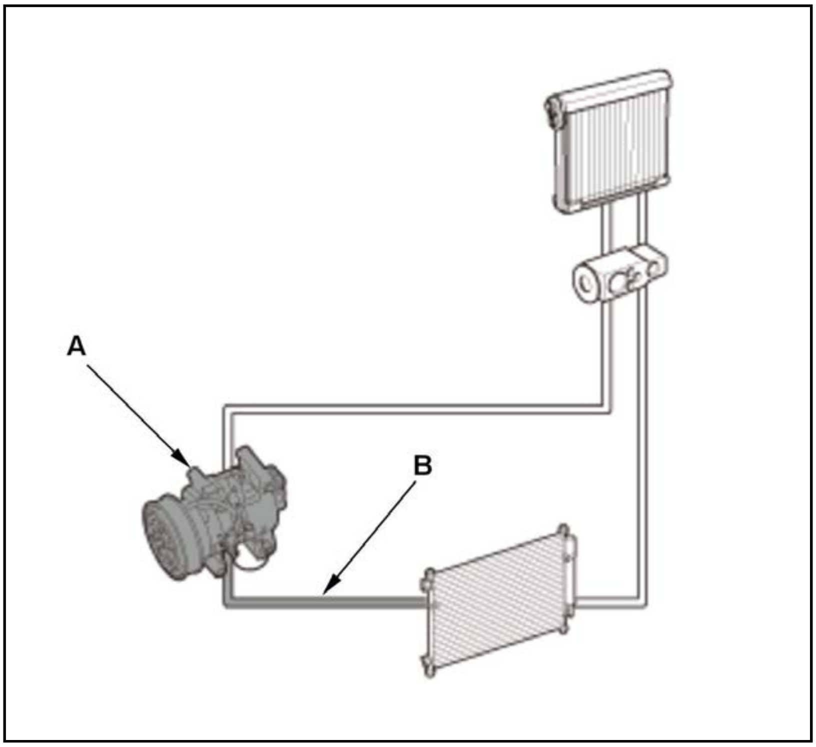
5	Discharge hose (A/C condenser inlet)	A/C condenser inlet port (E)	Replace the components in Repair Procedure B.	Re

Replacement

NOTE: The parts illustrations are sample. External appearance may vary from model to model.

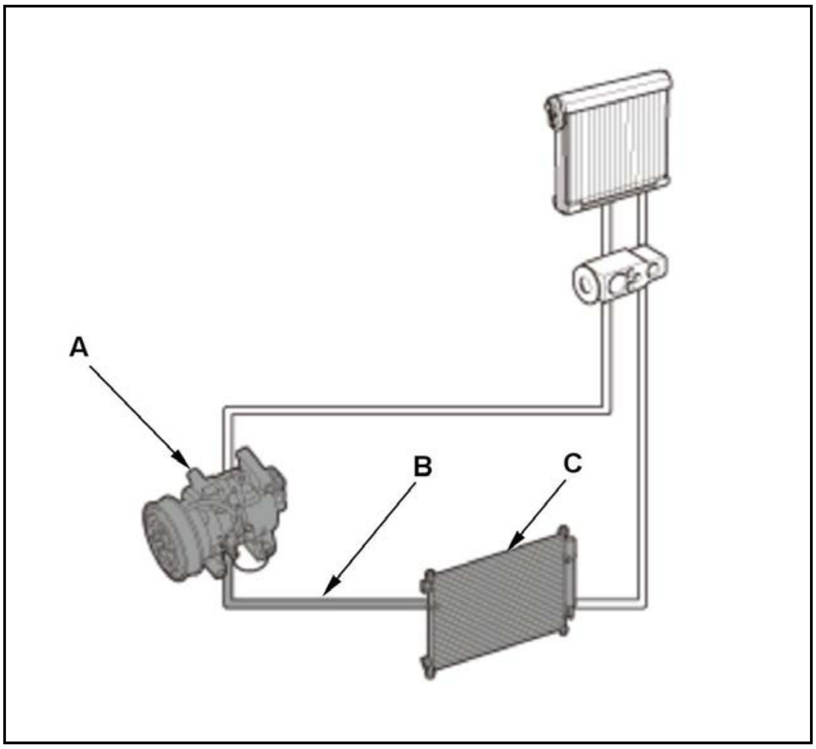
1. A/C Components - Replace



Repair Procedure A

Replace the following parts:

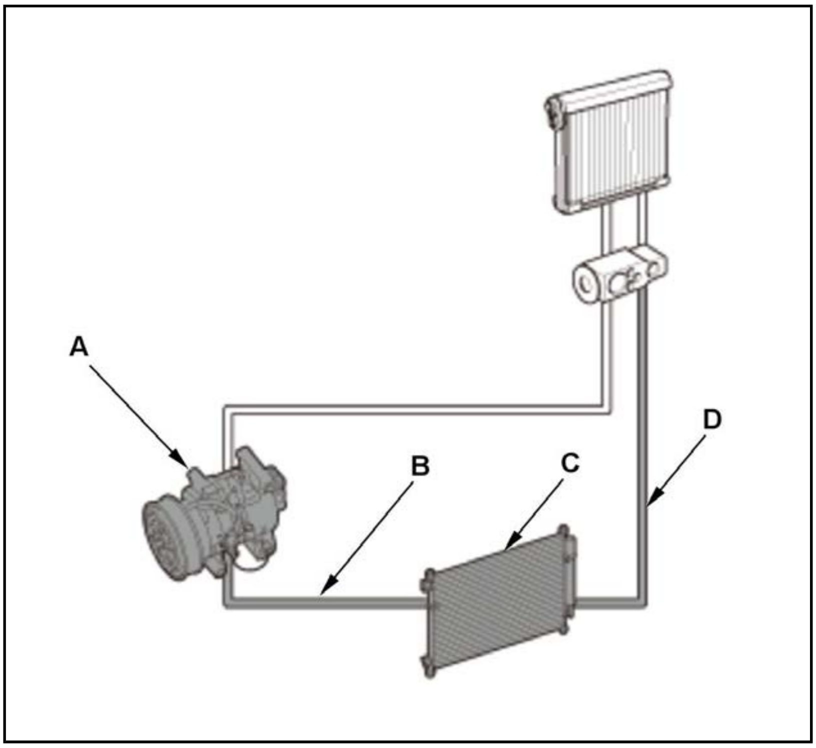
- A/C compressor (A)
- Discharge hose (B)



Repair Procedure B

Replace the following parts:

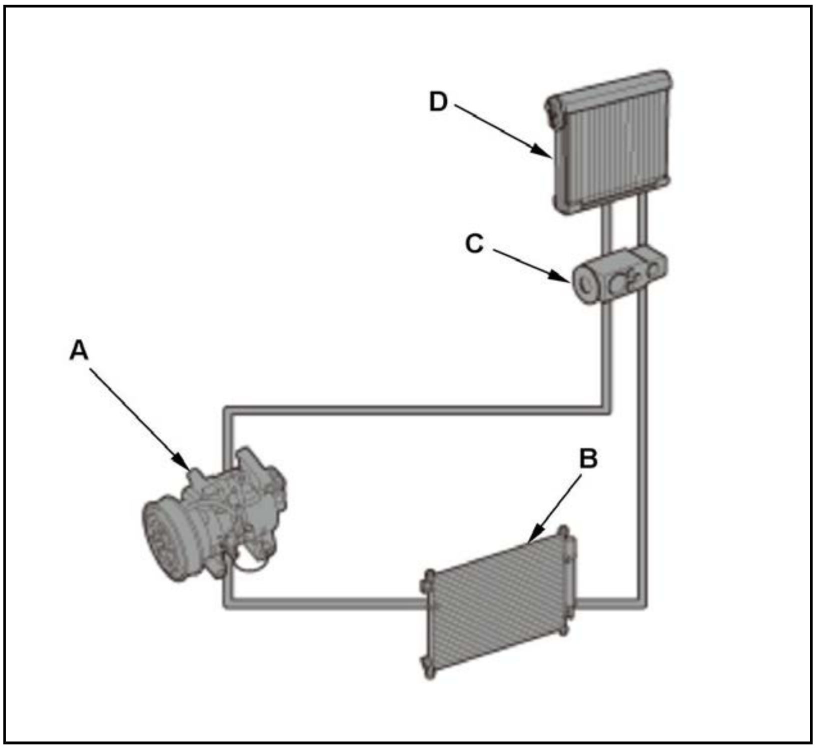
- A/C compressor (A)
- Discharge hose (B)
- A/C condenser (C)



Repair Procedure C

Replace the following parts:

- A/C compressor (A)
- Discharge hose (B)
- A/C condenser (C)
- Receiver line (D)



Repair Procedure D

Replace the following parts:

- **A/C compressor (A)**
- **A/C condenser (B)**
- **Expansion valve (C)**
- **Evaporator core (D)**
- **All A/C hoses and lines**

A/C SYSTEM INSPECTION

Inspection

NOTE:

- For A/C system noise, **do the A/C system noise check** .
- Check for climate control DTCs using the Self-Diagnostic Function. If there are any DTCs, **go to the appropriate troubleshooting**.

1. A/C System - Inspect

Before troubleshooting any problem with the A/C system, do the following to check if there is anything wrong with the A/C system. If any malfunctions are founc "Actions to take" in the table given below.

Inspection Area	Check for	
Fresh air intake for the HVAC unit (at the base of the windshield)	Leaves or debris blocking the air intake	Remove any blo
A/C lines and hoses	Kinks or sharp bends	Replace the A/C
• A/C components • A/C lines and hoses	Stains at the components or joints that may indicate a refrigerant or an A/C compressor oil leak	**Do the Refriger**
Drive belt	• Signs of slippage • Damage	**Inspect the driv**
A/C condenser	Dirt in the fins, or material clogging the fins (dirt, insects, etc.)	Clean the fins **NOTE:** • Carefully water and • Do not pe
	Fin damage, bent fins	Try to comb ther **NOTE:** If the fi
	Visible damage to the A/C condenser	**Do the Refriger** is leaking, **repla**
A/C compressor clutch armature plate engagement	Check that the A/C compressor clutch armature plate engages and is rotating at the same speed as the clutch pulley.	• **Do the A/** • **Do the A/**
A/C condenser fan and radiator fan	Check that the A/C condenser fan and the radiator fan operate when the A/C compressor clutch is engaged and blow air toward the engine compartment.	• **Refer to t** • **Do the fa**
Dust and pollen filter	The dust and pollen filter is clogged or restricted.	**Replace the dus**

Inspection Area	Check for	
Blower fan	Check that the A/C operates at each position of the fan control dial or icon (except OFF). If the A/C does not operate at all fan control icon positions, refer to the symptom troubleshooting. **NOTE:** Start the engine, turn the A/C system on, and allow it to run for a few minutes and reach stable operation.	**Refer to the sy**

GENERAL INFORMATION

A/C SERVICE TIPS AND PRECAUTIONS (1234YF)

WARNING:

- Compressed air mixed with the HFO-1234yf (R-1234yf) forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test HFO-1234yf (R-1234yf) service equipment or vehicle air conditioning systems.

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

The air conditioning system uses HFO-1234yf (R-1234yf) refrigerant and polyolester (POE) **refrigerant oil**.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J639 to remove R-1234yf from the air conditioning system.

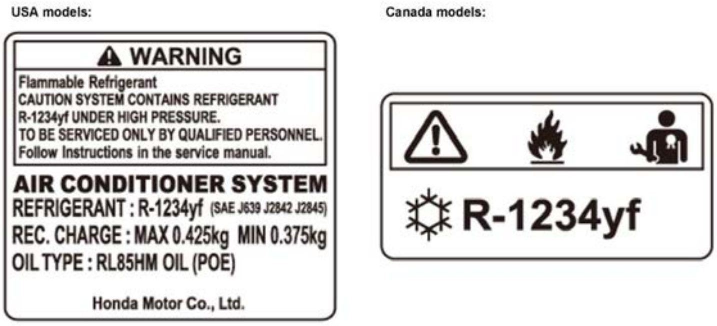
If accidental system discharge occurs, ventilate the work area before resuming service.

R-1234yf service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

NOTE:

- The following label is found under the hood.
- The following illustration is an example. The value and the oil type of the actual vehicle may vary depending on the model.



USA models:

⚠ WARNING

Flammable Refrigerant
CAUTION SYSTEM CONTAINS REFRIGERANT
R-1234yf UNDER HIGH PRESSURE.
TO BE SERVICED ONLY BY QUALIFIED PERSONNEL.
Follow Instructions in the service manual.

AIR CONDITIONER SYSTEM
REFRIGERANT : R-1234yf (SAE J639 J2842 J2845)
REC. CHARGE : MAX 0.425kg MIN 0.375kg
OIL TYPE : RL85HM OIL (POE)

Honda Motor Co., Ltd.

Canada models:

R-1234yf

Symbol	Symbol name
	Caution

Symbol	Symbol name
	Inflammable refrigerant

Symbol	Symbol name
	Requires properly trained technician to service mobile A/C systems
	A/C system

- Always disconnect the negative cable from the 12 volt battery whenever replacing air conditioning parts.
- Keep moisture and dirt out of the system. When disconnecting any lines, plug or cap the fittings immediately; do not remove the caps or plugs until just before yo
- Before connecting any hose or line, apply a few drops of **refrigerant oil** to the O-ring.
- When tightening or loosening a fitting, use a second wrench to support the matching fitting.
- When discharging the system, use an R-1234yf refrigerant A/C recover/recycle/recharge machine; do not release refrigerant into the atmosphere.
- Servicing of an R-1234yf system should be done in well-ventilated work area.
- To ensure proper and safe operation, the Society of Automotive Engineers (SAE J2845) recommends that the refrigerant system only be serviced by trained and c
- Never repair or replace the air conditioning evaporator (cooling coil) with one removed from a used or salvaged vehicle.
- New replacement mobile air conditioning evaporator must be certified (and labeled) as meeting SAE Standard J2842.
- Vented refrigerant is harmful to the environment.
- To avoid refrigerant from venting, never replace the evaporator with one removed from a used or salvaged vehicle.

- Refrigerant in your vehicle's air conditioning system is flammable and can be ignited during servicing if proper procedures are not followed.
- Requires a qualified technician to service.
- For safety system components should be replaced shall not be repaired or salvaged for reuse.

A/C SERVICE TIPS AND PRECAUTIONS (134A)

WARNING:

- Compressed air mixed with the R-134a forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test R-134a service equipment or vehicle air conditioning systems.

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

The air conditioning system uses HFC-134a (R-134a) refrigerant and polyalkylene glycol (PAG) **refrigerant oil**.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J2788 to remove R-134a from the air conditioning system.

If accidental system discharge occurs, ventilate the work area before resuming service.

R-134a service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

- Always disconnect the negative cable from the 12 volt battery whenever replacing air conditioning parts.
- Keep moisture and dirt out of the system. When disconnecting any lines, plug or cap the fittings immediately; do not remove the caps or plugs until just before yo
- Before connecting any hose or line, apply a few drops of **refrigerant oil** to the O-ring.
- When tightening or loosening a fitting, use a second wrench to support the matching fitting.
- When discharging the system, use an R-134a refrigerant A/C recover/recycle/recharge machine; do not release refrigerant into the atmosphere.

SYMPTOM TROUBLESHOOTING

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING - THE A/C COMPRESSOR CLUTCH DOES NOT ENGAGE, BUT THE A/C CONDI BLOWER AND HEATER CONTROLS WORK (2017 2018 2019)

The A/C compressor clutch does not engage, but the A/C condenser/radiator fans operate, and the blower and heater controls work

NOTE:

- It is normal for the A/C compressor to turn off under certain conditions, such as low idle, high engine coolant temperature, or hard acceleration.
- Do not use this troubleshooting procedure if the cooling fan is also inoperative with the A/C on. Refer to the symptom troubleshooting index.

- Before doing symptom troubleshooting, check for **PGM-FI DTCs** .

1. Fuse check

   -1. Check the following fuse.

Fuse	No. A23 (10 A)
Location	Under-hood fuse/relay box

   Is the fuse OK?

   YES

   Go to step 2.

   NO

   Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. A23 (10 A) fuse circuit.

2. A/C pressure sensor parameter check

   -1. **Connect the HDS to the DLC** .

   -2. Start the engine.

   Set the A/C system to the following conditions:

   - A/C: ON
   - Fan control: ON

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
ENGINE SPEED	670-770	rpm	B
ECT SENSOR 1	80-100	deg.C	B
	176-212	deg.F	

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
A/C PRESSURE SENSOR	196-2, 950	kPa	B
	2.00-30.08	kgf/cm 2	
	28.4-427.9	psi	

   Do the current condition(s) match the threshold?

   YES

   Go to step 3.

   NO

   Go to the **A/C system test**.

3. PGM-FI system parameter check

   -1. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
A/C SWITCH	ON	B	B
A/C CLUTCH	ON	B	B

   Do the current condition(s) match the threshold?

   YES

   Go to step 4.

   NO: A/C SWITCH is OFF

   A/C SWITCH is OFF, **replace the climate control unit** .

   NO: A/C SWITCH is ON and A/C CLUTCH is OFF

   A/C SWITCH is ON and A/C CLUTCH is OFF, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **subst** symptom/indication goes away and the PCM was substituted, **replace the original PCM** .

4. A/C compressor clutch relay check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the A/C compressor clutch relay from the under-hood fuse/relay box, and **test it** .

   Is the relay OK?

YES

Go to step 5.

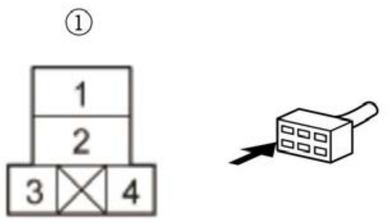
NO

Replace the A/C compressor clutch relay.

5. Open wire check (VMP line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode A/C compressor clutch relay: disconnected
Test point 1	A/C compressor clutch relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The VMP wire is OK. Go to step 6.

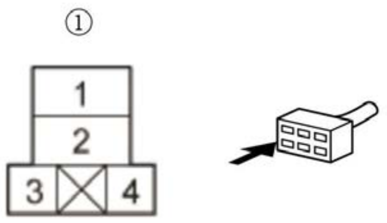
NO

Repair an open in the VMP wire.

6. Determine possible failure area (A/C compressor clutch relay switch side circuit, A/C compressor clutch relay coil side circuit)

-1. Connect terminals A and B with a jumper wire.

Terminal A	A/C compressor clutch relay 4P socket (female terminals) No. 1: ①
Terminal B	A/C compressor clutch relay 4P socket (female terminals) No. 2: ①



Does the A/C compressor clutch clickΩ

YES

Go to step 7.

NO

Go to step 9.

7. Open wire check (IG2 A/C line)

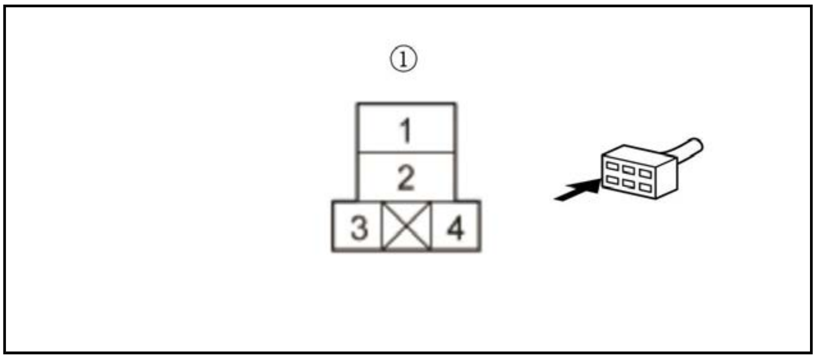
-1. Disconnect the jumper wire.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode A/C compressor clutch relay: disconnected

Test point 1	A/C compressor clutch relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG2 A/C wire is OK. Go to step 8.

NO

Repair an open in the IG2 A/C wire.

8. Open wire check (A/C MG CLUTCH RLY CL-/ACC (1.5 L engine) or A/C MG CLUTCH RLY CL- (2.4 L engine) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Reinstall the A/C compressor clutch relay.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-4. Disconnect the following connector.

1.5 L engine: PCM connector E (80P)
2.4 L engine: PCM connector A (51P)

-5. Connect terminals A and B with a jumper wire.

1.5 L engine

Terminal A	PCM connector E (80P) No. 31
Terminal B	Body ground

2.4 L engine

Terminal A	PCM connector A (51P) No. 13
Terminal B	Body ground

-6. Turn the vehicle to the ON mode.

Does the A/C compressor clutch clickΩ

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM , then recheck. If the substituted, replace the original PCM .

NO

Repair an open in the A/C MG CLUTCH RLY CL-/ACC (1.5 L engine) or A/C MG CLUTCH RLY CL- (2.4 L engine) wire.

9. Open wire check (A/C MG CLUTCH/MG CLUTCH (1.5 L engine) or A/C MG CLUTCH (2.4 L engine) line)

-1. Disconnect the jumper wire.

-2. Disconnect the following connector.

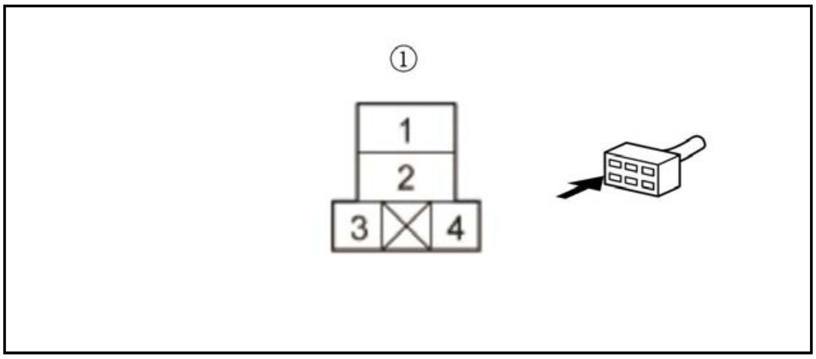
1.5 L engine: A/C compressor clutch 3P connector 2.4 L engine: A/C compressor clutch 1P connector

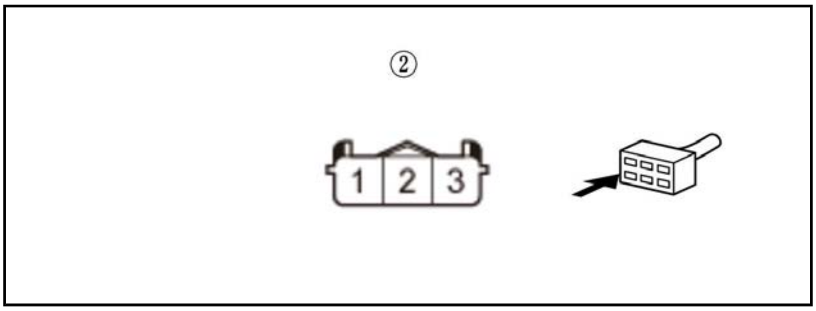
-3. Check for continuity between test points 1 and 2.

1.5 L engine

Test condition	Vehicle OFF (LOCK) mode
	A/C compressor clutch relay: disconnected
	A/C compressor clutch 3P connector: disconnected

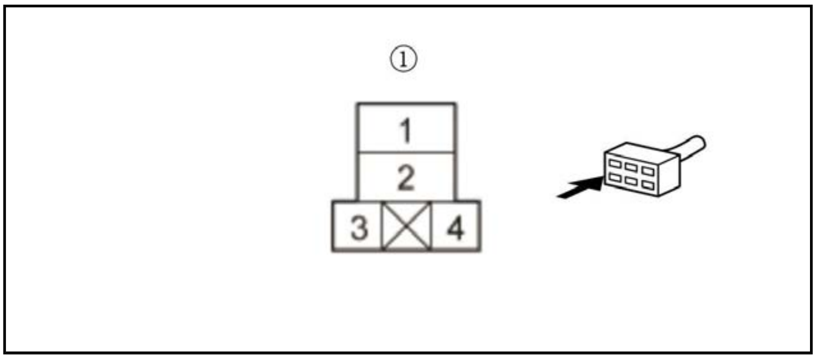
Test point 1	A/C compressor clutch relay 4P socket (female terminals) No. 2: ①
Test point 2	A/C compressor clutch 3P connector (female terminals) No. 1: ②

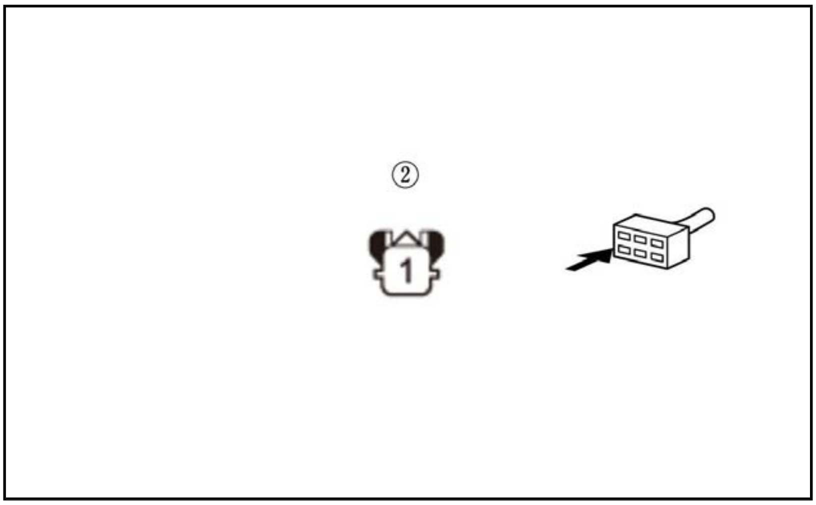




2.4 L engine

Test condition	Vehicle OFF (LOCK) mode
	A/C compressor clutch relay: disconnected
	A/C compressor clutch 1P connector: disconnected
Test point 1	A/C compressor clutch relay 4P socket (female terminals) No. 2: ①
Test point 2	A/C compressor clutch 1P connector (female terminals) No. 1: ②





Is there continuity?

YES

The A/C MG CLUTCH/MG CLUTCH (1.5 L engine) or A/C MG CLUTCH (2.4 L engine) wire is OK. **Check the A/C compressor clutch clearance and the A/**

NO

Repair an open in the A/C MG CLUTCH/MG CLUTCH (1.5 L engine) or A/C MG CLUTCH (2.4 L engine) wire.

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING - THE A/C COMPRESSOR CLUTCH DOES NOT ENGAGE, BUT THE A/C CONDI BLOWER AND HEATER CONTROLS WORK (2020 2021)

The A/C compressor clutch does not engage, but the A/C condenser/radiator fans operate, and the blower and heater controls work

NOTE:

- It is normal for the A/C compressor to turn off under certain conditions, such as low idle, high engine coolant temperature, or hard acceleration.
- Do not use this troubleshooting procedure if the cooling fan is also inoperative with the A/C on. **Refer to the symptom troubleshooting index**.
- Before doing symptom troubleshooting, check for **PGM-FI DTCs** .

1. Fuse check

   -1. Check the following fuse.

   Without wireless charger

Fuse	No. A23 (10 A)
Location	Under-hood fuse/relay box

   With wireless charger

Fuse	No. G31 (10 A)
Location	Fuse holder A

   Is the fuse OK.

   YES

   Go to step 2.

   NO

   - Without wireless charger: replace the fuse, and recheck. If the fuse blows again, repair a short in the No. A23 (10 A) fuse circuit.
   - With wireless charger: replace the fuse, and recheck. If the fuse blows again, repair a short in the No. G31 (10 A) fuse circuit.

2. A/C pressure sensor parameter check

   -1. **Connect the HDS to the DLC** .

   -2. Start the engine.

   Set the A/C system to the following conditions:

   - A/C: ON
   - Fan control: ON

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
ENGINE SPEED	670-770	rpm	B
ECT SENSOR 1	80-100	deg.C	B
	176-212	deg.F	

   -5. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
A/C PRESSURE SENSOR	196-2, 950	kPa	B
	2.00-30.08	kgf/cm 2	
	28.4-427.9	psi	

   Do the current condition(s) match the threshold?

   YES

   Go to step 3.

   NO

   Go to the **A/C system test**.

3. PGM-FI system parameter check

   -1. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
A/C SWITCH	ON	B	B
A/C CLUTCH	ON	B	B

Do the current condition(s) match the threshold?

YES

Go to step 4.

NO: A/C SWITCH is OFF

A/C SWITCH is OFF, replace the climate control unit .

NO: A/C SWITCH is ON and A/C CLUTCH is OFF

A/C SWITCH is ON and A/C CLUTCH is OFF, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or subst symptom/indication goes away and the PCM was substituted, replace the original PCM .

4. A/C compressor clutch relay check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the A/C compressor clutch relay from the under-hood fuse/relay box, and test it .

   Is the relay OK?

   YES

   Go to step 5.

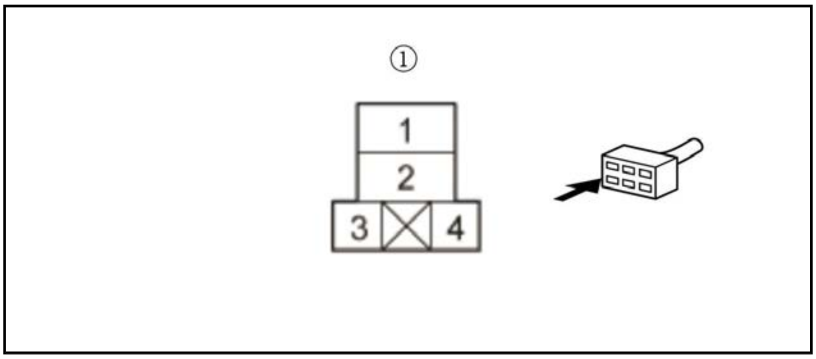
   NO

   Replace the A/C compressor clutch relay.

5. Open wire check (VMP line)

   -1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode A/C compressor clutch relay: disconnected
Test point 1	A/C compressor clutch relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The VMP wire is OK. Go to step 6.

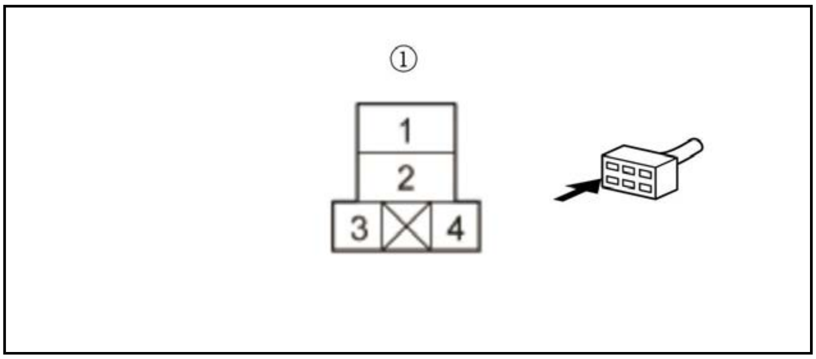
NO

Repair an open in the VMP wire.

6. Determine possible failure area (A/C compressor clutch relay switch side circuit, A/C compressor clutch relay coil side circuit)

   -1. Connect terminals A and B with a jumper wire.

Terminal A	A/C compressor clutch relay 4P socket (female terminals) No. 1: ①
Terminal B	A/C compressor clutch relay 4P socket (female terminals) No. 2: ①



Does the A/C compressor clutch clickΩ

YES

Go to step 7.

NO

Go to step 9.

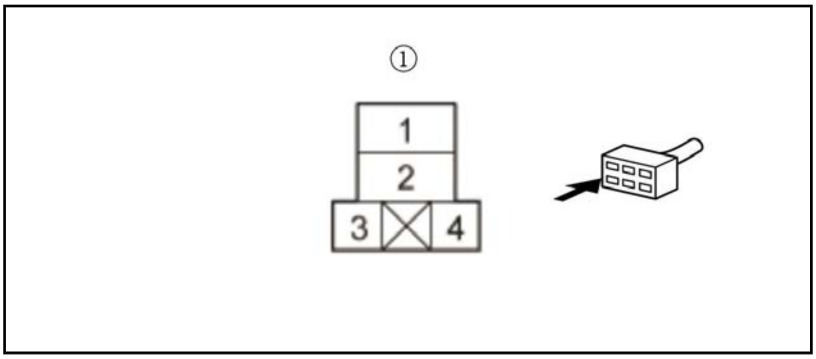
7. Open wire check (IG2 A/C line)

   -1. Disconnect the jumper wire.

   -2. Turn the vehicle to the ON mode.

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode A/C compressor clutch relay: disconnected
Test point 1	A/C compressor clutch relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG2 A/C wire is OK. Go to step 8.

NO

Repair an open in the IG2 A/C wire.

8. Open wire check (A/C MG CLUTCH RLY CL-/ACC line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Reinstall the A/C compressor clutch relay.

   -3. Jump the SCS line with the HDS, and wait more than 1 minute.

   -4. Disconnect the following connector.

PCM connector E (80P)

   -5. Connect terminals A and B with a jumper wire.

Terminal A	**PCM connector E (80P) No. 31**
Terminal B	Body ground

   -6. Turn the vehicle to the ON mode.

Does the A/C compressor clutch clickΩ

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the substituted, **replace the original PCM** .

NO

Repair an open in the A/C MG CLUTCH RLY CL-/ACC wire.

9. Open wire check (A/C MG CLUTCH/MG CLUTCH line)

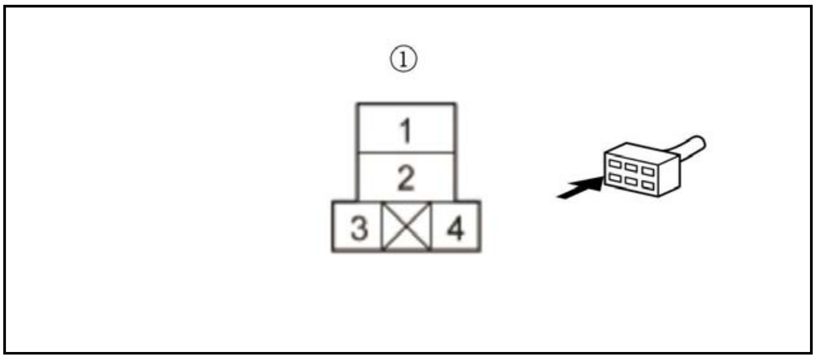
-1. Disconnect the jumper wire.

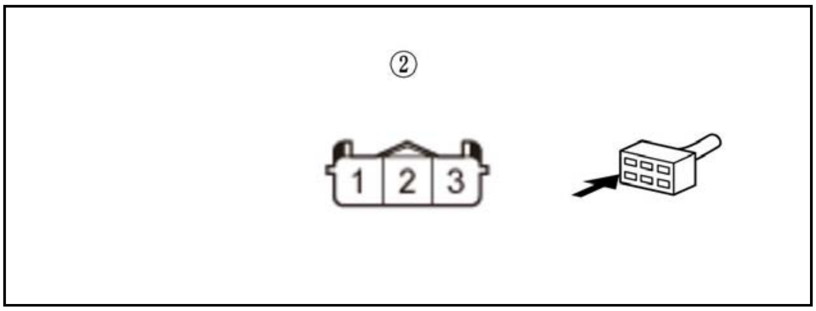
-2. Disconnect the following connector.

A/C compressor clutch 3P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	A/C compressor clutch relay: disconnected
	A/C compressor clutch 3P connector: disconnected
Test point 1	A/C compressor clutch relay 4P socket (female terminals) No. 2: ①
Test point 2	A/C compressor clutch 3P connector (female terminals) No. 1: ②





Is there 1.0 Ω or less?

YES

The A/C MG CLUTCH/MG CLUTCH wire is OK. **Check the A/C compressor clutch clearance and the A/C compressor clutch field coil**. Repair as needed.

NO

Repair an open in the A/C MG CLUTCH/MG CLUTCH wire.

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING - THE A/C CONDENSER/RADIATOR FANS DO NOT RUN AT HIGH SPEED, BUT

The A/C condenser/radiator fans do not run at high speed, but do run at low speed

NOTE:

- Do not use this troubleshooting procedure if the A/C compressor is inoperative. **Refer to the symptom troubleshooting index**.
- If the A/C system is inoperable, the radiator and A/C condenser fans are controlled based only on engine coolant temperature.
- Before doing symptom troubleshooting, check for **PGM-FI DTCs** .

1. Fuse check

-1. Check the following fuses.

Fuse	No. A2-6 (30 A)
Location	Under-hood fuse/relay box

Fuse	No. B25 (7.5 A)

Location	Fuse/relay holder A

Is each fuse OK?

YES

Go to step 2.

NO

Replace the fuse(s), and recheck. If the fuse(s) blows again, repair a short in the No. A2-6 (30 A) and/or the No. B25 (7.5 A) fuse circuit(s).

2. A/C condenser fan low speed operation check

   -1. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the PCM from damage.

   -2. Disconnect the following connector.

1.5 L engine: PCM connector A (50P)
2.4 L engine: PCM connector A (51P)

   -3. Connect terminals A and B with a jumper wire.

   1.5 L engine

Terminal A	**PCM connector A (50P) No. 17**
Terminal B	Body ground

   2.4 L engine

Terminal A	**PCM connector A (51P) No. 9**
Terminal B	Body ground

   -4. Turn the vehicle to the ON mode.

   Do the A/C condenser and radiator fans run on low?

   YES

   Go to step 3.

   NO

   Go to **radiator and A/C condenser fan low speed circuit troubleshooting**.

3. A/C condenser fan high speed operation check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Connect terminals A and B with jumper wires.

   1.5 L engine

Terminal A	**PCM connector A (50P) No. 18**
Terminal B	Body ground

   2.4 L engine

Terminal A	**PCM connector A (51P) No. 10**
Terminal B	Body ground

   -3. Turn the vehicle to the ON mode.

   Do the A/C condenser and radiator fans run on high?

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the substituted, **replace the original PCM** .

   NO

   Go to step 4.

4. A/C condenser fan relay check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the jumper wires.

   -3. Remove the A/C condenser fan relay from the relay holder F, and **test it** .

   Is the relay OK?

   YES

   Go to step 5.

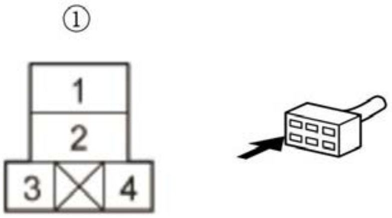
   NO

   Replace the A/C condenser fan relay.

5. Open wire check (+B SUB FAN line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	A/C condenser fan relay: disconnected
Test point 1	A/C condenser fan relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B SUB FAN wire is OK. Go to step 6.

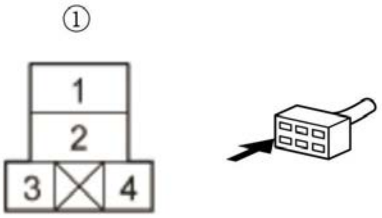
NO

An open in the +B SUB FAN wire.

6. Open wire check (SUB FAN MOTOR line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	A/C condenser fan relay 4P socket (female terminals) No. 1: ①
Terminal B	A/C condenser fan relay 4P socket (female terminals) No. 2: ①



Does the A/C condenser fan run on high?

YES

The SUB FAN MOTOR wire is not open. Go to step 7.

NO

Repair an open in the SUB FAN MOTOR wire.

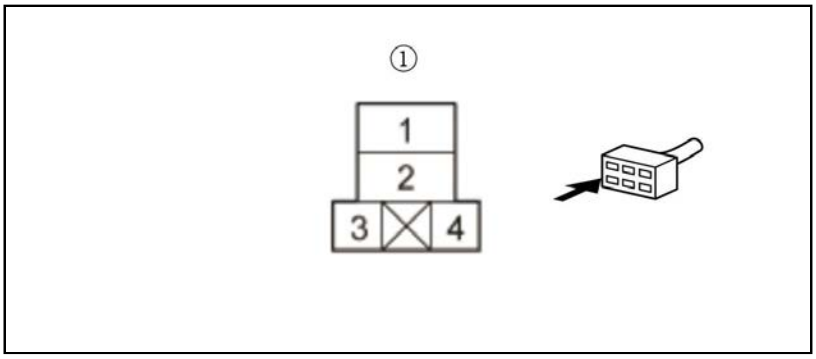
7. A/C condenser fan relay coil side power circuit check

-1. Disconnect the jumper wire.

-2. Measure the voltage between test points 1 and 2.

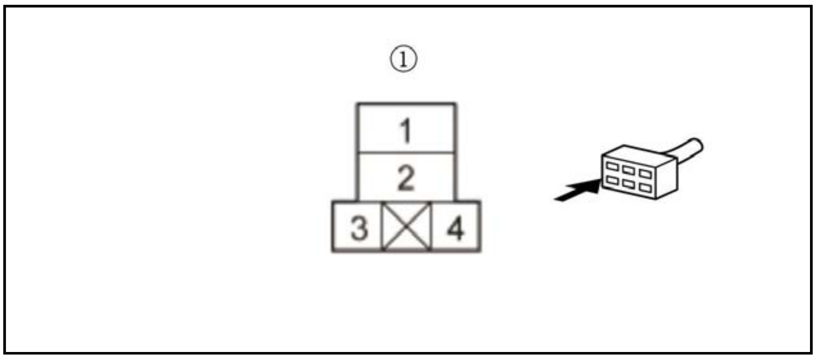
1.5 L engine

Test condition	Vehicle OFF (LOCK) mode
	PCM connector A (50P): disconnected
	A/C condenser fan relay: disconnected
Test point 1	A/C condenser fan relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



2.4 L engine

Test condition	Vehicle OFF (LOCK) mode PCM connector A (51P): disconnected A/C condenser fan relay: disconnected
Test point 1	A/C condenser fan relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



-3. Turn the vehicle to the ON mode.

Is there battery voltage?

YES

Repair an open in the FAN HI SIGNAL wire.

NO

Repair an open in the IGP2 SUB wire.

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING - THE A/C CONDENSER/RADIATOR FANS DO NOT RUN AT LOW SPEED WITH CONTROLS WORK NORMALLY

The A/C condenser/radiator fans do not run at low speed with the A/C on, but the blower and heater controls work normally

NOTE:

- Do not use this troubleshooting procedure if the A/C compressor is inoperative. **Refer to the symptom troubleshooting index**.
- If the A/C system is inoperable, the radiator and A/C condenser fans are controlled based only on engine coolant temperature.
- Before doing symptom troubleshooting, check for **PGM-FI DTCs** .

1. Fuse check

-1. Check the following fuse.

Fuse	No. A1-3 (30 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

Go to step 2.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. A1-3 (30 A) fuse circuit.

2. PGM-FI system parameter check

-1. Connect the HDS to the DLC.

-2. Turn the vehicle to the ON mode. Make sure the A/C system is OFF, then start the engine.

-3. Touch the fan control button ON, then momentarily turn ON the A/C with the A/C button.

NOTE: Do not run the A/C for more than a few seconds with the engine running or damage to the A/C system will result.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		
	Values	Unit	
FAN LOW CTRL	ON	B	B

Is the FAN LOW CTRL on with the A/C on?

YES

Go to step 3.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good PCM** , then recheck. If the substituted, **replace the original PCM** .

3. Radiator fan relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the radiator fan relay from the under-hood fuse/relay box, and **test it** .

Is the relay OK?

YES

Go to step 4.

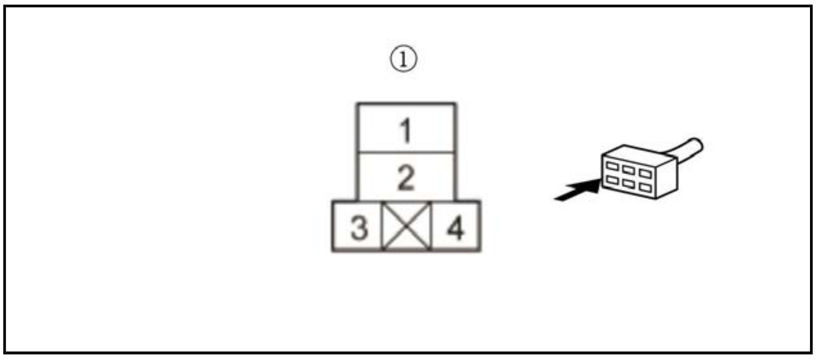
NO

Replace the radiator fan relay.

4. Open wire check (+B MAIN FAN line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Radiator fan relay: disconnected
Test point 1	Radiator fan relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B MAIN FAN wire is OK. Go to step 5.

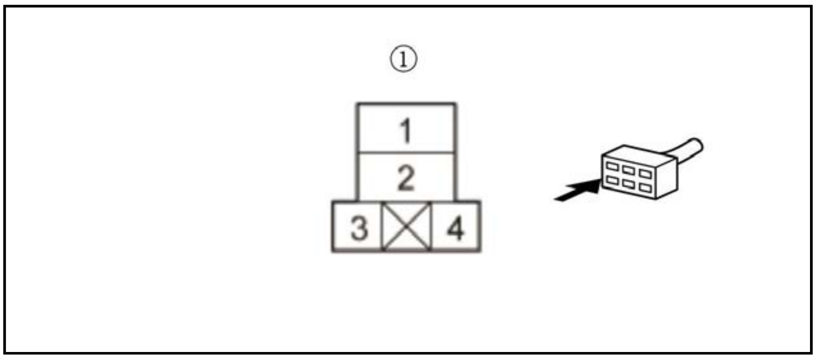
NO

An open in the +B MAIN FAN wire.

5. Determine possible failure area (radiator fan relay switch side circuit, radiator fan relay coil side circuit)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Radiator fan relay 4P socket (female terminals) No. 1: ①
Terminal B	Radiator fan relay 4P socket (female terminals) No. 2: ①



Do the A/C condenser and radiator fans run on low?

YES

Go to step 6.

NO

Go to step 8.

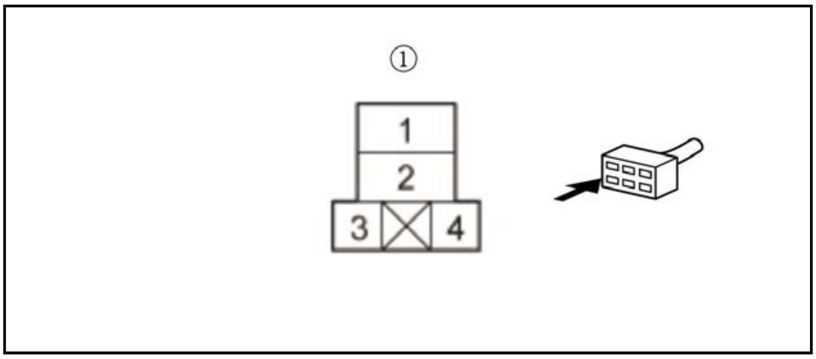
6. Open wire check (IG2 A/C line)

   -1. Disconnect the jumper wire.

   -2. Turn the vehicle to the ON mode.

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode Radiator fan relay: disconnected
Test point 1	Radiator fan relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG2 A/C wire is OK. Go to step 7.

NO

Repair an open in the wire between the No. D9 (10 A) fuse in the under-dash fuse/relay box and the radiator fan relay.

7. Open wire check (FAN LO SIGNAL line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Reinstall the radiator fan relay.

   -3. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the PCM from damage.

   -4. Disconnect the following connector.

1.5 L engine: PCM connector A (50P)
2.4 L engine: PCM connector A (51P)

   -5. Connect terminals A and B with a jumper wire.

1.5 L engine

Terminal A	**PCM connector A (50P) No. 17**
Terminal B	Body ground

2.4 L engine

Terminal A	PCM connector A (51P) No. 9
Terminal B	Body ground

-6. Turn the vehicle to the ON mode.

Do the A/C condenser and radiator fans run on low?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or substitute a known-good PCM , then recheck. If the substituted, replace the original PCM .

NO

Repair an open in the FAN LO SIGNAL wire.

8. Open wire check (MAIN FAN MOTOR line)

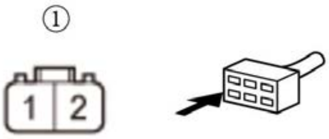
-1. Disconnect the following connector.

Radiator fan motor 2P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Radiator fan relay: disconnected
	Radiator fan motor 2P connector: disconnected
	Radiator fan relay 4P socket No. 1 and No. 2: jumped

Test point 1	Radiator fan motor 2P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The MAIN FAN MOTOR wire is OK. Go to step 9.

NO

Repair an open in the MAIN FAN MOTOR wire.

9. Radiator and A/C condenser fan motors test

-1. Test the radiator and the A/C condenser fan motors.

Are the radiator and A/C condenser fan motors OK?

YES

Go to step 10.

NO

Replace the radiator fan motor and/or the A/C condenser fan motor .

10. Fan control relay check

-1. Remove the fan control relay from the under-hood fuse/relay box, and test it .

Is the relay OK?

YES

Go to step 11.

NO

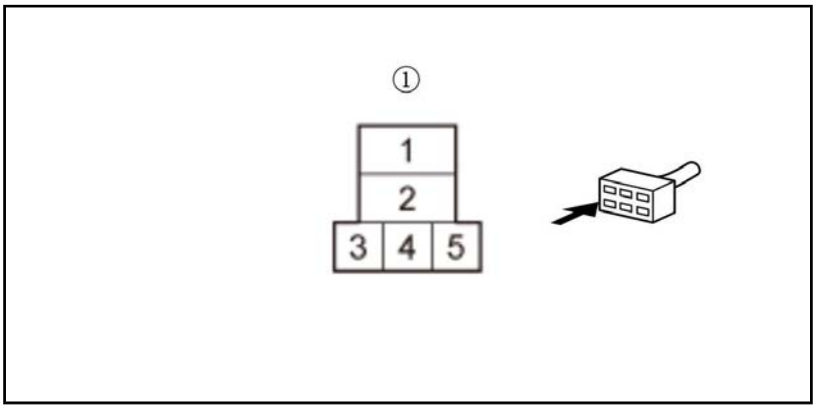
Replace the fan control relay.

11. Open wire check (FAN HI/LO RLY COM line)

-1. Reconnect the radiator fan motor 2P connector.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Radiator fan relay: disconnected Fan control relay: disconnected A/C condenser fan motor 2P connector: disconnected Radiator fan relay 4P socket No. 1 and No. 2: jumped
Test point 1	Fan control relay 5P socket (female terminals) No. 1
Test point 2	Body ground



Is there battery voltage?

YES

The FAN HI/LO RLY COM wire is OK. Go to step 12.

NO

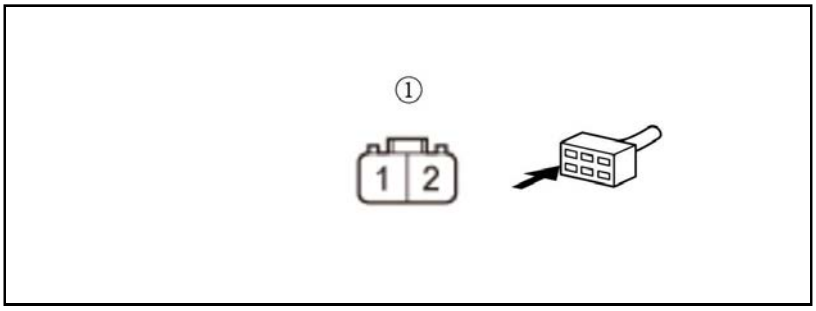
Repair an open in the FAN HI/LO RLY COM wire.

12. Open wire check (SUB FAN MOTOR line)

-1. Reinstall the fan control relay.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Radiator fan relay: disconnected
B	A/C condenser fan motor 2P connector: disconnected
B	Radiator fan relay 4P socket No. 1 and No. 2: jumped
Test point 1	A/C condenser fan motor 2P connector (female terminals) No. 1
Test point 2	Body ground



Is there battery voltage?

YES

Check for an open in the GND wire. If the wire is OK, check for poor ground at G351.

NO

Repair an open in the SUB FAN MOTOR wire.

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING - THE BLOWER AND THE HEATER CONTROLS AND THE A/C SYSTEM DO NC

The blower and the heater controls and the A/C system do not work

NOTE: Do this troubleshooting procedure only if sent here by symptom troubleshooting index.

1. Fuse check

-1. Check the following fuse.

Fuse	No. D9 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 2.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. D9 (10 A) fuse circuit.

2. Open wire check (IG2 A/C line)

-1. Disconnect the following connector.

Climate control unit connector A (32P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control unit connector A (32P): disconnected
Test point 1	**Climate control unit connector A (32P) No. 32**
Test point 2	Body ground

Is there battery voltage?

YES

The IG2 A/C wire is OK. Go to step 3.

NO

Repair an open in the IG2 A/C wire.

3. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
Test point 1	**Climate control unit connector A (32P) No. 28**
Test point 2	Body ground

Is there continuity?

YES

Replace the climate control unit .

NO

Check for an open in the GND wire. If the wire is OK, check for poor ground at G402.

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING - THE BLOWER AND THE HEATER CONTROLS AND THE A/C SYSTEM DO NC

The blower and the heater controls and the A/C system do not work

NOTE: Do this troubleshooting procedure only if sent here by **symptom troubleshooting index**.

1. Fuse check

-1. Check the following fuse.

Fuse	No. D9 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 2.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. D9 (10 A) fuse circuit.

2. Open wire check (IG2 A/C line)

-1. Disconnect the following connector.

Climate control unit connector A (32P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control unit connector A (32P): disconnected
Test point 1	**Climate control unit connector A (32P) No. 32**

Test point 2	Body ground

Is there battery voltage?

YES

The IG2 A/C wire is OK. Go to step 3.

NO

Repair an open in the IG2 A/C wire.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. B27 (30 A)
Location	Fuse/relay holder A

Is the fuse OK?

YES

Go to step 4.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. B27 fuse circuit.

4. Open wire check (+B_BACKUP2_SUB line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
Test point 1	**Climate control unit connector A (32P) No. 16**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_BACKUP2_SUB wire is OK. Go to step 5.

NO

Repair an open in the +B_BACKUP2_SUB wire.

5. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
Test point 1	**Climate control unit connector A (32P) No. 28**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Replace the climate control unit .

NO

Check for an open in the GND wire. If the wire is OK, check for poor ground at G402.

SYMPTOM TROUBLESHOOTING INDEX

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING INDEX (2017 2018 2019)

Symptom	Diagnostic Procedure	
The blower and the heater controls and the A/C system do not work	**Symptom Troubleshooting**	- **Climate contro** - Blown fuse No. - Poor ground at - Poor or loose c
The A/C compressor clutch and the cooling fan are inoperative, but the blower and heater controls work	Probable cause: A/C pressure sensor circuit malfunction or evaporator temperature sensor circuit malfunction	- **Climate contro** - **PGM-FI DTCs**

Symptom	Diagnostic Procedure	
	Troubleshoot the A/C pressure sensor circuit: - **A/C pressure sensor circuit low voltage** - **A/C pressure sensor circuit high voltage** **NOTE:** The A/C pressure sensor circuit can malfunction without setting a DTC	- **Abnormal A/C** - Faulty evaporat - Poor or loose cc
The A/C compressor clutch does not engage, but the cooling fan operate, and the blower and heater controls work	**Symptom Troubleshooting**	- **Climate contro** - Blown fuse No. - **Abnormal A/C** - Poor or loose cc
Blower fan runs slower than expected in cold weather (when in AUTO mode) **NOTE:** It is normal for the blower fan to run slowly until the coolant temperature rises when in AUTO mode	Probable cause: Engine coolant temperature (ECT) circuit malfunction Troubleshoot the ECT sensor circuit: - **ECT sensor 2 circuit low voltage** - **ECT sensor 2 circuit high voltage**	- **Climate contro** - **PGM-FI DTCs** - Blower motor o
The A/C compressor clutch cycles rapidly on and off *6	Probable cause: - A/C system is overcharged (Excessive pressure on high side of system causing pressure sensor to turn A/C compressor off) - Cooling fan inoperative - Low idle speed - Evaporator temperature sensor malfunction **Do the evaporator temperature sensor test**	- **Climate contro** - If there is no lea **A/C compresso** for an intermitte - Faulty A/C pres
The A/C compressor clutch does not disengage when the A/C switch is off	Probable cause: The A/C compressor clutch circuit is on (energized) continuously, shorted to ground, stuck A/C compressor clutch relay, or the A/C compressor clutch is mechanically jammed **Do the A/C compressor clutch check**, and repair any problems with the A/C compressor clutch	The A/C compressor r atmosphere, correct th the A/C compressor cl **compressor relief val**

*1: Without navigation *2: With navigation*3: Without dual zone control*4: With dual zone control*5: 1.5 L engine*6: 2.4 L engine

Symptom	Diagnostic Procedure	
The A/C compressor relief valve has vented refrigerant **NOTE:** This indicates the A/C system high side pressure was high	Probable cause: A high-side restriction, the cooling fan is inoperative, or the A/C compressor clutch is not disengaging - If the fans and A/C compressor clutch operate normally, feel the lines for restrictions **Do the A/C system contamination inspection** - If the A/C compressor clutch will not disengage, **troubleshoot the A/C compressor clutch circuit**, and **check for mechanical problems** - If the A/C condenser/radiator fans are inoperative, troubleshoot the fan circuits	**PGM-FI DTCs**
Driver's and passenger's side vent temperatures vary by more than 11B°C (20B°F)	Probable cause: - The air mix doors are malfunctioning Do the following troubleshooting: - - - **Air mix control motor test*3** - - **Driver's air mix control motor test** *4 - - **Passenger's air mix control motor test*4** - Low refrigerant charge - **Variable capacity control solenoid malfunction**	- **Climate contr** - Poor or loose c
HDS does not communicate with the climate control unit or the vehicle	**Troubleshoot the DLC circuit**	B
A/C information does not display on the center display unit, but the blower, heater and A/C system controls work (climate control panel without display)	Probable cause: Communication malfunction between the audio unit *1 or the audio-navigation unit *2 and the climate control unit Check the B-CAN line between the audio unit *1 or the audio-navigation unit *2 and the climate control unit	**Climate control DT**
Insufficient heating	- **Check the coolant level** - Check **the expansion tank cap*5** or **the radiator cap*6**	**Climate control DT**

Symptom	Diagnostic Procedure	

	• Check the engine coolant temperature (ECT) during normal operation with the HDS
	• Check the heater core inlet hose temperature:
	•
	    • If it is COLD, check for restrictions in the hose, a damaged or leaking thermostat, or a damaged or leaking water pump
	    • If it is HOT, check for restrictions in the heater core. Back flush or **replace the heater core**
	• Check the operation of the air mix doors:
	•
	    • **Air mix control motor test*3**
	    • Driver's air mix control motor test *4
	    • **Passenger's air mix control motor test*4**
	• Check the blower motor unit for obstructions
	• Check for air leaks around the ducts and vents	

*1: Without navigation *2: With navigation*3: Without dual zone control*4: With dual zone control*5: 1.5 L engine*6: 2.4 L engine

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING INDEX (2020 2021)

Symptom	Diagnostic Procedure	
The blower and the heater controls and the A/C system do not work	**Symptom Troubleshooting**	• **Climate contr** • Blown fuse Nc • Blown fuse Nc • Poor ground at • Poor or loose c

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE CLIMATE CONTROL SYSTEM (CLIMATE CONTROL PANEL WITH DISPLAY)

How to Check for DTCs with the HDS

NOTE:

- There are three methods used to check for DTCs. The recommended method is to use the Honda Diagnostic System (HDS) with the appropriate software, plugged
- The second method is to run the self-diagnostic function built into the climate control unit.
- The third method is to use **B-CAN system diagnosis test mode A** .

1. Turn the vehicle to the OFF (LOCK) mode.

2. **Connect the HDS to the DLC**

3. Select BODY ELECTRICAL in the System Selection Menu.

4. Select HVAC/Climate control in the Body Electrical System Select.

5. Select DTCs in the HVAC/Climate Control Mode Menu.Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubleshoo
refer to symptom troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function with the HDS

NOTE: This method is only available if the HDS can communicate with the climate control unit.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC.

3. Select BODY ELECTRICAL in the System Selection Menu.

4. Select HVAC/Climate Control in the Body Electrical System Select.

5. Select Inspection in the HVAC/Climate Control Mode Menu.

6. Select Climate Control Unit Self Test in the Inspection Menu.Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubl

- After troubleshooting, clear the DTCs with the HDS.
- For specific operations, refer to the user's manual that came with the HDS.

How to Use the Self-Diagnostic Function without the HDS

Button

Button	Button Name
AUTO	AUTO button
ON/ OFF	ON/OFF button

Button	Button Name
	REAR WINDOW DEFOGGER/MIRROR DEFOGGER * button
	RECIRCULATION button
	WINDSHIELD DEFROST button

*: With mirror defogger

The climate control unit has a self-diagnostic function. To run the self-diagnostic function, do the following:

1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

2. Press and hold the ON/OFF button, then within 10 seconds press and release the REAR WINDOW DEFOGGER/MIRROR DEFOGGER * button five times. Release segments come on for 2 seconds, then the self-diagnostic function begins.**NOTE:**

- The blower motor will run at various speeds regardless of what the panel is displaying.
- If there is any problem in the system, the temperature indicator flashes 88. Refer to checking for DTCs.
- If there is more than one DTC, they are displayed one at a time in sequence followed by a pause (all the display indicator segments illuminate) between the DTCs
- If no DTCs are present, the temperature indicator will flash "no".

Canceling the Self-Diagnostic Function

4. Turn the vehicle to the OFF (LOCK) mode to cancel the self-diagnostic function. After completing repair work, run the self-diagnostic function again to make sure th

Checking for DTCs

The temperature indicator display indicates single or multiple DTCs. If no DTCs are present, the temperature indicator will flash "no".

DTC (Temperature Indicator Segments)	DTC	Detection Item
01 *1	B1225	An open in the in-car temperature sensor circuit

DTC (Temperature Indicator Segments)	DTC	Detection Item
02 *1	B1226	A short in the in-car temperature sensor circuit

91	U1281	Climate control unit lost communication with MICU (body control module)
93	B2964	Climate control unit lost communication with front panel (climate control panel)
C0	---	Climate control unit internal error
Cd	---	Unknown sunlight sensor type

*1: Without auto idle stop system*2: 1.5 L engine*3: With auto idle stop system*4: With front seat heater

How to Check for History DTCs

The climate control unit can record history DTCs. To read the history DTCs, do the following:

1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

2. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.While pressing and holding both the WINDSHIEL goes directly to the A/C Error Display shown.

NOTE:

- **If there is any problem in the system, the temperature indicator flashes 88. Refer to checking for DTCs.**
- **If there is more than one DTC, they are displayed one at a time in sequence followed by a pause (all the display indicator s**
- **If no DTCs are present, the temperature indicator will flash "no".**

Canceling the Read History DTCs

4. Turn the vehicle to the OFF (LOCK) mode to cancel the history DTCs. After completing the repair work, clear the DTCs.

How to Clear the History DTCs

1. Turn the vehicle to the OFF (LOCK) mode.

2. Press and hold both the AUTO and WINDSHIELD DEFROST buttons, then turn the vehicle to the ON mode.

3. After about 5 seconds the windshield defrost indicator starts to blink, release the buttons.

4. Do the How to Check for History DTCs to verify DTCs have been cleared.

Displaying Sensor Inputs at the Climate Control Unit

The climate control unit has a mode that displays the sensor inputs it receives. This mode shows you what the climate control unit is receiving from each of the sensors, faulty.

Checks Before Using the Sensor Input Display Mode

1. Turn the vehicle to the ON mode, and check the recirculation door function; press the RECIRCULATION button to switch from FRESH to RECIRCULATE. The air TEMPERATURE CONTROL dial to the desired test temperature:

- "Lo" temperature setting will default to MAX COOL, VENT, and RECIRCULATE (A/C on) or FRESH (A/C off).
- "Hi" temperature setting will default to MAX HOT, HEAT, HEAT/DEF and FRESH.

3. Turn the vehicle to the OFF (LOCK) mode.

Run the Sensor Input Display Mode

1. Press and hold both the AUTO and RECIRCULATION buttons, then start the engine.

2. Release both buttons. The temperature indicator will flash the sensor number and then the value for that sensor. Record the value displayed.To advance to the next ser DEFOGGER * button.

*: With mirror defogger

NOTE:

- **The sensor values will be displayed in degrees Celsius (deg.C) or an alphanumeric code. Use the chart to convert the valu**
- **If the sensor value displays "Er", this indicates there is an open or short in the circuit or sensor. Check for DTCs using the function.**
- **If necessary, compare the sensor input display to a known-good vehicle under the same test conditions.**
- **If the sensor displayed value is out of the normal range, refer to the sensor test or substitute a known-good sensor, and re**
- **Unsupported items shall be skipped.**

Sensor	Item
0	In-car temperature sensor
1	Outside air temperature sensor
2	Sunlight sensor
3	Engine coolant temperature
4	Evaporator temperature sensor
5	Humidity sensor
8	Air mix opening (low value indicates cooler air distribution, higher value indicates warmer air distribution)
b	Mode positioning

Sensor	Item

HOW TO TROUBLESHOOT THE CLIMATE CONTROL SYSTEM(CLIMATE CONTROL PANEL WITHOUT DISPLAY)

How to Check for DTCs with the HDS

NOTE:

- There are three methods used to check for DTCs. The recommended method is to use the Honda Diagnostic System (HDS) with the appropriate software, plugge
- The second method is to run the self-diagnostic function built into the climate control unit.
- The third method is to use B-CAN system diagnosis test mode A .

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC

3. Select BODY ELECTRICAL in the System Selection Menu.

4. Select HVAC/Climate control in the Body Electrical System Select.

5. Select DTCs in the HVAC/Climate Control Mode Menu.Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troublesho refer to symptom troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function with the HDS

NOTE: This method is only available if the HDS can communicate with the climate control unit.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Connect the HDS to the DLC

3. Select BODY ELECTRICAL in the System Selection Menu.

4. Select HVAC/Climate Control in the Body Electrical System Select.

5. Select Inspection in the HVAC/Climate Control Mode Menu.

6. Select Climate Control Unit Self Test in the Inspection Menu.Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubl

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function without the HDS

How to Check for History DTCs

The climate control unit can record history DTCs. To read the history DTCs, do the following:

1. Turn the vehicle to the OFF (LOCK) mode and then the ON mode.

2. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.While pressing and holding both the WINDSHIEL goes directly to the A/C Error Display shown.

NOTE:

- **If there are any problems in the system, the A/C Error Display screen will indicate them. Select the previous/next icon to c the indication, refer to the table that follows.**
- **If there are no problems detected, The error status shows Normal, and The number of Errors indicates "0".**

Canceling the Read History DTCs

4. Turn the vehicle to the OFF (LOCK) mode to cancel reading the history DTCs. After completing the repair work, clear the DTCs.

How to Clear the History DTCs

1. Turn the vehicle to the OFF (LOCK) mode and then the vehicle ON mode.

2. While pressing the WINDSHIELD DEFROST button, press and hold the ON/OFF button for 10 seconds or more.

3. While pressing and holding both the WINDSHIELD DEFROST and ON/OFF buttons, the display screen goes directly to the A/C Error Display shown, touch and hol

4. Do the How to Check for History DTCs to verify DTCs have been cleared.

Displaying Sensor Inputs at the Climate Control Unit

The climate control unit has a mode that displays the sensor inputs it receives. This mode shows you what the climate control unit is receiving from each of the sensors, faulty.

Checks Before Using the Sensor Input Display Mode

1. Turn the vehicle to the ON mode, and check the recirculation door function; press the RECIRCULATION button to switch from FRESH to RECIRCLATE. The air v TEMPERATURE CONTROL dial to the desired test temperature:

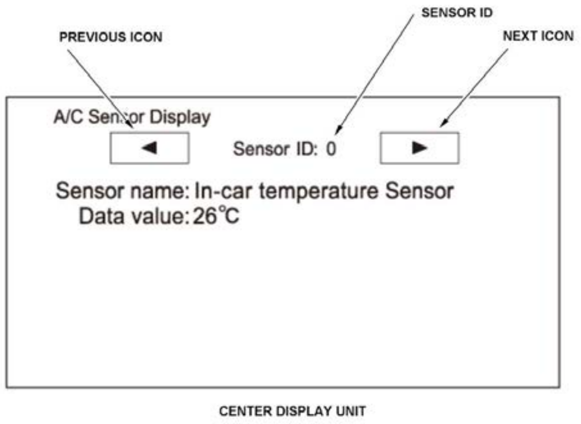
- "Lo" temperature setting will default to MAX COOL, VENT and RECIRCULATE (A/C on) or FRESH (A/C off).
- "Hi" temperature setting will default to MAX HOT, HEAT, HEAT/DEF, and FRESH.

3. Turn the vehicle to the OFF (LOCK) mode.

Run the Sensor Input Display Mode

1. Press and hold both the AUTO and RECIRCULATION buttons, then start the engine.

2. Release both buttons. The display screen goes directly to the A/C sensor display mode shown. The display screen indicates the sensor ID and then the value for that s



Sensor name: In-car temperature Sensor
Data value: 26℃

To advance to the next sensor, touch the sensor ID previous/next icon or press the REAR WINDOW DEFOGGER/MIRROR DEFOGGER * button.

*: With mirror defogger

NOTE:

- **The sensor values will be displayed in degrees Celsius (deg.C) or an alphanumeric code. Use the chart to convert the valu**
- **If the sensor value displays "255", this indicates there is an open or short in the circuit or sensor. Check for DTCs using th diagnostic function.**
- **If necessary, compare the sensor input display to a known-good vehicle under the same test conditions.**
- **If the sensor displayed value is out of the normal range, refer to the sensor test or substitute a known-good sensor, and re**
- **Unsupported items shall be skipped.**

HOW TO TROUBLESHOOT THE CLIMATE CONTROL SYSTEM(CLIMATE CONTROL PANEL WITHOUT DISPLAY)

How to Check for DTCs with the HDS

NOTE:

- There are three methods used to check for DTCs. The recommended method is to use the Honda Diagnostic System (HDS) with the appropriate software, plugge
- The second method is to run the self-diagnostic function built into the climate control unit.
- The third method is to use **B-CAN system diagnosis test mode A** .

1. Turn the vehicle to the OFF (LOCK) mode.

2. **Connect the HDS to the DLC**

3. Select BODY ELECTRICAL in the System Selection Menu.

4. Select HVAC/Climate control in the Body Electrical System Select.

5. Select DTCs in the HVAC/Climate Control Mode Menu.Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troublesho refer to symptom troubleshooting.

NOTE:

- **After troubleshooting, clear the DTCs with the HDS.**
- **For specific operations, refer to the user's manual that came with the HDS.**

How to Use the Self-Diagnostic Function with the HDS

NOTE: This method is only available if the HDS can communicate with the climate control unit.

1. Turn the vehicle to the OFF (LOCK) mode.

2. **Connect the HDS to the DLC**

3. Select BODY ELECTRICAL in the System Selection Menu.

4. Select HVAC/Climate Control in the Body Electrical System Select.

5. Select Inspection in the HVAC/Climate Control Mode Menu.

6. Select Climate Control Unit Self Test in the Inspection Menu.Check for DTCs. If any DTCs are indicated, write down the DTCs, then go to the indicated DTC troubl

- After troubleshooting, clear the DTCs with the HDS.
- For specific operations, refer to the user's manual that came with the HDS.

How to Use the Self-Diagnostic Function without the HDS

Button

- Check the expansion tank cap*5 or the radiator cap*6
- Check the engine coolant temperature (ECT) during normal operation with the HDS
- Check the heater core inlet hose temperature:
-
    - If it is COLD, check for restrictions in the hose, a damaged or leaking thermostat, or a damaged or leaking water pump
    - If it is HOT, check for restrictions in the heater core. Back flush or replace the heater core
- Check the operation of the air mix doors:
-
    - Air mix control motor test*3
    - Driver's air mix control motor test *4
    - Passenger's air mix control motor test*4
- Check the blower motor unit for obstructions
- Check for air leaks around the ducts and vents

Also Check for

Climate control DTCs

INSUFFICIENT HEATING (2020 2021)

Diagnostic Procedure

- Check the coolant level
- Check the expansion tank cap
- Check the engine coolant temperature (ECT) during normal operation with the HDS
- Check the heater core inlet hose temperature:
-
    - If it is COLD, check for restrictions in the hose, a damaged or leaking thermostat, or a damaged or leaking water pump

    - If it is HOT, check for restrictions in the heater core. Back flush or **replace the heater core**
- Check the operation of the air mix doors:
-
    - **Air mix control motor test*3**
    - **Driver's air mix control motor test*4**
    - **Passenger's air mix control motor test*4**
- Check the blower motor unit for obstructions
- Check for air leaks around the ducts and vents

Also Check for

Climate control DTCs

THE A/C COMPRESSOR CLUTCH AND THE COOLING FAN ARE INOPERATIVE, BUT THE BLOWER AND HEATER CONTROLS WORK (2017 201

Diagnostic Procedure

Probable cause: A/C pressure sensor circuit malfunction or evaporator temperature sensor circuit malfunction

Troubleshoot the A/C pressure sensor circuit:

- **A/C pressure sensor circuit low voltage**
- **A/C pressure sensor circuit high voltage**

NOTE: The A/C pressure sensor circuit can malfunction without setting a DTC

Also Check for

- **Climate control DTCs**
- **PGM-FI DTCs**
- **Abnormal A/C system pressures**
- Faulty evaporator temperature sensor
- Poor or loose connections at the terminals

THE A/C COMPRESSOR CLUTCH AND THE COOLING FAN ARE INOPERATIVE, BUT THE BLOWER AND HEATER CONTROLS WORK (2020 202

Diagnostic Procedure

Probable cause: A/C pressure sensor circuit malfunction or evaporator temperature sensor circuit malfunction

Troubleshoot the A/C pressure sensor circuit:

- **A/C pressure sensor circuit low voltage**
- **A/C pressure sensor circuit high voltage**

NOTE: The A/C pressure sensor circuit can malfunction without setting a DTC

Also Check for

- **Climate control DTCs**
- **PGM-FI DTCs**
- **Abnormal A/C system pressures**
- Faulty evaporator temperature sensor
- Poor or loose connections at the terminals

THE A/C COMPRESSOR CLUTCH CYCLES RAPIDLY ON AND OFF*6 (2017 2018 2019)

Diagnostic Procedure

Probable cause:

- A/C system is overcharged (Excessive pressure on high side of system causing pressure sensor to turn A/C compressor off)
- Cooling fan inoperative
- Low idle speed
- Evaporator temperature sensor malfunction

  Do the evaporator temperature sensor test

Also Check for

- **Climate control DTCs**
- If there is no leak and the refrigerant level is normal, **do the A/C compressor clutch circuit troubleshooting**, and look for an intermittent problem
- Faulty A/C pressure sensor

THE A/C COMPRESSOR CLUTCH DOES NOT DISENGAGE WHEN THE A/C SWITCH IS OFF (2017 2018 2019)

Diagnostic Procedure

Probable cause: The A/C compressor clutch circuit is on (energized) continuously, shorted to ground, stuck A/C compressor clutch relay, or the A/C compressor clutch i

Do the A/C compressor clutch check, and repair any problems with the A/C compressor clutch

Also Check for

The A/C compressor relief valve. If it has vented refrigerant to the atmosphere, correct the problem with the A/C compressor clutch or the A/C compressor clutch circuit

THE A/C COMPRESSOR CLUTCH DOES NOT DISENGAGE WHEN THE A/C SWITCH IS OFF (2020 2021)

Diagnostic Procedure

Probable cause: The A/C compressor clutch circuit is on (energized) continuously, shorted to ground, stuck A/C compressor clutch relay, or the A/C compressor clutch i

Do the A/C compressor clutch check, and repair any problems with the A/C compressor clutch

Also Check for

The A/C compressor relief valve. If it has vented refrigerant to the atmosphere, correct the problem with the A/C compressor clutch or the A/C compressor clutch circuit

THE A/C COMPRESSOR CLUTCH DOES NOT ENGAGE, BUT THE COOLING FAN OPERATE, AND THE BLOWER AND HEATER CONTROLS WO

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

- Climate control DTCs
- Blown fuse No. A23 (10 A) in the under-hood fuse/relay box
- Abnormal A/C system pressures
- Poor or loose connections at the terminals

THE A/C COMPRESSOR CLUTCH DOES NOT ENGAGE, BUT THE COOLING FAN OPERATE, AND THE BLOWER AND HEATER CONTROLS WO

Diagnostic Procedure

- Symptom Troubleshooting

Also Check for

- Climate control DTCs

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

A/C INFORMATION DOES NOT DISPLAY ON THE CENTER DISPLAY UNIT, BUT THE BLOWER, THE HEATER, AND THE A/C SYSTEM CONTRO WITHOUT DISPLAY)

Diagnostic Procedure

Probable cause: Communication malfunction between the audio unit and the climate control unit

Check the B-CAN line between the audio unit and the climate control unit

Also Check for

Climate control DTCs

BLOWER FAN RUNS SLOWER THAN EXPECTED IN COLD WEATHER (WHEN IN AUTO MODE)

NOTE: **It is normal for the blower fan to run slowly until the engine coolant temperature rises when in AUTO mode**

Diagnostic Procedure

Probable cause: Engine coolant temperature (ECT) circuit malfunction

Troubleshoot the ECT sensor circuit:

- ECT sensor 1 out of range
- ECT sensor 1 circuit range/performance problem
- ECT sensor 1 circuit low voltage
- ECT sensor 1 circuit high voltage

Also Check for

- Climate control DTCs
- PGM-FI DTCs
- Manual blower motor operation

DRIVER'S AND PASSENGER'S SIDE VENT TEMPERATURES VARY BY MORE THAN 20 B°F (11 B°C)

Diagnostic Procedure

Probable cause:

- The air mix doors are malfunctioning

  Do the following troubleshooting:

-
    - -

      Air mix control motor test*1
    - -

      Driver's air mix control motor test*2
    - -

      Passenger's air mix control motor test*2
- Low refrigerant charge

Also Check for

- Climate control DTCs
- Harness/connections

HDS DOES NOT COMMUNICATE WITH THE CLIMATE CONTROL UNIT OR THE VEHICLE

Diagnostic Procedure

- Troubleshoot the DLC circuit

INSUFFICIENT HEATING

Diagnostic Procedure

- Check the engine coolant level
- Check the radiator cap
- Check the engine coolant temperature (ECT) during normal operation with the HDS
- Check the heater core inlet hose temperature:
-
    - If it is COLD, check for restrictions in the hose, a damaged or leaking thermostat, or a damaged or leaking water pump

  - If it is HOT, check for restrictions in the heater core. Back flush or **replace the heater core**
- Check the operation of the air mix doors:
-
  - **Air mix control motor test*1**
  - **Driver's air mix control motor test*2**
  - **Passenger's air mix control motor test*2**
- Check the blower motor unit for obstructions
- Check for air leaks around the ducts and vents

Also Check for

Climate control DTCs

THE BLOWER, THE HEATER CONTROLS, AND THE A/C SYSTEM DO NOT WORK

Diagnostic Procedure

- **Symptom Troubleshooting**

Also Check for

- **Blown fuse No. D9**
- Poor ground at G251
- Climate control unit
- Harness/connections

THE ELECTRIC A/C COMPRESSOR AND THE COOLING FAN ARE INOPERATIVE, BUT THE BLOWER AND HEATER CONTROLS WORK

Diagnostic Procedure

Probable cause: A/C pressure sensor circuit malfunction or evaporator temperature sensor circuit malfunction

Troubleshoot the A/C pressure sensor circuit:

- **A/C pressure sensor circuit low voltage**
- **A/C pressure sensor circuit high voltage**

NOTE: The A/C pressure sensor circuit can malfunction without setting a DTC

Also Check for

- **Climate control DTCs**
- **PGM-FI DTCs**
- **Abnormal A/C system pressures**
- Evaporator temperature sensor
- Harness/connections

WHEN AN ENGINE STOPS, THE HEATER DOES NOT WARM (THE PTC HEATER DOES NOT HEAT UP)

Diagnostic Procedure

- **Do the PTC heater circuit troubleshooting**

Also Check for

- **Blown fuse No. C1-1**
- **Blown fuse No. C1-3**
- Poor ground at G352
- PTC heater B relay
- PTC heater D relay
- PTC heater core
- Climate control unit
- Harness/connections

DESCRIPTION & OPERATION

A/C SYSTEM DESCRIPTION

The Air Conditioning is a system that controls the interior space to a comfortable environment.

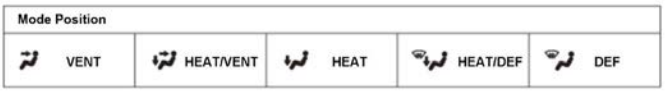
Climate Control



Mode Position				
VENT	HEAT/VENT	HEAT	HEAT/DEF	DEF

The climate control system transmits signals appropriate signals to each motor based on the information (sunlight, humidity, in-car temperature, outside air temperature)

- Air Mix Control Motor: The system controls the air temperature coming into the cabin by mixing the ratio of warm and cold air. The air mix control motor adjusts
- Mode Control Motor: The system directs the airflow to the specified area (VENT, HEAT/VENT, HEAT, HEAT/DEF, or DEF). The mode control motor switches t
- Recirculation Control Motor: The recirculation control motor switches the recirculation control door position to the "FRESH" or "RECIRCULATION".
- Blower Motor: The blower motor changes the air volume based on the voltage adjusted by the power transistor.

The climate control unit optimizes these controls in order to maintain passenger comfort.

Relationship between Vent (Air Outlet) Temperature and Actual In-Car Temperature

The climate control unit can automatically control vent temperature (air mix position), blower motor speed, blower intake, and the electric A/C compressor operation to the customer's temperature setting. The actual vent outlet temperature largely depends upon the difference between the in-car temperature sensor reading and the custom

Warm-Up Control

If the customer wants to warm-up the interior when no heat is available because the engine coolant temperature is low, the climate control unit will slow the fan speed to gradually increase the fan speed as the engine coolant temperature rises.

The climate control system will control this process when the following characteristics are present:

- Fan speed is set to "AUTO".
- Air outlet position is set to "AUTO", "HEAT", or "HEAT/DEF".
- Outside air temperature is less than 68 deg.F (20 deg.C).
- Engine coolant temperature sensor and outside air temperature sensor are normal.
- Engine coolant temperature is less than 131 deg.F (55 deg.C).

Low Engine Coolant Temperature Control

When the engine coolant temperature is low, the climate control system changes an air outlet position to the "DEF". When the engine coolant temperature increases, the outlet air temperature automatically.

Revision because of Sunlight

When the air conditioner is operating, if fan speed is set to "AUTO" and air outlet position is "VENT" or "HEAT/VENT", the climate control unit raises the fan speed d

Relationship between Vehicle Speed and Blower Intake Mode

Because the air resistance is different between fresh air and recirculated air, the volume of air coming through the vents would be different if the fan speed was constant the fresh air flow increases as the vehicle speed increases. The climate control unit regulates the fan speed so that the air volume is the same when "FRESH" or "RECIR

A/C Control

To prevent the evaporator from freezing, the climate control unit switches the electric A/C compressor ON and OFF based on the evaporator temperature sensor value. V control unit automatically varies the electric A/C compressor operation time based on the evaporator temperature sensor value, as well as the outside air temperature, ins

MAX Control

When the temperature setting is adjusted to "MAX COOL (Lo)" or "MAX HOT (Hi)", the climate control unit overrides automatic control and defaults to the following

- MAX COOL

  "RECIRCULATION", "VENT", blower fan maximum speed, and A/C system ON.

- MAX HOT

  "FRESH", "HEAT*", blower fan maximum speed, and A/C system ON.*: If the sensor information indicates that the windshield may fog, the air outlet switches t

ECON Control

- Electric A/C compressor load control

  Reduces load on electric A/C compressor by slightly raising the target temperature of the evaporator.

- Blower fan speed control

  Control the blower fan speed low compared to normal operation for an energy-saving operation with low air volume.

Customize Function

How to Change the Set Temperature (Climate Control Panel with Display)

The climate control unit has a function to change the set temperature +2.7 deg.F (+1.5 deg.C) or -2.7 deg.F (-1.5 deg.C) in case the customer feels the temperature is too

NOTE: Verify that the climate control and A/C system is working properly before using the customize function to offset the set temperature.

- Turn the vehicle to the ON mode, then based on the desired temperature change, set the temperature condition on the temperature control dial according to the tab
- Turn the climate control system OFF then turn the vehicle to the OFF (LOCK) mode.
- Depending on desired setting change, press and hold the pair of buttons according to the table.
- While holding the buttons, turn the vehicle to the ON mode.
- Keep the buttons pressed for 10 seconds.

Setting	Temperature Condition	Buttons		
+2.7 deg.F (+1.5 deg.C) Change	Hi			or
-2.7 deg.F (-1.5 deg.C) Change	Lo			or

Setting	Temperature Condition	Buttons		
Changing back to 0 deg.F (0 deg.C)	Except Hi or Lo			or

- Indication of the change

  The climate control unit displays the following during each change.

-
  - -

    Displays nothing from the vehicle ON mode for 5 seconds.

  - -

    Blinks the current setting for the next 5 seconds.

  - -

    The display will indicate a Hi, Lo or two dashes depending on the set temperature change.

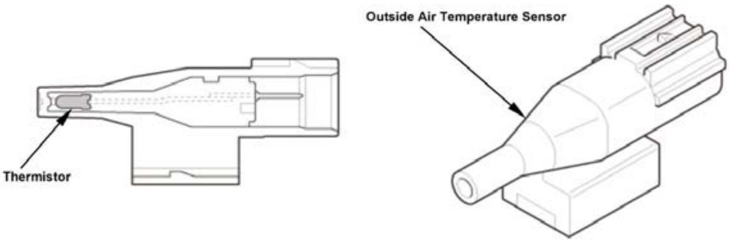
A/C SYSTEM DESCRIPTION - COMPONENTS

Outside Air Temperature Sensor

The outside air temperature sensor uses a sensor that decreases resistance when temperature rises. The climate control unit calculates the outside air temperature based c temperature sensor.

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

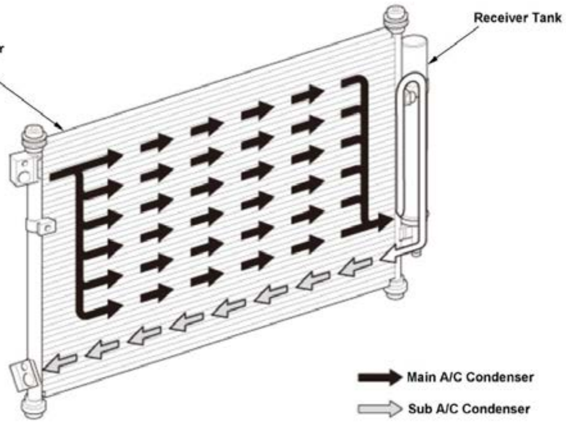


A/C Condenser

Sub Cool Cycle Condenser System

The condenser and receiver/dryer are integrated. The main A/C condenser changes the high pressure and temperature refrigerant vapor from the electric A/C compresso allows the refrigerant to release heat to the outside air. The receiver/dryer acts as a reservoir of liquid refrigerant for the expansion valve. It also removes debris and moi the high pressure and high temperature liquid refrigerant even further to improve A/C performance.

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

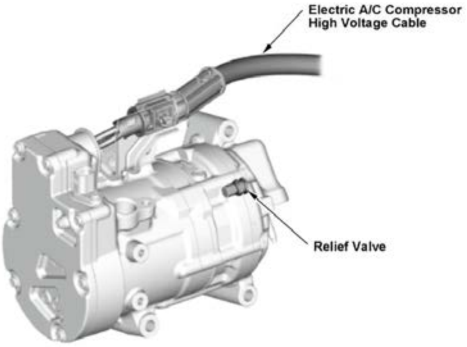


A/C Condenser
Receiver Tank
Main A/C Condenser
Sub A/C Condenser

Electric A/C Compressor

The electric A/C compressor is pump driven by a built-in motor to compress the A/C refrigerant. The compressed refrigerant from the electric A/C compressor turns into condenser. The electric A/C compressor has a mechanical relief valve, and the valve opens when pressure exceeds the rated value. It cannot be reused, and should be rep significantly low (below level "L" as shown on state of charge (SOC) analog meter at the gauge control module), operation of the electric A/C compressor will be limite to vehicle propulsion.

NOTE: This illustration is an example only. The appearance and structure of the actual parts may vary depending on the model.



Electric A/C Compressor
High Voltage Cable
Relief Valve

A/C Pressure Sensor

The A/C pressure sensor's output voltage changes in response to changes in A/C discharge pressure. The PCM receives the voltage signal and is used to drive the electric the upper limit, or decreases to the lower limit, the PCM stops the electric A/C compressor to protect the system.

- Upper limit: 2, 950 kPa (30.08 kgf/cm 2, 427.9 psi)
- Lower limit: 196 kPa (2.00 kgf/cm 2, 28.4 psi)

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

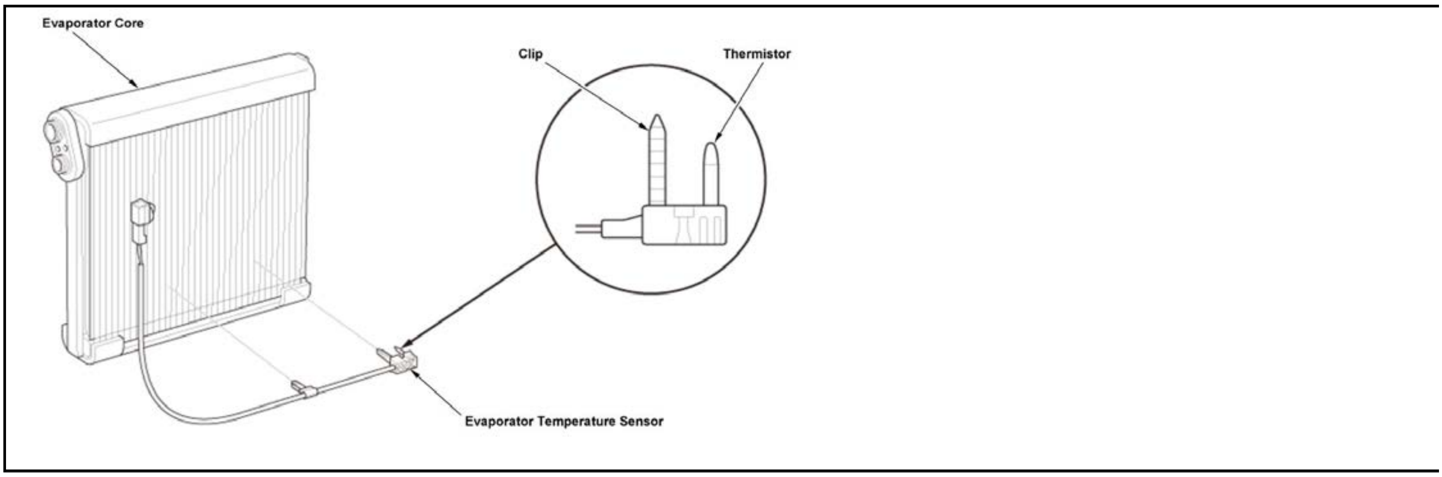
Lens
Photodiode
Resistor
Sunlight Sensor

Evaporator Temperature Sensor

The evaporator temperature sensor is a clip-type thermistor, with a sensing element that is directly mounted to the evaporator core fins. The sensor is connected to the cl temperature. The electric A/C compressor and fans are cycled off briefly if the temperature approaches the freezing point of water. If the evaporator temperature gets too freeze, causing restricted evaporator airflow and poor A/C performance.

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

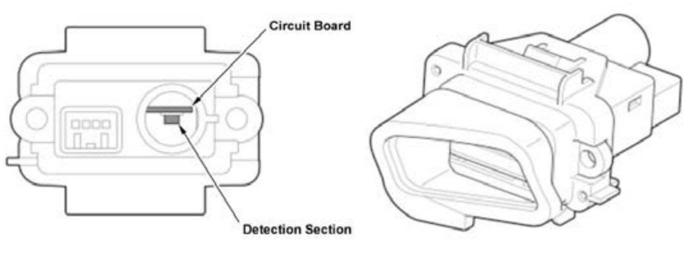


Evaporator Core
Clip
Thermistor
Evaporator Temperature Sensor

Humidity/In-Car Temperature Sensor

The humidity/in-car temperature sensor has a humidity sensor and an in-car temperature sensor. The climate control unit receives humidity information from the sensor When it is humid, the climate control unit operates the electric A/C compressor to prevent a windshield from being fogged. When the humidity is low enough, the clima A/C compressor. A flexible hose connects the sensor case to an aspirator on the HVAC unit to detect the accuracy of temperature and humidity.

NOTE: This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.



Circuit Board
Detection Section

PTC Heater

When the engine coolant temperature is low, the heating performance is not available due to low engine coolant temperature. The climate control unit turns on the electr performance. The climate control unit drives PTC heater relays and turns on the electric heater and secures heater performance. If heater core temperature rises enough, and the power supply to the PTC heater.

PTC: Positive Temperature Coefficient

HEATED STEERING WHEEL SYSTEM DESCRIPTION

Basic Control/Function

The heated steering wheel switch turns on or off the heated steering wheel system. When the heated steering wheel switch is pressed, the switch sends on signals to the l steering wheel indicator. The heated steering wheel control unit controls outputs to the steering heater based on the heater temperature sensor values. While the heater is the illumination signal via LIN, and adjusts the brightness of the indicator.

Automatic Control

When the remote engine start control system is activated, the climate control system turns on the seat heater system based on the vehicle temperature. When the seat hea the gauge control module sends ON commands to the heated steering wheel control unit, and provides power to the heater pad. When the seat heater is turned on in this on.

Transition to Off State

The heater output shall transition to the off state under any of the following conditions

- +B_HTR power is off.
- The current operation state is off.
- Thermistor open/short failure is detected.
- Heater current abnormal failure is detected.
- Steering wheel not heating failure is detected.
- Main heater switch failure is detected.
- Heated steering wheel switch failure is detected.

HEATED STEERING WHEEL SYSTEM DESCRIPTION - COMPONENTS

Steering Heater

Heating is done by the current from the heated steering wheel control unit.

Heated Steering Wheel Switch

The heated steering wheel switch is a momentary switch and performs input to the heated steering wheel control unit. The heated steering wheel indicator is driven by t

DIAGNOSIS

A/C DIAGNOSTIC PROCESS

When a customer presents an A/C concern, do the following procedure to identify the cause of the problem.

1. Confirm the type of concern.

- If a customer complains about an A/C performance problem, go to step 2.
- If a customer complains about an A/C noise problem, **do the A/C system noise check**.

2. **Do the A/C system inspection** and repair any problems. If no problems are found, go to step 3.

- If the refrigerant charge is within specifications, go to step 5.
- If the refrigerant charge is significantly under specifications, go to step 4.
- If the refrigerant charge is significantly over specifications, go to step 5.

3. **Recover the refrigerant from the A/C system** and measure the refrigerant charge from the A/C system using an A/C recover/recycle/recharge station.

4. **Do the refrigerant leak check** and repair any leaks. If no leaks are found, go to step 5.

5. **Evacuate and recharge the system** and **do the A/C system test**.

- If vent temperature or suction/discharge pressures are within specifications, the repair is confirmed and the A/C diagnostic process is complete.
- If vent temperature or suction/discharge pressures are not within specifications, a problem may still exist. Return to step 2, and recheck your test procedures.

GENERAL INFORMATION

A/C SERVICE TIPS AND PRECAUTIONS

WARNING:

- Compressed air mixed with the HFO-1234yf (R-1234yf) forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test HFO-1234yf (R-1234yf) service equipment or vehicle air conditioning systems.

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

The air conditioning system uses HFO-1234yf (R-1234yf) refrigerant and polyolester (POE) **refrigerant oil**.

Use only service equipment that is U.L.-listed and is certified to meet the requirements of SAE J639 to remove R-1234yf from the air conditioning system.

If accidental system discharge occurs, ventilate the work area before resuming service.

R-1234yf service equipment or vehicle air conditioning systems should not be pressure tested or leak tested with compressed air.

Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.

- Always disconnect the negative cable from the 12 volt battery whenever replacing air conditioning parts.
- Keep moisture and dirt out of the system. When disconnecting any lines, plug or cap the fittings immediately; do not remove the caps or plugs until just before yo
- Before connecting any hose or line, apply a few drops of **refrigerant oil** to the O-ring.
- When tightening or loosening a fitting, use a second wrench to support the matching fitting.
- When discharging the system, use an R-1234yf refrigerant A/C recover/recycle/recharge machine; do not release refrigerant into the atmosphere.
- Servicing of an R-1234yf system should be done in well-ventilated work area.
- To ensure proper and safe operation, the Society of Automotive Engineers (SAE J2845) recommends that the refrigerant system only be serviced by trained and c
- Never repair or replace the air conditioning evaporator (cooling coil) with one removed from a used or salvaged vehicle.
- New replacement mobile air conditioning evaporator must be certified (and labeled) as meeting SAE Standard J2842.
- Vented refrigerant is harmful to the environment.
- To avoid refrigerant from venting, never replace the evaporator with one removed from a used or salvaged vehicle.
- Refrigerant in your vehicle's air conditioning system is flammable and can be ignited during servicing if proper procedures are not followed.
- Requires a qualified technician to service.
- For safety system components should be replaced shall not be repaired or salvaged for reuse.

A/C Label Description

The blower, the heater controls, and the A/C system do not work	Symptom Troubleshooting	- Blown fuse No. - Poor ground at - Climate control - Harness/connec
The electric A/C compressor and the cooling fan are inoperative, but the blower and heater controls work	Probable cause: A/C pressure sensor circuit malfunction or evaporator temperature sensor circuit malfunction Troubleshoot the A/C pressure sensor circuit: - A/C pressure sensor circuit low voltage - A/C pressure sensor circuit high voltage **NOTE:** The A/C pressure sensor circuit can malfunction without setting a DTC	- Climate contro - PGM-FI DTCs - Abnormal A/C - Evaporator tem - Harness/connec
Blower fan runs slower than expected in cold weather (when in AUTO mode) **NOTE:** It is normal for the blower fan to run slowly until the engine coolant temperature rises when in AUTO mode	Probable cause: Engine coolant temperature (ECT) circuit malfunction Troubleshoot the ECT sensor circuit: - ECT sensor 1 out of range - ECT sensor 1 circuit range/performance problem - ECT sensor 1 circuit low voltage - ECT sensor 1 circuit high voltage	- Climate contro - PGM-FI DTCs - Manual blower
Driver's and passenger's side vent temperatures vary by more than 20 deg.F (11 deg.C)	Probable cause: - The air mix doors are malfunctioning Do the following troubleshooting: - - - Air mix control motor test*1 - - Driver's air mix control motor test*2 - - Passenger's air mix control motor test*2 - Low refrigerant charge	- Climate contro - Harness/connec
HDS does not communicate with the climate control unit or the vehicle	Troubleshoot the DLC circuit	B
A/C information does not display on the center display unit, but the blower, the heater, and the A/C system controls work (climate control panel without display)	Probable cause: Communication malfunction between the audio unit and the climate control unit Check the B-CAN line between the audio unit and the climate control unit	Climate control DTC
When an engine stops, the heater does not warm (The PTC heater does not heat up)	Do the PTC heater circuit troubleshooting	- Blown fuse No. - Blown fuse No. - Poor ground at

Symptom	Diagnostic Procedure	
		• PTC heater B re • PTC heater D re • PTC heater core • Climate control • Harness/connec

Insufficient heating	• **Check the engine coolant level**
	• **Check the radiator cap**
	• Check the engine coolant temperature (ECT) during normal operation with the HDS
	• Check the heater core inlet hose temperature:
	•
	    • If it is COLD, check for restrictions in the hose, a damaged or leaking thermostat, or a damaged or leaking water pump
	    • If it is HOT, check for restrictions in the heater core. Back flush or **replace the heater core**
	• Check the operation of the air mix doors:
	•
	    • **Air mix control motor test*1**
	    • **Driver's air mix control motor test*2**
	    • **Passenger's air mix control motor test*2**
	• Check the blower motor unit for obstructions
	• Check for air leaks around the ducts and vents
		Climate control DTC

*1: Without dual zone climate control

*2: With dual zone climate control

INSPECTION

A/C SYSTEM CONTAMINATION INSPECTION

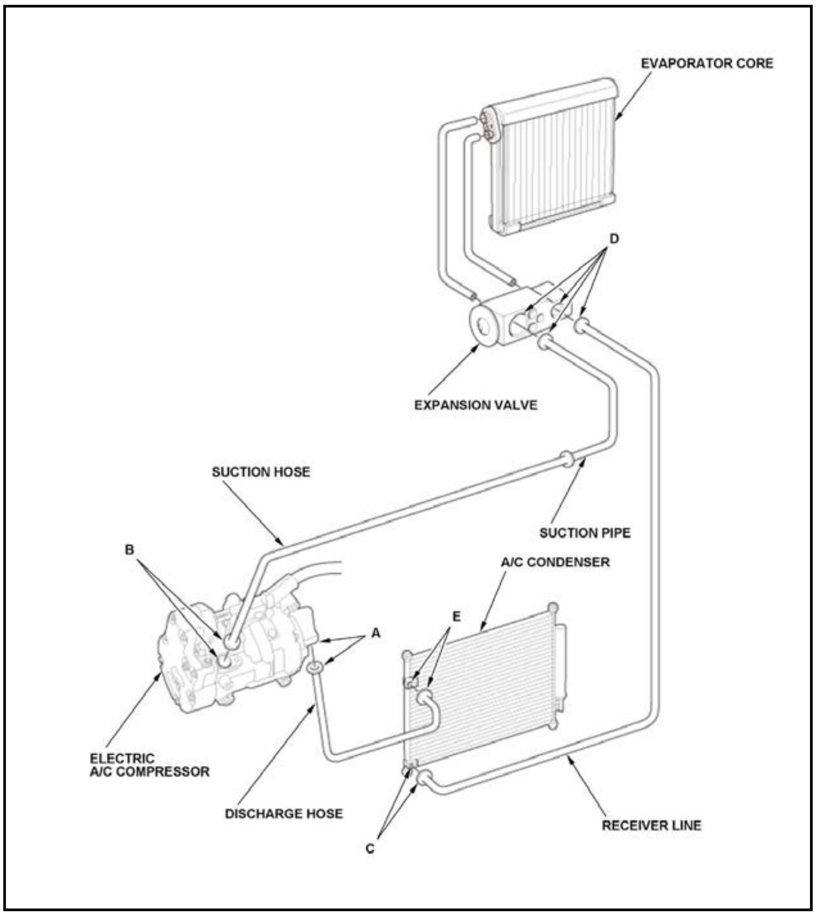
Inspection

NOTE:

- If an electric A/C compressor failure is determined, always check for contamination in the A/C system.
- The parts illustrations are samples. External appearance may vary from model to model.

1. A/C System Contamination - Inspect

   Remove the listed parts, step by step as shown in the table. Then swab inside the component using a cotton swab to see if there are any metal, dark grey or black r



EVAPORATOR CORE
D
EXPANSION VALVE
SUCTION HOSE
SUCTION PIPE
B
A/C CONDENSER
E
A
ELECTRIC
A/C COMPRESSOR
DISCHARGE HOSE
RECEIVER LINE
C

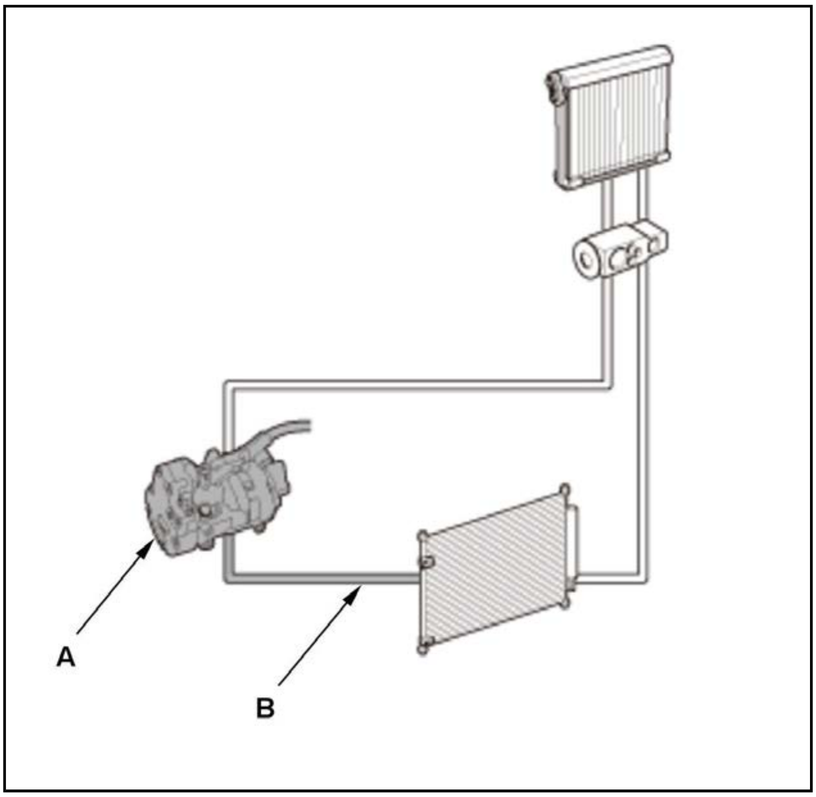
Step	Part to remove	Inspection area	Metal, dark
			Found
1	Discharge hose (electric A/C compressor side)	Discharge port (A)	Go to step 2
2	Suction hose (electric A/C compressor side)	Suction port (B)	Replace the components in Repair Procedure
3	Receiver line (A/C condenser outlet)	A/C condenser outlet port (C)	Go to step 4
4	Receiver line and suction pipe (Both are expansion valve side)	Expansion valve port (D)	Replace the components in Repair Procedure

Step	Part to remove	Inspection area	Metal, dark
			Found
5	Discharge hose (A/C condenser inlet)	A/C condenser inlet port (E)	Replace the components in Repair Procedure

Replacement

NOTE: The parts illustrations are samples. External appearance may vary from model to model.

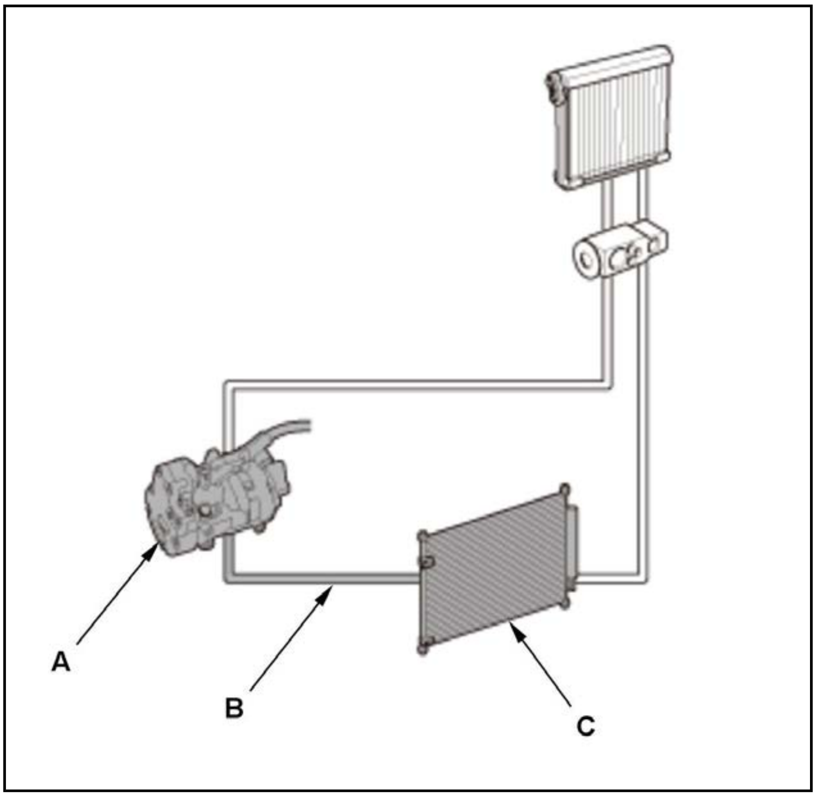
1. A/C Components - Replace



Repair Procedure A

Replace the following parts:

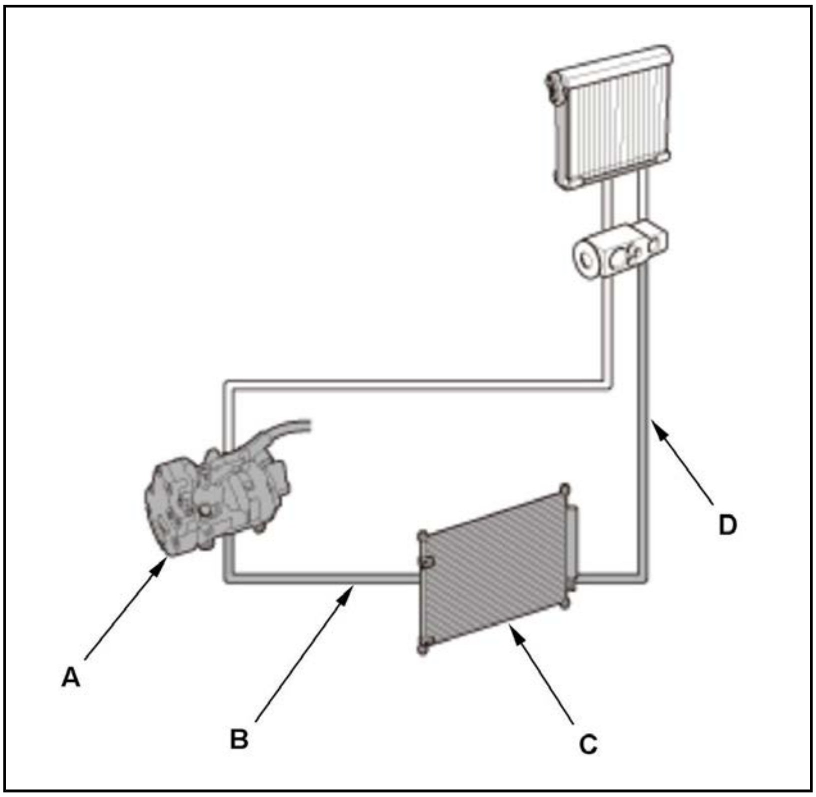
- Electric A/C compressor (A)
- Discharge hose (B)



Repair Procedure B

Replace the following parts:

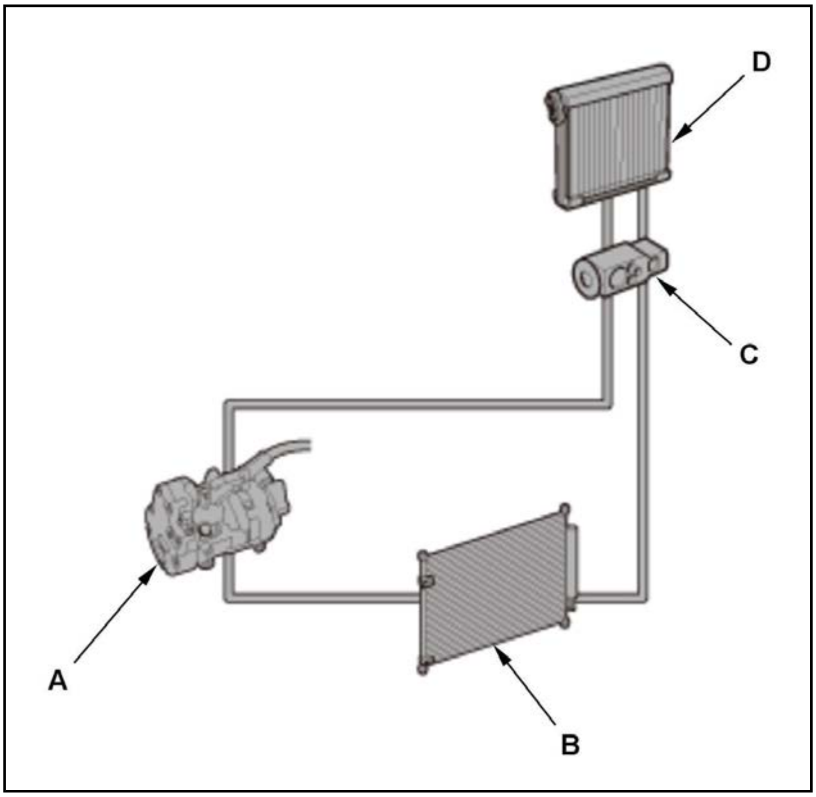
- Electric A/C compressor (A)
- Discharge hose (B)
- A/C condenser (C)



Repair Procedure C

Replace the following parts:

- Electric A/C compressor (A)
- Discharge hose (B)
- A/C condenser (C)
- Receiver line (D)



Repair Procedure D

Replace the following parts:

- Electric A/C compressor (A)
- A/C condenser (B)
- Expansion valve (C)
- Evaporator core (D)
- All A/C hoses and lines

A/C SYSTEM INSPECTION

Inspection

NOTE:

- For A/C system noises, **go to the A/C System Noise Check**.
- **Check for climate control DTCs using the Self-Diagnostic Function** . If there are any DTCs, **go to the appropriate troubleshooting** .

1. A/C System - Inspect

   Before troubleshooting any problem with the A/C system, do the following to check if there is anything wrong with the A/C system.

Inspection Area	Check for	
Fresh air intake for the HVAC unit (at the base of the windshield)	Leaves or debris blocking the air intake	Remove any bl
A/C lines and hoses	Kinks or sharp bends	Replace the A/C
• A/C components • A/C lines and hoses	Stains at the components or joints that may indicate a refrigerant or an electric A/C compressor oil leak	**Do the Refrige**
A/C condenser	Dirt in the fins, or material clogging the fins (dirt, insects, etc.)	Clean the fins. **NOTE:** • **Carefull clean ar material from the A/C conden fins witl water ar deterge** • **Do not perform system test unt the conden is complet dry.**
	Fin damage, bent fins	Try to comb the **NOTE:** If the fi
	Visible damage to the A/C condenser	**Do the Refrige** condenser is lea
Cooling fan	Check that the cooling fan operates when the electric A/C compressor is operated and that airs flows toward the under-hood compartment	**RFC system m**
Electric A/C compressor	Electric A/C compressor does not operate (A/C is switched on)	• **Troubles** • **Troubles** • **F-CAN n**
Dust and pollen filter	The dust and pollen filter is clogged or restricted	**Replace the du**

Inspection Area	Check for	
Blower fan	Check that the A/C operates at each position of the fan control (except OFF). If the A/C does not operate at all fan control positions, refer to the symptom troubleshooting **NOTE:** Turn the vehicle to the READY TO DRIVE mode, turn the A/C system on, and allow it to run for a few minutes	**Refer to the sy**

REPLACEMENT

A/C REFRIGERANT OIL REPLACEMENT

Special Tools Required

Image	D
	R-1234yf POE Oil In

*Available through the Honda Tool and Equipment Program; call 888-424-6857.

Replacement

WARNING:

Using the wrong refrigerant oil increases the chance of electric shock or death. You must use the specified refrigerant oil when servicing the A/C system.

1. A/C Refrigerant Oil - Replace

   Recommended POE oil: DENSO ND-OIL 11

   NOTE: Although the refrigerant oil information is listed on the under-hood air conditioning information label, always use the recommended refrigerant oil listed

Parts Number	Oil Amount
38899-TX9-023	40 mL (1 1/3 fl oz)

   The electric A/C compressor in this vehicle is powered by the electric powertrain high voltage battery module, and this oil is required because it has unique electri

   It is important to have the correct amount of refrigerant oil in the A/C system to ensure proper lubrication of the electric A/C compressor. Too little oil damages th cooling capacity of the system, and can produce high vent temperatures.

   - To avoid contamination, do not return the oil to the container once dispensed, and never mix it with other refrigerant oils.
   - Use the refrigerant oil immediately after opening the container, and dispose of any unused oil. The oil rapidly absorbs moisture, which damages its electrica
   - Do not spill the refrigerant oil on the vehicle, because it may damage painted surfaces. If refrigerant oil contacts the paint, wash it off with water immediate

   Add the recommended refrigerant oil in the amount listed if you replace any of the following parts:

Parts	Oil Amount
A/C condenser	**25 mL (5/6 fl oz)**
Evaporator	**40 mL (1 1/3 fl oz)**
Line or hose	**10 mL (1/3 fl oz)**
Desiccant	**10 mL (1/3 fl oz)**
Leakage repair	**25 mL (5/6 fl oz)**
Electric A/C compressor	**120-135 mL (4-4 1/2 fl oz)**

A/C REFRIGERANT RECOVERY/EVACUATION/CHARGING

Special Tools Required

Image	Description/
	R-1234yf A/C Recover/Recycle/Recharge Ma
	R-1234yf POE Oil Injector ROB18470*

*These tools are available through the Honda Tool and Equipment Program; call 888-424-6857.

Procedure

WARNING:

- Compressed air mixed with the HFO-1234yf (R-1234yf) forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test HFO-1234yf (R-1234yf) service equipment or vehicle air conditioning systems.

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

NOTE:

- If accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.
- Do not allow moisture to contaminate the A/C system oil. Moisture in the oil is difficult to remove, and it can damage the electric A/C compressor.
- Air conditioning refrigerant is poisonous. If ingested, get medical attention immediately.
- Connect an A/C recover/recycle/recharge machine, following the equipment manufacturer's instructions.

When an A/C system has been opened to the atmosphere, such as during installation or repair, it must be evacuated using an A/C recover/recycle/recharge machine. If th receiver/dryer or the desiccant, drain the **refrigerant oil**, and add fresh oil. Then evacuate the system for several hours before charging it.

1. A/C Refrigerant - Recover
   1. Recover the refrigerant from the A/C system.
   2. Measure the amount of **refrigerant oil**

   removed from the A/C system after the recovery process is completed. Be sure to put the same amount of new **refrigerant oil** back into the A/C system before ch
2. A/C System - Evacuate

1. Evacuate the system. The vacuum pump should run for a minimum of 30 minutes or until the moisture vacuum test passes, to eliminate all moisture from the sy mmHg, -27.55 inHg) for at least 30 minutes, or the moisture vacuum test passes, close all valves, and turn off the vacuum pump.

2. If the suction gauge does not reach approximately -93.3 kPa (-700 mmHg, -27.55 inHg) in 15 minutes or the moisture vacuum test fails, there is probably a leal leaks.

3. A/C Refrigerant - Leak Check
4. A/C Refrigerant - Charge

1. Charge the system with the specified amount of R-1234yf refrigerant. Do not overcharge the system; the electric A/C compressor will be damaged.Select the ap recover/recycle/recharge machine.

Refrigerant Capacity:
415 to 465 g
14.64 to 16.40 oz
0.415 to 0.465 kg
0.915 to 1.025 lbs

5. A/C Refrigerant - Leak Check
6. A/C System - Test

SYMPTOM TROUBLESHOOTING

CLIMATE CONTROL SYSTEM SYMPTOM TROUBLESHOOTING - THE BLOWER, THE HEATER CONTROLS, AND THE A/C SYSTEM DO NOT W

NOTE: Do this troubleshooting procedure only if sent here by symptom troubleshooting index.

1. Fuse check

-1. Check the following fuse.

Fuse	No. D9

Is the fuse OK?

YES

Go to step 2.

NO

Replace the fuse, and recheck. If the fuse blows again, repair a short in the No. D9 fuse circuit.

2. Open wire check (IG2_A/C line)

-1. Disconnect the following connector.

Climate control unit connector A (32P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control unit connector A (32P): disconnected
Test point 1	Climate control unit connector A (32P) No. 32
Test point 2	Body ground

Is there battery voltage?

YES

The IG2_A/C wire is OK. Go to step 3.

NO

Repair an open in the IG2_A/C wire.

3. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control unit connector A (32P): disconnected
Test point 1	Climate control unit connector A (32P) No. 28
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

Replace the climate control unit .

NO

Check for an open in the GND wire. If the wire is OK, check for poor ground at G402.

TEST

A/C SYSTEM TEST

Test

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

The performance test will help determine if the A/C system is operating within specifications.

NOTE:

- If accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.
- Connect an A/C recover/recycle/recharge station, following equipment manufacturer's instructions.

Performance Test

1. A/C System - Inspect
    1. **Do the A/C system inspection**, and correct any problems found.
2. **Glove Box - Remove**
3. A/C System - Test

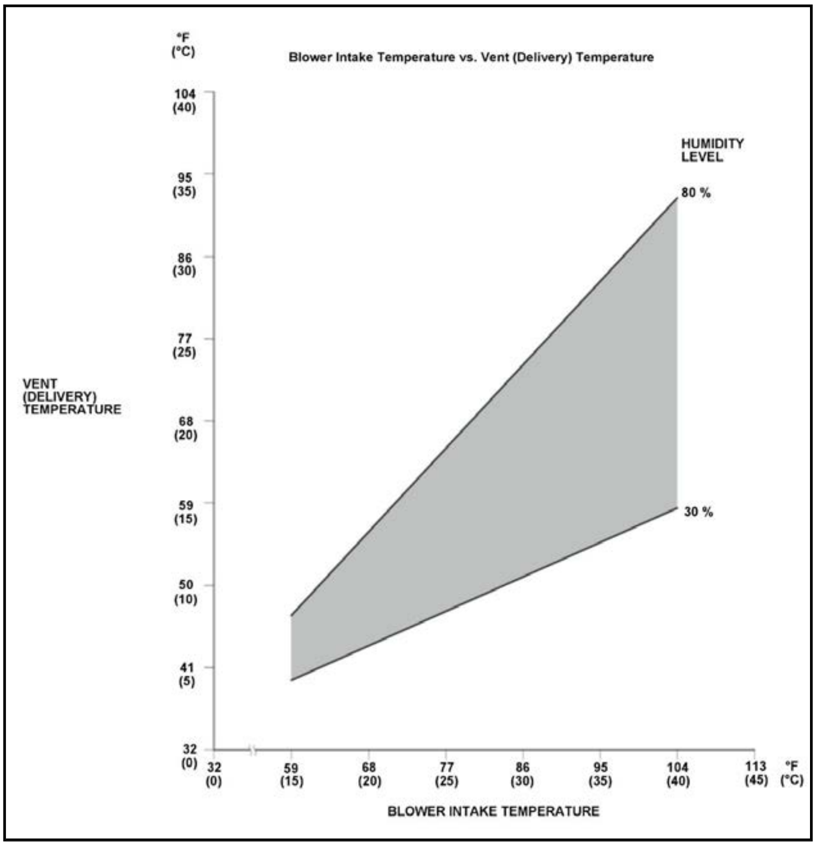
 	
	1. Determine the relative humidity and air temperatu
	2. Insert a thermometer (A) in the dashboard center
	3. To measure the intake temperature, place a hygro-
	4. Test conditions:
	- The blower intake temperature must be at leas
	- Move the vehicle out of direct sunlight and let If necessary, wash the vehicle to cool it down
	- Open the hood.
	- Open the front doors.
	- Apply the parking brake.
	- Shift the vehicle to P position/mode.
	- Turn the vehicle to the READY TO DRIVE m
	- Set the A/C system to the following condition
	-
	  - - A/C: ON
	  - - Temperature control: MAX COOL (Lo)
	  - - Mode control: VENT ( )
	  - - Recirculation control: RECIRCULATE
	  - - Fan control: Max
	  - - All vents: Open
	- No driver or passengers in the vehicle.
	5. Inspect the A/C components for the following con
	- Abnormal frost areas.
	- Unusual noises.
	If you observe any of these conditions, **refer to the**

6. After running the air conditioning for 10 minutes under the test conditions, read the delivery temperature from the thermometer in the center vent, the blower in
(high) and suction (low) pressures on the A/C gauges

7. To complete the vent (delivery)/blower intake temperature chart:

- Mark the vent (delivery) temperature on the vertical line.
- Mark the blower intake temperature on the bottom line.
- Draw a vertical line from the blower intake temperature mark.
- Draw a horizontal line from the vent (delivery) temperature mark until it intersects the vertical line.

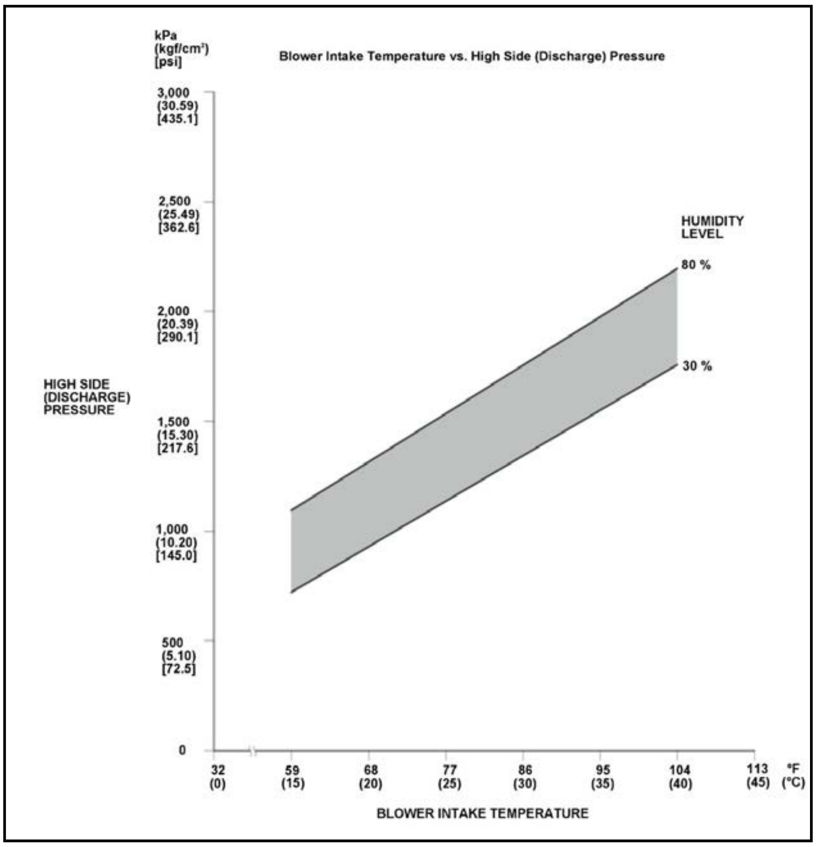
NOTE: The vent (delivery) temperature and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the n



8. To complete the high side (discharge) pressure/blower intake temperature chart:

- Mark the high side (discharge) pressure on the vertical line.
- Mark the blower intake temperature on the bottom line.
- Draw a vertical line from the blower intake temperature mark.
- Draw a horizontal line from the high side (discharge) pressure mark until it intersects the vertical line.

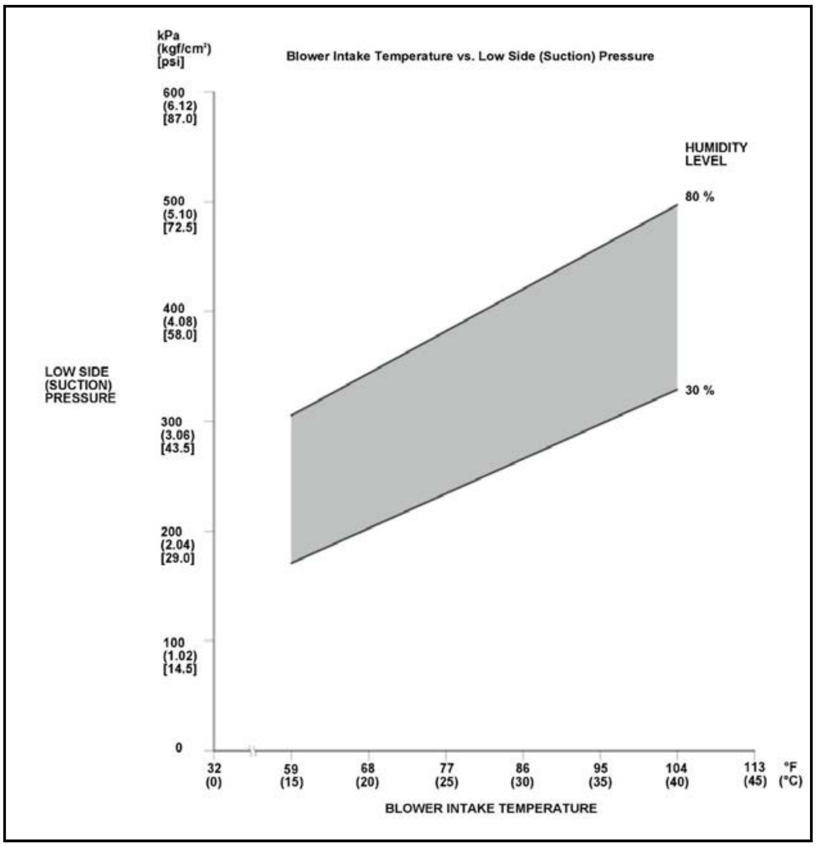
NOTE: The high side (discharge) pressure and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the



9. To complete the low side (suction) pressure/blower intake temperature chart:

- Mark the low side (suction) pressure along the vertical line.
- Mark the blower intake temperature along the bottom line.
- Draw a vertical line from the blower intake temperature mark.
- Draw a horizontal line from the low side (suction) pressure mark until it intersects the vertical line.

NOTE: The low side (suction) pressure and blower intake temperature should intersect in the shaded area. Any measurements outside the line may indicate the ne



Pressure Test

4. Refrigerant Pressure Check Procedure

1. Connect a manifold gauge and start operating the A/C system.

2. Check the value shown on the manifold gauge. If the value is out of the normal range, do proper troubleshooting and check it again.

5. How to Read Gauge

	1. Check that the A/C system works pr at outside temperature 68 deg.F (20 de

6. A/C System Pressure - Test

Gauge Level	Related Symptoms	
	Suction pressure is low	• •
	Suction line from expansion valve to A/C compressor is not cold	Low r
	More than 18-29 deg.F (10-16 deg.C) temperature difference between A/C compressor inlet pipe and outlet pipe	Refrig passag
	Vent temperature is too high	Low r
	Large temperature difference between high/low pressure sides of A/C line or among components	Refrig discha
	Pressure in A/C system is equalized with static pressure high after electric A/C compressor is stopped (4-12 hours after engine is off)	• •
	A/C compressor or receiver pipe is not hot	Debris

Gauge Level	Related Symptoms	
 Normal Low LO HI	Air coming from outlet is not cold enough	Sligh
 High Low LO HI	• Pressures at suction and discharge lines are equalized quickly after A/C compressor is stopped • Suction pressure is higher than normal	Fault
	• Excessive A/C compressor noise • Pressure is equalized quickly and there is excessive noise after A/C compressor is stopped	A/C c debri
 Low (Negative pressure may occur) Normal LO HI	Air coming from outlet is not cold at all	• • •
	After refrigerant is added properly	• •

Gauge Level	Related Symptoms	
	Air coming from outlet is not cold enough	Expar
	Suction pressure is turned to negative pressure because openings at expansion valve are freezing	• •
	Suction pressure drops slightly when "Recirculated" airflow is switched to "Fresh Air"	Expar suffic
	Temperature of suction hose at A/C compressor is lower than outlet of expansion valve or evaporator	Suctic
	Airflow through A/C condenser is weak or restricted	
	Temperature between A/C condenser inlet and outlet is less than about 9 deg.F (5 deg.C) when radiator and A/C condenser fan run at high speed, with doors opened and fresh air selected	• • •

Gauge Level	Related Symptoms	
	Discharge pressure is reduced when A/C condenser is cooled	Refrig
	• Airflow in VENT ( ) is reduced • Air temperature in VENT ( ) is very low	Faulty
	• Suction pressure drops slightly when "Recirculated" airflow is switched to "Fresh Air" • Discharge pressure is almost normal value	Expan
	• A sheet of paper does not stick on to A/C condenser surface with the cooling fans on • Temperature between A/C condenser inlet and outlet is less than about 9 deg.F (5 deg.C) when radiator and A/C condenser fan run at high speed, with doors opened and fresh air selected	Radia
	Belt type A/C compressor: A/C compressor clutch remains engaged when A/C system is stopped	• • • •

HEATED STEERING WHEEL TEMPERATURE SENSOR TEST

Test

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: The heated steering wheel temperature sensor is built into the steering wheel.

CHECK

A/C REFRIGERANT LEAK CHECK

Check

WARNING:

- Compressed air mixed with the HFO-1234yf (R-1234yf) forms a combustible vapor.
- The vapor can burn or explode causing serious injury.
- Never use compressed air to pressure test HFO-1234yf (R-1234yf) service equipment or vehicle air conditioning systems.

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.
- Do not operate the leak detector near flammable vapors. Its sensor operates at high temperatures, and could ignite the vapors, resulting in personal injury and/or d
- Electric powertrain components are located near A/C system components. Make sure you have read the electric powertrain service precautions before doing repai

NOTE:

- If accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.
- Check the system for leaks using an R-1234yf refrigerant leak detector with an accuracy of 14 g (0.49 oz) per year or better.
- Always use the most current approved A/C service equipment and tools. Refer to the Acura / Honda Tools and Equipment catalog and available service informatic

1. A/C Refrigerant - Recover

   1. Connect an Acura/Honda approved A/C recover/recycle/recharge machine to the high-pressure service port and the low-pressure service port following the equ

   2. Check the amount of refrigerant recovered. Is the amount of refrigerant recovered according to specifications?**YES**

   - Charge refrigerant and go to A/C system Test for further diagnosis.**NO** - Go to the next step.

2. A/C System - Evacuate

   NOTE: You must use the moisture (thermistor) vacuum option when you evacuate.

3. A/C Refrigerant - Charge

   Did the A/C recover/recycle/recharge machine prohibit a charge?

   YES - There is a leak large enough that the vehicle cannot retain a charge. Evacuate the system again under the timed vacuum option and use a ultrasonic leak det information for details.

   NO - Go to the next step.

4. A/C Refrigerant - Leak Check

   NOTE:

   - **There are a variety of approved leak detectors available that can be used to detect a leak depending on the model. Re information.**
   - **Use of leak dyes are prohibited depending on the model. Refer to available service information to see which models c**
   - **If a leak cannot be found by any method, do the following:**
   -
     - **-**

       Let the vehicle idle for 30 minutes with the hood down and the climate control set to the max cool position.
   -
     - **-**

       After 30 minutes, drive the vehicle for couple miles and check for leaks again.

   1. With the power system off, use a leak detector to detect the leak source. Follow a continuous path in order to ensure that you will not miss any possible leaks. T Move the probe slowly (1 in/second or less), and keep it within 1/4 in of the component being checked. This maximizes the chance of detecting a leak.

Possible Leak Area	Diagnostic Procedure	Notes
Service ports	Check the service ports with the service caps installed	Ensure that the seals on the service caps are in place, and that the caps used as the final seals in the system

Possible Leak Area	Diagnostic Procedure	Notes
Electric A/C compressor	Wave the leak detector around the entire electric A/C compressor	Check for leaks at all of the electric A/C compressor joints, hose fittin relief valve and the scroll bolts on the back of the electric A/C compre
A/C condenser	Wave the leak detector around the entire A/C condenser	• Check for joints or connections coated with oily dust • Check for damaged and corroded areas • Check all fittings, couplings, brazed/welded areas and areas aro • If you detect a leak, determine if the leak is coming from the A/ receiver/dryer • When using a refrigerant gas leak detector - If you detect a leak over the area, then recheck for leaks. For large leaks, cleaning tl compressed air may help you pinpoint the leak source
Evaporator	• Check at the evaporator drain hose • Turn the blower on at low speed and check at the passenger's side vent	Remove **the blower unit** and **the evaporator core cover** (as necessar
A/C lines	Wiggle the rubber hoses when checking crimped metal ends	• Check all fittings, couplings, pressure switches, brazed/welded attachment points on A/C lines and components • Check for damaged and corroded areas

Detected Leak Area	Repair Action
Service ports	If a leak is found, replace the cap/O-ring seal or A/C line as needed
Electric A/C compressor	• If the electric A/C compressor relief valve appears to be leaking, determine whether the leak is coming from the relief valve, or the joint between the electric A/C compressor casing and the valve. If the leak is from the relief valve, check the A/C system pressures, and refer to the **pressure test table in the A/C system test**. If the leak is from the casing/valve joint, **replace the electric A/C compressor relief valve** • If the leak is coming from the suction hose and/or discharge hose fittings on the electric A/C compressor, clean the A/C fittings and replace the suction/discharge fitting O-rings • For all other electric A/C compressor leaks, **remove and replace the electric A/C compressor**
A/C condenser	**Replace either the receiver/dryer** or **the A/C condenser** , depending on the location of the leak
Evaporator	• If the source of the leak was determined, replace the component causing the leak • If the source of the leak was not determined, remove the evaporator core and visually check for damage and oily dust, then **replace the evaporator core, O-rings** , or **the expansion valve** as necessary
A/C lines	**Remove and replace the A/C line causing the leak**

A/C SYSTEM NOISE CHECK

Check

WARNING:

- Air conditioning refrigerant or lubricant vapor can irritate your eyes, nose, or throat.
- Be careful when connecting service equipment.
- Do not breathe refrigerant or vapor.

The A/C system noise check will help you determine the source of abnormal A/C system noise.

NOTE:

- If an accidental system discharge occurs, ventilate the work area before resuming service.
- Additional health and safety information may be obtained from the refrigerant and lubricant manufacturers.
- Identify the conditions when the noise occurs. The weather, vehicle speed, vehicle being in gear or in neutral, engine temperature, or other conditions may be fact
- **Do the A/C system inspection**, and correct any problems found prior to diagnosing abnormal noises.
- Abnormal A/C noises can be misleading. For example, a sound similar to a failed bearing may be caused by loose fasteners or loose mounting brackets.

1. A/C System (Cabin) - Noise Check

   1. Cycle the HVAC system through all blower speeds and all air distribution modes, and check for unusual noises and excessive vibration. If noise and/or vibratio this inspection, close the doors and windows, and do not start the engine.

Check for	Result	Also
Conditions when the noise occurs	The noise or vibration occurs only in a specific mode or setting	• Check the operation of the air mix cor • Check the operation of the mode cont • Check the operation of the recirculatic
	There is a squeaking or chirping noise, but no unusual vibration	**Replace the blower motor** .
Foreign material in the blower motor and fan	Foreign material (leaves or twigs, for example) is present	Remove it, and recheck for noise.
	No foreign material (leaves or twigs, for example) is present	**Remove the blower motor** , and check thes problems are present.

Check for	Result	Also
		- Damage on the fan blades - Tightness of the fan retainer - Fan alignment on the blower motor sh

2. A/C System (Under-Hood) - Noise Check

1. Set up the vehicle:

- Select a quiet area for testing.
- Apply the parking brake.
- Shift the transmission to P position/mode
- Turn the vehicle to the READY TO DRIVE mode
- Set the A/C system to the following conditions:
-
    - -

      Temperature control: MAX COOL (Lo)
    - -

      Mode control: VENT ( )
    - -

      Fan control: minimum (but not OFF)
    - -

      A/C: ON

2. Switch the electric A/C compressor on and off several times to clearly identify the sound during electric A/C compressor operation. Listen to the noise while th Probe the motor area with a stethoscope to pinpoint the noise

NOTE: If the noise does not change when the electric A/C compressor operated or non-operated, the noise may be caused by an electric powertrain-related comp pinpoint the noise.

3. Listen for noises coming from the A/C lines, the A/C hoses, the A/C condenser, the evaporator, the receiver/dryer, or the expansion valve, and check these item

Check for	Result	
Noises caused by A/C components touching other components or the body	The noise is present	Reroute or insu noise.
Loose, damaged or excessively worn A/C components or mounting hardware	Loose, damaged or excessively worn item is present	Repair or replac noise.
A moaning noise coming from the suction pipe and suction hose	A moaning noise is present	Check the syste **replace the rec**

Check for	Result	
A whistling or hissing noise from the expansion valve	A whistling or hissing noise is present	Evacuate the sy present, **replac**

4. Listen with a stethoscope for noises coming from the electric A/C compressor, and check these items:

Check for	Result	
The noise changes when the electric A/C compressor non-operated	Does not change	Check for the n component.
The A/C system operating pressures are normal	Abnormal	Troubleshoot th **system test**. Co noise.
The electric A/C compressor hose connections and fasteners are in good condition	Loose, damaged, or excessively worn	Repair or replac noise.
	In good condition	**Replace the ele**

TROUBLESHOOTING

PTC HEATER CIRCUIT TROUBLESHOOTING

NOTE: Do this troubleshooting procedure only if sent here by **symptom troubleshooting index**.

1. Determine possible failure area (PTC heater, fuse)

-1. Check the following fuses.

Fuse	**No. C1-1**
	No. C1-3

Are the fuses OK?

YES: PTC heater B

Go to step 2.

YES: PTC heater D

Go to step 10.

NO

Replace the fuse(s), and recheck. If the fuse blows again, repair a short in the No. C1-1 or No. C1-3 fuse circuit.

2. PTC heater B relay check

-1. Remove the PTC heater B relay from the under-hood fuse/relay box, and **test it** .

Is the relay OK?

YES

Go to step 3.

NO

Replace the PTC heater B relay.

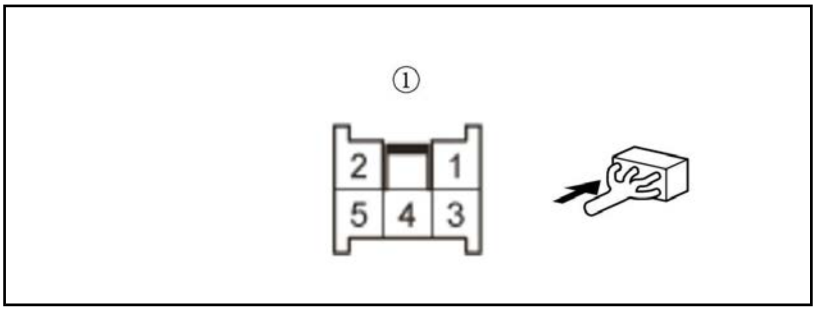
3. Open wire check (GND line)

-1. Disconnect the following connector.

PTC heater core 5P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PTC heater B relay: disconnected
	PTC heater core 5P connector: disconnected
Test point 1	PTC heater core 5P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 4.

NO

Check for an open in the GND wire. If the wires are OK, check for poor ground at G352.

4. PTC heater B circuit check

-1. Disconnect the following connectors.

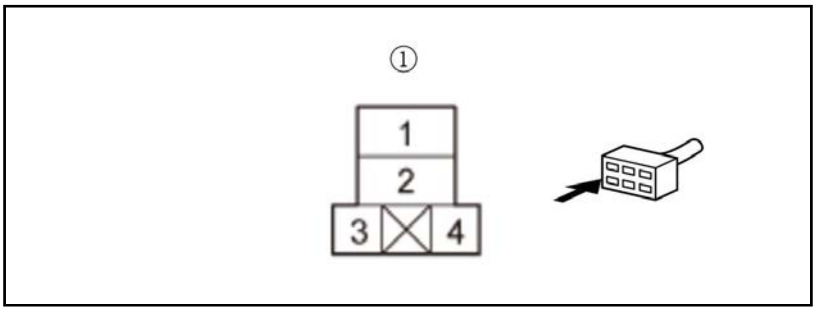
Climate control unit connector A (32P)

-2. Connect terminals A and B with jumper wires.

Terminal A	**Climate control unit connector A (32P) No. 22**
Terminal B	Body ground

Terminal A	PTC heater B relay 4P socket (female terminals) No. 1: ①
Terminal B	PTC heater B relay 4P socket (female terminals) No. 2: ①

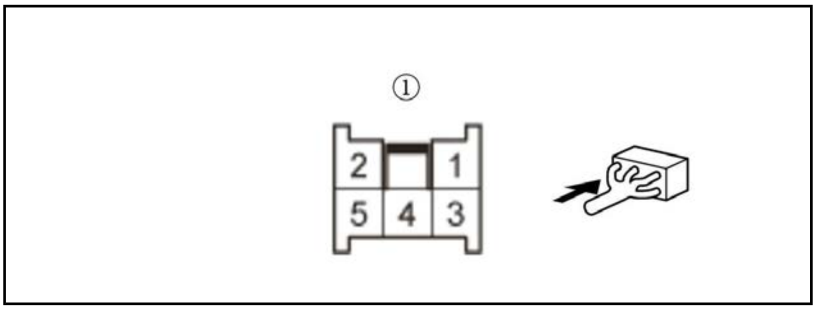
Terminal A	PTC heater B relay 4P socket (female terminals) No. 3: ①
Terminal B	PTC heater B relay 4P socket (female terminals) No. 4: ①



-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PTC heater B relay: disconnected
	Climate control unit connector A (32P): disconnected
	PTC heater core 5P connector: disconnected
	Climate control unit connector A (32P) No. 22: jumped to body ground
	PTC heater B relay 4P socket No. 1 and No. 2: jumped
	PTC heater B relay 4P socket No. 3 and No. 4: jumped
Test point 1	PTC heater core 5P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

NO

Go to step 6.

5. PTC heater B check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wires.

-3. **Test the PTC heater core** .

Is the PTC heater B OK?

YES

Replace the climate control unit .

NO

Replace the PTC heater core .

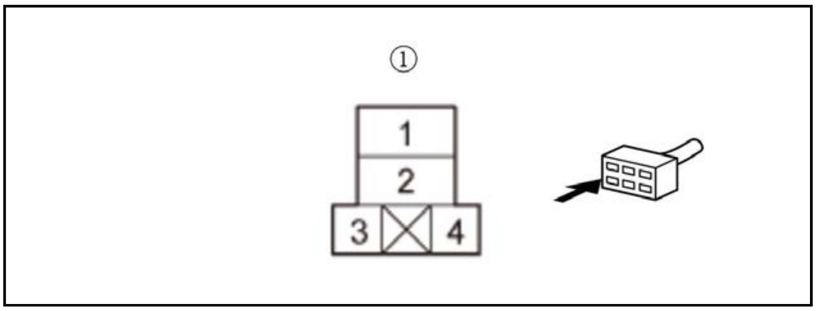
6. Open wire check (A/C_PTC2 line)

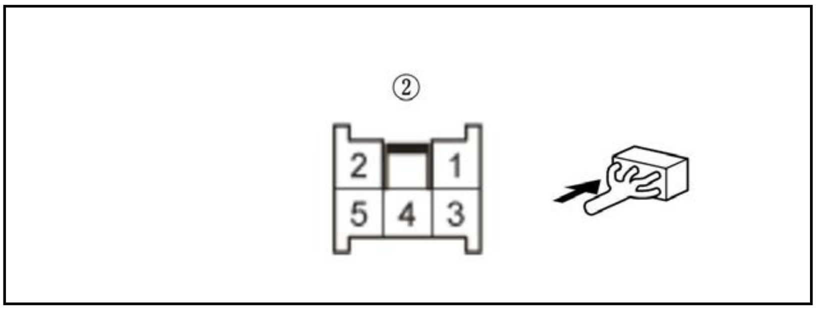
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wires.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PTC heater B relay: disconnected
	Climate control unit connector A (32P): disconnected
	PTC heater core 5P connector: disconnected
Test point 1	PTC heater B relay 4P socket (female terminals) No. 2: ①
Test point 2	PTC heater core 5P connector (female terminals) No. 5: ②





Is there 1.0 Ω or less?

YES

The A/C PTC2 wire is OK. Go to step 7.

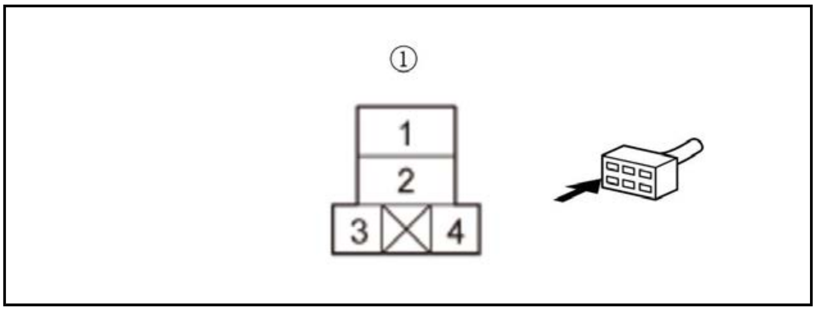
NO

Repair an open in the A/C_PTC2 wire.

7. Open wire check (+B_A/C_PTC1 line)

-1. Measure the voltage between these test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PTC heater B relay: disconnected
	Climate control unit connector A (32P): disconnected
	PTC heater core 5P connector: disconnected
Test point 1	PTC heater B relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_A/C_PTC1 wire is OK. Go to step 8.

NO

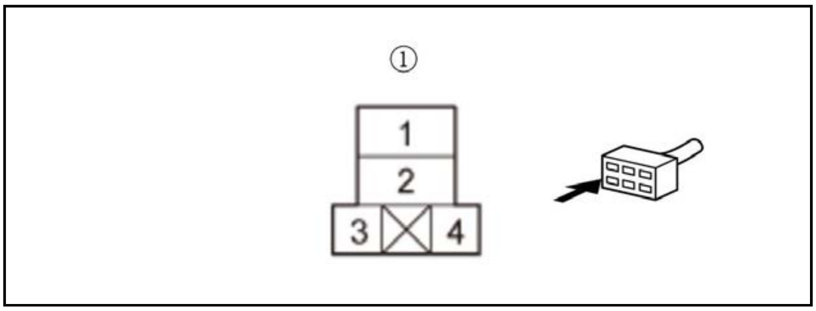
Repair an open in the +B_A/C_PTC1 wire.

8. Open wire check (IG2_A/C line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between these test points 1 and 2.

Test condition	Vehicle ON mode
	PTC heater B relay: disconnected
	Climate control unit connector A (32P): disconnected
	PTC heater core 5P connector: disconnected
Test point 1	PTC heater B relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IIG2_A/C wires are OK. Go to step 9.

NO

Repair an open in the IG2_A/C wire.

9. Open wire check (A/C_PTC2_RLY_CL- line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PTC heater B relay: disconnected
	Climate control unit connector A (32P): disconnected
	PTC heater core 5P connector: disconnected
Test point 1	**Climate control unit connector A (32P) No. 22**
Test point 2	PTC heater B relay 4P socket (female terminals) No. 4: ①

   Is there 1.0 Ω or less?

   YES

   Replace the climate control unit .

   NO

   Repair an open in the A/C_PTC2_RLY_CL- wire.

10. PTC heater D relay check

    -1. Remove the PTC heater D relay from the under-hood fuse/relay box, and **test it** .

    Is the relay OK?

    YES

    Go to step 11.

    NO

    Replace the PTC heater D relay.

11. Open wire check (GND line)

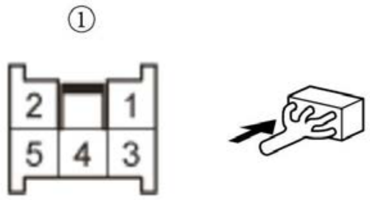
    -1. Disconnect the following connector.

PTC heater core 5P connector

    -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PTC heater D relay: disconnected
	PTC heater core 5P connector: disconnected
Test point 1	PTC heater core 5P connector (female terminals) No. 2: ①

Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 12.

NO

Check for an open in the GND wire. If the wires are OK, check for poor ground at G352.

12. PTC heater D circuit check

-1. Disconnect the following connectors.

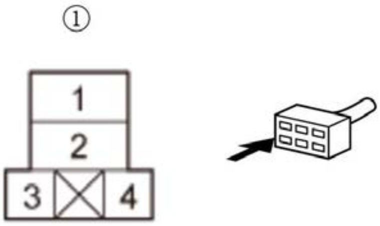
Climate control unit connector A (32P)

-2. Connect terminals A and B with a jumper wires.

Terminal A	**Climate control unit connector A (32P) No. 23**
Terminal B	Body ground

Terminal A	PTC heater D relay 4P socket (female terminals) No. 1: ①
Terminal B	PTC heater D relay 4P socket (female terminals) No. 2: ①

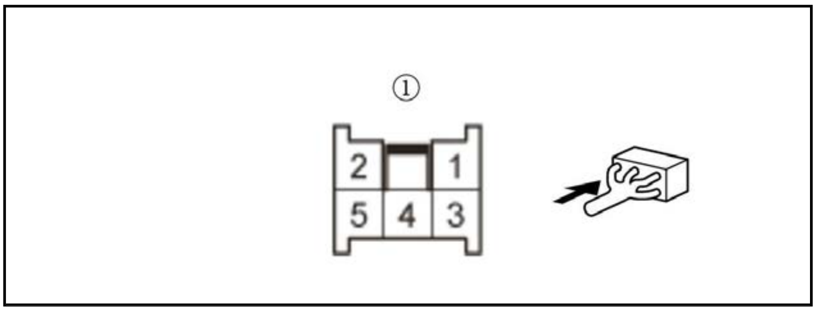
Terminal A	PTC heater D relay 4P socket (female terminals) No. 3: ①
Terminal B	PTC heater D relay 4P socket (female terminals) No. 4: ①



-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	PTC heater B relay: disconnected
	Climate control unit connector A (32P): disconnected
	PTC heater core 5P connector: disconnected
	Climate control unit connector A (32P) No. 23: jumped to body ground
	PTC heater D relay 4P socket No. 1 and No. 2: jumped
	PTC heater D relay 4P socket No. 3 and No. 4: jumped
Test point 1	PTC heater core 5P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 13.

NO

Go to step 14.

13. PTC heater D check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wires.

-3. **Test the PTC heater core** .

Is the PTC heater D OK?

YES

Replace the climate control unit .

NO

Replace the PTC heater core .

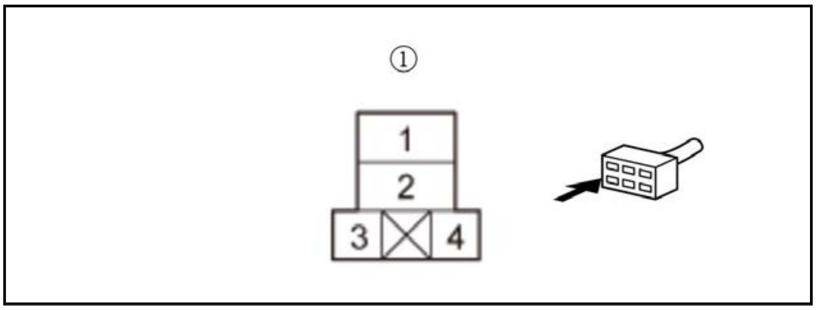
14. Open wire check (A/C_PTC4 line)

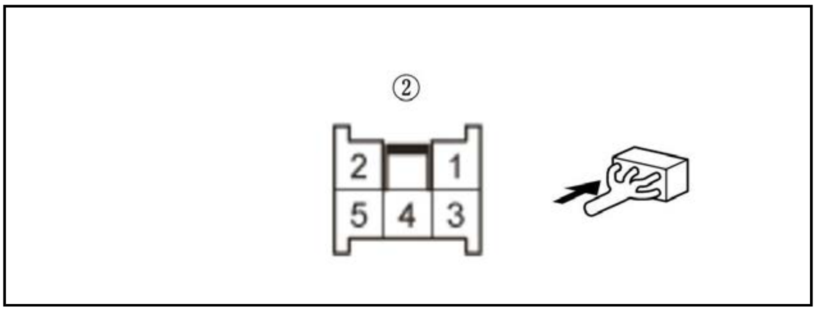
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wires.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode PTC heater D relay: disconnected Climate control unit connector A (32P): disconnected PTC heater core 5P connector: disconnected
Test point 1	PTC heater D relay 4P socket (female terminals) No. 2: ①
Test point 2	PTC heater core 5P connector (female terminals) No. 3: ②





Is there 1.0 Ω or less?

YES

The A/C_PTC4 wire is OK. Go to step 15.

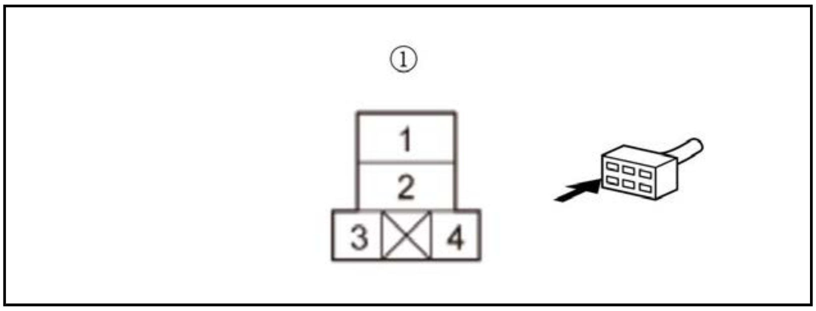
NO

Repair an open in the A/C_PTC4 wire.

15. Open wire check (+B_A/C_PTC3 line)

-1. Measure the voltage between these test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PTC heater D relay: disconnected
	Climate control unit connector A (32P): disconnected
	PTC heater core 5P connector: disconnected
Test point 1	PTC heater D relay 4P socket (female terminals) No. 1: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_A/C_PTC3 wire is OK. Go to step 16.

NO

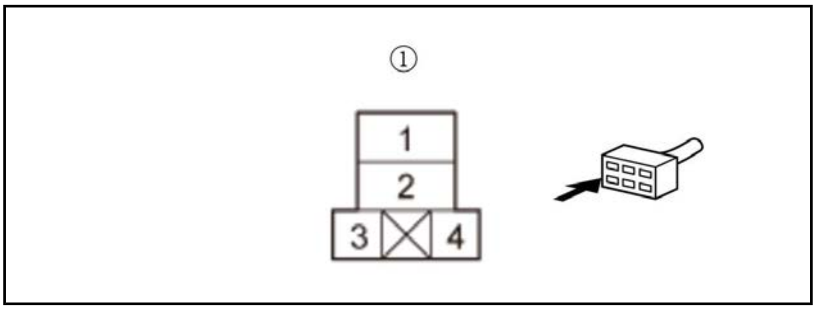
Repair an open in the +B_A/C_PTC3 wire.

16. Open wire check (IG2_A/C line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between these test points 1 and 2.

Test condition	Vehicle ON mode
	PTC heater D relay: disconnected
	Climate control unit connector A (32P): disconnected
	PTC heater core 5P connector: disconnected
Test point 1	PTC heater D relay 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG2_A/C wires are OK. Go to step 17.

NO

Repair an open in the IG2_A/C wire.

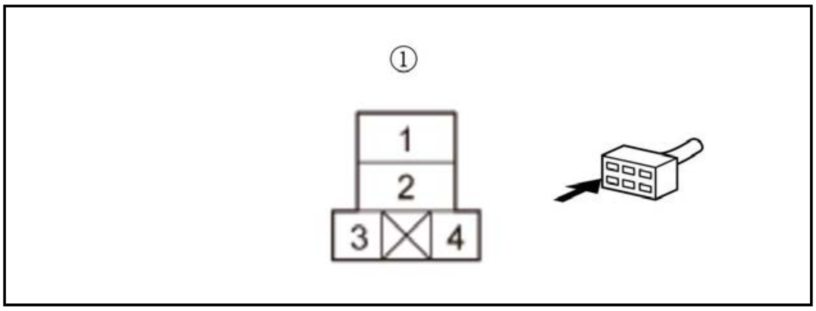
17. Open wire check (A/C_PTC4_RLY_CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	PTC heater D relay: disconnected

	Climate control unit connector A (32P): disconnected PTC heater core 5P connector: disconnected
Test point 1	Climate control unit connector A (32P) No. 23
Test point 2	PTC heater D relay 4P socket (female terminals) No. 4: ①



Is there continuity?

YES

Replace the climate control unit .

NO

Repair an open in the A/C_PTC4_RLY_CL- wire.

ADJUSTMENT

A/C REFRIGERANT OIL ADJUSTMENT

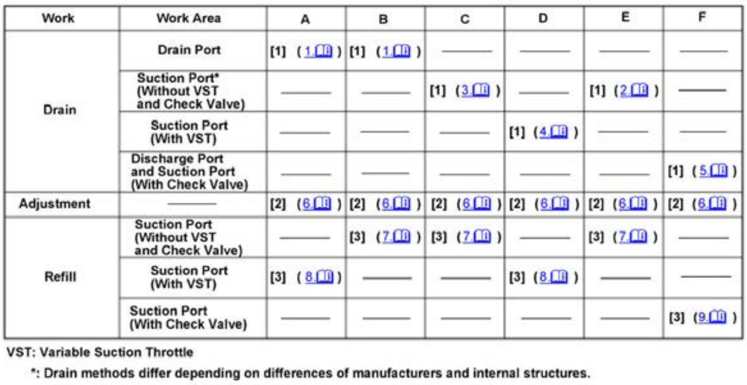
Adjustment

NOTE:

- When the A/C compressor is replaced, check the work procedures from the table below and adjusts the A/C refrigerant oil amount.
- Cover the pulley and clutch with plastic bag to prevent the A/C refrigerant oil contact.
- Drain the A/C refrigerant oil sufficiently until the drip disappears.

Procedure

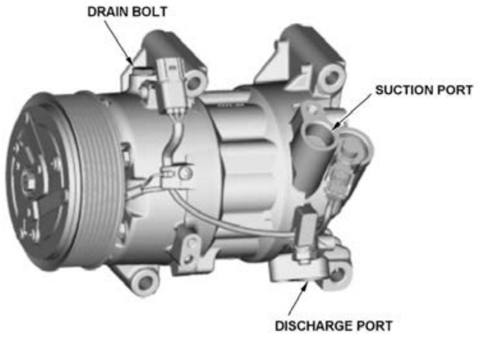
NOTE: **[ ] indicates the work process order and () indicates the number describing the work contents in following procedure.**



Work	Work Area	A	B	C	D	E	F
Drain	Drain Port	[1] (1)	[1] (1)	—	—	—	—
	Suction Port* (Without VST and Check Valve)	—	—	[1] (3)	—	[1] (2)	—
	Suction Port (With VST)	—	—	—	[1] (4)	—	—
	Discharge Port and Suction Port (With Check Valve)	—	—	—	—	—	[1] (5)
Adjustment	—	[2] (6)	[2] (6)	[2] (6)	[2] (6)	[2] (6)	[2] (6)
Refill	Suction Port (Without VST and Check Valve)	—	[3] (7)	[3] (7)	—	[3] (7)	—
	Suction Port (With VST)	[3] (8)	—	—	[3] (8)	—	—
	Suction Port (With Check Valve)	—	—	—	—	—	[3] (9)

VST: Variable Suction Throttle

*: Drain methods differ depending on differences of manufacturers and internal structures.



This illustration is an example only. Appearance and structure of the actual parts may vary depending on the model.

1. A/C Refrigerant Oil - Drain (Drain Port)

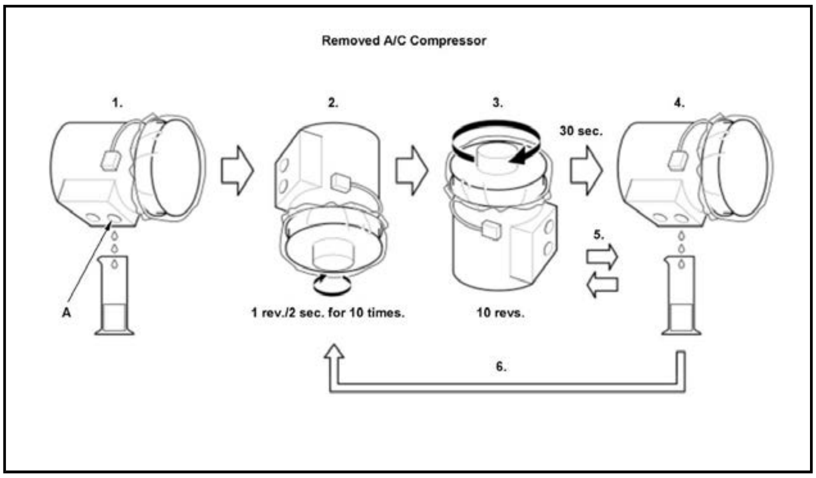
 Removed Compressor B A	1. Remo 2. Drain measuri
 New Compressor B A	3. Remove the drain bolt (A) from the new A/ 4. Drain the A/C refrigerant oil from the drain 5. Use a new drain bolt and install it with the s Control System (Under-Hood) Removal, Insta

2. A/C Refrigerant Oil - Drain (Suction Port (Without VST and Check Valve))

 Removed A/C Compressor A	1. Drain the A/C refrigera compressor in a measurin
 New Compressor A	2. Drain the A/C refrige compressor in a measuri

3. A/C Refrigerant Oil - Drain (Suction Port (Without VST and Check Valve))

1. Drain the A/C refrigerant oil from the suction port (A) of the removed A/C compressor in a measuring device.



2. With the A/C compressor clutch faced downward, rotating the armature plate 10 times at a speed of 1 revolution per 2 seconds.

NOTE: When the armature plate is rotated, the refrigerant or refrigerant oil may squirt. Direct the suction port and discharge port in a safe direction.

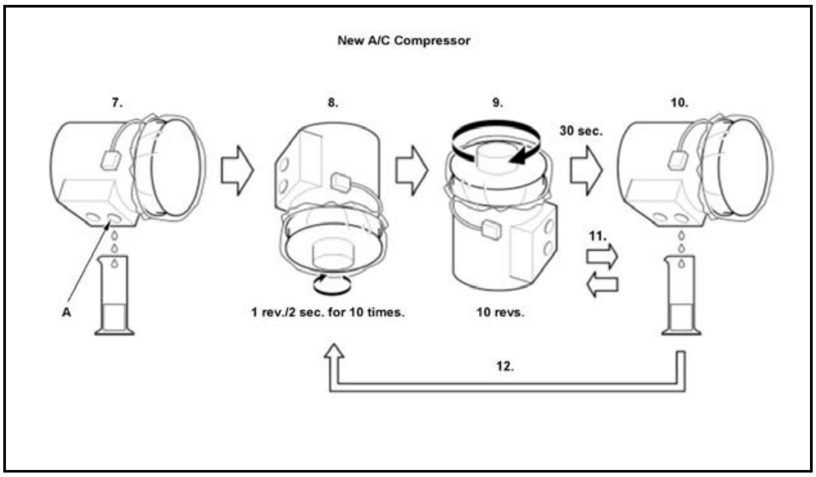
3. With the A/C compressor clutch faced upward, rotating the armature plate 10 times at wait 30 seconds.

4. Drain the A/C refrigerant oil from the suction port.

5. Repeat steps 3 and 4 several more times until the refrigerant and refrigerant oil does not discharge.

6. When draining of the A/C refrigerant oil from the A/C compressor has ended, perform step 2, and repeat step 3 and step 4.

7. Drain the A/C refrigerant oil from the suction port (A) of the new A/C compressor in a measuring device.



8. With the A/C compressor clutch faced downward, rotating the armature plate 10 times at a speed of 1 revolution per 2 seconds.

NOTE: When the armature plate is rotated, the refrigerant or refrigerant oil may squirt. Direct the suction port and discharge port in a safe direction.

9. With the A/C compressor clutch faced upward, rotating the armature plate 10 times at wait 30 seconds.

10. Drain the A/C refrigerant oil from the suction port.

11. Repeat steps 9 and 10 several more times until the refrigerant and refrigerant oil does not discharge.

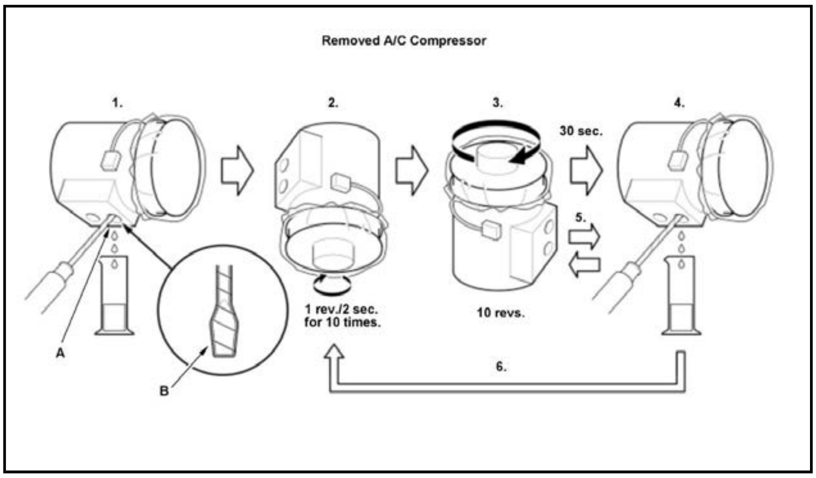
12. When draining of the A/C refrigerant oil from the A/C compressor has ended, perform step 8, and repeat step 9 and step 10.

4. A/C Refrigerant Oil - Drain (Suction Port (With VST))

1. Push the VST with a flat-tip screwdriver, and drain the A/C refrigerant oil from the suction port (A) of the removed A/C compressor in a measuring device. The

NOTE:

- **Use a screwdriver that is not painted or rusted.**
- **Wrap the screwdriver it with protective tape (B) to prevent damage.**
- **Be careful not to damage the suction port.**
- **The VST is opened and closed using a light amount of force. Be careful not to press down it too hard.**



2. With the A/C compressor clutch faced downward, rotating the armature plate 10 times at a speed of 1 revolution per 2 seconds.

When the armature plate is rotated, the refrigerant or refrigerant oil may squirt. Direct the suction port and discharge port in a safe direction.

3. With the A/C compressor clutch faced upward, rotating the armature plate 10 times at wait 30 seconds.

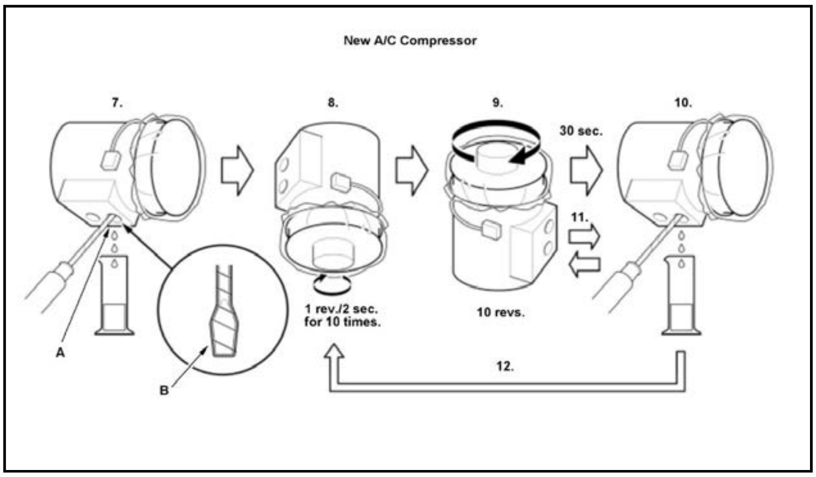
4. Push the VST with a flat-tip screwdriver, and drain the A/C refrigerant oil from the suction port.

5. Repeat steps 3 and 4 several more times until the refrigerant and refrigerant oil does not discharge.

6. When draining of the A/C refrigerant oil from the A/C compressor has ended, perform step 2, and repeat step 3 and step 4.

7. Push the VST with a flat-tip screwdriver, and drain the A/C refrigerant oil from the suction port (A) of the new A/C compressor in a measuring device. The VS

- Use a screwdriver that is not painted or rusted.
- Wrap the screwdriver it with protective tape (B) to prevent damage.
- Be careful not to damage the suction port.
- The VST is opened and closed using a light amount of force. Be careful not to press it down too hard.



8. With the A/C compressor clutch faced downward, rotating the armature plate 10 times at a speed of 1 revolution per 2 seconds.

NOTE: When the armature plate is rotated, the refrigerant or refrigerant oil may squirt. Direct the suction port and discharge port in a safe direction.

9. With the A/C compressor clutch faced upward, rotating the armature plate 10 times at wait 30 seconds.

10. Push the VST with a flat-tip screwdriver, and drain the A/C refrigerant oil from the suction port.

11. Repeat steps 9 and 10 several more times until the refrigerant and refrigerant oil does not discharge.

12. When draining of the A/C refrigerant oil from the A/C compressor has ended, perform step 8, and repeat step 9 and step 10.

5. A/C Refrigerant Oil - Drain (Discharge Port and Suction Port (With Check Valve))

 Removed A/C Compressor A	1. Drain the A/C refrigerant compressor in a measuring
 Removed A/C Compressor A	2. Install the lid (A) to the d the armature 5 times or so. **NOTE:** - **Use the lid that comes with a new A/C compressor.** - **Drain the A/C refrigerant oil in the cylinder by compressing air.**

 Removed A/C Compressor A	3. Drain the A/C refrigerant compressor in a measuring

 Removed A/C Compressor A B	4. Push the check valve with a flat-tip screwdriver, and drain the removed A/C compressor in a measuring device. The check valve **NOTE:** - **Use a screwdriver that is not painted and rusted.** - **Wrap the screwdriver with protective tape (B) to prevent damage.** - **Be careful not to damage the suction port.** - **The check valve is opened and closed using a light amount of force. Be careful not to press it down too hard.**

 New A/C Compressor A	5. Drain the A/C refrigera compressor in a measurin
 New A/C Compressor A	6. Install the lid (A) to the armature 5 times or so. **NOTE:** - **Use the lid that comes with a new A/C compressor.** - **Drain the A/C refrigerant oil in the cylinder by compressing air.**

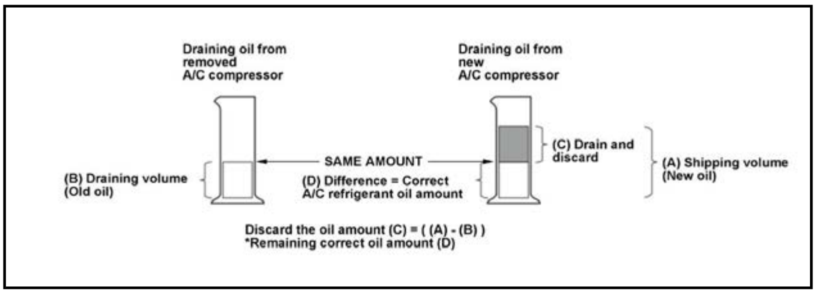
	7. Drain the A/C refrigera compressor in a measurin

	8. Push the check valve with a flat-tip screwdriver, and drain the A/C compressor in a measuring device. The check valve stroke **NOTE:** - **Use a screwdriver that is not painted and rusted.** - **Wrap the screwdriver it with protective tape (B) to prevent damage.** - **Be careful not to damage the suction port.** - **The check valve is opened and closed using a light amount of force. Be careful not to press down it too hard.**

6. A/C Compressor Oil - Adjustment

1. Adjust the A/C refrigerant oil drained from the new A/C compressor to the same amount as the A/C refrigerant oil drained from the removed A/C compressor.

NOTE: If no A/C refrigerant oil was drained from the removed A/C compressor, do not drain more than 50 mL (1 2/3 fl oz, 1.76 Imp oz) from the new A/C comp



Draining oil from removed A/C compressor
Draining oil from new A/C compressor
(C) Drain and discard
SAME AMOUNT
(A) Shipping volume (New oil)
(B) Draining volume (Old oil)
(D) Difference = Correct A/C refrigerant oil amount
Discard the oil amount (C) = ((A) - (B))
*Remaining correct oil amount (D)

7. A/C Refrigerant Oil - Refill (Without VST and Check Valve)

	1. Refill the adjuste through the suction

8. A/C Refrigerant Oil - Refill (With VST)

	1. Push the VST with a flat-tip screwdriver, and refill the through the suction port (A). The VST stroke depth is ab **NOTE:** - **Use a screwdriver that is not painted or rusted.** - **Wrap the screwdriver it with protective tape (B) to prevent damage.** - **Be careful not to damage the suction port.** - **The VST is opened and closed using a light amount of force. Be careful not to press down it too hard.**

9. A/C Refrigerant Oil - Refill (With Check Valve)

	1. Push the check valve with a flat-tip screwdriver, and refill th compressor through the suction port (A). The check valve strok - Use a screwdriver that is not painted and rusted. - Wrap the screwdriver it with protective tape (B) to preve - Be careful not to damage the suction port. - The check valve is opened and closed using a light amou

MAINTENANCE

MAINTENANCE MAIN ITEMS

If a Maintenance Minder indicator does not appear more than 12 months after the display is reset, change the engine oil every year.
NOTE: Adjust the valves during services A, B, 1, 2, or 3 if they are noisy.

Symbol	Maintenance Main Items
A	**Replace engine oil**
B	**Replace engine oil** and **oil filter**
B	**Inspect front and rear brakes**
B	• Check pads and discs for wear (thickness), damage, and cracks. • Check calipers for damage, leaks, and tightness of mounting bolts.
B	Check parking brake adjustment (Except EPB)
B	Check expiration date of the tire repair kit bottle (if equipped)
B	**Inspect tie-rod ends, steering gearbox, and gearbox boots**
B	• Check steering linkage. • Check boots for damage and leaking grease.
B	**Inspect suspension components**
B	• Check bolts for tightness. • Check condition of ball joint boots for deterioration and damage.
B	**Inspect driveshaft boots**
B	• Check boots for cracks and boot bands for tightness.
B	**Inspect brake hoses and lines including VSA lines**
B	• Check master cylinder and VSA modulator-control unit for damage and leakage.
B	Inspect all fluid levels and condition of fluids
B	• **Engine coolant** • **Transmission fluid** • **Rear Differential** • **Brake fluid** • Windshield washer fluid
B	**Inspect exhaust system**
B	• Check catalytic converter heat shields, exhaust pipes, and muffler for damage, leaks, and tightness.
B	**Inspect fuel lines** and **connections**
B	• Check for loose connections, cracks, and deterioration; retighten loose connections and replace damaged parts.

NOTE: According to state and federal regulations, failure to do the maintenance items marked with an asterisk (*) will not void the customer's emissions warranties. However, Honda recommends that all maintenance services be done at the recommended interval, to ensure long-term reliability.

MAINTENANCE SUB ITEMS

If a Maintenance Minder indicator does not appear more than 36 months after the item 7 is reset, change the brake fluid every 3 years.
NOTE: Adjust the valves during services A, B, 1, 2, or 3 if they are noisy.

Number	**Maintenance Sub Items**
1	Rotate tires, and check tire inflation and condition
B	• Follow the pattern shown in the Owner's Manual.
2	**Replace air cleaner element**
B	• If the vehicle is driven primarily in dusty conditions, replace every 15000 miles (24000 km).
B	**Replace dust and pollen filter**
B	• Replace filter whenever airflow from the heating and air conditioning system is less than normal. • If the vehicle is driven mostly in urban areas that have high concentrations of soot in the air from industry and from diesel-powered vehicles, replace every 15000 miles (24000 km).
3	**Replace transmission fluid**
B	• Driving in mountainous areas at very low vehicle speeds or trailer towing results in higher transmission temperatures. This requires transmission fluid changes more frequently than recommended by the Maintenance Minder. If the vehicle is regularly driven under these conditions, have the transmission fluid changed every 47500 miles (75000 km) or 3 years.
4	**Replace spark plugs**
B	**Inspect valve clearance**
5	**Replace engine coolant**
6	**Replace rear differential fluid**
7	**Replace brake fluid**

GENERAL INFORMATION FOR MAINTENANCE

LUBRICANTS AND FLUIDS

Application	**Lubricant or Fluid**
Engine	Honda Motor Oil: 0W-20 Look for the API certification seal on the oil container. Make sure it says "For Gasoline Engines." SAE Viscosity: See chart.
Transmission (e-CVT)	Honda Automatic Transmission Fluid (ATF DW-1): Always use Honda ATF DW-1. **NOTE:** Using the wrong type of fluid will damage the transmission.

Application	Lubricant or Fluid
Rear differential (with AWD)	Honda DPSF-II
Brake system (including VSA lines)	Honda DOT 3 Brake Fluid: Always use Honda DOT 3 Brake Fluid. Using a non-Honda brake fluid can cause corrosion and decrease the life of the system.
Cooling system	Always use Honda Long Life Antifreeze/Coolant Type 2. **NOTE:** For prolonged cold temperatures below -22B°F (-30B°C), add Honda Extreme Cold Weather Antifreeze/Coolant Type 2 **(concentrate)** .

Recommended Engine Oil

<table>
<tr><th>Recommended Engine Oil</th><th colspan="3">Engine Oil Standard</th></tr>
<tr><td>• Honda Genuine Motor Oil (0W-20)</td><td colspan="3">• If "Honda Genuine Motor Oil" is not available, use 0W-20.</td></tr>
<tr><td>B</td><td>B</td><td>API
Certification
Mark
"Starburst"</td><td>B</td></tr>
<tr><td></td><td colspan="3"> </td></tr>
</table>

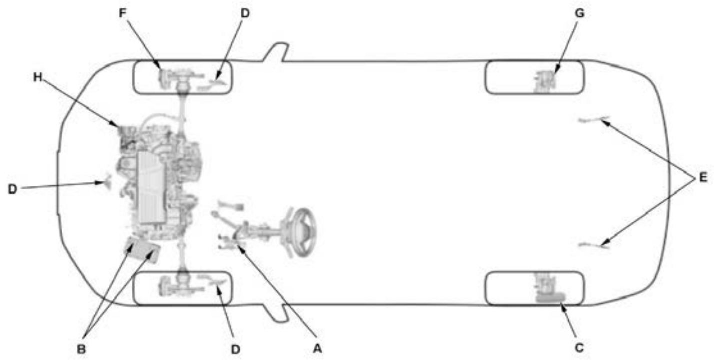
For the details of the lubrication points and the type of lubricants to be applied, refer to the illustrated index and the various work procedures (such as Assembly/Reassembly, Replacement, Overhaul, Installation, etc.) contained in the service information.

Application		Lubricant or Fluid
A	Brake pedal yoke pin	Multipurpose grease
B	12 volt battery terminals	
C	Fuel fill door	
D	Hood hinges and hood latch	
E	Tailgate hinges	
F	Front brake caliper pins and pin boots	Honda silicone grease (P/N 08C30-B0234M) or Caliper set grease (NIGLUBE RM)
	Front brake caliper piston seals	Honda silicone grease (P/N 08C30-B0234M) or Caliper set grease (Shin-Etsu Chemical KS62M)
	Front brake caliper piston boots	Honda silicone grease (P/N 08C30-B0234M) or Caliper set grease (Cosmo Rubber Grease)
	Front brake caliper piston	Brake Fluid DOT 3

Application		Lubricant or Fluid
G	Rear brake caliper pins and pin boots	Honda silicone grease (P/N 08C30-B0234M) or Caliper set grease (NIGLUBE RM)
	Rear brake caliper piston seals	Brake Fluid DOT 3
	Rear brake caliper piston boots	Caliper set grease (GB3G)
H	Air conditioning compressor	Compressor Oil: DENSO ND-OIL 11 (POE oil: P/N 38899-TX9-023) for refrigerant HFO-1234yf (R-1234yf)

NOTE:

- Lubricate the following areas using the recommended lubricants and fluids.
- In corrosive areas, more frequent lubrication is necessary.



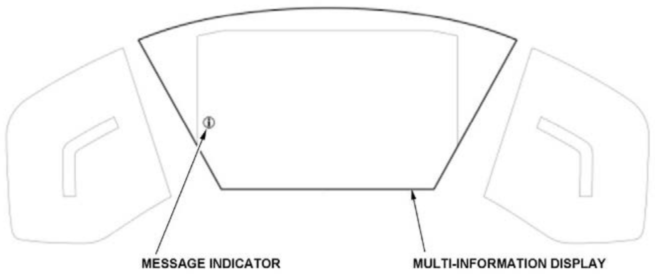
MAINTENANCE MINDER™ GENERAL INFORMATION

Maintenance Minder™ General Information

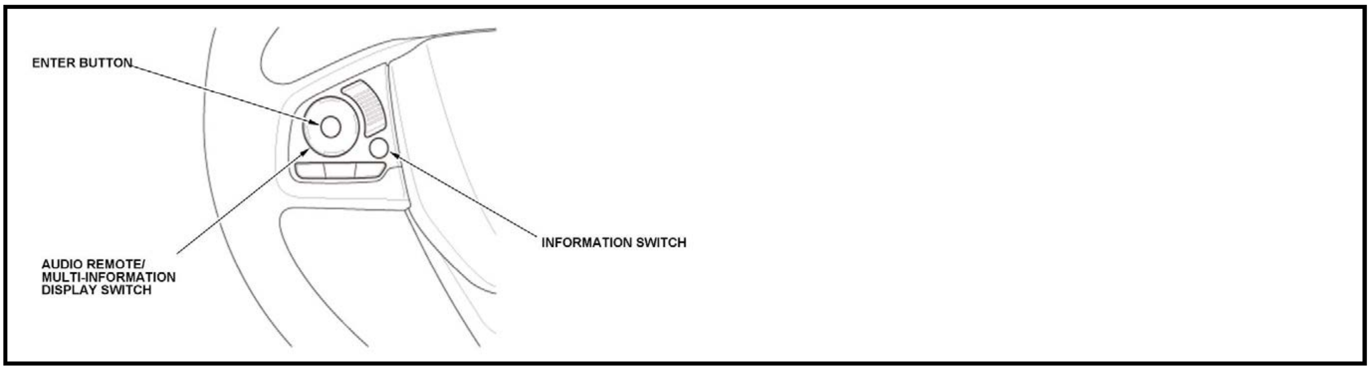
Maintenance Minder

The Maintenance Minder is an important feature of the multi-information display. Based on engine and transmission operating conditions, and accumulated engine revolutions, the onboard computer (PCM) calculates the remaining engine oil and the transmission fluid life. The system also displays the remaining engine oil life along with the code(s) for other scheduled maintenance items needing service.

Gauges:



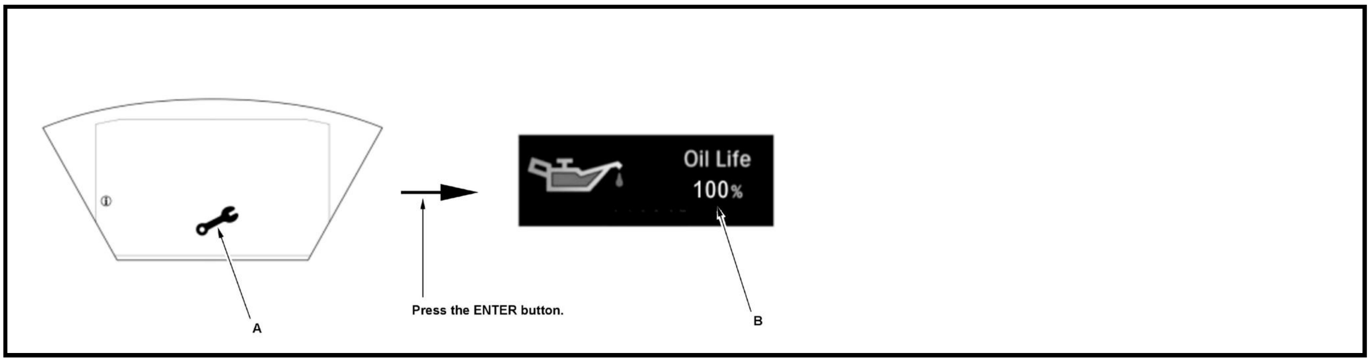
Steering Wheel:



ENTER BUTTON
INFORMATION SWITCH
AUDIO REMOTE/
MULTI-INFORMATION
DISPLAY SWITCH

Service Information

1. The remaining engine oil life is shown as a percentage on the multi-information display. To see the current engine oil life, turn the vehicle to the ON mode, then press the information switch repeatedly until "Maintenance Minder (A)" appears on the multi-information display. Press the ENTER button to show the current engine oil life (B) on the display.

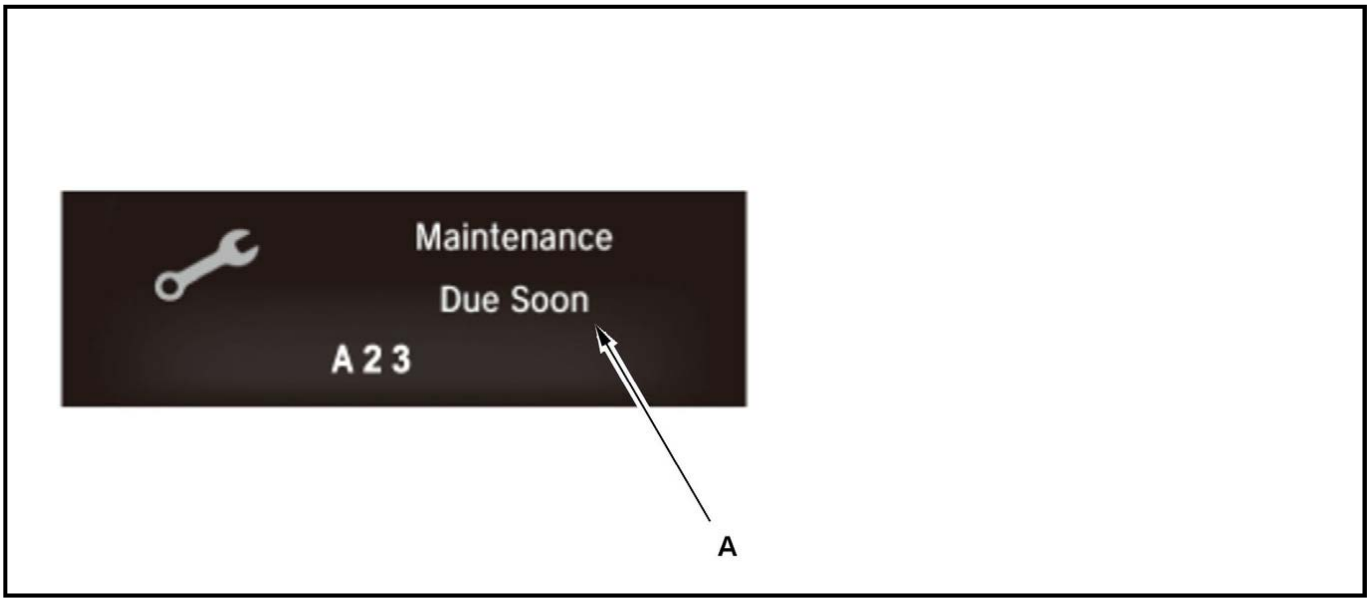


Oil Life
100%
A
Press the ENTER button.
B

2. When the vehicle is in the ON mode, and the remaining engine oil life is 15% to 6%, the remaining engine oil life and other scheduled maintenance item(s) needing service are displayed.

The Maintenance Minder message "Maintenance Due Soon" (A) also comes on. To cancel the message, press the information switch or audio remote/multi-information display switch. The display continues to show the remaining engine oil life (B) and the message indicator (C) until it is reset.

- Complete list of maintenance main items (D).
- Complete list of maintenance sub items (E).



Maintenance
Due Soon

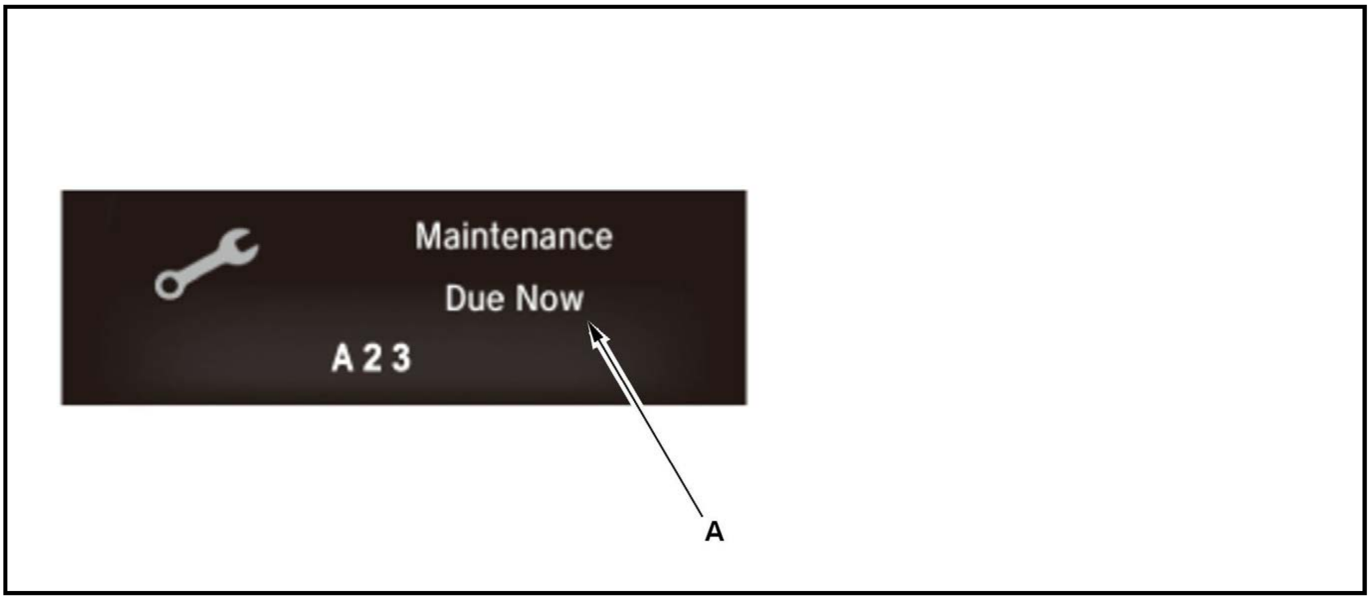
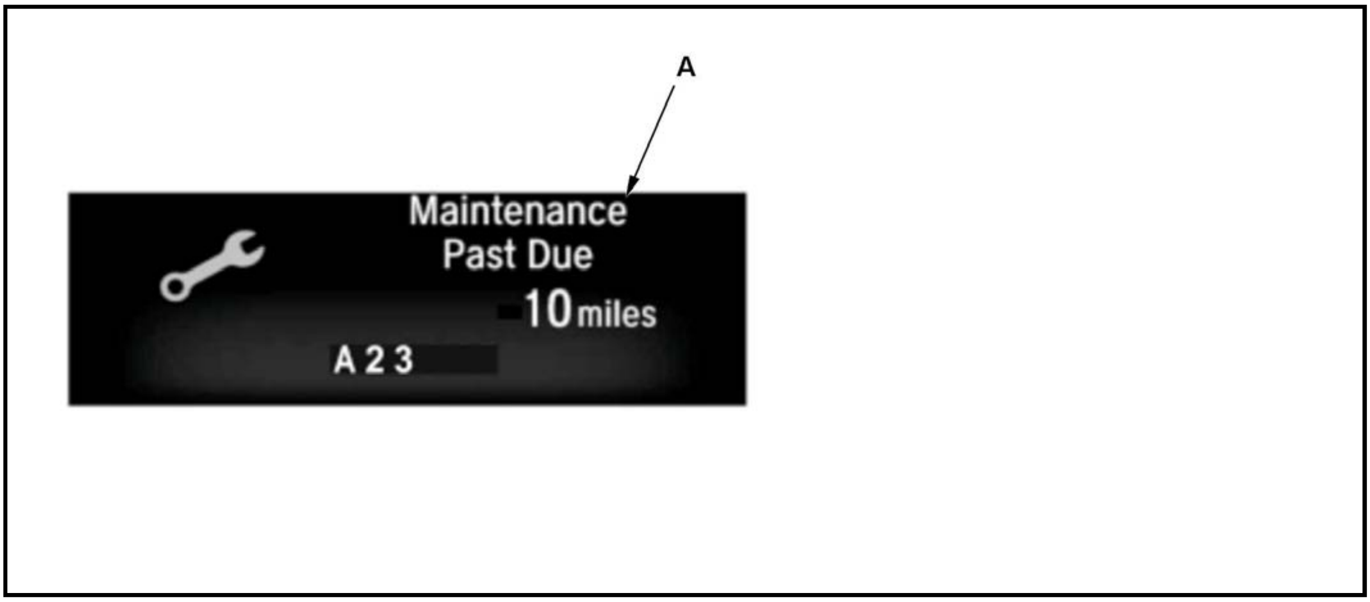
D
E
B

3. When the vehicle is in the ON mode, and the remaining engine oil life is 5% to 1%, the Maintenance Minder message "Maintenance Due Now" (A) is displayed along with the maintenance item code(s).



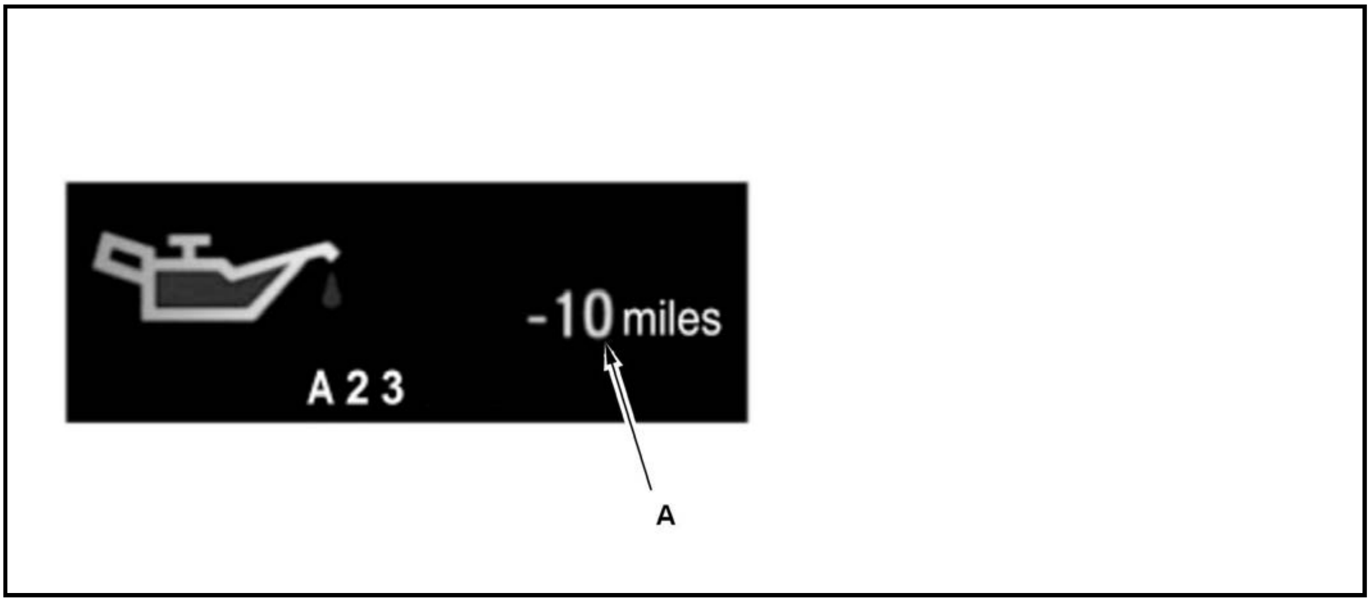
Maintenance
Due Now
A23
A

4. When the vehicle is in the ON mode, and the remaining engine oil life is 0%, the Maintenance Minder message "Maintenance Past Due" (A) is displayed along with the maintenance item code(s).



A
Maintenance
Past Due
10 miles
A23

5. If the indicated maintenance is not done, the Maintenance Minder shows a negative distance traveled (A), for example "-10 miles," on the display. If the negative distance traveled is between 0 and 9, the message is displayed for only a few seconds when turning the vehicle to the ON mode. The negative distance traveled remains displayed after the vehicle is driven more than 10 miles (for USA models) or 10 km (for Canada models) after 0% oil life is reached, and the display cannot be canceled. This means the indicated maintenance item(s) should have been done more than 10 miles (or 10 km) ago.



Resetting the Maintenance Minder

NOTE:

- The vehicle must be stopped to reset the Maintenance Minder.
- If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.
- You can reset all maintenance items together, or you can select and reset each maintenance item individually on the display.
- The engine oil life and maintenance item(s) can also be independently reset with the HDS.

1. Turn the vehicle to the ON mode.

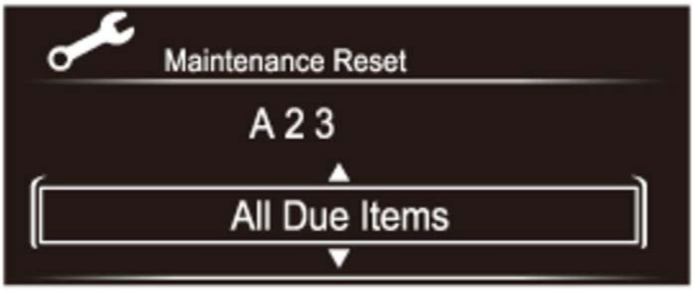
2. If system message(s) are displayed, press the information switch or audio remote/multi-information display switch to cancel the display until the "Maintenance Minder" icon is displayed, then press the ENTER button.

3. When the display shows the remaining engine oil life, press and hold the ENTER button for 10 seconds or more. The "Maintenance Reset" mode appears on the multi-information display.

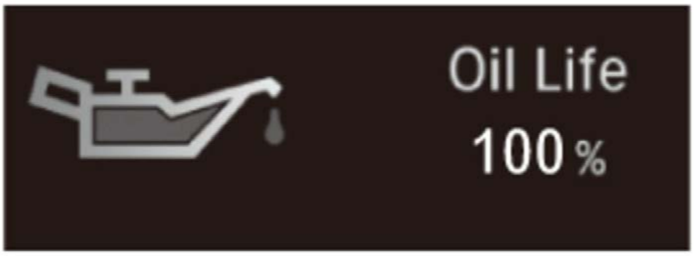
NOTE:

- If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.
- To cancel the "Maintenance Reset" mode, press the audio remote/multi-information display switch to select the "Cancel," then press the ENTER button.

4. If you reset all the maintenance items shown on the display "A23 (for example)", select "All Due Items" by pressing the audio remote/multi-information display switch and press the ENTER button. If you want to reset each maintenance item individually, select an item (complete list of maintenance **main item(s)** and **sub item(s)**) you wish to reset by pressing the audio remote/multi-information display switch and press the ENTER button.



5. The maintenance item code(s) will disappear, and the engine oil life will reset to "100%."



Resetting Individual Maintenance Items by HDS

1. **Connect the HDS**

2. Select GAUGES in the BODY ELECTRICAL with the HDS.

3. Select ADJUSTMENT in the GAUGES with the HDS.

4. Select MAINTENANCE INFORMATION in the ADJUSTMENT with the HDS.

5. Select MAINTENANCE MINDER in the MAINTENANCE INFORMATION with the HDS.

6. Select the individual maintenance item you wish to reset with the HDS.

GENERAL INFORMATION FOR MAINTENANCE

LUBRICANTS AND FLUIDS (ECUADOR) (2019 2020 2021)

Application	Lubricant or Fluid
Engine	Recommended Engine Oil: See chart.
CVT	Always use genuine Honda HCF-2. **NOTE:** Using the wrong type of fluid will damage the transmission.
Rear differential (with AWD)	Honda DPSF-II
Brake system (including VSA lines)	Brake Fluid DOT 3 or DOT 4:We recommend genuine Honda Brake Fluid. Using a non-Honda brake fluid can cause corrosion and decrease the life of the system.
Cooling system	We recommend Honda All Season Antifreeze/Coolant Type 2.

Recommended Engine Oil

- Engine oil viscosity for ambient temperature ranges.
- Using oils other than preferred viscosity may adversely affect consumption.

<table>
<tr><th>Recommended Engine Oil</th><th colspan="3">Engine Oil Standard</th></tr>

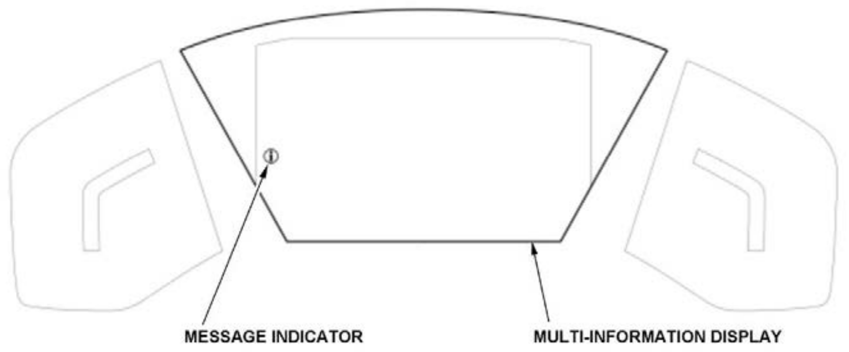
MAINTENANCE MINDER™ GENERAL INFORMATION (KA/KC (WITH MULTI-INFORMATION DISPLAY))

Maintenance Minder

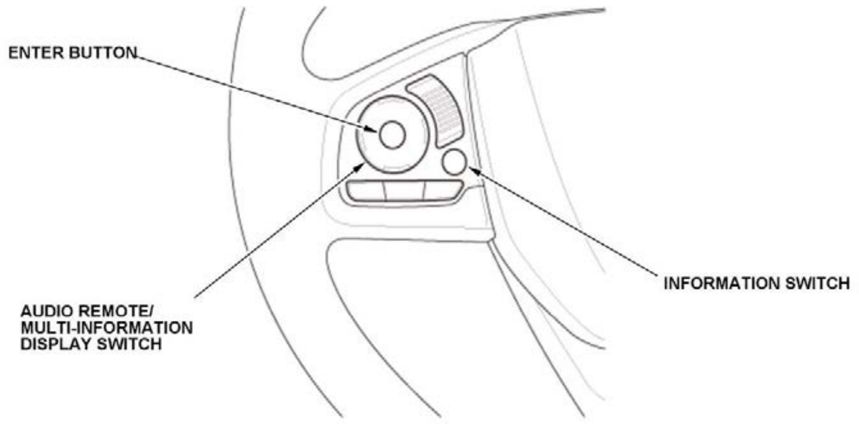
The Maintenance Minder is an important feature of the multi-information display. Based on engine and transmission operating conditions, and accumulated engine revolutions, the onboard computer (PCM) calculates the remaining engine oil and the transmission fluid life. The system also displays the remaining engine oil life along with the code(s) for other scheduled maintenance items needing service.

Gauges:



MESSAGE INDICATOR
MULTI-INFORMATION DISPLAY

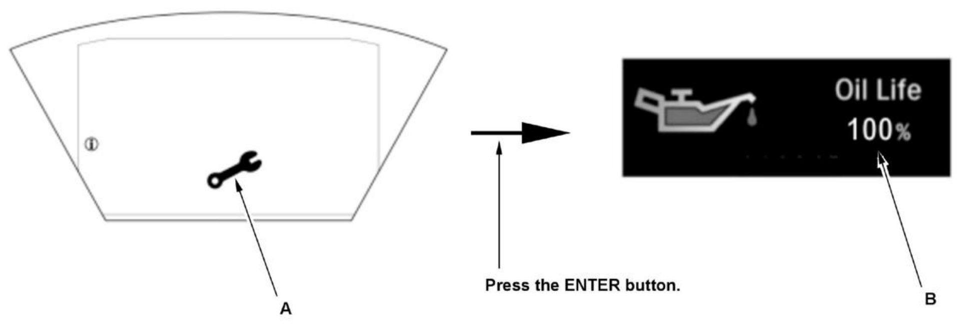
Steering Wheel:



ENTER BUTTON
AUDIO REMOTE/
MULTI-INFORMATION
DISPLAY SWITCH
INFORMATION SWITCH

Service Information

1. The remaining engine oil life is shown as a percentage on the multi-information display. To see the current engine oil life, turn the vehicle to the ON mode, then press the information switch repeatedly until "Maintenance Minder (A)" appears on the multi-information display. Press the ENTER button to show the current engine oil life (B) on the display.



Oil Life
100%
A
Press the ENTER button.
B

When the vehicle is in the ON mode, and the remaining engine oil life is 15 % to 6 %, the remaining engine oil life and other scheduled maintenance item(s) needing service are displayed. The Maintenance Minder message "Maintenance Due Soon" (A) also comes on. To cancel the message, press the information switch or audio remote/multi-information display switch. The display continues to show the remaining engine oil life (B) and the message indicator (C) until it is reset.

- Complete list of maintenance main items (D).
- Complete list of maintenance sub items (E).

A 2 3
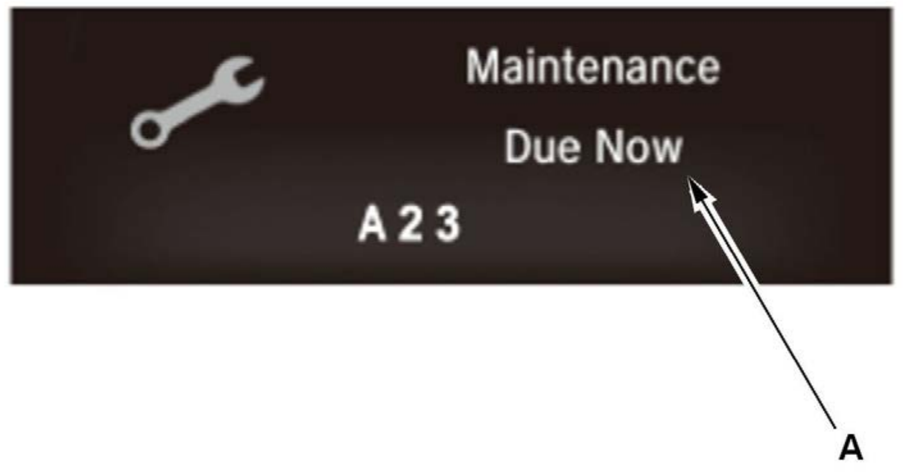
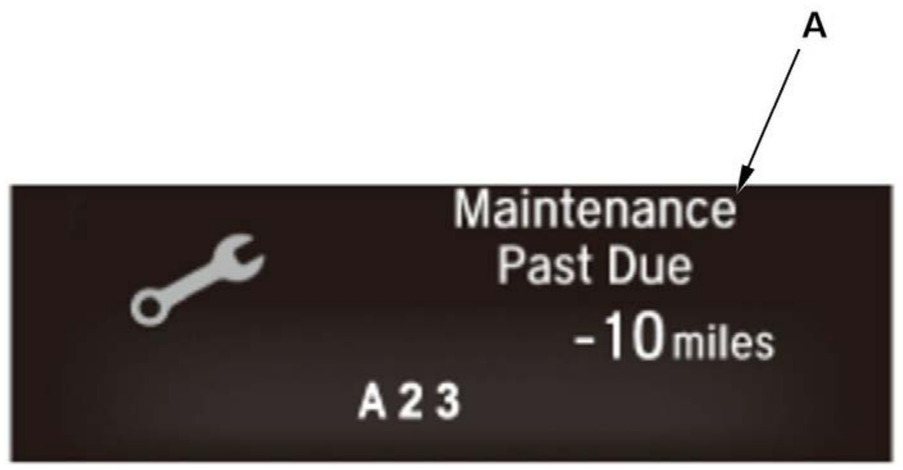
D
E
B

3. When the vehicle is in the ON mode, and the remaining engine oil life is 5 % to 1 %, the Maintenance Minder message "Maintenance Due Now" (A) is displayed along with the maintenance item code(s).

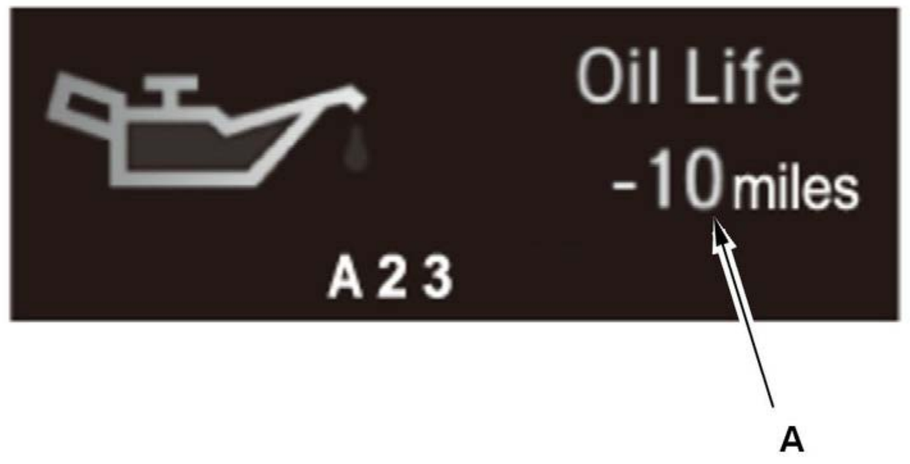


Maintenance
Due Now
A 2 3
A

4. When the vehicle is in the ON mode, and the remaining engine oil life is 0 %, the Maintenance Minder message "Maintenance Past Due" is displayed along with the maintenance item code(s).



5. If the indicated maintenance is not done, the Maintenance Minder shows a negative distance traveled (A), for example "-10 miles," on the display. If the negative distance traveled is between 0 and 9, the message is displayed for only a few seconds when turning the vehicle to the ON mode. The negative distance traveled remains displayed after the vehicle is driven more than 10 miles (for USA models) or 10 km (for Canada models) after 0 % oil life is reached, and the display cannot be canceled. This means the indicated maintenance item(s) should have been done more than 10 miles (or 10 km) ago.



Resetting the Maintenance Minder

NOTE:

- The vehicle must be stopped to reset the Maintenance Minder.
- If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.
- You can reset all maintenance items together, or you can select and reset each maintenance item individually on the display.
- The engine oil life and maintenance item(s) can also be independently reset with the HDS.

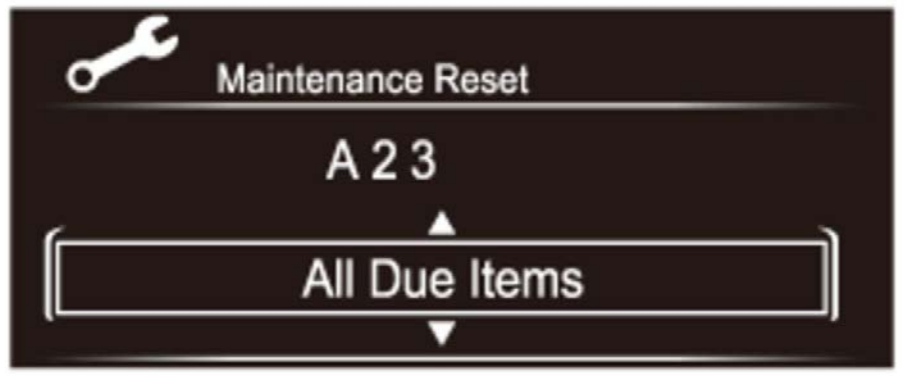
1. Turn the vehicle to the ON mode.

2. If system message(s) are displayed, press the information switch or audio remote/multi-information display switch to cancel the display until the "Maintenance Minder" icon is displayed, then press the ENTER button. When the display shows the remaining engine oil life, press and hold the ENTER button for 10 seconds or more. The "Maintenance Reset" mode appears on the multi-information display.

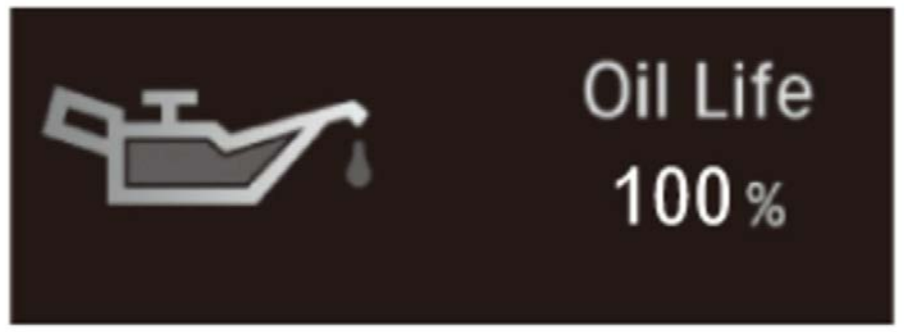
NOTE:

- If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.
- To cancel the "Maintenance Reset" mode, press the audio remote/multi-information display switch to select the "Cancel," then press the ENTER button.

4. If you reset all the maintenance items shown on the display "A23 (for example)", select "All Due Items" by pressing the audio remote/multi-information display switch and press the ENTER button. If you want to reset each maintenance item individually, select an item (complete list of maintenance **main item(s)** and **sub item(s)**) you wish to reset by pressing the audio remote/multi-information display switch and press the ENTER button.



5. The maintenance item code(s) will disappear, and the engine oil life will reset to "100 %."



Resetting Individual Maintenance Items by HDS

1. Connect the HDS

2. Select GAUGES in the BODY ELECTRICAL with the HDS.

3. Select ADJUSTMENT in the GAUGES with the HDS.

4. Select MAINTENANCE INFORMATION in the ADJUSTMENT with the HDS.

5. Select MAINTENANCE MINDER in the MAINTENANCE INFORMATION with the HDS.

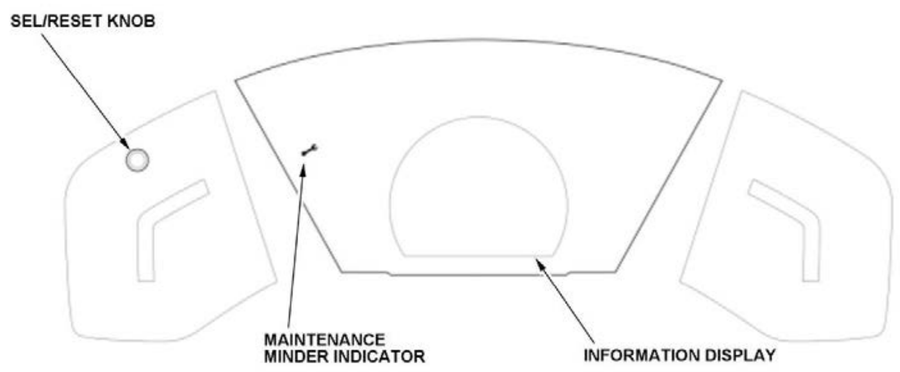
6. Select the individual maintenance item you wish to reset with the HDS.

MAINTENANCE MINDER™ GENERAL INFORMATION (KA/KC (WITHOUT MULTI-INFORMATION DISPLAY))

Maintenance Minder

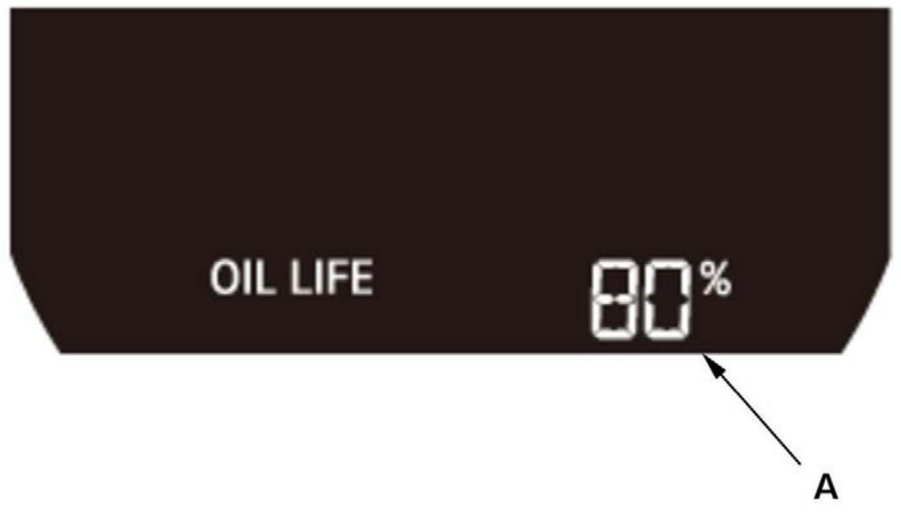
The Maintenance Minder is an important feature of the information display. Based on engine and transmission operating conditions, and accumulated engine revolutions, the onboard computer (PCM) calculates the remaining engine oil and the transmission fluid life. The system also displays the remaining engine oil life along with the code(s) for other scheduled maintenance items needing service.

Gauges:



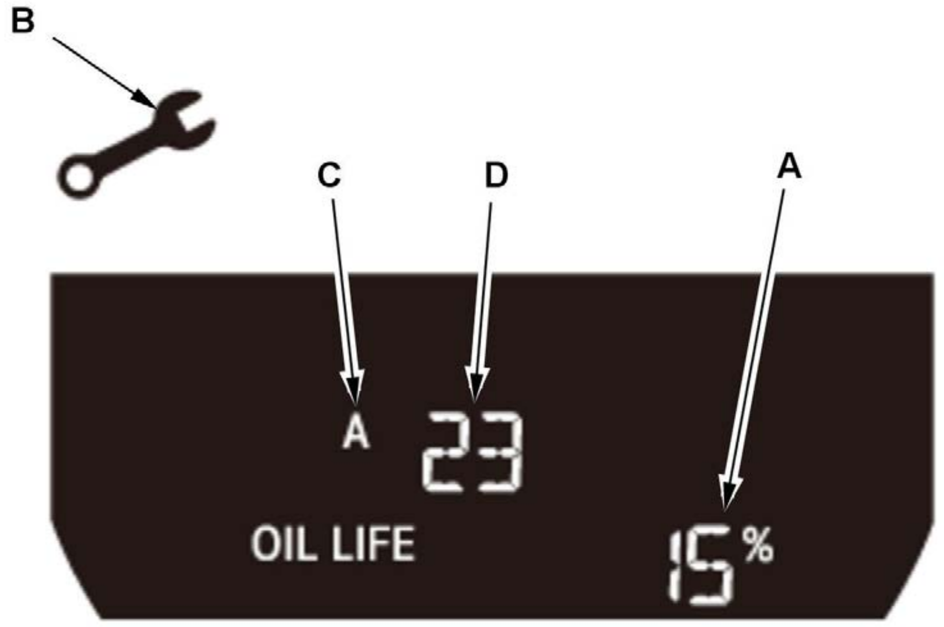
Service Information

1. The remaining engine oil life (A) is shown as a percentage on the information display. To see the current engine oil life, turn the vehicle to the ON mode, then push and release the SEL/RESET knob repeatedly until the engine oil life appears on the information display.

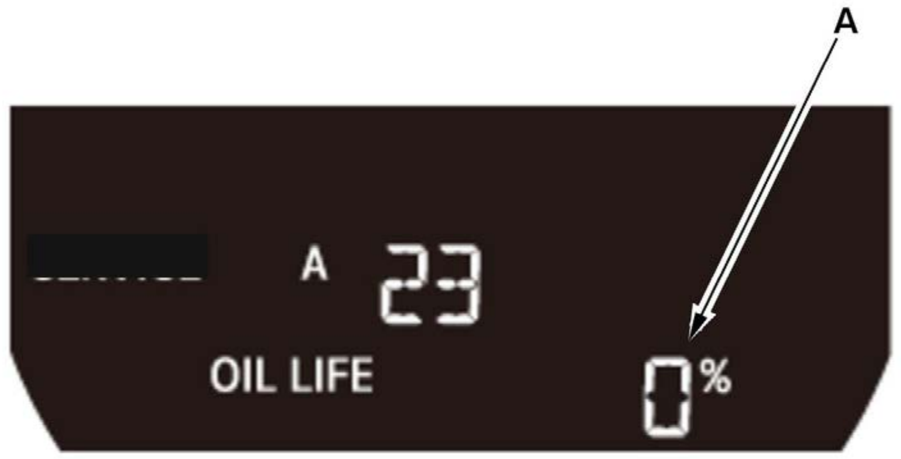


When the vehicle is in the ON mode, and the remaining engine oil life is 15 % or less, the remaining engine oil life (A) and other scheduled maintenance item(s) needing service are displayed. The maintenance minder indicator (B) also comes on. To cancel the display and the indicator, press the SEL/RESET knob.

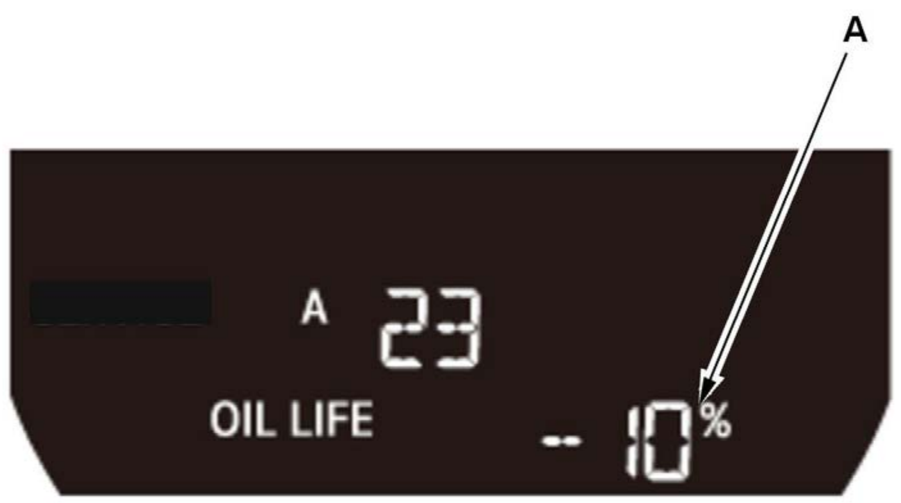
- **Complete list of maintenance main items (C)**.
- **Complete list of maintenance sub items (D)**.



3. When the vehicle is in the ON mode, and the remaining engine oil life is 0 %, the engine oil life indicator (A) blinks. Pressing the SEL/RESET knob cancels the display, but the Maintenance Minder indicator stays on.



4. If the indicated maintenance is not done, the engine oil life indicator shows a negative distance traveled (A), for example "-10" on the display. If the negative distance traveled is between 0 and -9, the indicator is displayed for only a few seconds when turning the vehicle to the ON mode. The negative distance traveled remains displayed after the vehicle is driven more than 10 miles (for USA models) or 10 km (for Canada models) after 0 % oil life is reached, and the display cannot be canceled.This means the indicated maintenance item(s) should have been done more than 10 miles (or 10 km) ago.



Resetting the Maintenance Minder

NOTE:

- The vehicle must be stopped to reset the Maintenance Minder.
- If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.
- You can reset all maintenance items together, or you can select and reset each maintenance item individually on the display.
- The engine oil life and maintenance item(s) can also be independently reset with the HDS.

1. Turn the vehicle to the ON mode.

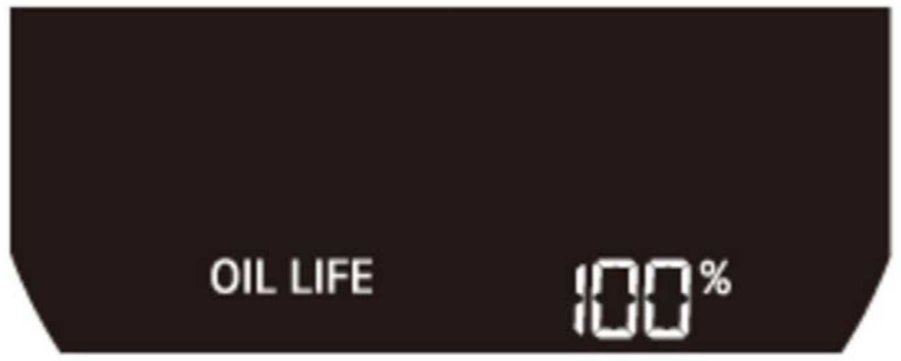
2. Push the SEL/RESET knob repeatedly until the engine oil life is displayed.

3. Press and hold the SEL/RESET knob for 10 seconds or more. The engine oil life and the maintenance item code(s) will blink to show it is in reset mode.

NOTE: If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.

4. If you reset all the maintenance items shown on the display "A23 (for example)", press and hold the SEL/RESET knob for 5 seconds or more. If you want to reset each maintenance item individually, select an item (complete list of maintenance **main item(s)** and **sub item(s)**) you wish to reset by rotating the SEL/RESET knob, and press and hold the knob for 5 seconds or more.

5. The maintenance item code(s) will disappear, and the engine oil life returns to "100 %."



Resetting Individual Maintenance Items by HDS

1. **Connect the HDS**

2. Select GAUGES in the BODY ELECTRICAL with the HDS.

3. Select ADJUSTMENT in the GAUGES with the HDS.

4. Select MAINTENANCE INFORMATION in the ADJUSTMENT with the HDS.

5. Select MAINTENANCE MINDER in the MAINTENANCE INFORMATION with the HDS.

6. Select the individual maintenance item you wish to reset with the HDS.

MAINTENANCE

MAINTENANCE MAIN ITEMS (KA)

If a Maintenance Minder indicator does not appear more than 12 months after the display is reset, change the engine oil every year.

NOTE:

- Inspect idle speed every 160, 000 miles (256, 000 km).
- Adjust the valves during services A, B, 1, 2, or 3 if they are noisy.

Symbol	Maintenance Main Items
A	Replace engine oil

B	• Engine oil capacity without oil filter
	•
	  ◦ 1.5 L engine models: 3.2 L (3.4 US qt)
	  ◦ 2.4 L engine models: 4.2 L (4.4 US qt)

B	Replace engine oil and oil filter

B	• Engine oil capacity with oil filter
	•
	  ◦ 1.5 L engine models: 3.5 L (3.7 US qt)
	  ◦ 2.4 L engine models: 4.4 L (4.6 US qt)

B	Inspect front and rear brakes
B	• Check pads and discs for wear (thickness), damage, and cracks. • Check calipers for damage, leaks, and tightness of mounting bolts.
B	Inspect tie-rod ends, steering gearbox, and gearbox boots
B	• Check steering linkage. • Check boots for damage and leaking grease.
B	Inspect suspension components
B	• Check bolts for tightness. • Check condition of ball joint boots for deterioration and damage.
B	Inspect driveshaft boots
B	• Check boots for cracks and boot bands for tightness.
B	Inspect brake hoses and lines including VSA lines
B	• Check master cylinder and VSA modulator-control unit for damage and leakage.
B	Inspect all fluid levels and condition of fluids
B	• Engine coolant • CVT fluid • Rear differential fluid (with AWD) • Brake fluid • Windshield washer fluid
B	Inspect exhaust system
B	• Check catalytic converter heat shields, exhaust pipes, and muffler for damage, leaks, and tightness.
B	Inspect fuel lines and connections
B	• Check for loose connections, cracks, and deterioration; retighten loose connections and replace damaged parts.

NOTE: According to state and federal regulations, failure to do the maintenance items marked with an asterisk (*) will not void the customer's emissions warranties. However, Honda recommends that all maintenance services be done at the recommended interval, to ensure long-term reliability.

MAINTENANCE SUB ITEMS (KA)

If a Maintenance Minder indicator does not appear more than 36 months after the item 7 is reset, change the brake fluid every 3 years.

NOTE:

- Inspect idle speed every 160, 000 miles (256, 000 km).
- Adjust the valves during services A, B, 0, 1, 2, 3, or 9 if they are noisy.

Number	Maintenance Sub Items
1	Rotate tires, and check tire inflation and condition
B	• Follow the pattern shown in the Owner's Manual.
2	Replace air cleaner element
B	• If the vehicle is driven primarily in dusty conditions, replace every 15, 000 miles (24, 000 km).
B	Replace dust and pollen filter
B	• Replace filter whenever airflow from the heating and air conditioning system is less than normal. • If the vehicle is driven mostly in urban areas that have high concentrations of soot in the air from industry and from diesel-powered vehicles, replace every 15, 000 miles (24, 000 km).
B	Inspect drive belt
B	• Look for cracks and damage, then check the position of drive belt auto-tensioner indicator.
3	Replace CVT fluid
B	• Driving in mountainous areas at very low vehicle speeds or trailer towing results in higher transmission temperatures. This requires transmission fluid changes more frequently than recommended by the Maintenance Minder. If the vehicle is regularly driven under these conditions, have the transmission fluid changed every 25, 000 miles (40, 000 km). • Use Honda HCF-2. **NOTE:** Using the wrong type of fluid will damage the transmission. • Capacity

Number	Maintenance Sub Items
	• • AWD models: 4.3 L (4.5 US qt) • 2WD models: 3.7 L (3.9 US qt)
4	**Replace spark plugs**
B	**Inspect valve clearance (cold)**
B	• 1.5 L engine models: • • Intake: 0.21-0.25 mm (0.009 in) • Exhaust: 0.25-0.29 mm (0.010-0.011 in) • 2.4 L engine models: • • Intake: 0.21-0.25 mm (0.009 in) • Exhaust: 0.25-0.29 mm (0.010-0.011 in)
5	**Replace engine coolant**
B	• Use Honda Long Life Antifreeze/Coolant Type 2, and if necessary add Honda Extreme Cold Weather Antifreeze/Coolant Type 2 (concentrate) as needed for prolonged cold temperatures below -22 deg.F (-30 deg.C). • 1.5 L engine models: • • Coolant capacities (including engine, heater, hoses, and expansion tank): 6.2 L (1.64 US gal) • 2.4 L engine models: • • Coolant capacities (including engine, heater, hoses, and reservoir): 6.3 L (1.66 US gal)
6	**Replace rear differential fluid** (with AWD)
B	• Honda DPSF-II • Capacity: 1.2 L (1.3 US qt)
7	**Replace brake fluid**

Number	Maintenance Sub Items
B	• Honda DOT 3 Brake Fluid: We recommend genuine Honda Brake Fluid. • Make sure the brake fluid level is between upper and lower marks on the reservoir.

(1) Beginning with 2012 models, Honda no longers indicates whether the higher-end Multi-Information Display, that was previously only installed in the Touring models, continues to be available only in Touring. If you find a non-Touring model with a Multi-Information Display (identified by the steering wheel controls), use the Touring reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 01

NOTE: **For Civic and CR-V, this procedure is for models with the Information Display. For 2013-15 Civic and CR-V models with i-MID, see PROCEDURE 11. For 2014-16 CR-V with i-MID, see PROCEDURE 12.**

1. Turn ignition switch to ON (II).
2. Press SELECT/RESET knob repeatedly until engine oil life indicator is displayed. See Fig. 3 or Fig. 4 .
3. Press SELECT/RESET knob for 10 seconds, until the Engine oil life indicator and the Maintenance item codes blink, then release the button.
4. Press SELECT/RESET knob again for 5 seconds. Maintenance items codes will disappear and engine oil life indicator will reset to 100%.

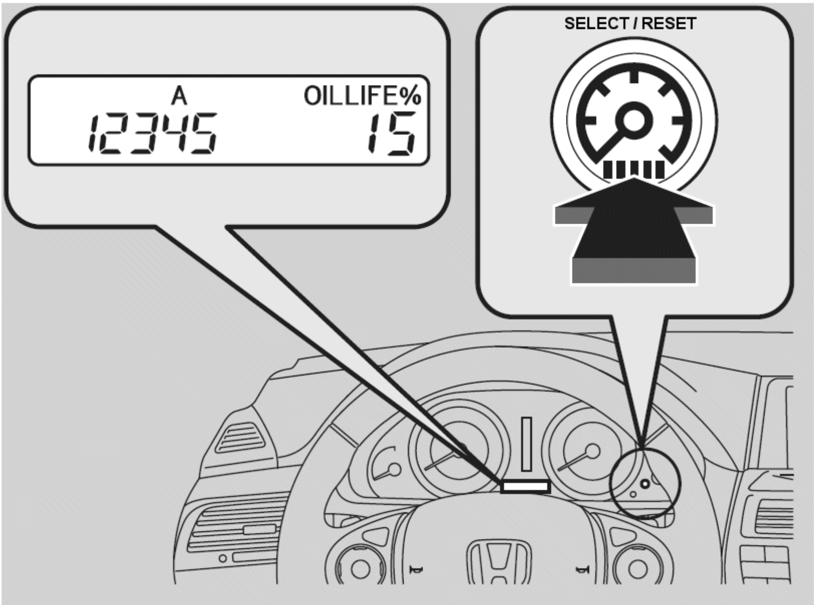

Fig. 3: Oil Life Display Controls (Maintenance Minder) - Typical Early Model Instrument Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

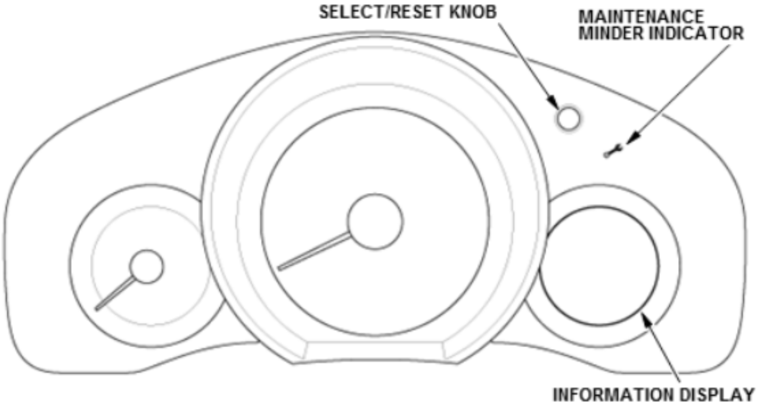

Fig. 4: Oil Life Display Controls (Maintenance Minder) - Typical Late Model Instrument Panel
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 02

NOTE:

- **The vehicle must be stopped to reset the display. If a required service is done and the display is not reset, or if the maintenance display is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**
- **The engine oil life and the maintenance items can be reset independently only with the HDS.**

1. Turn the ignition switch to ON (II).
2. Push and release the Select/Reset knob repeatedly until the engine oil life indicator is displayed.
3. Press and hold the Select/Reset knob for about 10 seconds. The information display shows the reset mode display.

NOTE: **If you are resetting the display when the engine oil life is more than 15%, make sure any maintenance items requiring service are done before resetting the display.**

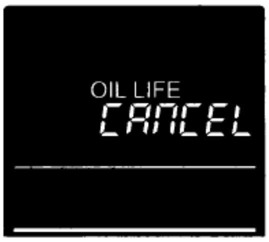

Fig. 5: Screen Display - Reset Knob Cancels
Courtesy of AMERICAN HONDA MOTOR CO., INC.

4. Twist the Select/Reset knob to select OIL LIFE, the display will begin to blink.
5. Push in on the Select/Reset knob to enter this selection, the OIL LIFE and the maintenance item codes will begin to blink.
6. Press and hold the Select/Reset knob again for about 5 seconds. The maintenance item codes will disappear, and the engine oil life will reset to 100%.

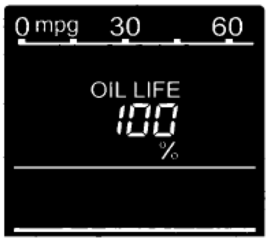

Fig. 6: Screen Display - Select/Reset Knob
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 03

NOTE:

- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the next required maintenance is needed.**
- **The engine oil life and maintenance item(s) can be independently reset with the HDS.**

1. Turn the vehicle to the ON mode.
2. Push the INFO button repeatedly until the engine oil life indicator is displayed.
3. Press and hold the SEL/RESET button for about 10 seconds. The Maintenance Reset screen appears on the multi-information display.

NOTE:

- **If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**
- **To cancel the Maintenance Reset mode, press the INFO button to select the Cancel, then press the SEL/RESET button.**

4. Press the INFO button to select Reset, then press the SEL/RESET button. The "Reset Completed" message appears. The maintenance item code(s) will disappear and the engine oil life will be reset to 100%.

Resetting Individual Maintenance Items

1. Connect the HDS.
2. Select GAUGES in the BODY ELECTRICAL with the HDS.
3. Select ADJUSTMENT in the GAUGES with the HDS.
4. Select MAINTENANCE INFORMATION in the ADJUSTMENT with the HDS.
5. Select MAINTENANCE MINDER in the MAINTENANCE INFORMATION with the HDS.
6. Select the individual maintenance item you wish to reset with the HDS.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 04

1. Turn ignition switch to ON (II) position.
2. Press SELECT button repeatedly until engine oil life display or service message is displayed.
3. Press the RESET button for about 10 seconds. A "MAINT RESET" message will appear.
4. Select appropriate answer - "MAINT RESET >N" (NO) or "MAINT RESET >Y" (YES) by pressing the select button. ">N" or ">Y" is displayed on the outside temperature display.
5. Select the "MAINT RESET >Y" (YES), and press and hold RESET button again to reset engine oil life to 100%.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 05

NOTE:

- **The vehicle must be stopped to reset the display.**
- **If a required service is done and the display is not reset, or if the maintenance display is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**
- **The engine oil life and maintenance item(s) can be reset independently only with the HDS.**

1. Turn the ignition switch to ON (II).
2. Press release the trip button repeatedly until the engine oil life indicator is displayed.
3. Press and hold the trip button for about 10 seconds.

   The engine oil life indicator and the maintenance item code(s) will blink.

NOTE: **If you are resetting the display when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**

4. Press and hold the trip button for another 5 seconds. The maintenance item cods(s) will disappear, and the engine oil life will reset to "100".

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 06

NOTE:

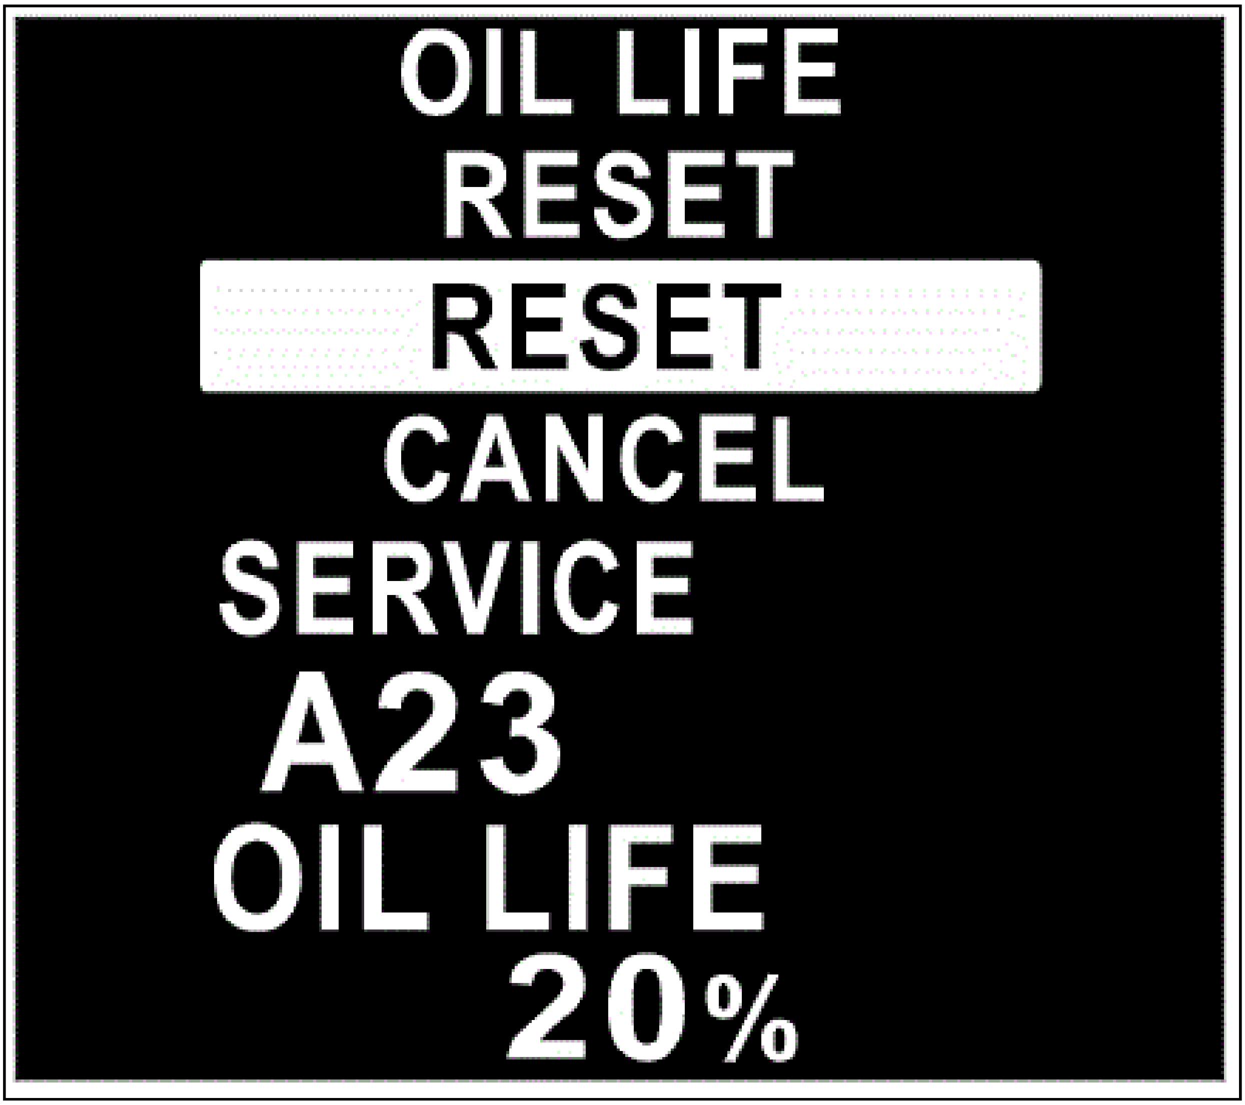
- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**

- **The engine oil life and maintenance item(s) can be independently reset with the HDS.**

1. Turn the ignition switch to ON (II).
2. If system message(s) are displayed, press the INFO button to cancel the display.
3. Push the SEL/RESET button repeatedly until the engine oil life indicator is displayed.
4. Press and hold the SEL/RESET button for about 10 seconds, the OIL LIFE RESET" mode display appears.

NOTE:

- **If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**
- **To cancel the OIL LIFE RESET" mode, press the INFO button repeatedly until the CANCEL" indicator is displayed, then press the SEL/RESET button.**



5. Press the INFO button repeatedly until the RESET" indicator is displayed, then press the SEL/RESET button. The maintenance item code(s) will disappear, and the engine oil life will reset to 100 %."

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 07

NOTE: **Use this procedure if the vehicle IS NOT equipped with Navigation System.**

1. Turn ignition switch to ON (II) position.
2. Press the SELECT button repeatedly until the engine oil life is displayed.
3. Press the TRIP/RESET button for about 10 seconds. The engine oil life and the maintenance item codes will blink.
4. Press the TRIP/RESET button again for 5 seconds. The maintenance item codes will disappear, and the engine oil life will reset to 100%.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 08

NOTE: **Use this procedure if the vehicle IS equipped with Navigation System.**

1. Turn ignition switch to ON (II) position.
2. Press the SEL/RESET button on the dashboard until you see the engine oil life display.
3. Press and hold the SEL/RESET button for 10 seconds. The multi-information display will ask for a confirmation.
    - If you are sure you want to reset the display, press SEL/RESET button to select OK.
    - If you do not want to reset the display, press the INFO (ARROW) button to select CANCEL.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 09

1. Turn the ignition switch to ON (II).

    NOTE: **If system messages are displayed, press the INFO button to cancel the display.**

2. Push the ARROW buttons repeatedly until the engine oil life indicator is displayed. See Fig. 8.
3. Select RESET with the ARROW buttons
4. Press the SEL/RESET button for 10 seconds. The service code will disappear and the engine oil life display will return to 100%.
5. To cancel the oil life reset mode, select CANCEL, then press the SEL/RESET button.

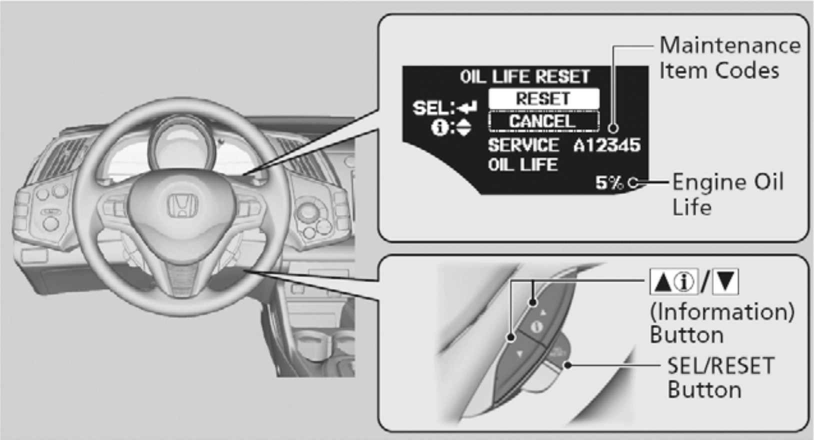

Fig. 8: Resetting Oil Life Display (Maintenance Minder) - Typical
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 10

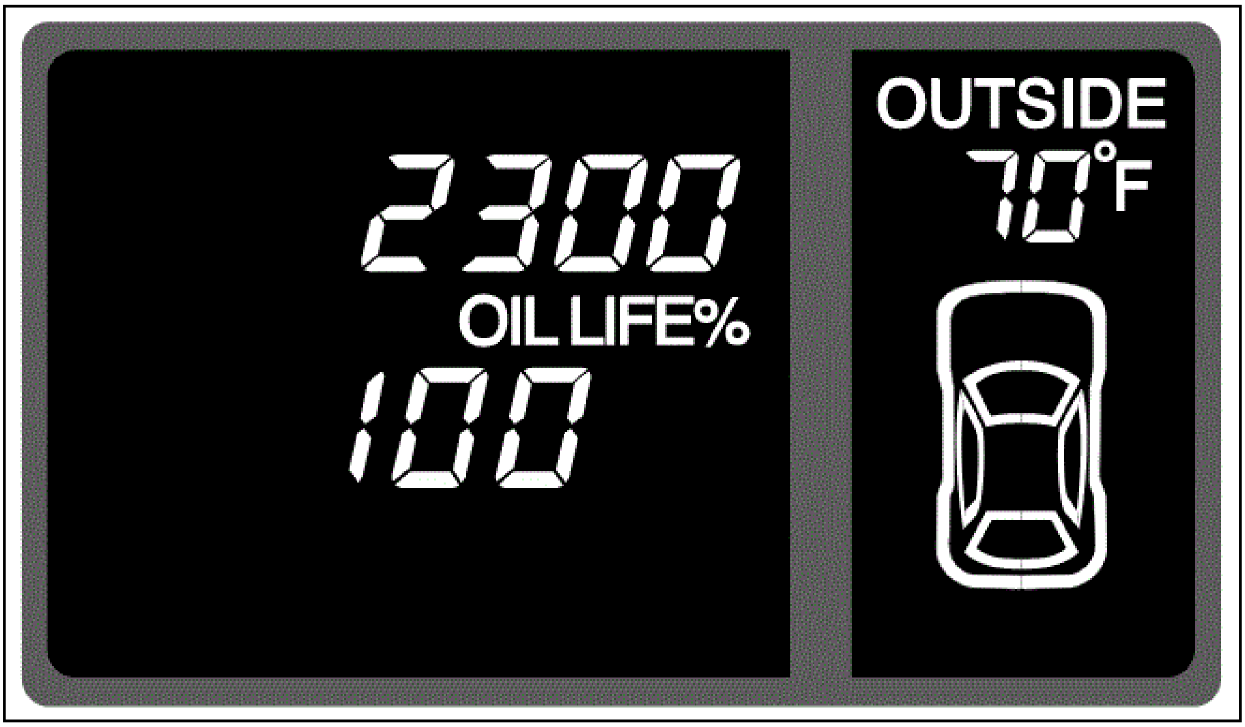
NOTE:

- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**
- **The engine oil life and the maintenance item(s) can be independently reset with the HDS.**

1. Turn the ignition switch to ON (II).
2. Push the SEL/RESET knob repeatedly until the engine oil life indicator is displayed.
3. Press and hold the SEL/RESET knob for about 10 seconds. The engine oil life indicator and the maintenance item code(s) will be blink, then release the knob.

    NOTE: **If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**

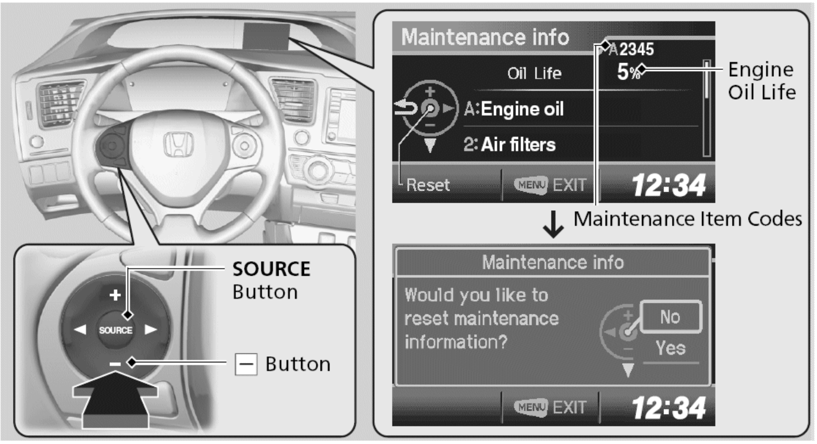
4. Push the SEL/RESET knob to select OIL LIFE, the display will begin to blink.
5. Push in on the SEL/RESET knob to enter this selection, the OIL LIFE and the maintenance item code(s) will begin to blink.
6. Press and hold the SEL/RESET knob for another 5 seconds. The maintenance item code(s) will disappear, and the engine oil life will reset to 100."



ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 11

Maintenance Minder messages begin appearing on the i-MID when engine oil life is less than 15%. The system message indicator comes on along with the Maintenance Minder message.

1. Turn the ignition switch to ON (II).
2. Press the MENU button to go to VEHICLE INFORMATION. See Fig. 9.
3. Select VEHICLE INFORMATION with the PLUS (+) button, then press the SOURCE button.
4. Press the SOURCE button again to go to the MAINTENANCE INFO screen. The engine oil life appears on the i-MID.
5. Select YES with the MINUS (-) button, then press the SOURCE button. The displayed maintenance items disappear, and the engine oil life display returns to 100%. Any maintenance items that are necessary for this vehicle at the next maintenance service will appear.
6. To cancel the oil life reset mode, select No, then press the SOURCE button.



Would you like to reset maintenance information?

Fig. 9: Resetting Oil Life Display (Maintenance Minder)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 12

1. Set the power mode to ON.
2. Press ARROWS button (right side of steering wheel) to select VEHICLE SETTINGS, then press the SEL/RESET button.
3. Press ARROWS button until MAINTENANCE MINDER RESET appears on the display.
4. Press the SEL/RESET button. The MAINTENANCE MINDER reset mode is displayed on the multi-information display.
5.
    - **To Reset All Due Items At Once** : Select ALL DUE ITEMS with the ARROWS button, then press the SEL/RESET button. The displayed maintenance items disappear.
    - **To Reset Each Item Separately** : Select ITEM # ONLY with the ARROWS button, then press the SEL/RESET button. The displayed maintenance item (i.e. #) disappears.

NOTE: **To cancel the Maintenance Minder reset mode, select CANCEL, then press the SEL/ RESET button.**

You can also reset the Maintenance Minder display using the audio/information screen. With the power mode in ON, press the SETTINGS button. Rotate to select: Vehicle Settings > Maintenance Info. > Maintenance Minder Reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 13

1. Turn the ignition switch to ON (II).

   NOTE: **Models with the smart entry system have an ENGINE START/STOP button instead of an ignition switch.**

2. Press the DISPLAY/INFORMATION button repeatedly until the Wrench Icon appears. See Fig. 10.
3. Press the ENTER button.
4. Press and hold the ENTER button for about 10 seconds to enter the reset mode.
5. Press the UP/DOWN ARROW buttons to select a maintenance item to reset, or to select ALL DUE ITEMS (You can also select CANCEL to end the process).
6. Press the ENTER button to reset the selected item.

NOTE: **Repeat from step 4 for any other items needing to be reset.**

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 15

NOTE: **This procedure is for vehicles with the Multi-Information Display.**

NOTE: **The engine oil life and maintenance item(s) can also be independently reset with an appropriate scan tool. See ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20.**

1. Turn ignition switch to ON (II).

   NOTE: **Models with the smart entry system have an ENGINE START/STOP button instead of an ignition switch.**

2. If system messages are displayed, press the INFO button to cancel the display.
3. Display the engine oil life by repeatedly pressing the SEL/RESET button. See Fig. 12.
4. Press and hold the SEL/RESET button for 10 seconds or more. The oil life reset mode is displayed on the multi-information display.
5. Select RESET with the INFORMATION button, then press the SEL/RESET button. The service code will disappear and the engine oil life display will return to 100%.
6. To cancel the oil life reset mode, select CANCEL, then press the SEL/RESET button.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 16

NOTE:

- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the next required maintenance is needed.**

1. Turn ignition switch to ON (II).

   NOTE: **Models with the smart entry system have an ENGINE START/STOP button instead of an ignition switch.**

2. In the Multi-Information Display (MID), go to the Maintenance Info. group. > Customized Features.
3. Press and hold the RESET button. The oil life reset mode is displayed on the MID. See Fig. 13.
4. Select Reset with the INFORMATION button, then push the RESET button. The displayed maintenance items disappear, and the engine oil life display returns to 100%.
5. To cancel the oil life reset mode, select CANCEL, then press the RESET button.

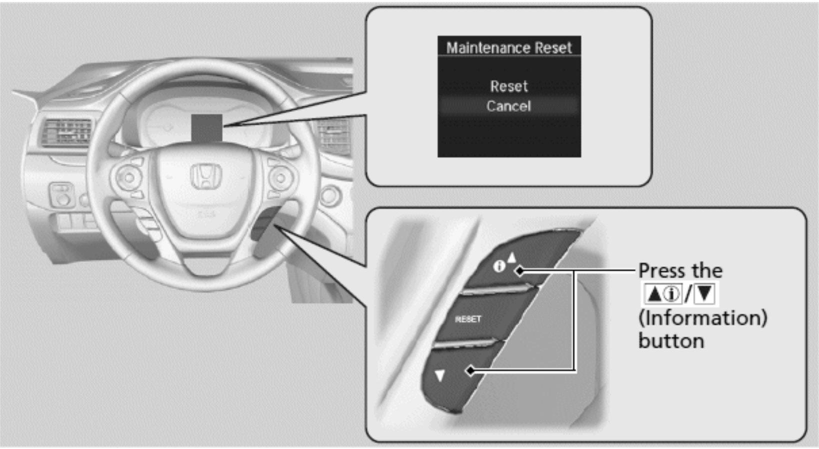

Fig. 13: Resetting Oil Life Display (Maintenance Minder)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 17

NOTE: **The engine oil life and maintenance item(s) can also be independently reset with an appropriate scan tool. See ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20.**

NOTE: **There are three ways to reset the engine oil life, by using the infromation display select/reset knob, with the audio/information screen, or with the multi-information display screen.**

NOTE: **The engine oil life and maintenance items can be independently reset with an OEM scan tool.**

Information Display Select/Reset Knob Method

1. Turn ignition switch to ON (II).
2. Press SELECT/RESET knob (right side of instrument cluster) repeatedly until engine oil life indicator is displayed.
3. Press SELECT/RESET knob for 10 seconds. Engine oil life indicator and the maintenance item codes will blink.
4. Press SELECT/RESET knob again for 5 seconds. Maintenance items codes will disappear and engine oil life indicator will reset to "100%"

Multi-Information Display Screen Method

1. Press the engine start/stop button to select the ON mode.
2. Press INFO button (right-side steering wheel controls) to select VEHICLE SETTINGS, then press the SEL/RESET button.
3. Press the INFO button until MAINTENANCE RESET appears on the display, then press the SEL/RESET button. The oil life reset mode is displayed on the multi-information display.

   NOTE: **To cancel the oil life mode, press the INFO button to select CANCEL, then press the SEL/RESET button.**

4. Press the INFO button to select RESET, then press the SEL/RESET button. The maintenance item codes will disappear, and the engine oil life will reset to 100%.

Audio/Infomation Screen Method

1. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode
2. Press the SETTINGS button, then rotate the Selector Knob to select vehicle settings, then select maintence items.
3. Follow the screen prompts to reset the engine oil life.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 18

NOTE: **The engine oil life and maintenance item(s) can also be independently reset with an appropriate scan tool. See ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20.**

NOTE: **You can reset all maintenance items by batch, or you can select and reset each maintenance item individually on the display.**

NOTE: **The engine oil life and maintenance items can be independently reset with the HDS.**

With Information Display

1. Turn the ignition switch to the ON (II) position.
2. Press the SELECT/RESET knob (on instrument cluster - right side) repeatedly until the engine oil life is displayed
3. Press and hold the SELECT/RESET knob for about 10 seconds. The engine oil life and the maintenance item codes will blink to show it is in reset mode.
4. If you wish to reset all the maintenance items shown on the display, press and hold the SEL/RESET knob for 5 seconds or more. If you reset each maintenance item individually, select an item (complete list of maintenance main items and sub items) you wish to reset by rotating the SEL/RESET knob, and press and hold the knob for 5 seconds or more.
5. The maintenance item codes will disappear and the engine oil life will reset to 100%.

With Multi-Information Display

1. Turn the vehicle to the ON mode.
2. If system messages are displayed, press the INFOMATION switch (see Fig. 14) or Audio Remote/Multi-Information Display Switch to cancel the display until the MAINTENANCE MINDER icon is displayed, then press the SOURCE/ENTER button.
3. Display shows the remaining engine oil life, and then press and hold the SOURCE/ENTER button for 10 seconds or more. The MAINTENANCE RESET mode appears on the multi-information display.

   NOTE: **To cancel the MAINTENANCE RESET mode, press the Audio Remote/Multi-Information Display Switch to select CANCEL, then press the SOURCE/ENTER button.**

4. If you wish to reset all the maintenance items shown on the display, select "All Due Items" by pressing the Audio Remote/Multi-Information Display Switch and press the SOURCE/ENTER button. If you reset each maintenance item individually, select an item (complete list of maintenance main items and sub items) you wish to reset by pressing the Audio Remote/Multi-Information Display Switch and press the SOURCE/ENTER button.
5. The maintenance item codes will disappear, and the engine oil life will reset to 100%.

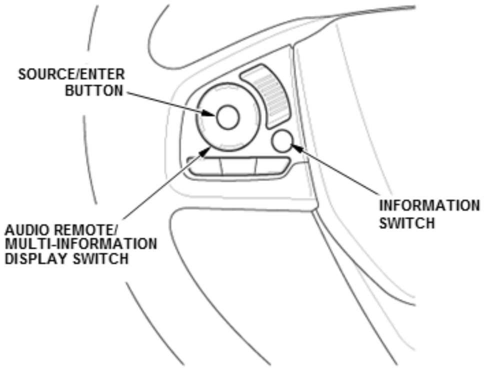

Fig. 14: Resetting Oil Life Display (Steering Wheel Controls)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 19

NOTE: **The engine oil life and maintenance item(s) can also be independently reset with an appropriate scan tool. See ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20.**

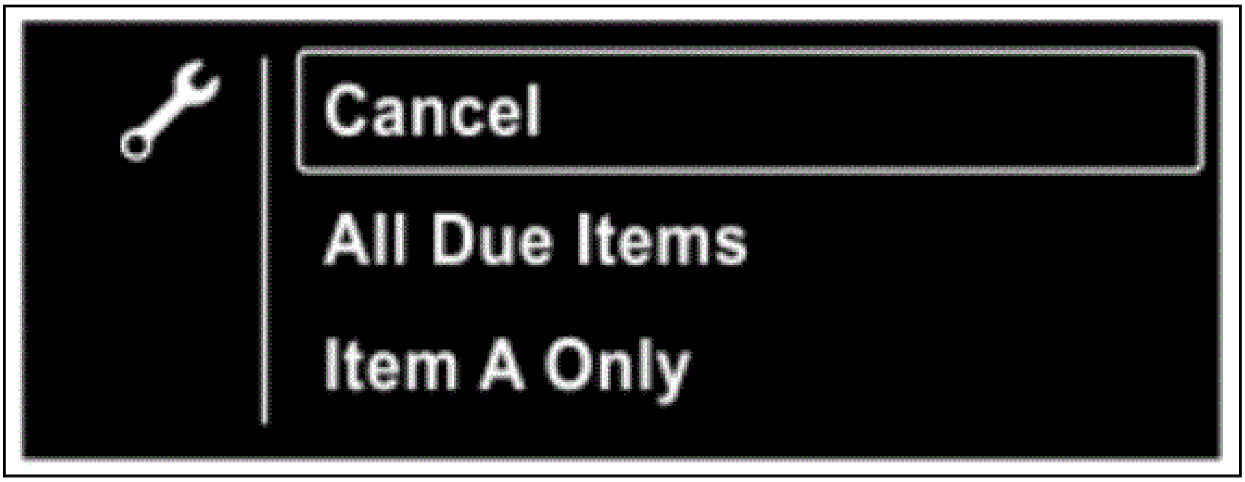
NOTE:

- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**
- **You can reset all maintenance items by batch, or you can select and reset each maintenance item individually on the display.**
- **The engine oil life and maintenance item(s) can be independently reset with the HDS.**

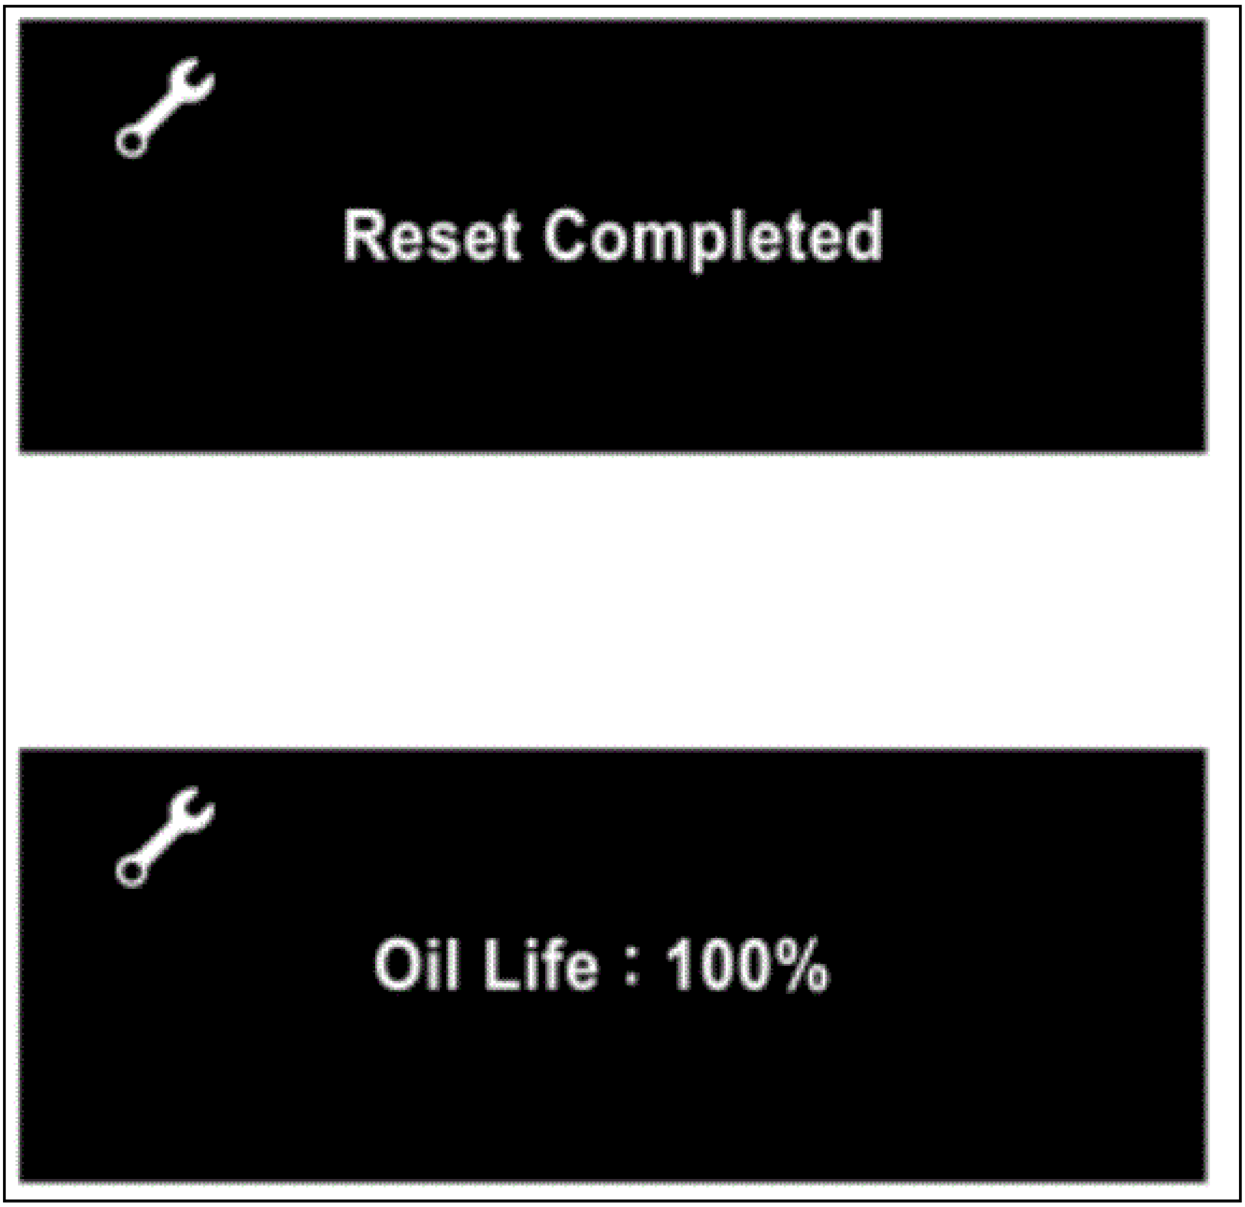
1. Turn the vehicle to the ON mode.
2. Press the HOME button and select "Maintenance" application by pushing repeatedly the Audio Remote/Multi-Information Display switch. Press and hold the ENTER button more than 10 seconds, and then display will change to Maintenance mode. Select "Oil Life" by pushing the Audio Remote/Multi-Information Display switch and press and hold the ENTER button more than 10 seconds to show the reset mode.
3. If you reset all the maintenance items shown on the display, select "All Due Items" by pressing the Audio Remote/Multi-Information Display switch and press the ENTER button. If you reset each maintenance item individually, select an item (complete list of maintenance main item(s) and sub item(s)) you wish to reset by pressing the Audio Remote/Multi-Information Display switch and press the ENTER button.

   NOTE:

   - **If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**
   - **To cancel the reset mode, select "Cancel," then push the ENTER button.**



4. "Reset Completed" appears on the display and maintenance item code(s) will disappear. The engine oil life will reset to "100 %."



Reset Completed

Oil Life : 100%

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20

NOTE: **The engine oil life and maintenance item(s) can be independently reset with an appropriate scan tool. Follow procedure below.**

1. Connect the Honda Diagnostic System (HDS) to the data link connector (DLC).
2. Turn the vehicle to the ON mode.
3. Make sure the HDS communicates with the vehicle and the powertrain control module (PCM). If it doesn't communicate, troubleshoot the DLC circuit.
4. Select GAUGES in BODY ELECTRICAL with the HDS.
5. Select ADJUSTMENT in GAUGES.
6. Select MAINTENANCE INFORMATION in ADJUSTMENT.
7. Select MAINTENANCE MINDER in MAINTENANCE INFORMATION.
8. Select the individual maintenance item you wish to reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 21

NOTE: **The engine oil life and maintenance item(s) can also be independently reset with an appropriate scan tool. See Engine Oil Replacement Reminder Reset - Procedure 20.**

NOTE:

- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**

1. With the vehicle stationary and the power mode ON, press the INFO button and then select the smart maintenance icon (wrench icon) using the right/left buttons. See Fig. 15.
2. After the smart maintenance screen is shown, press and hold the ENTER button for 10 seconds. The reset mode screen will appear.
3. Select the item you want to reset by pressing the up/down buttons, and then press the ENTER button. There are "All Due Items", "Item 1 only", "Item 2 only", and so on.

NOTE:

- **If you are resetting the Maintenance Minder, make sure that any maintenance items to service are done.**
- **To cancel the "Maintenance Reset" mode, press the up/down buttons to select the "Cancel," and then press the ENTER button.**

4. The "Reset Completed" message will appear. The maintenance items are reset and the maintenance item code(s) will disappear.

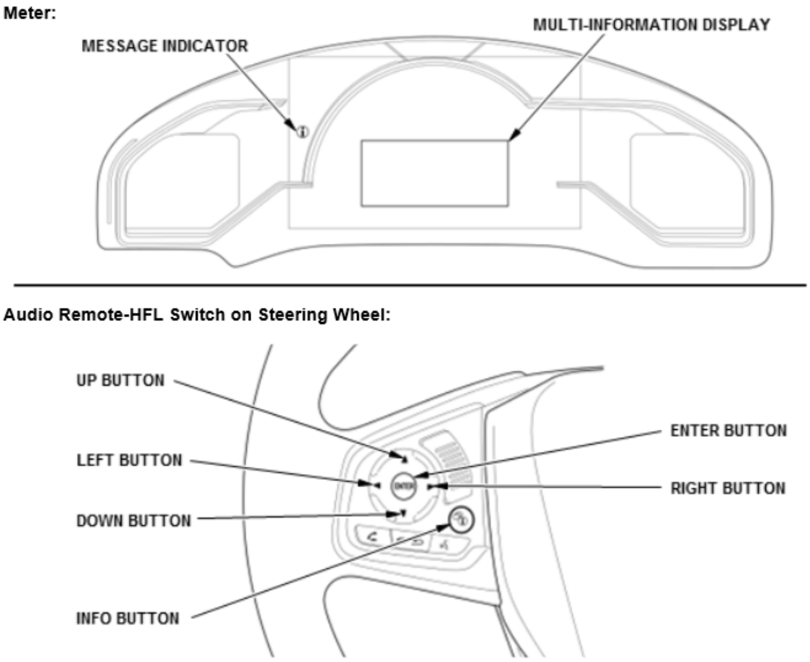


Fig. 15: Identifying Information Display And Steering Wheel Controls
Courtesy of AMERICAN HONDA MOTOR CO., INC.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 22

NOTE: **The engine oil life and maintenance item(s) can also be independently reset with an appropriate scan tool. See ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20.**

NOTE:

- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**
- **You can reset all maintenance items by batch, or you can select and reset each maintenance item individually on the display.**
- **The engine oil life and maintenance item(s) can be independently reset with the HDS.**

1. Turn the vehicle to the ON mode.
2. Press the HOME button and select "Maintenance" application by pushing repeatedly the Audio Remote/Multi-Information Display switch. See Fig. 16. Press and hold the ENTER button more than 10 seconds, and then display will change to Maintenance mode. Select "Oil Life" by pushing the Audio Remote/Multi-Information Display switch and press and hold the ENTER button more than 10 seconds to show the reset mode.
3. If you wish to reset all the maintenance items shown on the display, select "All Due Items" by pressing the Audio Remote/Multi-Information Display switch and press the ENTER button. If you reset each maintenance item individually, select an item (complete list of maintenance main item(s) and sub item(s)) you wish to reset by pressing the Audio Remote/Multi-Information Display switch and press the ENTER button.

NOTE:

- **If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**
- **To cancel the reset mode, select "Cancel," then push the ENTER button.**

4. "Reset Completed" appears on the display and maintenance item code(s) will disappear. The engine oil life will reset to "100 %."

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 23

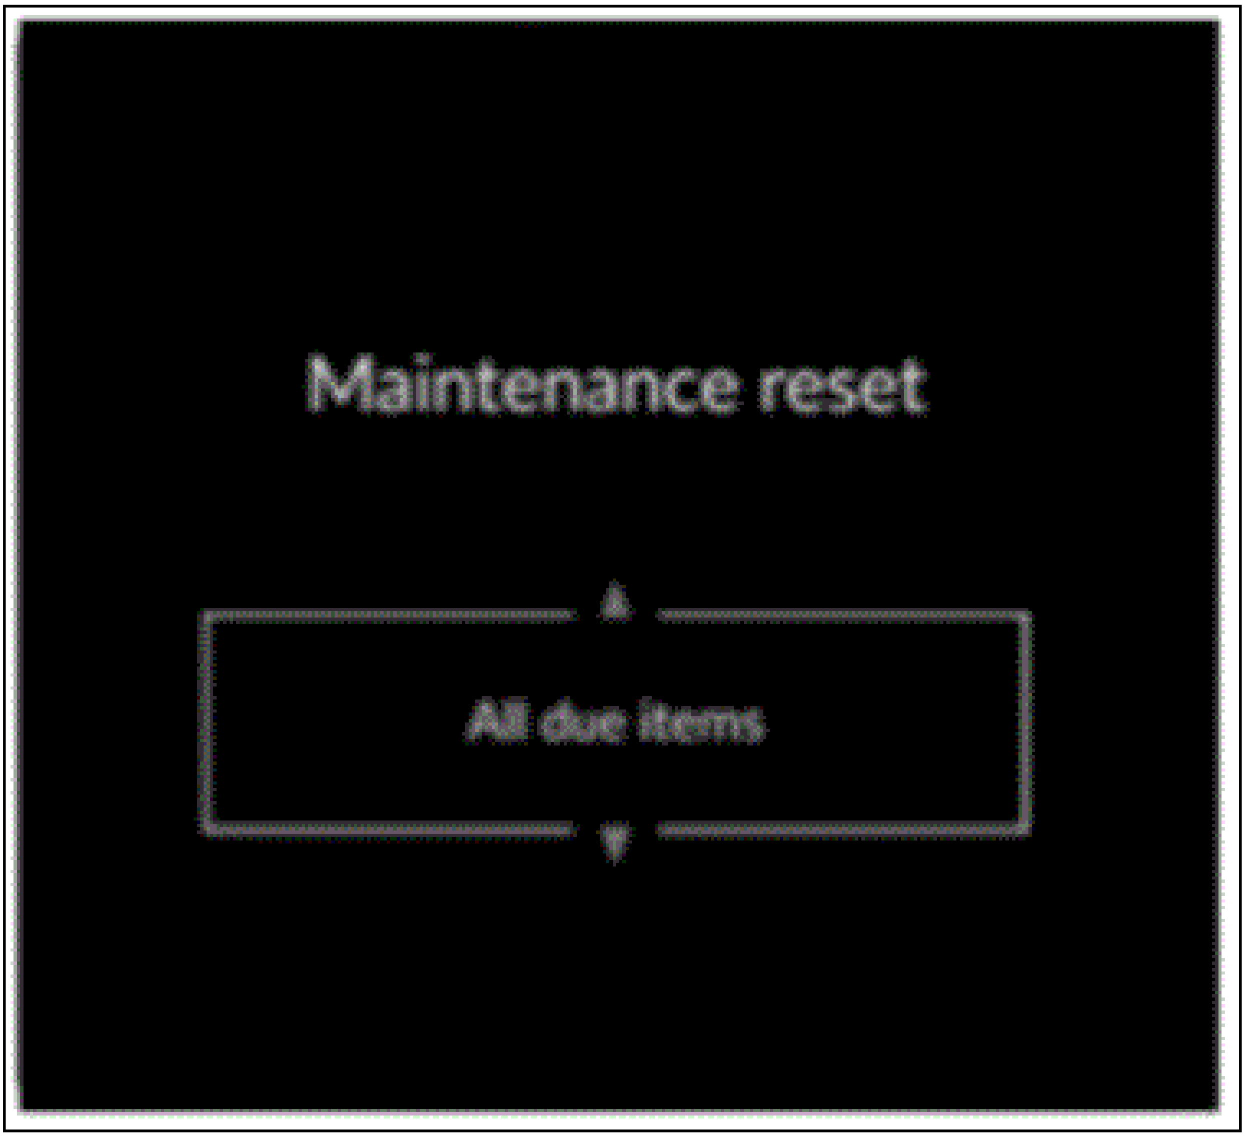
NOTE:

- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**
- **You can reset all maintenance items by batch, or you can select and reset each maintenance item individually on the display.**

1. Turn the vehicle to the ON mode.
2. Refer to the "How to access the current engine oil life," display the engine oil life on the multi-information display.
3. Press and hold the multi-function steering wheel controller for 10 seconds or more to show the reset mode.
4. If you reset all the maintenance items shown on the display "A23 (for example)", select "All due items" by rolling the multi-function steering wheel controller and press it. If you reset each maintenance item individually, select an item (complete list of maintenance main item(s) and sub item(s)) you wish to reset by rolling the multi-function steering wheel controller and press it.

   NOTE:

   - **If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**
   - **To cancel the reset mode, toggle the multi-function steering wheel controller to the left.**



5. "Reset completed" appears on the display and maintenance item code(s) will disappear. The engine oil life will reset to "100 %."

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 24

NOTE:

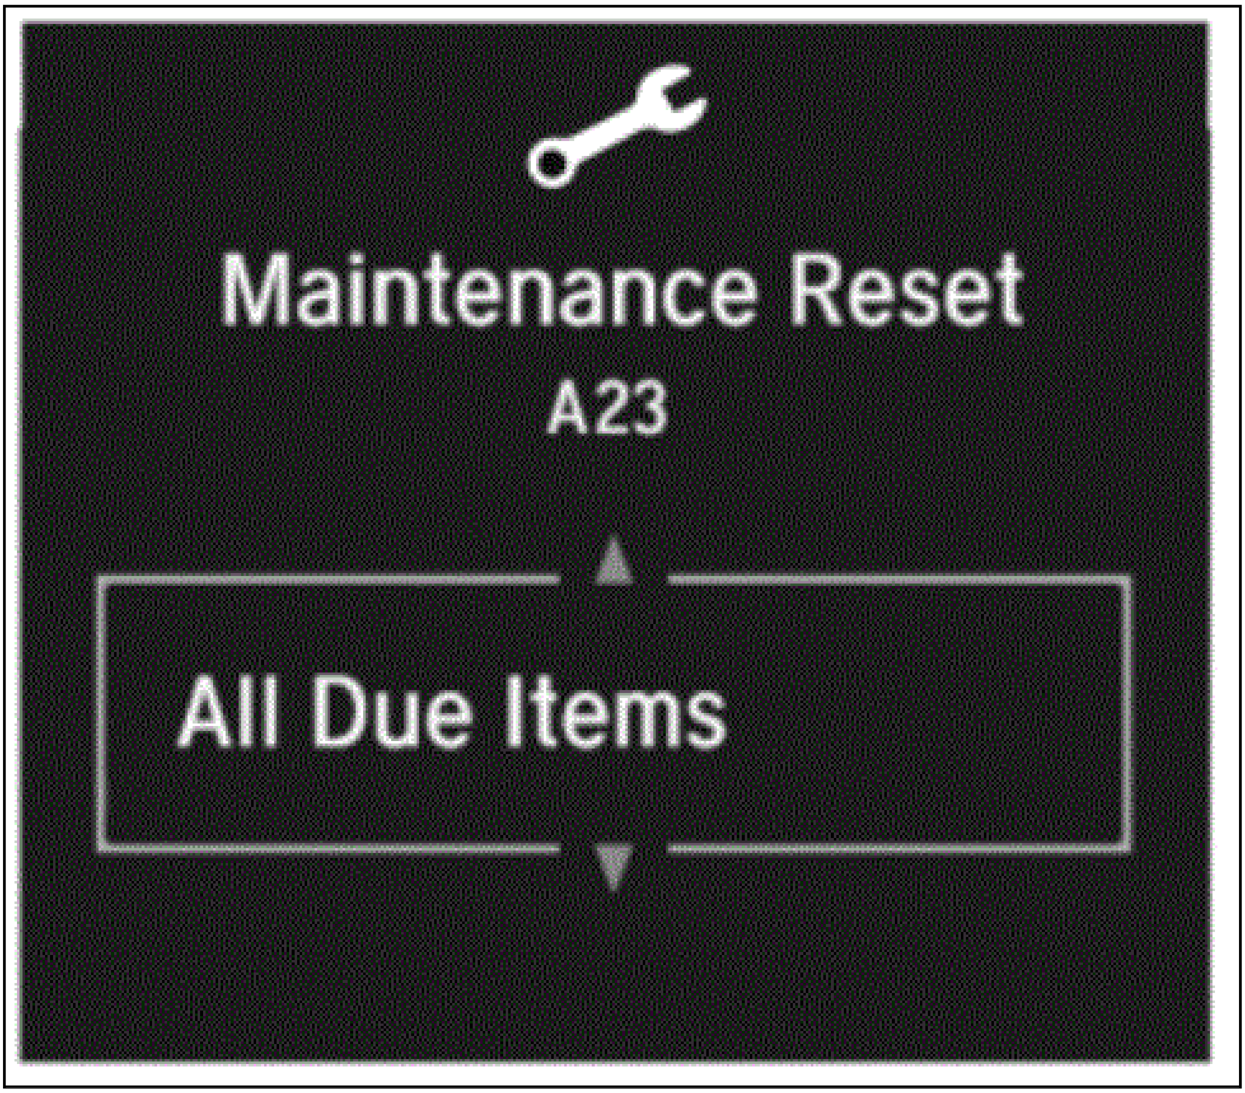
- **The vehicle must be stopped to reset the Maintenance Minder.**
- **If a required service is done and the Maintenance Minder is not reset, or if the Maintenance Minder is reset without doing the service, the system will not show the proper maintenance timing. This can lead to serious mechanical problems because there will be no accurate record of when the required maintenance is needed.**
- **You can reset all maintenance items by batch, or you can select and reset each maintenance item individually on the display.**
- **The engine oil life and maintenance item(s) can be independently reset with the HDS.**

1. Turn the vehicle to the ON mode.
2. If system message(s) are displayed to the multi-Information display, press the Left Selector Wheel to cancel the display. Press the HOME button, then select the "Maintenance" by rolling the Left Selector Wheel, and press that wheel.
3. Display shows the remaining engine oil life, and then press the Left Selector Wheel for 10 seconds or more. The "Maintenance Reset" mode appears on the multi-information display.

   NOTE:

   - **If you are resetting the Maintenance Minder when the engine oil life is more than 15 %, make sure any maintenance item(s) requiring service are done before resetting the display.**
   - **To cancel the "Maintenance Reset" mode, rolling the Left Selector Wheel to select the "Cancel", and press that wheel.**

4. If you reset all the maintenance items shown on the display "A23 (for example)", select "All Due Items" by rolling the Left Selector Wheel, and press that wheel. If you reset each maintenance item individually, select an item (complete list of maintenance main item(s) and sub item(s)) you wish to reset by rolling the Left Selector Wheel, and press that wheel.



Maintenance Reset

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 01

1. At each 7500 mile service interval, the MAINTENANCE REQUIRED light will change from Green to Yellow. If service is not performed (and light is not reset), the MAINTENANCE REQUIRED light will change from Yellow to Red.
2. When service has been completed, reset MAINTENANCE REQUIRED reminder light. To reset reminder light, turn ignition off. Insert ignition key in slot provided to the right of tachometer (or beside the indicator). See Fig. 17.

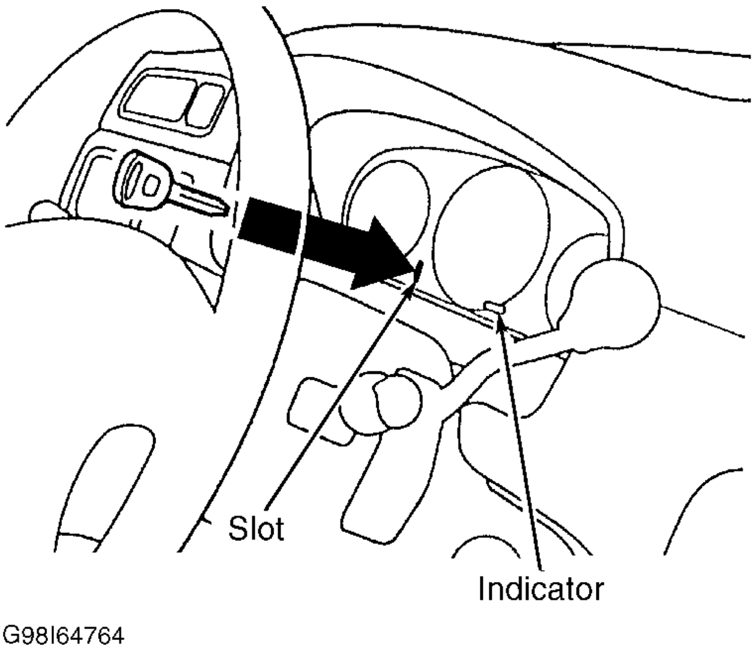

Fig. 17: Maintenance Reminder Light Reset
Courtesy of AMERICAN HONDA MOTOR CO., INC.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 02

To reset MAINT REQ'D indicator light, turn ignition switch to OFF position. Push and hold the SELECT/RESET button and turn ignition switch to ON (II) position. Continue to hold button for more than 10 seconds or until MAINT REQ'D light goes out.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 03

1. For the first 8000 miles after maintenance required indicator is reset, the MAINT REQ'D indicator light illuminates when the ignition is turned on, then will go out after 2 seconds. When mileage is 8000-10, 000 miles, the MAINT REQ'D reminder light will illuminate for 2 seconds, then blink for 10 seconds, and

then go out. When mileage exceeds 10, 000 miles, MAINT REQ'D indicator light illuminates and stays on while ignition switch is in ON (II) position.

2. To reset the MAINT REQ'D indicator light, turn ignition switch to OFF position. Press and hold the SELECT/RESET button. While still holding button, turn ignition switch to ON position, with engine off. Hold SELECT/RESET button for about 10 seconds until indicator resets.
3. If MAINT REQ'D reminder light does not reset, ensure headlights, parking lights, or both are turned off when resetting reminder light. The MAINT REQ'D indicator cannot be reset if any of these lights are on. If vehicle is equipped with daytime running lights and lights come on when ignition switch is turned to ON (II) position, daytime running lights must be disabled before indicator light can be reset.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 04

1. When distance driven since maintenance required indicator was reset is 6000 miles, the MAINT REQ'D reminder light will start to blink. After exceeding 7500 miles without having scheduled maintenance performed and MAINT REQ'D reminder light reset, light will remain on until it is reset.
2. To reset the light, turn ignition switch to OFF position. Press and hold TRIP button, located on lower right side of instrument cluster. While still holding TRIP button, turn ignition switch to ON position with engine off. Hold button for about 10 seconds until indicator resets.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 05

Oil, filter and service interval indicator flags/lights activate every 7500 miles. To reset indicators, insert ignition key into appropriate slot below glowing indicator flags/lights at lower right corner of instrument cluster. Push key in until reminder window changes from Red to Green.

Model & Year	Reset Procedure
(1) There are no TPMS reset procedures required for these models. Ensure tires are inflated to recommend pressure. Tire pressure sensor IDs need to be memorized if new sensor or TPMS control unit is installed.	
(2) This vehicle is equipped with an Indirect TPMS that does not use tire-mounted pressure sensors.	

TPMS REMINDER RESET - PROCEDURE 01

NOTE: **There is no TPMS reset procedure when re-inflating tires to the correct specification. Ensure tires are inflated to recommend pressure, and the TPMS indicator will go out shortly.**

NOTE: **If a flat tire is replaced with the spare tire, and the flat tire is stored in the cargo area, the low pressure indicator will stay on but the appropriate tire indicator will go off. This prevents the customer from thinking there is a problem with the spare tire. When the flat tire is taken out of the vehicle for repair, the TPMS indicator will come on because the system is no longer receiving the signal from the tire's transmitter.**

All four tire pressure sensor IDs must be memorized to the TPMS control unit whenever you do any of these actions:

- Replace the TPMS control unit.
- Replace the tire pressure sensor
- Substitute a known-good wheel with tire pressure sensor

When doing a tire rotation, memorizing the sensors in not needed.

Memorizing The Tire Pressure Sensor IDs

NOTE: **For vehicles that use this procedure, a tire pressure sensor activation tool is needed. As early as 2007 Honda started requiring the use, on some models, of the TPMS Sensor Activation Tool ATEQ VT55 instead of the standard Sensor Initializer Tool AKS0620006 or Sensor Activation Tool Bartec Wheelrite Tech 300-J-48714. Honda is not entirely clear on which models the VT55 only can be used. The models listed below have ID memorizing procedures that name the VT55 only. The procedures for all other models name the VT55 and one of the older type activation tools, or just an older activation tool. The VT55 can be used on all models with initiator-less TPM Systems.**

- **Crosstour, CR-V (2007-12), CR-Z, Fit (2009 & later): Only use the TPMS Sensor Activation Tool ATEQ VT55**
- **All Other Models: Can use either TPMS Sensor Initializer Tool AKS0620006 or TPMS Sensor Activation Tool Bartec Wheelrite Tech 300-J-48714**

NOTE: **To ensure the control unit memorizes the correct ID, the vehicle with the new sensor must be at least 10 ft (3 m) away from other vehicles that have tire pressure sensors.**

1. With the ignition switch in LOCK (0), connect the HDS to the data link connector (DLC) located under the driver's side of the dashboard.
2. Turn the ignition switch to ON (II)
3. Make sure the HDS communicates with the vehicle and the TPMS control unit. If it doesn't, troubleshoot the DLC circuit.
4. Select Sensor ID Learning from the mode menu on the HDS.
5. Follow HDS screen prompts to turn on the TPMS sensor initializer tool.

   NOTE: **On the TPMS Sensor Initializer Tool (AKS0620006), verify that the power switch (B) is in the "Low" position. See Fig. 18. If the power switch is in the "High" position, more than one sensor or sensors on other vehicles may be activated. Make sure the power switch is in the "Low" position.**

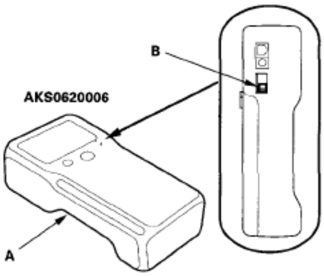

Fig. 18: Identifying TPMS Sensor Initializer Tool (AKS0620006) & Power Switch
Courtesy of AMERICAN HONDA MOTOR CO., INC.

6. Hold the TPMS sensor initializer tool near one wheel, memorize the pressure sensor ID by following the screen prompts on the HDS. See Fig. 19.

   NOTE:
   - **If you turn the ignition switch to LOCK (0) before memorizing all four sensor IDs, the memorizing ID is cancelled.**
   - **If more than one sensor ID is displayed on the HDS, verify that the power switch is in the "LOW" position, the vehicle has not been driven for 5 minutes, and there are no other vehicles within 10 ft (3 m).**
   - **See the HDS Help menu for specific instructions.**

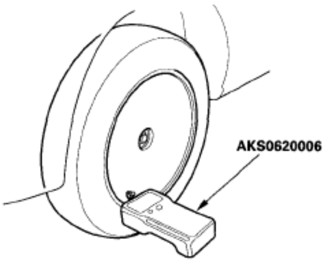

Fig. 19: Identifying TPMS Sensor Initializer Tool (AKS0620006) On Wheel (ATEQ VT55 & Tech 300-J-48714 Are Similar)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

7. Repeat step 6 for each wheel until all four sensor IDs are memorized. When all four IDs are memorized, the low tire pressure indicator blinks
8. Turn the ignition switch to LOCK (0).
9. Disconnect the HDS from the DLC.
10. Test-drive the vehicle at 28 mph (45 km/h) or more for at least 1 minute.
11. Make sure the low tire pressure indicator does not blink.
12. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb sticker.

TPMS REMINDER RESET - PROCEDURE 02

NOTE: **When a tire pressure sensor is replaced, the sensor ID must be memorized by the TPMS control unit.**

NOTE: **If a flat tire is replaced with the spare tire, and the flat tire is stored in the cargo area, the low pressure indicator will stay on but the appropriate tire indicator will go off. This prevents the customer from thinking there is a problem with the spare tire. When the flat tire is taken out of the vehicle for repair, the TPMS indicator will come on because the system is no longer receiving the signal from the tire's transmitter.**

Memorizing a Sensor ID Automatically

After rotating the tires or replacing a tire pressure sensor, drive the vehicle for at least 40 seconds at a speed of 15 mph (24 km/h) or more, and all the sensor IDs will be memorized automatically.

NOTE: **When replacing the TPMS control unit, use the HDS to memorize IDs. After the IDs are memorized, reduce the pressure in all four tires to less than the appropriate specification, and check to see that the four tire indicators come on.**

Memorizing a Sensor ID with the HDS

NOTE: **To ensure the control unit memorizes the correct ID, the vehicle with the new sensor must be at least 3 m (10 ft) from any other TPMS pressure sensor not installed on that vehicle.**

The HDS can memorize the ID of a new tire pressure sensor or a previously memorized ID.

1. With the ignition switch OFF, connect the HDS to the data link connector (DLC) located under the left side of the dashboard.
2. Turn the ignition switch ON (II), and memorize the ID of the tire pressure sensor by following the screen prompts on the HDS.

   NOTE:
   - **See the HDS Help menu for specific instructions.**
   - **When replacing the TPMS control unit, use the HDS to memorize IDs.**
   - **After the IDs are memorized, reduce the pressure in all four tires to less than the appropriate specification, and check to see that the four tire indicators come on.an indirect TPMS that doesnt use tire pressure sensors mounted inside the tires. It uses the existing VSA wheel speed sensors to monitor and compare tire characteristics while driving.**

3. Turn the vehicle to the OFF (LOCK) mode.

TPMS REMINDER RESET - PROCEDURE 03

This vehicle is equipped with an indirect TPMS that doesn't use tire pressure sensors mounted inside the tires. It uses the existing VSA wheel speed sensors to monitor and compare tire characteristics while driving.

TPMS calibration is required after performing any of the following actions:

- Adjusting tire pressures
- Rotating the tires
- Replacing the tires
- Updating/replacing the VSA modulator-control unit

Calibration begins when TPMS switch is pressed or Calibration is selected through the Multi-information display (MID). The process finishes automatically as the customer drives the vehicle. This takes about 30 minutes of cumulative driving at 30 to 60 mph.

Calibration - Models With TPMS Switch

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label. Vehicle must be stopped with the transmission in neutral (M/T) or P or N (A/T, CVT).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Press the TPMS switch (lower dash, left of steering wheel) for 3 seconds.
4. When the calibration successfully begins, the TPMS indicator (instrument cluster, center left) blinks twice.
5. Calibration is completed after driving 31 to 62 mph (50 to 100 km/h), steadily without much acceleration or deceleration for about 30 minutes.

Calibration - Models Without TPMS Switch

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label. Vehicle must be stopped with the transmission in neutral (M/T) or P or N (A/T, CVT).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Use ARROW buttons (right side of steering wheel) to select VEHICLE SETTINGS, then press the SEL/RESET button. TPMS CALIBRATION appears on the display.
4. Press the SEL/RESET button. The display switches to the customization setup screen, where you can select CANCEL or CALIBRATE.
5. Use ARROW buttons to select CALIBRATE, then press the SEL/RESET button. CALIBRATION STARTED screen appears, then the display returns to the customization menu screen

   NOTE: **If the CALIBRATION FAILED TO START message appears, repeat steps 4 and 5.**

6. Calibration is completed after driving 31 to 62 mph (50 to 100 km/h), steadily without much acceleration or deceleration for about 30 minutes.

TPMS REMINDER RESET - PROCEDURE 04

NOTE: **Make sure the tire pressure is properly adjusted to the specified tire pressure listed on the doorjamb label before doing the TPMS calibration.**

Do the TPMS calibration after doing the following items:

- Adjust the tire pressure
- Rotating the tires
- Replacing the tires
- Update/replace the VSA modulator-control unit

The calibration begins when the calibration is selected through the MID (multi-information display). The calibration is completed after driving in an ideal driving condition (28 to 65 mph (45 to 105 km/h), driving steadily without much acceleration or deceleration) for about 19 minutes. Full functionality of the system cannot be performed properly if the calibration is not completed.

1. Turn the ignition switch to ON (II), or the engine start/stop button is pressed to select the ON mode.

   NOTE: **Vehicle must be stopped with the transmission in neutral (M/T) or P or N (A/T and CVT).**

2. Press the MENU button (left side of steering wheel) to enter the customizing mode.
3. Press the AUDIO REMOTE + or - button to select CUSTOMIZE SETTINGS > TPMS CALIBRATION > INITIALISE.
4. Press the AUDIO REMOTE + or - button to select YES.
5. When the calibration successfully begins, "TPMS CALIBRATION HAS BEEN INITIALIZED" gets displayed on MID when the system received the calibration.

NOTE: **If the calibration does not begin successfully, "UNABLE TO INITIALIZE TPMS CALIBRATION" gets displayed on MID. Troubleshoot the TPMS.**

TPMS REMINDER RESET - PROCEDURE 05

NOTE: **Make sure the tire pressure is properly adjusted to the specified tire pressure listed on the doorjamb label before doing the TPMS calibration**

The calibration begins when the calibration is selected through the Multi-Information display. The calibration is completed after driving in an ideal driving condition 28 to 65 mph (45 to 105 km/h), driving steadily without much acceleration or deceleration for about 19 minutes. Full functionality of the system cannot be performed properly if the calibration is not completed.

Do the TPMS calibration after doing the following items.

- Adjust the tire pressure.
- Rotating the tires.
- Replacing the tires.
- Update/replace the VSA modulator-control unit.

Calibrate TPMS (Without TPMS Switch)

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.
2. Turn the vehicle to the ON mode.

   NOTE: **Vehicle must be stopped with the shift lever in P or N position.**

3. Press and hold the INFORMATION button for at least 3 seconds to enter the customizing mode. See Fig. 20.
4. Press the SEL/RESET button to select TPMS CALIBRATION.
5. Press the SEL/RESET button to select CALIBRATE.
6. When the calibration successfully begins, "CALIBRATION STARTED" is shown on the Multi-Information display.

NOTE: **If the calibration does not begin successfully, "CALIBRATION FAILED TO START" gets displayed on multi-information display and do the troubleshooting the TPMS symptom troubleshooting.**

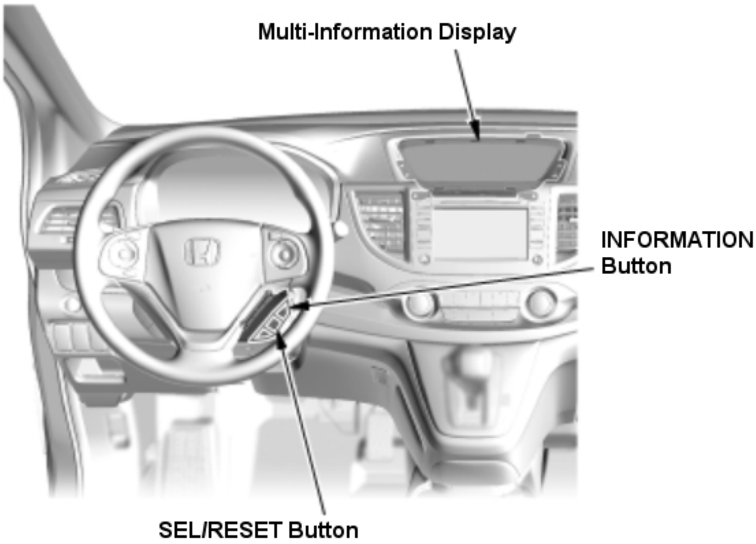

Fig. 20: Identifying TPMS Reset Controls
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Calibrate TPMS (With TPMS Switch)

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.
2. Turn the vehicle to the ON mode.

NOTE: **Vehicle must be stopped with the transmission in P or N position.**

3. Press the TPMS switch for 3 seconds. See Fig. 21.
4. When the calibration successfully begins, the indicator blinks twice.

NOTE: **If the indicator does not blink, check the TPMS switch.**

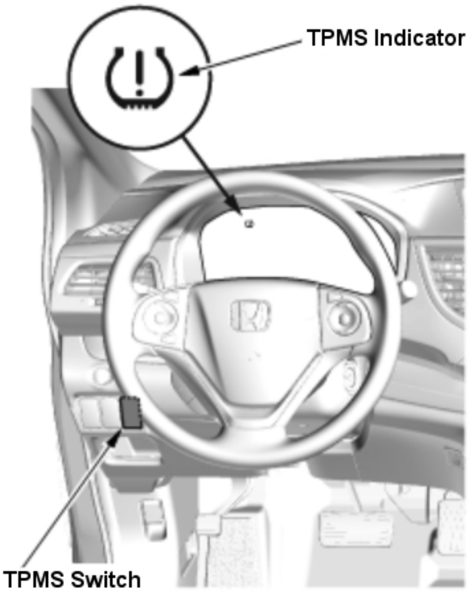

Fig. 21: Identifying TPMS Switch & Indicator
Courtesy of AMERICAN HONDA MOTOR CO., INC.

Calibration Check Method

The calibration check process gets interrupted if the vehicle moves. Do the troubleshooting if the indicator does not go off after 2 seconds, keeps blinking or stays on when the vehicle is in the ON mode.

Check if calibration is completed by following these procedures:

1. Stop the vehicle and shift into P or N position.
2. Turn the vehicle to the OFF (LOCK) mode.
3. Turn the vehicle to the ON mode and wait to see the low pressure indicator come on for 2 seconds and then off.
4. Do not drive the vehicle and wait for 45 seconds as is.
5. If the calibration is completed, the indicator does not come on. If the calibration is not yet completed, then the indicator comes on for 2 seconds and then goes off.

TPMS REMINDER RESET - PROCEDURE 06

Set the tire pressure of all wheels to pressure specified on the tire and loading information label. Make sure the vehicle is at a complete stop.

- For Manual transmission models: The shift lever is in "N".
- For CVT models: The shift lever is in "P".
- The power mode is ON.

Calibrate the system from the CUSTOMIZE SETTINGS menu on the multi-information display:

1. Press the UP/DOWN ARROW buttons on the right side of steering wheel to select CUSTOMIZE SETTINGS, then press the SEL/RESET button to see TPMS CALIBRATION appears on the display. See Fig. 22.
2. Press the SEL/RESET button. The display switches to the customization setup screen to select CALIBRATE.
3. Press the ARROW buttons and select CALIBRATE, then press the SEL/RESET button to see CALIBRATION STARTED screen appears, then the display returns to the customization menu screen.
4. The calibration process finishes automatically.

NOTE: If the CALIBRATION FAILED TO START message appears, repeat steps 2 and 3.

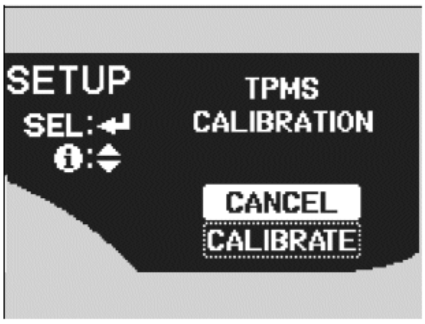

Fig. 22: Identifying Multi-Information Display (CR-Z)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

TPMS REMINDER RESET - PROCEDURE 07

This vehicle is equipped with an indirect TPMS that doesn't use tire pressure sensors mounted inside the tires. It uses the existing VSA wheel speed sensors to monitor and compare tire characteristics while driving.

The calibration begins when the TPMS switch is pressed or the calibration is selected through the Multi-information display. The calibration is completed after driving 31 to 62 mph (50 to 100 km/h), steadily without much acceleration or deceleration for about 19 minutes.

TPMS calibration is required after performing any of the following actions:

- Adjusting tire pressures
- Rotating the tires
- Replacing the tires
- Updating/replacing the VSA modulator-control unit

Calibration begins when TPMS switch is pressed (Models Without ACC) or Calibration is selected through the Multi-information display (Models With ACC). The process finishes automatically as the vehicle is driven. This takes about 30 minutes of cumulative driving at 30 to 60 mph.

Calibration - Models Without ACC

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label. Vehicle must be stopped with the transmission in neutral (M/T) or P or N (A/T, CVT).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Press the TPMS switch (lower dash, left of steering wheel) for 3 seconds.
4. When the calibration successfully begins, the TPMS indicator (instrument cluster, center left) blinks twice.
5. Calibration is completed after driving 31 to 62 mph (50 to 100 km/h), steadily without much acceleration or deceleration for about 30 minutes.

Calibration - Models With ACC

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label. Vehicle must be stopped with the transmission in neutral (M/T) or P or N (A/T, CVT).
2. Turn the ignition switch to ON (II), or press the engine start/stop button to select the ON mode.
3. Press and hold the INFORMATION button (right side of steering wheel) to enter the VEHICLE SETTINGS mode.
4. Press the SEL/RESET button to select TPMS CALIBRATION.
5. When the calibration successfully begins, "Calibration Started" gets displayed on Multi-information display when the system received the calibration.

   NOTE: If the CALIBRATION FAILED TO START message appears, repeat steps 3 and 4.

6. Calibration is completed after driving 31 to 62 mph (50 to 100 km/h), steadily without much acceleration or deceleration for about 30 minutes.

TPMS REMINDER RESET - PROCEDURE 08

This vehicle is equipped with an indirect TPMS that doesn't use tire pressure sensors mounted inside the tires. It uses the existing VSA wheel speed sensors to monitor and compare tire characteristics while driving.

Calibration begins when it is selected through the Multi-information display (7-inch screen) or the TPMS switch is pressed (5-inch screen). Calibration is completed after driving 28 to 65 mph (50 to 100 km/h), steadily without much acceleration or deceleration for about 20 minutes.

TPMS calibration is required after performing any of the following actions:

- Adjusting tire pressures
- Rotating the tires
- Replacing the tires
- Updating/replacing the VSA modulator-control unit

With Display Audio Type (7-Inch Screen)

NOTE: Vehicle must be stopped with the transmission in neutral (M/T) or P or N (CVT).

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.
2. Turn the vehicle to the ON mode.
3. Press the INFORMATION button (left side of steering wheel - See Fig. 23), then press the AUDIO REMOTE button to select the VEHICLE SETTINGS.
4. Press the AUDIO REMOTE button to select TPMS CALIBRATION.
5. Press the AUDIO REMOTE button to select CALIBRATE.
6. When the calibration successfully begins, CALIBRATION STARTED is displayed on Multi-information display when the system receives the calibration.

NOTE: If the calibration does not begin successfully, CALIBRATION FAILED TO START is displayed on Multi-information display.

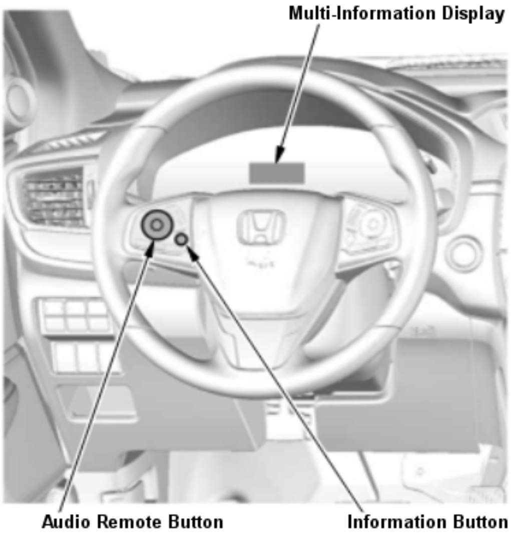

Fig. 23: TPMS Reset Controls (Steering Wheel Controls)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

With Display Audio Type (5-Inch Screen)

NOTE: Vehicle must be stopped with the transmission in neutral (M/T) or P or N (CVT).

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.
2. Turn the vehicle to the ON mode.
3. Press and hold the TPMS switch (lower left dash) for 3 seconds.
4. When the calibration successfully begins, the indicator blinks twice.

TPMS REMINDER RESET - PROCEDURE 09

This vehicle is equipped with an indirect TPMS that doesn't use tire pressure sensors mounted inside the tires. It uses the existing VSA wheel speed sensors to monitor and compare tire characteristics while driving.

Calibration begins when it is selected through the Multi-information display (7-inch screen) or the TPMS switch is pressed (5-inch screen). Calibration is completed after driving 28 to 65 mph (50 to 100 km/h), steadily without much acceleration or deceleration for about 20 minutes.

TPMS calibration is required after performing any of the following actions:

- Adjusting tire pressures
- Rotating the tires
- Replacing the tires
- Updating/replacing the VSA modulator-control unit

With Display Audio Type (7-Inch Screen)

NOTE: Vehicle must be stopped with the transmission in neutral (M/T) or P or N (CVT).

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.
2. Turn the vehicle to the ON mode.
3. Select the HOME button on the screen.
4. Select SETTINGS.
5. Select VEHICLE.
6. Select TPMS CALIBRATION.
7. Select CALIBRATION.

8. When the calibration successfully begins, CALIBRATION STARTED is displayed on Multi-information display when the system receives the calibration.

NOTE: **If the calibration does not begin successfully, UNABLE TO INITIALIZE TPMS is displayed on Multi-information display.**

With Display Audio Type (5-Inch Screen)

NOTE: **Vehicle must be stopped with the transmission in neutral (M/T) or P or N (CVT).**

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.
2. Turn the vehicle to the ON mode.
3. Press the INFORMATION button (left side of steering wheel - See Fig. 24), then press the AUDIO REMOTE button to select the VEHICLE SETTINGS.
4. Press the AUDIO REMOTE button to select TPMS CALIBRATION.
5. Press the AUDIO REMOTE button to select CALIBRATE.
6. When calibration successfully begins, CALIBRATION STARTED is displayed on Multi-information display when the system receives the calibration.

NOTE: **If calibration does not begin successfully, CALIBRATION FAILED TO START is displayed on Multi-information display.**

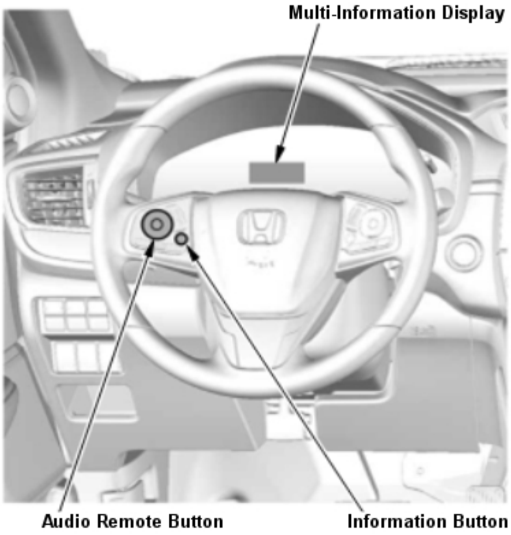

Fig. 24: TPMS Reset Controls (Steering Wheel Controls)
Courtesy of AMERICAN HONDA MOTOR CO., INC.

With TPMS Switch

NOTE: **Vehicle must be stopped with the transmission in neutral (M/T) or P or N (CVT).**

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.
2. Turn the vehicle to the ON mode.
3. Press and hold the TPMS switch (lower left dash) for 3 seconds.
4. When the calibration successfully begins, the indicator blinks twice.

INSPECTION

SEAT BELT INSPECTION

Inspection

1. Seat Belt - Inspection (In Vehicle)

    In-Vehicle

    1. Check that the seat belt is not twisted or caught on anything.

    2. After installing the anchors, check for free movement on the anchor bolts. If necessary, remove the anchor bolts, and check that the washers and other parts are not damaged or improperly installed.

    3. Check the seat belts for damage or discoloration. Clean with a shop towel if necessary. Use only soap and water to clean the seat belts.

    NOTE: Dirt build-up in the loops of the upper anchors can cause the seat belts to retract slowly. Wipe the inside of the loops with a shop towel dampened with isopropyl alcohol.

    4. Check that the seat belt does not lock when pulled out slowly. The seat belt is designed to lock only during a sudden stop or impact.

    5. Make sure that the seat belt will retract automatically when released.

    6. For each rear seat belt, check the seat belt retractor locking mechanism automatic locking retractor (ALR). This function is for securing child seats.

    Pull out the seat belt all the way to engage the ALR. The seat belt should retract with a ratcheting sound, but not extend. This is normal.

    -2. To disengage the ALR, release the seat belt and allow it to fully retract, then pull out the seat belt part-way. The seat belt should retract and extend normally.

    7. Replace the seat belt with a new assembly if there is any abnormality. Do not disassemble any part of the seat belt for any reason.

2. **Headliner - Removal**
3. Seat Belt - Inspection (Out of Vehicle)

    Out of Vehicle

    For front seat belt retractors with seat belt tensioners, review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

REMOVAL AND INSTALLATION

CABLE REEL REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: Before doing this procedure, set the front wheels in the straight ahead position.

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Steering Wheel - Remove**
3. **Column Cover - Remove**
4. Cable Reel - Remove

	1. Disconnect the connectors (A) from the cable reel. 2. For some models: Disconnect the connector (B) from the cable reel. 3. Release the lock tabs (C), then remove the cable reel (D).

Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- Before installing the steering wheel, make sure the front wheels are aligned straight ahead.
- The new cable reel is locked by a yellow tab for center adjustment. When installing a new cable reel there is no need to rotate the cable reel. After installation of the cable reel, remove the tab and discard it.
- If the driver's airbag deployed, the cable reel cannot be reused because of thermal damage.

1. Cable Reel - Install

	1. Install the cable reel (A). 2. Connect the connectors (B) to the cable reel. 3. For some models: Connect the connector (C) to the cable reel.

2. Column Cover - Install
3. Cable Reel - Align

For some models  **For some models** 	1. Make sure the front wheels are pointing straight ahead. 2. Rotate the cable reel (A) clockwise until it stops. 3. Rotate the cable reel counterclockwise until the arrow mark (B) on the cable reel points straight up. 4. Rotate the cable reel counterclockwise two full turns. The arrow mark on the cable reel should point straight up.

4. Steering Wheel - Install
5. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

DRIVER'S AIRBAG REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

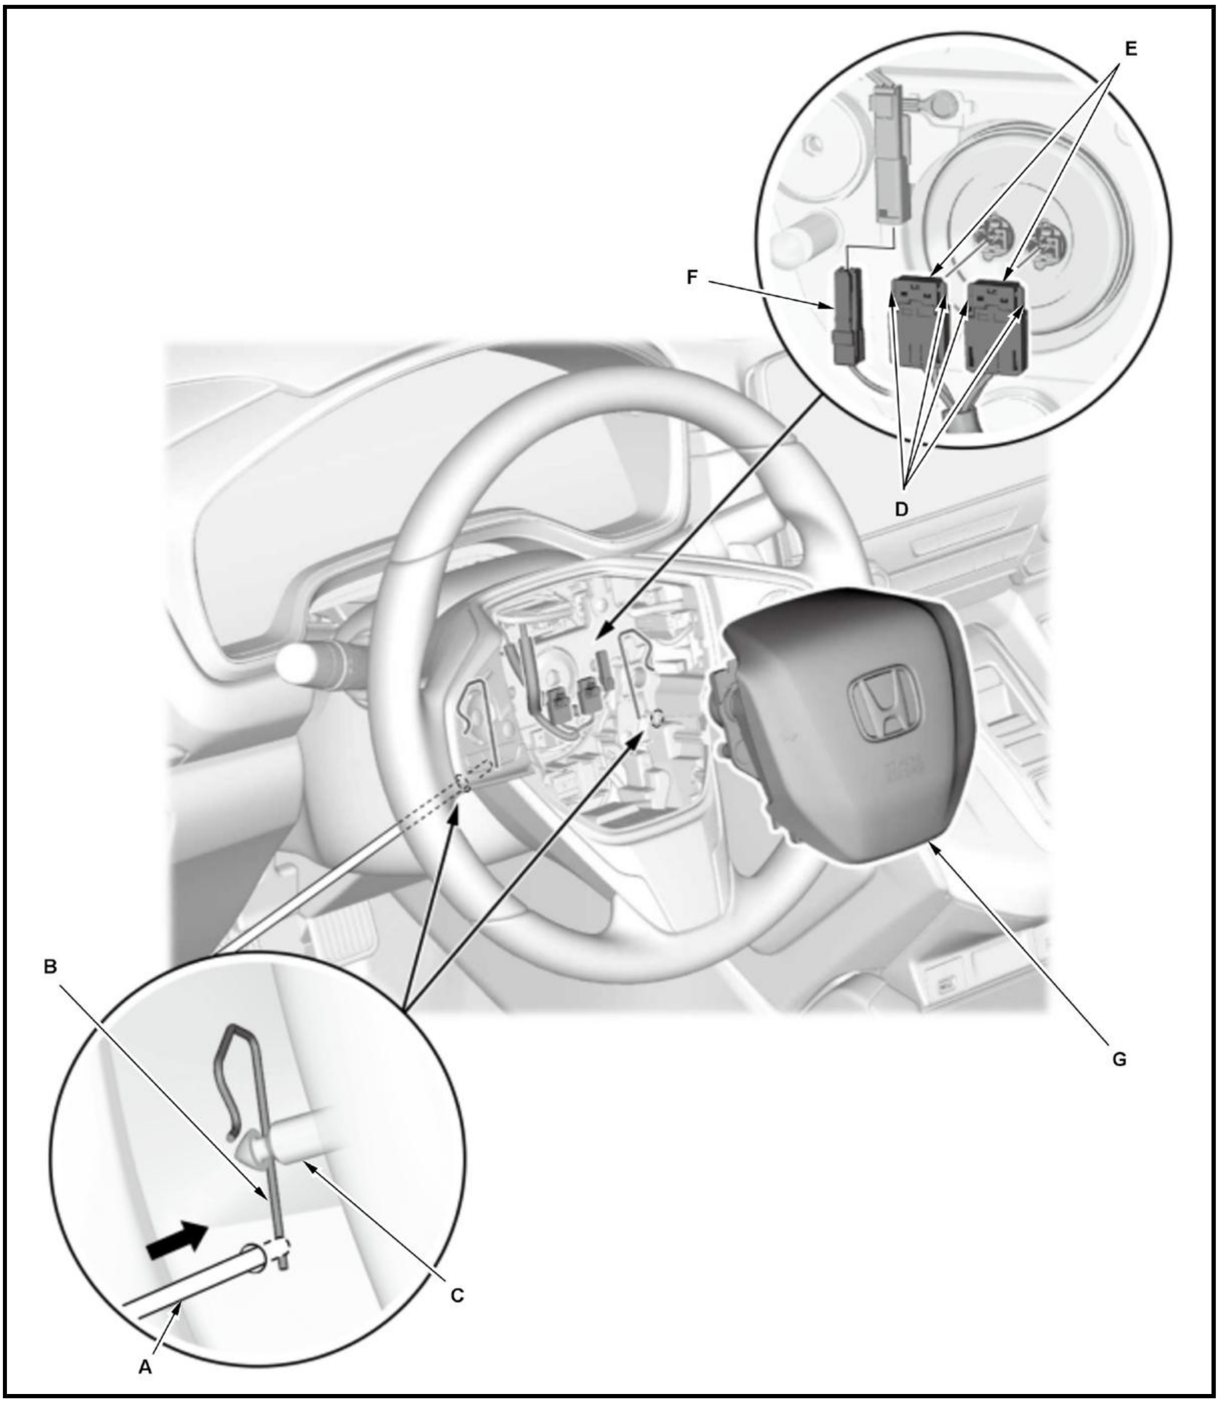
NOTE: If replacing the driver's airbag after deployment, **refer to Component Replacement/Inspection After Deployment** for a complete list of other parts that must also be replaced.

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. Driver's Airbag - Remove

   1. Insert a punch (A) (diameter of 5.5 mm) through the left hole of the steering wheel cover and push the spring (B) to release the front airbag pin (C) while pulling out the airbag. Repeat for the right side.



2. Pull up on both locking tabs (D) to disconnect the connector (E).

NOTE: Be careful not to damage the connectors.

3. Disconnect the connector (F).

4. Remove the driver's airbag (G).

3. Spring - Remove (If necessary)

	1. Remove the springs (A) from the steering wheel (B). **NOTE:** Be careful not to damage the steering wheel.

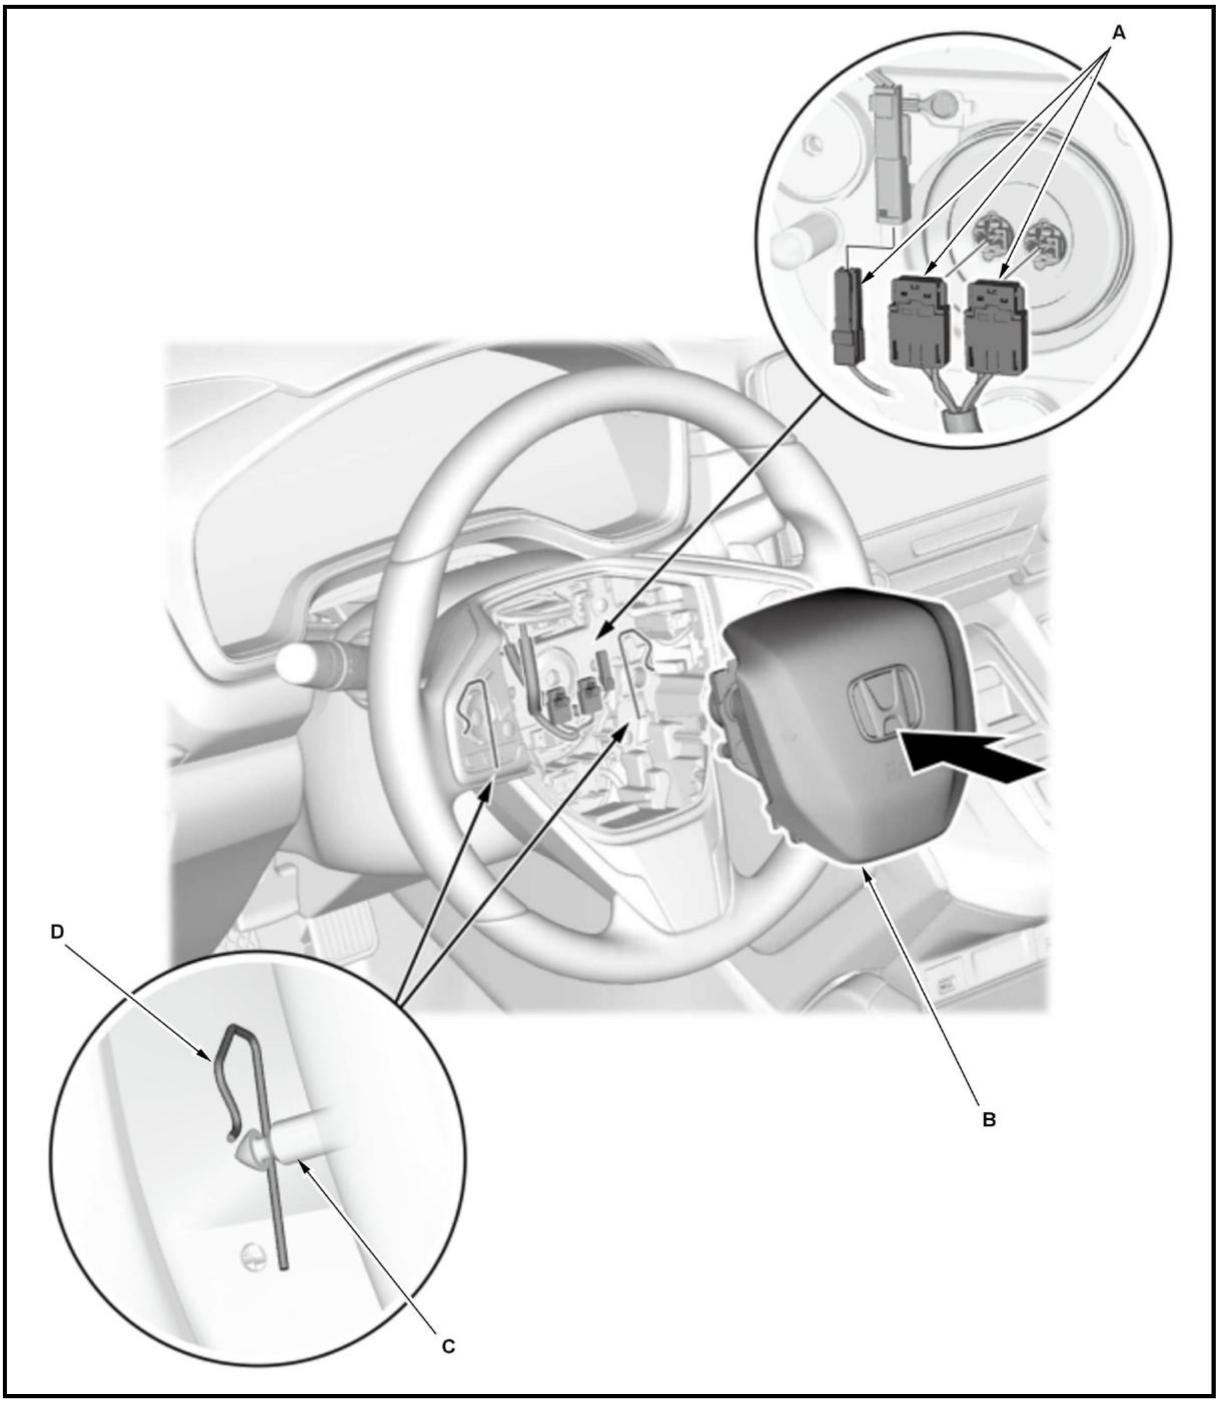
Installation

1. Spring - Install (If necessary)

	1. Install the springs (A) to the steering wheel (B). **NOTE:** Make sure that the springs are installed properly.

2. Driver's Airbag - Install

   1. Connect the connectors (A).



2. Install the driver's airbag (B) by pushing it in until you hear a click.

NOTE: Confirm that the front airbag pins (C) are securely mounted to the springs (D).

	3. Make sure the clearance (A) between the steering wheel and horn pad is the specified value. 4. After connecting the negative cable to the 12 volt battery, make sure the horn works properly.

3. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

DRIVER'S SEAT POSITION SENSOR REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- **How to read the torque specifications** .
- Do not turn the vehicle to the ON mode, while removing or installing the driver's seat position sensor.

1. **Front Seat - Remove**

   NOTE: Raise the driver's seat all the way up.

2. Driver's Seat Position Sensor - Remove

	1. Disconnect the connector (A). 2. Remove the nut (B), then remove the driver's seat position sensor (C).

3. All Removed Parts - Install

1. Install the all removed parts in the reverse order of removal.

NOTE:

- Be sure to install the harness so it is not pinched or interferes with other parts.
- After replacing the driver's seat position sensor with a new one, check the driver's seat position sensor operation .

4. Driver's Seat Position Sensor - Operation Check
5. SRS Operation - Confirm

1. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

FRONT PASSENGER'S AIRBAG CUTOFF INDICATOR REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. 12 Volt Battery Terminal - Disconnect

   NOTE: Wait at least 3 minutes before starting work.

2. Climate Control panel / Front Passenger's Airbag Cutoff Indicator - Remove
3. All Removed Parts - Install

1. Install the all removed parts in the reverse order of removal.

4. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

FRONT PASSENGER'S AIRBAG REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- **How to read the torque specifications** .
- If replacing the front passenger's airbag after deployment, **refer to Component Replacement/Inspection After Deployment** for a complete list of other parts that must also be replaced.

Removal Before the Front Passenger's Airbag Deployment

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Blower Unit - Remove**
3. Front Passenger's Airbag - Remove

	1. Disconnect the connector (A).

	2. Remove the mounting bolts (A). 3. Release the hooks (B) from the front passenger's airbag housing holes (C) of the dashboard. **NOTE:** • When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage. • Take care not to damage the front passenger's airbag housing holes of the dashboard. • Take care not to damage the front passenger's airbag. 4. Lower the front passenger's airbag and release the hooks of the engine room side, then remove the airbag from the dashboard.

Removal After the Front Passenger's Airbag Deployment

1. 12 Volt Battery Terminal - Disconnect

   NOTE: Wait at least 3 minutes before starting work.

2. Glove Box - Remove
3. Front Passenger's Airbag Inflator Connector - Disconnect

	1. Disconnect the connector (A).

4. **Front Passenger's Airbag/Dashboard - Remove**

Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: **How to read the torque specifications** .

Installation Before the Front Passenger's Airbag Deployment

1. Front Passenger's Airbag - Install

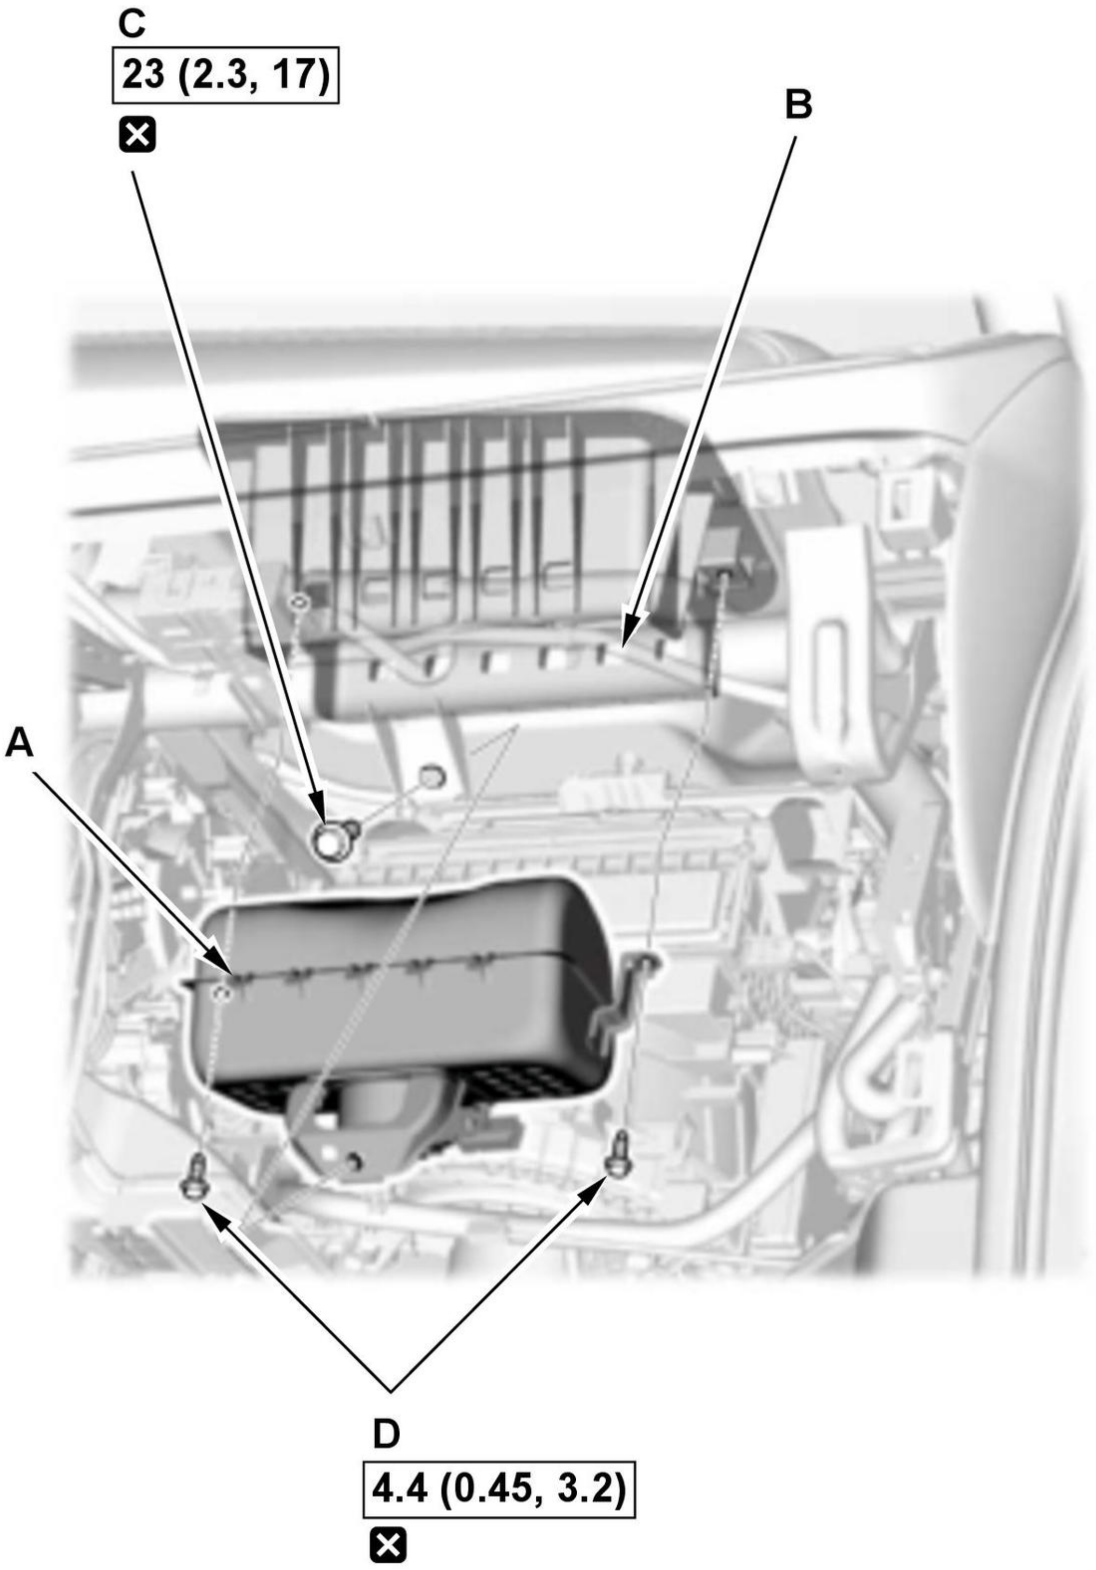


Fig. 1: Front Passenger's Airbag Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Insert the hooks (A) into the front passenger's airbag housing holes (B).

NOTE:

- Make sure there are no objects between the airbag and the dashboard.
- Make sure the airbag is fully seated, and make sure the dashboard is not deformed or damaged after the airbag is in place.
- Make sure the hooks are set properly.

2. Tighten the new mounting bolts (C, D).

	3. Connect the connector (A).

2. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

3. Blower Unit - Install

Installation After the Front Passenger's Airbag Deployment

1. Front Passenger's Airbag - Install

	1. Insert the hooks (A) of the front passenger's airbag into the housing holes (B). **NOTE:** • Make sure there are no objects between the airbag and the dashboard. • Make sure the airbag is fully seated, and make sure the dashboard is not deformed or damaged after the airbag is in place. • Make sure the hooks are set properly. 2. Tighten the new bolts (C).

2. **Front Passenger's Airbag/Dashboard - Install**
3. Front Passenger's Airbag Inflator Connector - Connect

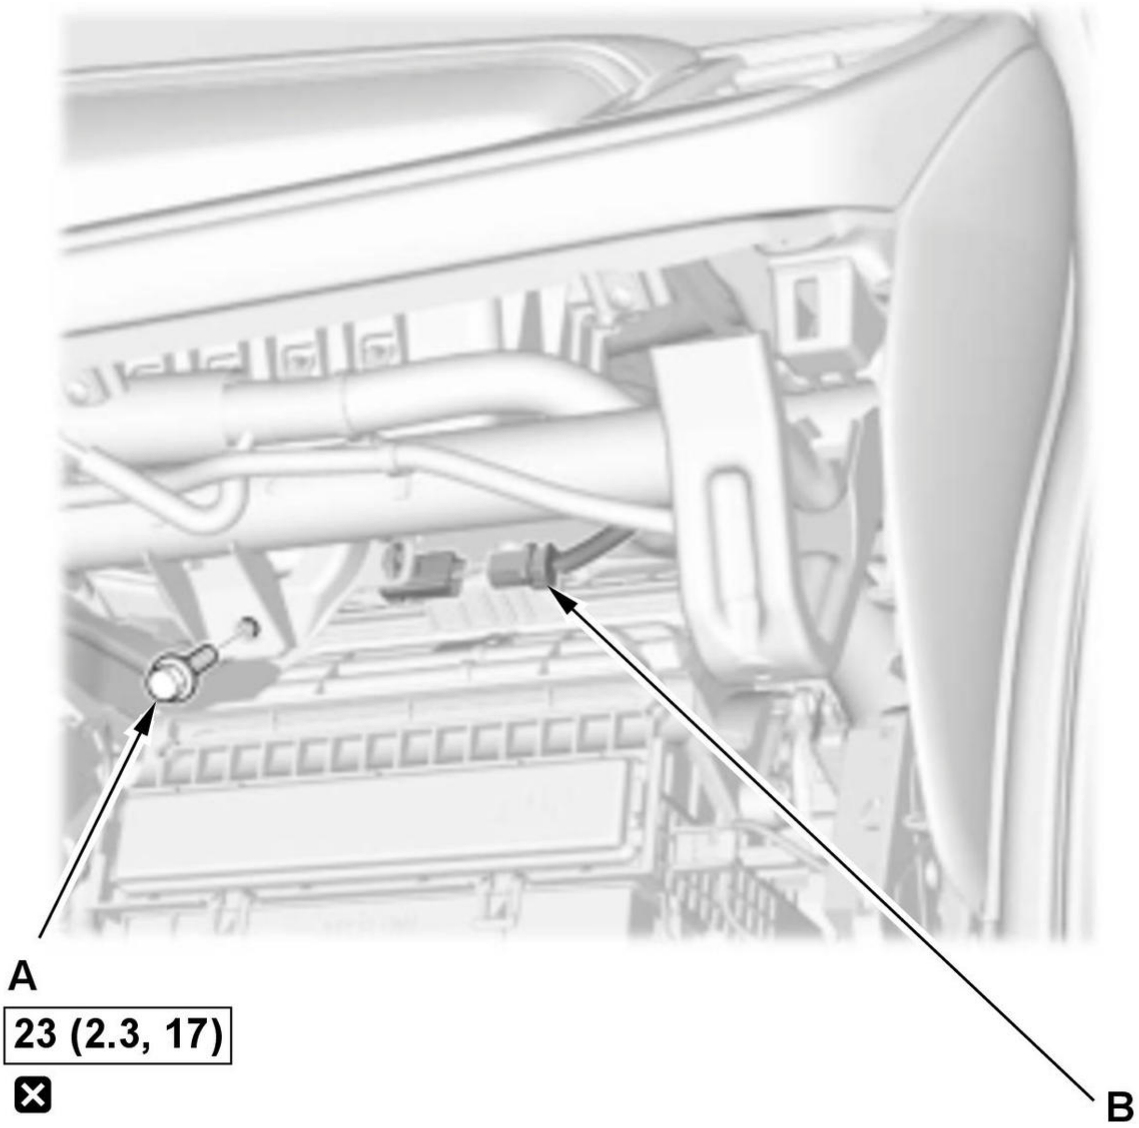

Fig. 2: Front Passenger's Airbag Inflator With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Tighten the new mounting bolt (A).

2. Connect the connector (B).

4. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

5. **Glove Box - Install**

FRONT PASSENGER'S WEIGHT SENSOR REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- **Removal of the front passenger's weight sensors must be done according to Precautions and Procedures** .
- Manual seat: The front passenger's weight sensor is part of the seat frame and must be replaced as an assembly.
- Power seat: The front passenger's weight sensor is part of the seat rail and must be replaced as an assembly.

Manual Seat

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Front Seat Frame (Passenger's side) - Remove**
3. **Front Passenger's Seat Frame/Front Passenger's Weight Sensors - Remove**

Power Seat

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Front Seat Frame (Passenger's side) - Remove**
3. **Front Passenger's Seat Rail/Front Passenger's Weight Sensors - Remove**

Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- Be sure to install the harness wires so they are not pinched or interfering with other parts.
- Manual seat: The front passenger's weight sensor is part of the seat frame and must be replaced as an assembly.
- Power Seat: The front passenger's weight sensor is part of the seat rail and must be replaced as an assembly.

Manual Seat

1. **Front Passenger's Seat Frame/Front Passenger's Weight Sensors - Install**
2. **Front Seat Frame (Passenger's side) - Install**
3. **12 Volt Battery Terminal - Connect**
4. Seat Operation - Confirm

   1. Move the front seat and the seat-back through their full ranges of movement, making sure the harness is not pinched or interfering with other parts.

5. **Front Passenger's Weight Sensor - Initialize**
6. **Front Passenger's Weight Sensor - Operation Check**
7. SRS Operation - Confirm

   1. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

Power Seat

1. **Front Passenger's Seat Rail/Front Passenger's Weight Sensors - Install**
2. **Front Seat Frame (Passenger's side) - Install**
3. **12 Volt Battery Terminal - Connect**
4. Seat Operation - Confirm

1. Move the front seat and the seat-back through their full ranges of movement, making sure the harness is not pinched or interfering with other parts.

5. **Front Passenger's Weight Sensor - Initialize**
6. **Front Passenger's Weight Sensor - Operation Check**
7. SRS Operation - Confirm

1. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

IMPACT SENSOR REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: **How to read the torque specifications** .

Front Impact Sensor

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Front Bumper - Remove**
3. Front Impact Sensor - Remove

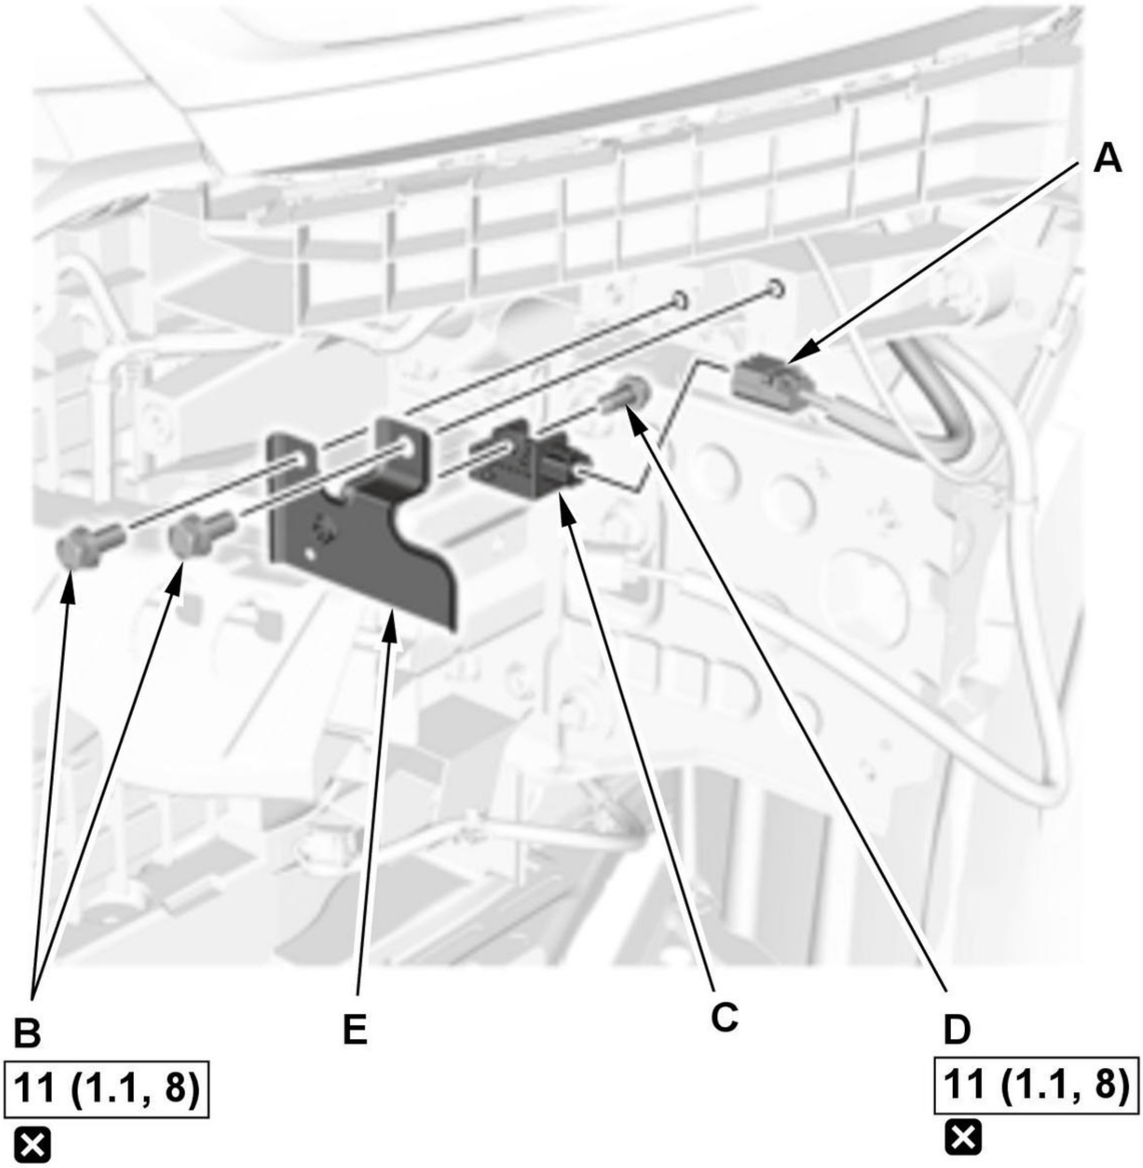

Fig. 3: Front Impact Sensor Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Disconnect the connector (A).

2. Remove the bolts (B), then remove the front impact sensor (C).

3. Remove the bolt (D), then remove the bracket (E).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- During installation, install the new bolt to the specified torque.
- Before installing the front inner fender, make sure the SRS indicator works normally.

5. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

Side Impact Sensor (First)

1. 12 Volt Battery Terminal - Disconnect

   NOTE: Wait at least 3 minutes before starting work.

2. B-pillar Lower Trim Cover - Remove
3. Side Impact Sensor (First) - Remove

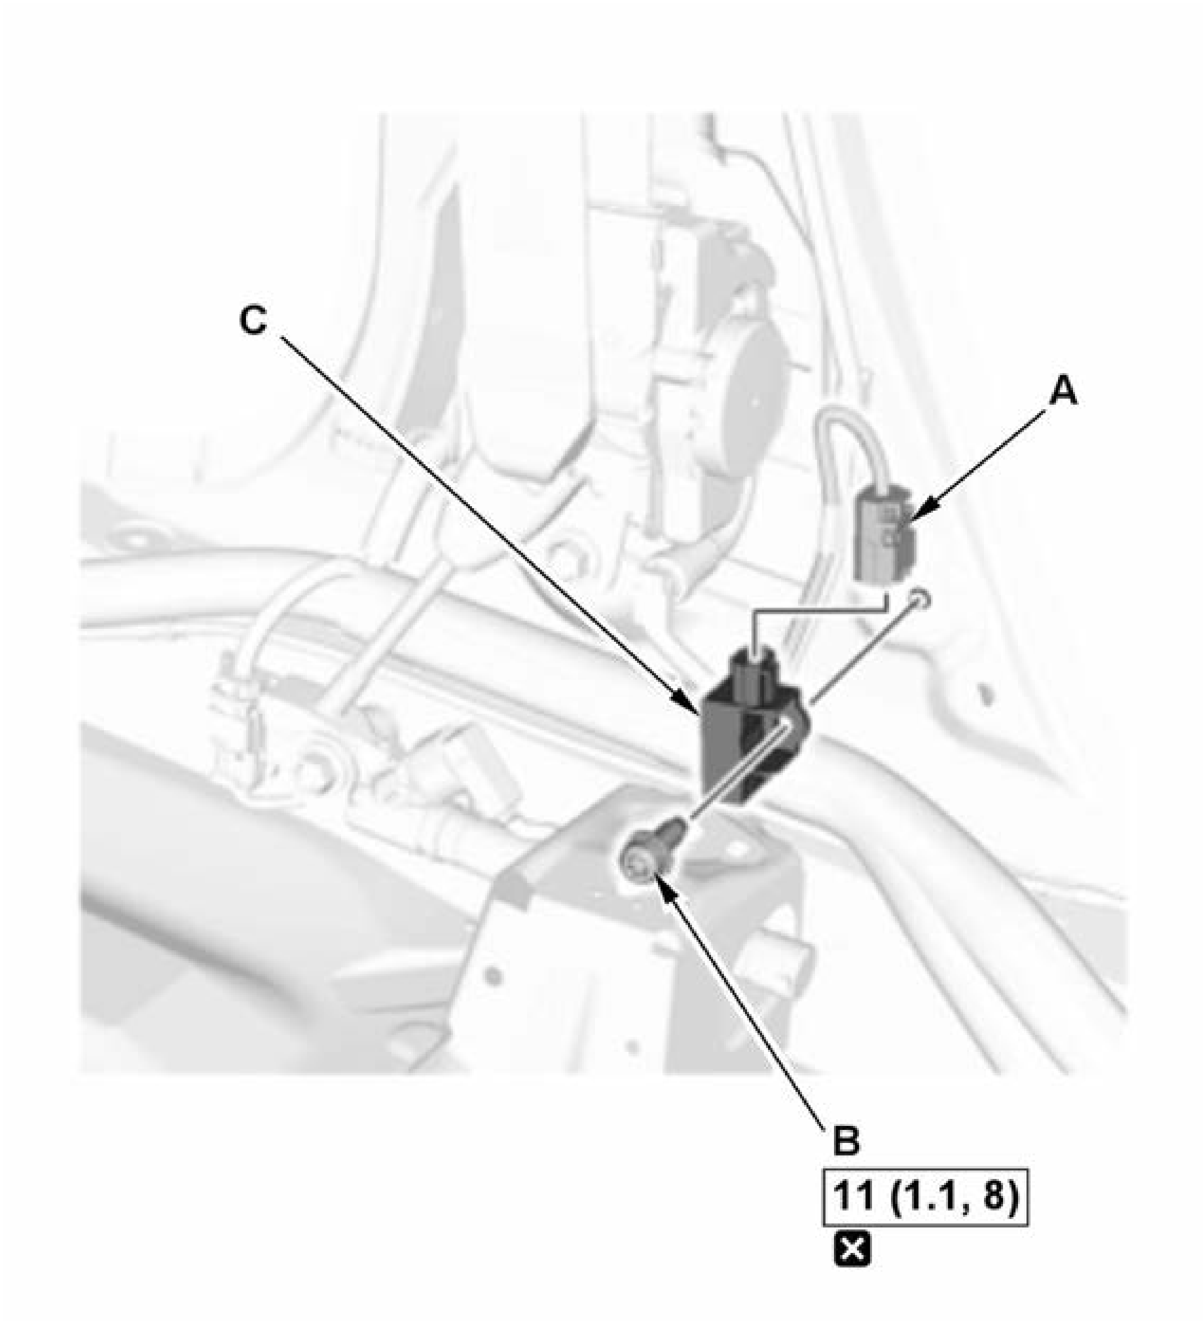

Fig. 4: Side Impact Sensor (First) Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Disconnect the connector (A).

2. Remove the bolt (B), then remove the side impact sensor (first) (C).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- During installation, install the new bolt to the specified torque.
- Before installing the B-pillar lower trim, make sure the SRS indicator works normally.

5. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

Side Impact Sensor (Second)

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Rear Side Trim Panel - Remove**
3. Side Impact Sensor (Second) - Remove

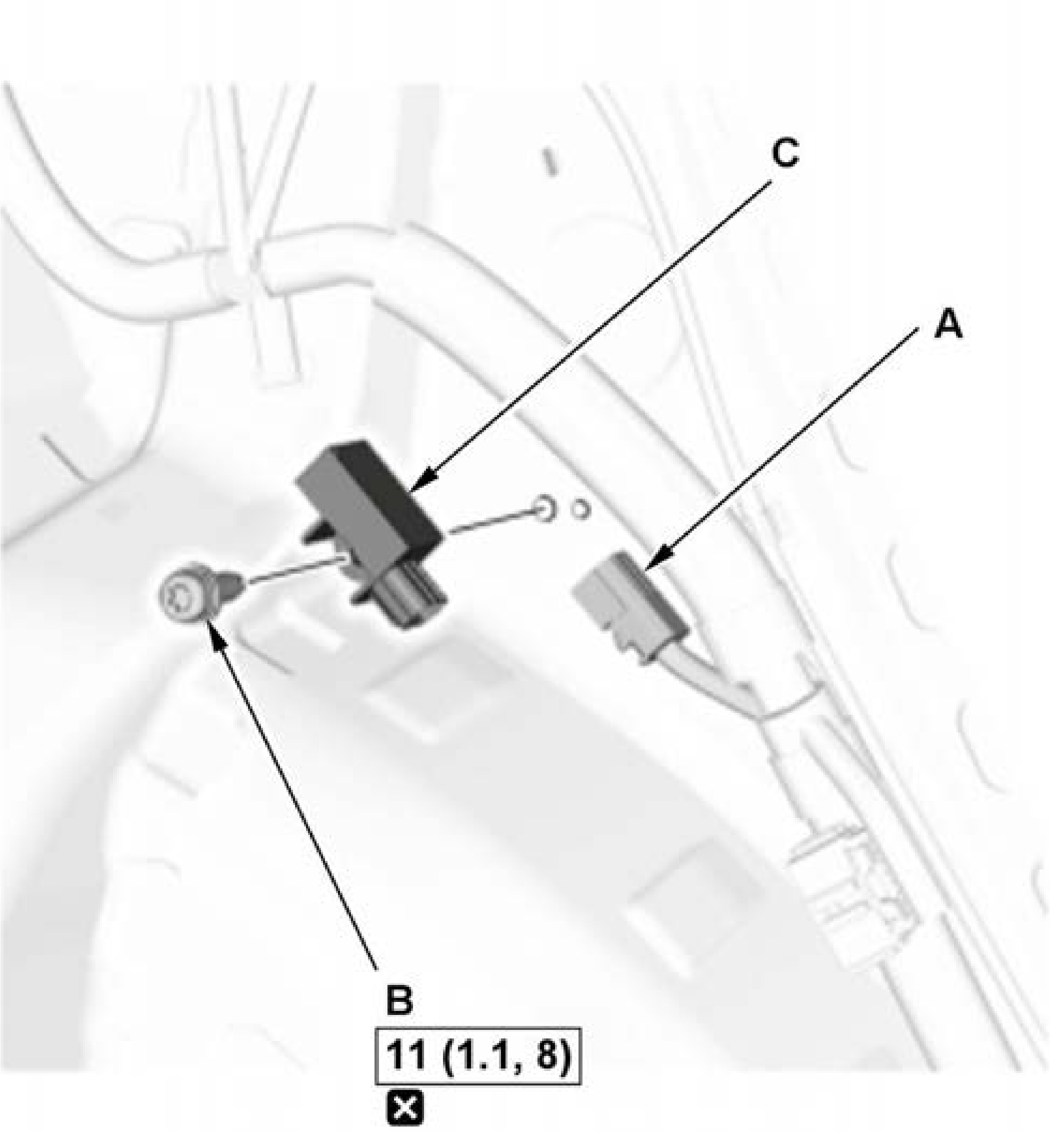

Fig. 5: Side Impact Senor (Second) Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Disconnect the connector (A).

2. Remove the bolt (B), then remove the side impact sensor (second) (C).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.
NOTE:

- During installation, install the new bolt to the specified torque.
- Before installing the rear side trim panel, make sure the SRS indicator works normally.

5. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SRS UNIT REMOVAL AND INSTALLATION

Removal and Installation

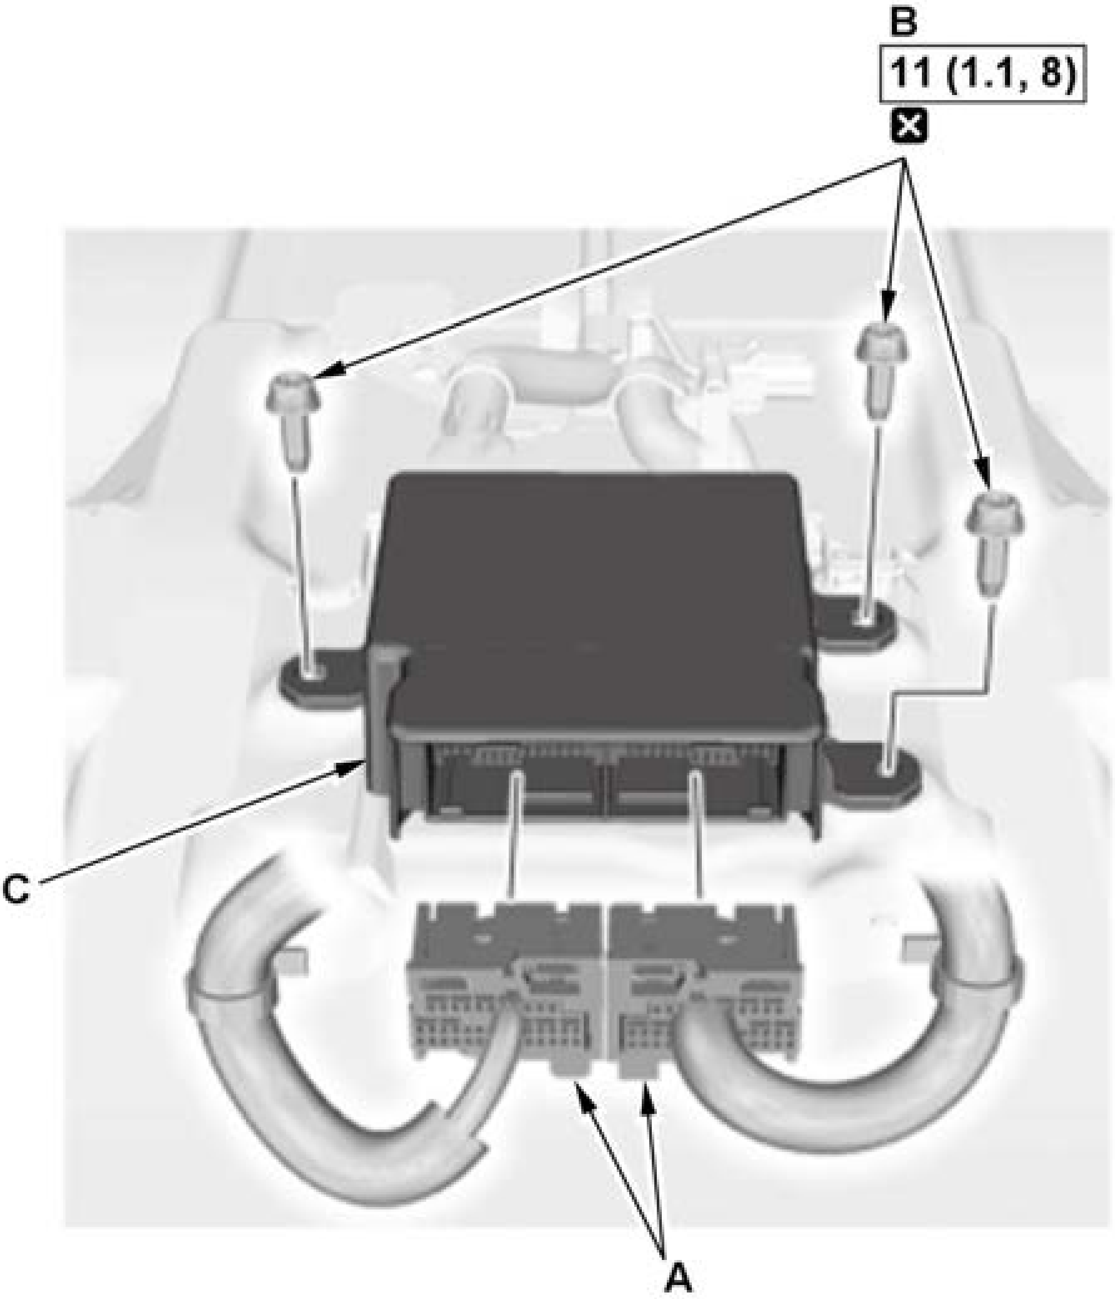
SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: **How to read the torque specifications** .

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Center Console - Remove**
3. SRS Unit - Remove



[Fig. 6: SRS Unit Components With Torque Specifications]

Courtesy of HONDA, U.S.A., INC.

1. Disconnect the connectors (A). **NOTE:** The SRS unit connectors have lever locks. Release the locks before disconnecting the connectors 2. Remove the bolts (B). 3. Remove the SRS unit (C).

4. All Removed Parts - Install

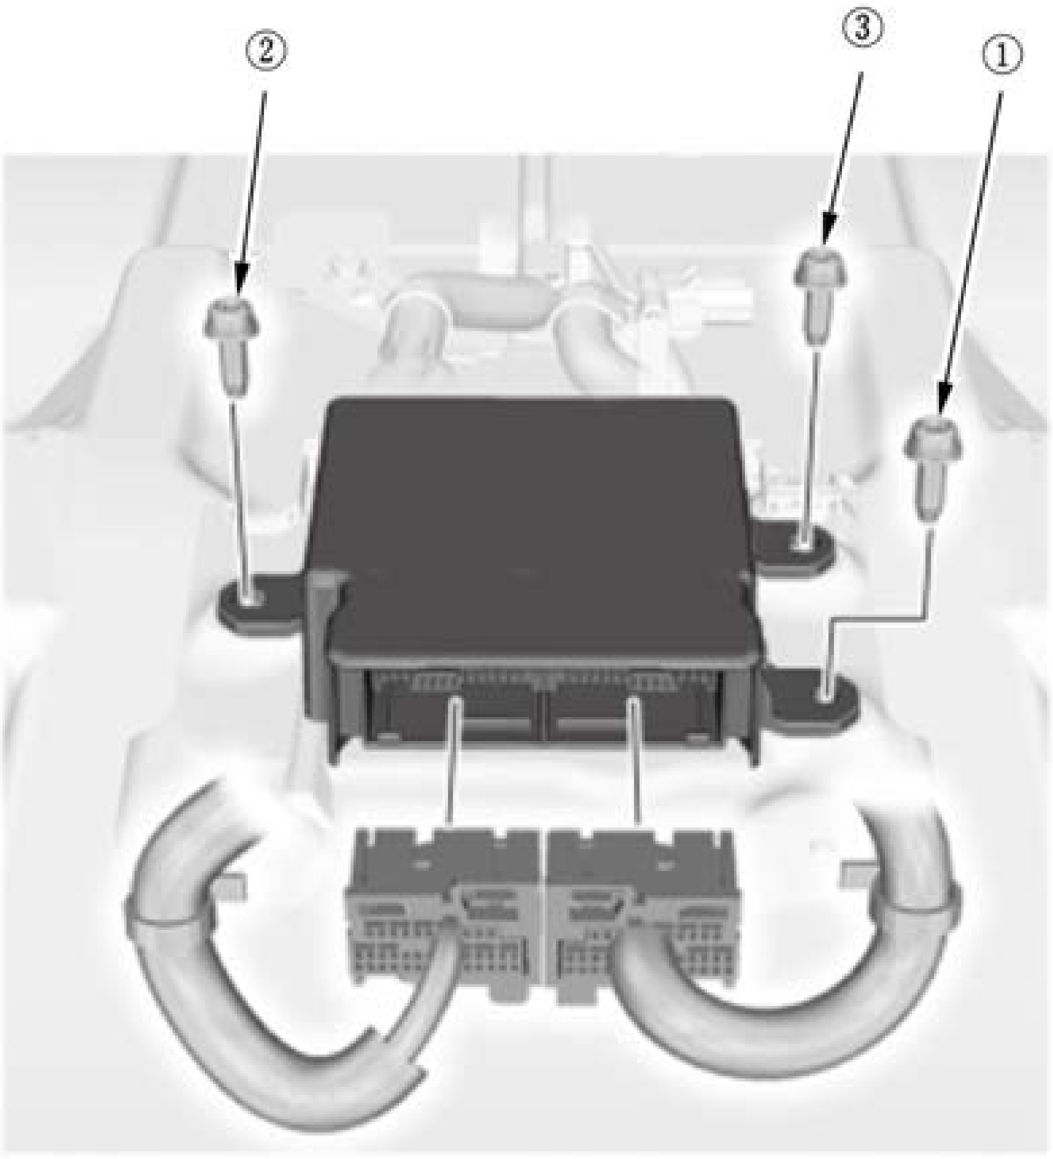


Fig. 7: SRS Unit Bolts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

1. Install the parts in the reverse order of removal.

NOTE:

- During installation, install the new bolts to the specified torque.
- Before installing the center console, make sure the SRS indicator works normally.
- Make sure the SRS unit has the latest software. If it does not have the latest, update the software in the SRS unit .
- Tighten the bolts to specified torque in the numbered sequence shown.

5. Yaw Rate-Acceleration Neutral Position - Memorize

NOTE: After replacing the SRS unit with a new one, memorize the yaw rate-acceleration neutral position.

6. **Front Passenger's Weight Sensor - Initialize**

   NOTE: After replacing the SRS unit with a new one, initialize the front passenger's weight sensors.

7. SRS Operation - Confirm

   1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SIDE AIRBAG REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- **How to read the torque specifications** .
- If replacing the side airbag after deployment, **refer to Component Replacement/Inspection After Deployment** for a complete list of other parts that must also be replaced.
- Before the front power seat is removed, slide the front power seat to the half-way position, then raise the seat to the highest position.
- When troubleshooting, do not remove the front seat. Disconnect only the side airbag inflator connector from under the front seat.

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Front Seat - Remove**
3. Front Seat-Back Cover/Pad - Remove

   1. **Remove the front seat-back cover/pad and harness clips as needed** .

4. Side Airbag - Remove

	1. Release the harness clips (A). 2. Remove the mounting nut (B), then remove the side airbag (C).

5. All Removed Parts - Install

1. Install the all removed parts in the reverse order of removal.

NOTE:

- During installation, install the new mounting nut to the specified torque.
- If the side airbag cover is secured with tape, remove the tape.
- Do not open the lid on the side airbag cover.
- Make sure that the seat-back cover/pad is installed properly. Improper installation may prevent proper deployment.
- Be sure to install the harness so that they are not pinched or interfering with other parts.

6. Seat Operation - Confirm

1. Move the front seat and the seat-back through their full ranges of movement, making sure the harness are not pinched or interfering with other parts.

7. SRS Operation - Confirm

1. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SIDE CURTAIN AIRBAG REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

- How to read the torque specifications .
- If replacing the side curtain airbag after deployment, refer to Component Replacement/Inspection After Deployment for a complete list of other parts that must also be replaced.

- **Review the interior trim replacement procedure before doing repair or service** .

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Headliner - Remove**
3. Side Curtain Airbag - Remove

	1. Pull up on both locking tabs (A) to disconnect the connector (B). **NOTE:** Be careful not to damage the connector.

2. Remove the side curtain airbag mounting bolts (A), then remove the side curtain airbag (B).

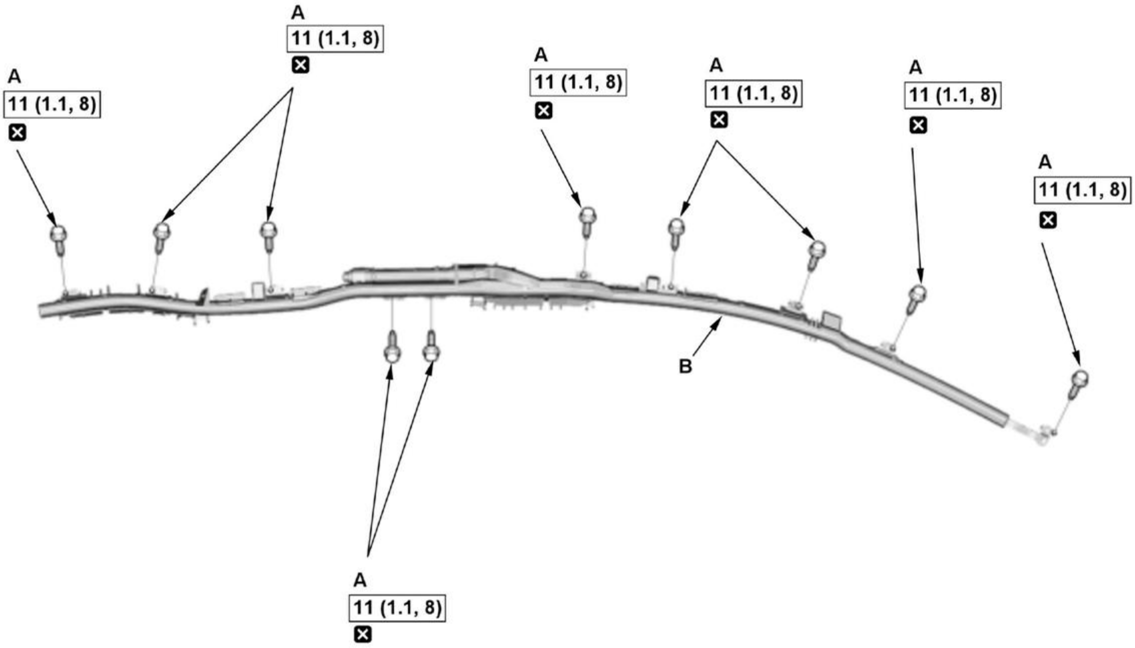

Fig. 8: Side Curtain Airbag And Mounting Bolts With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

4. All Removed Parts - Install

1. Install all of the removed parts in reverse order.

NOTE:

- During installation, install the new side curtain airbag mounting bolts to the specified torque.
- If the side curtain airbag is frayed, or has any other visible damage, replace it. Do not attempt to repair an airbag.
- When you install the side curtain airbag, make sure it is not twisted, and that it is not caught between the inflator bracket by the bracket bolts.
- Make sure that the side curtain airbag inflator retainer is installed properly. Otherwise the side curtain airbag could incorrectly deploy and cause damage or injuries.
- If there is any damage to the side curtain airbag, do not try to repair it. Replace any damaged side curtain airbag.
- Before installing the headliner, make sure the SRS indicator works normally.

5. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

6. **Headliner/Pillar Trim Overlap - Confirm**

REMOVAL AND INSTALLATION

CABLE REEL REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: Before doing this procedure, set the front wheels in the straight ahead position.

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Steering Wheel - Remove**
3. **Column Cover - Remove**
4. Cable Reel - Remove
